magneto is real has been made patent on more than one occasion. Obviously the real danger exists not when the car is in motion, as there then is a considerable draft under the hood, but rather when the car is at rest and the engine is being started. In this respect, owing to the tendency of some carburetters to flood or drip, they often are the principal source of danger, and even though the magneto were on the opposite side of the engine in such a case, the danger still remains, though in a lessened degree.

To the question of proper and efficient drives, which early designers were wont to

FIG. 1—DISPOSITION OF HIGH TENSION WIRES ON E-M-F MOTOR

FIG. 2—ARRANGEMENT OF WIRING ON FLANDERS MOTORS

the solving of the problem of where and how best to locate the magneto, and component parts of the rest of the ignition system, such as wiring, commutators, switches, etc., has been none the less important, though its actual importance often is overlooked. That the importance of the proper location of the magneto should be underestimated is, perhaps, not difficult to understand in view of the fact that as the wires by means of which the ignition current is conducted to the spark plug are flexible and therefore may be bent and trailed almost at will, it apparently is possible to place the magneto almost in any position and obtain results, provided only that it is so placed as to be easily attached to the driving member. Which, briefly, was the hypothesis on which magnetos were fitted to many of the old cars. Also the fact that in the designing of the earlier engines no provision was made for a mag-

these was, and in many cases still is, the possibility of fire resulting from the juxtaposition of carburetter and magneto.

Just how far the practice of placing the carburetter and magneto together has been carried is evidenced by a census of 60 cars which was taken at one of the recent New York shows. Of these 60 cars, 27, or 44 per cent., had the magneto mounted on the same side of the engine as the carburetter. But though a fairly large percentage of manufacturers incline to this arrangement, a still larger percentage favors the isolation of these parts, 21 engines having the magneto located on the right side with the carburetter at the left and 12 having the reverse arrangement. Thus the totals reveal a majority of 33 types, or 56 per cent., in which the carburetter and magneto are on opposite sides of the engine.

That the danger of fire as a result of a too close arrangement of carburetter and

pay little attention, the modern designer has devoted a greater amount of time and energy than at first might be suspected. Naturally with the development of magnetos, methods of mounting have been perfected, and though practically every engine which now is manufactured is provided with a bracket or base suitably located to make connection easy, it is only comparatively recently that the actual means of coupling the driving and driven members has been perfected. It may not be generally known that by reason of the structure of magnetos, the rotation of the armature is easy and hard alternately, according to the position of the armature with regard to the magnets. The pull on the driving member therefore is intermittent and is as a series of jerks rather than a steady pull. On the theory that the continual dropping of water will wear away a stone, it is entirely within reason to sus-

pect that the continual jerking, even though it is slight, may cause uneven wear or the loosening of fastenings which would be practically unaffected by a steady load. That such is the case is evidenced by the fact that not a few manufacturers use magneto couplings which are in effect universal joints. Their use in this respect permits of the magneto getting out of line temporarily without the disastrous results which might accrue if a rigid coupling were used. Similarly, several forms of spring drive, in which the effect of a universal joint is obtained, recently have been evolved, the result being that the probability of fractured magneto shafts of bound bearings is considerably lessened.

Generally, magnetos are driven from the cam shaft, as this arrangement permits the

a metal strap over the magneto, as shown in the Flanders arrangement illustrated in Fig. 2; in some cases both bolts and a strap are used, though generally reliance is placed on either one or the other alone. With the strap arrangement small pins generally are used to prevent the magneto shifting, the pins fitting into holes in the magneto base.

In the mounting of the magneto on Flanders engines, the pump shaft also is utilized to drive the magneto armature, the principal point of difference between the two drives being that in the Flanders arrangement there is a bearing between the pump and the magneto. Though the ignition system in both E-M-F and Flanders cars is practically identical, and embraces a Splitdorf low tension magneto with dash

the reluctance of some manufacturers to "put all their eggs in one basket," though the merits of the expedient have been proven, is evidenced by a continuance of the practice of supplying two independent and separate ignition systems. Undoubtedly two systems entail greater complication than one, but this is more than offset by the added security of the two in precluding the possibility of involuntary stops caused by ignition failures.

The Bosch double system, embracing a high tension magneto for one set of plugs and a distributor and timer combined, operated by a storage battery and coil, for another set, is shown in Fig. 4, as regularly supplied on Columbia poppet valve motors. The magneto is driven directly from the cam shaft gearing, and is held in position

FIG. 3—SIMPLICITY OF HUPMOBILE SET SPARK SYSTEM

use of a smaller number of gears in reducing the armature speed to half that of the crank shaft speed. One of the most popular arrangements is that in which the shaft which drives the magneto also drives the water circulation pump, the magneto shaft being in effect merely a continuation of the pump shaft. Such an arrangement, illustrative of E-M-F "30" practice, is shown in Fig. 1, and it may be seen that both magneto and pump are instantly accessible, while at the same time the distance which the ignition wires have to be led is comparatively short.

As important as is the coupling of armature shafts to the driving member, however, the method of attaching the magneto rigidly to its base is of equal importance, as it may readily be appreciated that, if the magneto should shift, shafts would be thrown out of line and direful results would follow. In the E-M-F engine, and also in a large number of others, the magneto is simply bolted down by means of cap screws passed up through the bracket. An alternate method embraces the use of

transformer and non-vibrating coil, the arrangement of wiring is quite different. Both sets of wiring are shown on the Flanders engine, one set going to the plugs and the other to the transformer, whereas in the picture of the E-M-F engine only the high tension wires leading to the plugs are shown.

Probably the simplest form of ignition apparatus extant is embraced in the set spark system, in which dependence is placed entirely on a high tension magneto, batteries being omitted. Such a system, composed of a Bosch magneto, four wires and four plugs, is used on Hupmobiles, as shown in Fig. 3, and the simplicity of the arrangement is self evident. In the arrangement of the magneto drive the pump shaft is not utilized as it is in other makes of cars. The magneto is driven directly from the cam shaft gears, and the driving shaft is of the minimum length owing to the proximity of the magneto to the front gear train.

Though the tendency toward set spark high tension magneto ignition is increasing,

FIG. 4—EFFECTIVE WIRING OF COLUMBIA DOUBLE IGNITION

by a metal strap which is tightened by means of a winged thumb nut, the removal of the magneto therefore being a comparatively simple matter. From the magneto the high tension wires are led to a manifold on top of the engine, whence they emerge directly over their respective plugs. The combined timer and distributor, also of Bosch manufacture, is located at the opposite end of the cam shaft at the top of a vertical shaft, by means of which the oil pump is operated. To avoid confusion, and also better to insulate them, the wires from the timer-distributor are led through a separate manifold, also on top of the engine, and like the others they are let out exactly at the plugs to which they are to be attached.

An unusual method of steadying a magneto, which, as well as assisting to hold it in position also operates to discourage any tendency toward vibration and consequent loosening of the holding down bolts, is used on Kissel engines, and is illustrated in Fig. 5. Conforming to general practice, the magneto is driven from the cam shaft

gears by means of the same shaft which operates the water pump and is fastened in position by means of cap screws through the bottom of the bracket. Over the magneto and bolted to the cylinder casting, a small bracket carries a yoke which fits transversely over the center magnet and is tightened against it by means of a bolt, the security of the adjustment being insured by a lock nut. The magneto forms part of the standard Bosch dual system.

The method of holding a magneto in position by means of a metal strap, which arrangement has attained considerable popularity, is shown clearly in Fig. 6, in which the manner of mounting the Splitdorf magneto on Velie engines is illustrated. The popularity of this method is due principally to its simplicity and the

FIG. 5—BRACKET MAGNETO STEADYING DEVICE ON KISSEL ENGINES

easy and quick manner of removal of the magneto which it provides. In the Velie arrangement the magneto is driven from one end of the pump shaft; mounted vertically near the opposite end of the shaft, from which it is driven by means of bevel gears, a second shaft carries an Atwater-Kent timer-distributor which operates through a second set of plugs, making a second independent ignition system.

In the Rutenber motor, which is used by a number of car manufacturers, the method of driving the magneto armature is quite different from the usual practice and involves a number of unique features. The magneto is mounted near the front of the engine and at the right side, as shown in Fig. 7. It is driven from a vertical shaft actuated from the crank shaft by means of spiral gears, the same shaft also driving the oil pump in the crank case; a timer for use in operating coils for a second ignition system is mounted at the top of the shaft and, coming very nearly level with the top of the engine, is in an easily accessible position.

Owing to the construction of modern motors, which favors the placing of magnetos longitudinally, that position generally is the rule, though in some cases they are placed cross-wise. The Pope-Hartford

FIG. 6—STRAP METHOD OF HOLDING MAGNETO ON VELIE CARS

motor, which is illustrated in Fig. 8, belongs in this class, the magneto being placed transversely to the axis of the motor. Otherwise the method of mounting and driving is similar to orthodox practice, a metal strap serving to hold the magneto in position and the drive being obtained by means of a jack shaft from a gear on the water pump shaft.

FIG. 7—UNUSUAL MAGNETO AND TIMER DRIVE ON RUTENBER MOTOR

Though the position of magnetos in general and methods of driving are pretty well established at present, just what the future will bring forth in these respects remains

more or less obscure. That some change will be made, however, and in the not far distant future, seems within reason, not because of any inefficiency of present machines or methods, but simply because of the unmistakable tendency toward reducing the necessity for manual labor, the reduction being brought about by the no means simple expedient of combining in the ignition magneto a lighting dynamo and an engine starter. Obviously the method of mounting and driving such a machine must be considerably different from current practice in the arrangement of much smaller and lighter magnetos. As several such systems already have made their appearance and have the backing of prominent manufacturers, it is reasonably certain that others will come as well, and

FIG. 8—TRANSVERSE MAGNETO MOUNTING ON POPE-HARTFORD "SIX"

it is not altogether improbable that present day methods will give way in time to better ones, for as fast as improvements are made they will be adopted.

De Palma to Build Made-to-Order Cars.

Ralph De Palma, the well-known racing driver, is to become an automobile manufacturer. He has no idea of rivaling any of the huge establishments which now exist, but he believes that there is a niche for a man possessed of his information and experience, and he means to turn them to advantage. In brief, he purposes building cars to order, not merely speed cars, but touring cars and roadsters which will embody not only this own idea, but the personal whims of those who pay for them. He expects to set up a modest plant in New York City for the purpose.

De Palma's success in "tuning up" the many racing cars which he has driven, and the fact that as long ago as 1905 he built two pleasure cars which are still running, tend to justify his belief in himself.

PUSH-BUTTON STARTS INTER-STATE

Three-in-One Electrical Equipment Adopted by Muncie Manufacturers—Two New Models Added to Line.

To start the engine of the forthcoming new model Inter-State cars it will be necessary only to push a button, a new combination "starting, lighting and igniting" system which has been developed for them being so constituted that its actuation is reduced to that simple operation. Furthermore, the system is so complete that the introduction of the magneto for supplying ignition current after the engine has been started will be accomplished without even throwing a switch. The system has sufficient reserve capacity to run the motor 40 minutes.

While the innovation in electrical equipment is to be one of the most notable features of the new line, its other particulars, as disclosed by the Inter-State Automobile Co., of Muncie, Ind., indicate that it is to be by no means the only one worthy of consideration. Two entirely new chassis designs, embodying distinct improvements over the successful line now current will constitute the basis of six individual types. The line will be enlarged by the addition of two new models reproduced from present practice with slight improvements.

Of the two newcomers, both of which will employ the new electrical system, one will be of 50 horsepower, equipped with a 5 x 6-inch four-cylinder engine, and will be put forth in three seven-passenger types. The other will be of 40 horsepower rating and will have a 4½ x 5½-inch block motor, like that of the larger chassis, of entirely new construction and distinguished by exceptionally fine pulling powers at low rotative speeds, it is said. This chassis, which likewise is to be built in three different styles of finished car, will have 118-inch wheel base and will be shod with 36 x 4-inch tires.

Apart from the differences in engine design and sundry other points pertaining to size and power, both of the new chassis will embody a number of differences from current Inter-State practice. These new features will include a new drop frame with sub frame mounting for the power plant, a new style multiple disk clutch with cork inserts which is to be mounted integrally with the fly wheel, instead of being embodied in the transmission unit, as heretofore. The clutch has been carefully developed and is connected through a universal joint with the change gear mechanism in such a way that all stresses save those due to driving are eliminated. The gearset is of four-speed construction and is mounted on annular ball bearings, both as to splined driving, lay and main shaft journals.

In the way of equipment, the new cars will be provided with a mechanical tire pumping device, demountable rims, wind-shields, speedometers, and the usual minor outfits in the way of tools and supplies. They will be trimmed in nickel and black enamel. Body developments, of course, have kept pace with the improvements in chassis construction, the new styles being applied to the 30-A closed-front and 32-A roadster, which are to be practically reproduced. It is expected that the new line will be ready by the middle of next month.

"Wizard" Tesla Evolves a Turbine.

Disclosures as to the details of a new form of engine on which Dr. Nikola Tesla, the famous scientist, has been engaged for some time, are reviving discussion as to the possible effect of gas turbine developments on the automobile industry. Tesla's invention, which is described as the application of a new principle in fluid propulsion, embodies action which closely parallels that of the turbine, while differing from it in material respects. In a small steam engine which has been tested at the Waterside station of the New York Edison Co., no less than 110 horsepower is claimed to have been developed from a rotor only 9¼ inches in diameter by 2 inches wide. Equally remarkable results are anticipated from gas engines working on the same plan.

Its almost childish simplicity is the most striking feature of the new Tesla engine. Essentially it consists of a group of thin circular disks mounted side by side on a shaft and enclosed in a casing of simple form. No buckets, blades or vanes, such as are used in ordinary turbines, are employed, the friction between the motive fluid and the disks being relied on to impart motion to the shaft. The adhesion of the fluid for the metal surfaces of the disks and its own viscosity are the physical properties employed in the action of the engine.

The principle involved is that the fluid delivered to the surfaces of the rotor will seek an outlet by traversing the disks in spiral paths and the great flexibility claimed for the system is thought to depend on the fact that in seeking its own course of travel the fluid is following lines of least resistance. The principle may be used for either pump or engine construction and the rotor will work equally well in either direction. Its simplicity will render its cost of construction, if brought to a practical solution, extremely low.

Secures Rights to Term "Motorette."

The C. W. Kelsey Mfg. Co., of Hartford, Conn., has been successful in securing trade mark registration of the term "Motorette" as a word descriptive of all three-wheel motor vehicles. The fact is of more than passing interest as the term was employed by several automobile manufacturers in the early days of the industry.

BIG BUS PROJECT FOR WINDY CITY

Chicago's New Transportation Company Proves to Have Far-reaching Plans—Prominent Men Interested.

A motor 'bus service rivaling that of New York City, and ultimately those of London and Paris, is the ambitious project of a group of Chicago capitalists, headed by John C. Shaffer, which is about to be put into execution in the Windy City. The initial service, for which 12 special vehicles have been ordered, is to be instituted in the shopping region of the "loop" district, from which circumstance early accounts of the venture made it appear limited to that field. According to later disclosures, however, the plan is of much broader scope and involves very much more than the mere co-operation of the department store companies in bringing customers from the railroad stations to their doors. It is further declared that despite the conspicuous part to be played in the new undertaking by controlling interests in the Parmelee Transfer Co., which has a practical monopoly of the depot transportation business in Chicago, it will in no way be affiliated with that institution.

Back of the bus undertaking is the Chicago Motor Transportation Co., a \$100,000 corporation, the capitalization of which, according to present plans, will be swelled to \$300,000 within two years. Shaffer, who is president of the Transportation company, likewise is president of the Parmelee company and owner of the Chicago Evening Post. John D. Core, secretary, is secretary and treasurer of the Parmelee company; while Carroll Shaffer is vice-president and treasurer. John C. Shaffer, Carroll Shaffer, Charles A. McCulloch, John J. Mitchell and Chauncey Keep comprise the board of directors. The interest of the large department stores in the undertaking is said to be limited to stock holdings.

By the middle of this month it is expected that the 12 machines will be in operation on the first route, which will connect the important depots with the State street stores of Marshall Field & Co., Mandel Bros., Carson, Pirie, Scott & Co., and Charles A. Stevens & Bros.

Pay-as-you-enter buses have been designed for the purpose which will provide seating accommodations for 19 passengers besides the driver, with one door on the right side for entrance and exit and a rear door for exit only. Both doors will be controlled by the driver. Electric lighting and electric ventilating fans, together with heating coils supplied by both exhaust gas and jacket water from the engines are among the features provided for the passengers' comfort. The equipment chosen is the standard 1½ ton White commercial chassis with the wheel base extended.

Body Designs and Their Relation to Windage

Taking a cue from Nature herself and imitating with grotesque exactitude the outline of the humble tad-pole, the designer of the "stream-line" body has arrived at results which are remarkable in their influence on vehicle speed. Though employed principally on racing cars at the present time, touring bodies of this type already have made their appearance, while the influence of the stream-line design is indirectly apparent in many of the newer bodies that are coming on the market. It is further apparent that designers of tour-

FIG. 1

ing cars are considering the principles involved with an eye to their fuller introduction in future products.

The origin of what may be termed the stream-line movement in body design is clearly indicated by W. G. Ashton, the well-known English authority, in an able discussion of the question which the Auto-car presents. "When the powers that were commenced to impose limitations upon the 'bore,' the racing car designer immediately got his own back by enlarging the dimension of 'stroke,'" as he proceeds to explain, "and when this again was in course of time restricted, he found that, in order to obtain as much or more speed, there were two available courses open to him. The first was the obvious one of pushing up the revolutions of a comparatively small engine until its output was comparable to that of an ordinary everyday motor of something like twice the size; whilst the

FIG. 2

alternative was to leave the efficiency of the engine much as it was, and, instead of attempting to increase the power, achieve the same end by reducing the resistance. This reduction of load might be to a very small extent accomplished by cutting down chassis weight, but as Brooklands has proved times without number that weight is quite the least important factor in the equation, the designer has perforce had his attention called to the necessity of con-

structing a car on such lines that the wind resistance shall become as small a factor as possible.

"For the past three years this matter has received a great deal of deliberate consideration, and the result is that speed records have been set up for small engine powers which are perfectly extraordinary, and could never have been achieved had not the wind resistance question been thoroughly studied and the practical result of experiments applied.

"In a sense this state of affairs is inclined to be regrettable, for it means that soon we shall have arrived at a stage—if, indeed, we have not already done so—in which the fact of a car setting up new records does not necessarily imply that its engine is either more efficient or more powerful than the previous best performer, but merely indicates that the design of the bodywork (perhaps in connection with a racing car it would be more correct to refer to it merely as 'superstructure') is superior.

"In another—and a larger sense—the re-

FIG. 3

grets suggested above should be by no means indulged in, for, as we well know, the results of track experience of the past have in course of time been applied to the benefit of the ordinary touring motorist, and there is no reason to suppose that he will fail to feel the influence of the results which have attended experiments in racing bodywork. Indeed, there are strong indications on every hand, but more especially in the automobile productions of France and Germany, that the manufacturer has at last realized what an enormous influence body design can have upon the behavior of his cars.

"Figs. 1 and 2, which make no pretensions to accuracy in detail, are intended to show graphically the behavior of air when moving past, first, a solid cube and, second, a body of 'stream-line form.' The definition of the last-named is that it is a body of such shape that its motion through a fluid does not give rise to surfaces of discontinuity. In other words, at no point upon the body does the fluid tend to do other than follow the contour of the body. The nearest natural equivalent to stream-line form which we have are the bodies of

fishes and birds, but it must not be forgotten that in both these cases certain differences in the shape are the result of differences in habit, and that in every natural case there is some reason for the purely stream-line form being departed from, as, for instance, the gills in the head of a fish and the attachment of the wings to the body of a bird.

"The locality of surfaces of discontinuity are marked in Fig. 1 by an extra thickness in the outline, whilst the regions of 'dead-air' (analogous to dead-water) produced by these surfaces of discontinuity are shaded

FIG. 4

ed by dots. As a matter of fact, these regions are not 'dead' at all, but are composed of a complicated system of eddy-currents, a simple case of which is indicated in Fig. 3. It is these eddy-currents, which provide a ready means of dissipating energy, that account for the great power required to drive a clumsily-shaped body through a fluid as compared with that required for a body of stream-line form.

"When bodies which are not of stream-line form are moved through a fluid, the presence of surfaces of discontinuity causes them to be surrounded with a system of flow that has the same effect eventually as though the body itself were of easy lines, but, as indicated in Fig. 4 (in which the system of flow is shaded), the result is that motion is imparted to a very much larger volume of fluid than if the body were well shaped. Thus the nearer a body is to stream-line form the smaller will be the surrounding volume of fluid affected,

FIG. 5

whether air or water, and hence the smaller will be the power required to propel it at a given speed.

"In Figs. 5, 6 and 7 are given diagrams showing the flow around a body of stream-line form which has been mutilated, first by having a small portion of its head cut off, second by being completely decapitated, and thirdly by having its tail docked. It will be seen that, in the first instance,

only a slight surface of discontinuity is produced, but it must be borne in mind that if the speed of motion were considerably increased the surfaces of discontinuity would become more accentuated. It will also be realized that, when a certain degree of mutilation has been reached, the stream-line form of the rest of the body has little or no effect. Thus, if a racing body is to

FIG. 6

be made 'stream-line,' it is obviously useless to pay particular attention to the sharpness of the tail if the 'entrance' and shoulders be not correctly proportioned; similarly the best designed head will be neutralized by that of an ill-conceived tail. In certain circumstances it may be even better to discard all stream-line ideas if they cannot be applied throughout, and an instance of this is provided by an ordinary railway train.

"It was thought by many locomotive engineers that a wind-cutting device in front of the boiler and a sloping front to the

FIG. 7

cab would allow a train to realize more speed, yet with the ordinary design of rolling stock it was found that the very reverse was the case, for the easy 'entrance' of the 'stream-line' locomotives allowed the wind to blow directly against all the window—and door—recesses of the following carriages, with the result that a higher resistance was set up than before, when the surfaces of discontinuity raised by the locomotive were so pronounced and so wide in

FIG. 8

effect that the rest of the train was given a stream-line eddy-system which was drawn along with it. This phenomenon may be observed by watching from a bridge how the exhaust steam behaves when a slight side wind is blowing across the path in which the train may be moving. "During autumn, when days are calm and leaves litter the ground in some quantity, the way in which air is carried along by a

car is very noticeable. Light objects 15 or 20 feet away from and at the side of the car are affected by its passage, and this gives a good idea of the very large volume of air which is uselessly set in motion.

"We will now consider some concrete cases of touring and racing cars, and examine their wind resistance effects. It is necessary, however, to point out in this connection, that, owing to the various shapes and angles of different parts of a car, it is impossible more than roughly to approximate the end-on resistance area of a car in calculating the horsepower absorbed, whilst other resistances, such as those occasioned by a slight side wind and that of the rear seat and folded cape cart hood, will have

FIG. 9

to be left out altogether. In any case the effects of both of these factors will be so small as to be safely negligible in an empirical consideration of the present type.

"In Fig. 8, is given a rough end-on view of a typical car with dimensions to indicate the approximate sizes.

"In summing up to ascertain the total area of resistance one or two points require consideration. First of all, with regard to the radiator, this can scarcely be reckoned as dead resistance, owing to the large volume of air which passes through it, but, on the other hand, by no means all the air that strikes it passes through. We still have, therefore, to examine into what happens when the air has passed through the radiator. Some of it flows easily around

FIG. 10

the engine and out under the floorboards, but the greater part, no doubt, has to be first deflected by the vertical dash board, and hence the reaction is not very different from what it would be if the radiator were not porous at all. However, to be on the safe side, the resistance of the radiator will be written down 50 per cent. from what it would be if solid.

"With regard to the curved mud-guards, the resistance area of these will be taken as being equal to their projected area, i. e., the area shown in Fig. 8. The mean angle of their inclination, viz., of the portion in the rear of the horizontal extension—is about 45 per cent., and the total pressure on their surface may therefore be taken as sensibly the same as if they were not

inclined at all. (This is according to the Eiffel Tower air-pressure formula.) Again, in view of the distance between the front and rear mud-guards, and also of their proximity to the side of the body, the 'shielding' effect exercised by the front pair will be practically negligible, and the rear pair, therefore, will have to be taken into

FIG. 11

the calculation in addition to the front ones.

"The resistance of the wind screen will be practically the same whether it be vertical or inclined, as it is only in rare cases that one finds a screen set at an angle smaller than 45 degrees.

"The approximate end-on resistance area will be, then, equal to that of a normal plane area of 23 square feet, made up as follows:

Sq. ft.
Area of dash, screen and undershield.. 18

FIG. 12

Area of four mudguards.....	5
Area of side and head lamps.....	1
	—
Less reduction for radiator, say.....	1
	—
Total	23

"It will be noticed that the area of resistance of the wheels has not been taken into consideration; this, however, is not likely to prove of any moment except at very high speeds indeed.

"Let us now inquire into the amount of power which is common in overcoming this resistance, calculated on a speed basis of 30 miles per hour. As will be seen from the calculations, the power varies as the cube of the speed, and hence, if the speed

FIG. 13

be doubled, making it 60 miles per hour, the power absorbed will be multiplied by eight.

"According to the Eiffel Tower formula, which is the one generally used, the pressure on a normal plane is equal to .003AV², where A is the area in square feet, V the velocity in miles per hour, and the pressure represented in pounds. Substituting, we have:

Rambler

Motor Cars

Rambler
Sixty-four

THERE is no danger in cranking a Rambler. The Rambler Safety Cranking Device removes possibility of injury to you. Examine the illustration below and you will see how important is this exclusive Rambler feature. The Rambler has many such advantages of safety, comfort and convenience. Big wheels, big tires and long wheel-base make it ride easily. Seven-eighths elliptic springs and shock absorbers protect you from jolts. The steering pillar may be adjusted to suit your comfort. The upholstery is that found in the finest club furniture. The Spare Wheel removes worry about tire trouble and brakes are larger than will ever be needed. The Offset Crank Shaft and Straight Line Drive enable slow driving on high gear in crowded traffic and obviate the necessity of rushing the hard pulls through sand and up grades.

A telephone message to the nearest Rambler representative will bring this car to your door for inspection. The new catalogue is ready. Send for it.

The lug on the shaft cannot engage with a tooth on the starting crank until spark retarder lever has been moved from the dotted line to position as shown and the spark retarded

The Thomas B. Jeffery Company

Main Office and Factory, Kenosha, Wisconsin
Branches: Chicago, Boston, New York,
Milwaukee, Cleveland, San Francisco

$$\text{Pressure} = .003 \times 23 \times 900 \\ = 52.1 \text{ lbs.}$$

"From this we obtain the horsepower absorbed by multiplying this figure by the speed in feet per minute and dividing by 33,000.

$$\frac{62.1 \times 2,640}{33,000} = 4.96 \text{ H. P.}$$

"In order to avoid fractions we will suppose that we have under-estimated the resistance area (which is practically certain), and therefore call the figure five horsepower.

"The following table, then, indicates the power absorbed at various speeds:

Miles Per Hr.	Horsepower Absorbed
10185
20	1.480
30	5.000
40	11.840
50	23.125
60	39.960
70	63.455
80	94.720

"Figs. 9 and 10 are diagrams indicating the probable direction of the air currents around an ordinary car with the square type of dash board, first in side elevation and next in plan. These are to be compared with Figs. 11 and 12, which represent the same phenomenon, only in this case the car has a better designed body with taper bonnet and tail extension. In this case, however, the screen is tilted. The diagrams speak for themselves except that it should be noted that in Fig. 10 the eddy currents produced by the wind screen and dash board would be largely augmented if no side doors were fitted to the front seats. Thus it will be understood that the mere addition of such doors to a body not already so fitted may of itself realize a sensible addition to speed.

"Upon glancing at the table of horsepower absorbed, anyone may say that since his car is only capable of 40 miles per hour, its behavior is not very seriously affected by wind resistance, but it need hardly be said that the weather is not always a flat calm, and that if the resistance area be, as in the example, 23 square feet, and he be doing 20 miles per hour against a 30 miles per hour head wind, he will need 23.12 horsepower, instead of 1.48 horsepower. In other words, the speeds in this table are not land speeds, but air speeds, i. e., the speeds relative to the wind.

"Referring to stream-line form racing bodies, many of these, though quite good, could be improved, as indicated in Fig. 13. The dotted lines show the body as it is and the unbroken lines of the body as it should be. By fitting the driver's head and shoulders with a following 'tail,' the eddy currents produced by his person are considerably reduced.

"In order to gain an idea of how much resistance some of these stream-line bodies actually have it is necessary to work back from a concrete example. Such a one (which shall be nameless) is a 15.9 car, the

brake horsepower tests of which have shown it capable of exactly 70 horsepower, and the track tests of which demonstrate a speed of almost exactly 90 miles per hour. From the horsepower available for overcoming wind resistance will have to be deducted a certain amount absorbed in the friction of transmission and in the loss between the tires and the track. The transmission efficiency is probably about 75 per cent., and if another ten per cent. be added to this loss of 25 per cent., making 35 per cent. in all, the result will be sufficiently near the truth for the purposes of this approximation. The available horsepower is, therefore, 65 per cent. of 70 horsepower, or roughly, 45 horsepower.

"Calling the total pressure X, we have,
 $X \times 7,920 \text{ (Speed of car in ft. per min.)} = 45$

$$\begin{aligned} X &= 187.5 \text{ lbs.} = .003 AV^2 \\ X &= 187.5 \text{ lbs.} = .003 AV^2 = .003 (90)^2 A \\ &187.5 \end{aligned}$$

$$\begin{aligned} \text{Hence, } A &= \frac{33,000}{.003 \times 8,100} \text{ square feet} \\ A &= 7.7 \text{ square feet.} \end{aligned}$$

The Locomotive as a Good Example.

If motor truck operators would expend a greater amount of energy in the details of daily maintenance of their equipments and less in spasmodic periods of overhauling, it is the opinion of many authorities that their total expenses for upkeep would be proportionately less. In support of this view, a well-known motor truck engineer cites the manner in which locomotive maintenance is divided, showing how 60 per cent. of the total is applied to the routine operations of wiping, cleaning, washing and inspecting. Very suggestively, he says:

"Your truck is a road locomotive. We submit a few facts regarding steam locomotives that run on rails, under conditions much less strenuous than those of motor trucking. An express passenger locomotive is inspected at the end of every 80 miles and a freight locomotive at the end of every 150 to 200 miles. As many as five inspectors work on a locomotive at one time. Each is responsible for certain groups of parts.

"To show the relative cost of different kinds of maintenance service and the importance placed on cleaning and inspecting every part inside and out, the following distribution of labor on passenger engines is cited for consideration, the period covered averaging eight months: Wiping, cleaning, washing, inspecting, 60 per cent.; clinkering, firing up, 12 per cent.; watching, hostling and calling, 12 per cent.; supplying, coaling, sanding, 10 per cent.; turntable and laborers, 6 per cent.

"How would these compare with similar items of care for an auto truck? Under these conditions passenger locomotives run 127,000 miles without going to shop for overhauling; freight locomotives 100,000 miles.

"On four out of five of the trunk lines

running west out of New York the locomotive repairs per mile are 4.4 cents, 7 cents, 12 cents and 16.6 cents. The first road has the heaviest grades of the four. The last road runs 30,000,000 locomotive miles. Its repairs cost 12 cents per mile more than the first road, and it is losing \$3,600,000 a year. Why?"

Electrics to be Featured at Palace.

At the New York Electrical Exposition, which this year will be held in the new Grand Central Palace, October 11th to 21st, electric vehicles will be featured more strongly than ever before. Already eight car manufacturers and two storage battery makers have contracted for space, and others are in line. The cars will be displayed on the main floor of the building and the third floor will be given over entirely to demonstration purposes. On it will be laid out a circular course, and in one corner will be set up a model garage equipped with every up-to-date device for the proper handling and care of electric vehicles. The circular track, of course, will not be fit for speed contests, but it is asserted that it will permit of tests of everything from the smallest runabout to the largest truck. The cars for which space already has been contracted are the Anderson, Baker, General Vehicle, Lansden, Rauch & Lang, Studebaker and Waverley. The Electric Storage Battery Co. and the Edison Storage Battery Co. are also included in the list of exhibitors.

Adjusting the Wicks of Tail Lamps.

Though a tail lamp may be blamed for its tendency to go out periodically, not infrequently the trouble may be traced to the carelessness of the person who lights it in turning the wick up too high. While the assumption that a large flame is harder to extinguish than a smaller one is correct in most cases, it is wrong in this one for the reason that the size of the flame governs the amount of foul gases which are given off. As the vent holes are only designed to liberate the gas which is formed when the wick is turned up to the proper height, the rest remains and simply suffocates the flame. Obviously the remedy consists in keeping the wick turned down as low as possible consistent with the amount of light which the law and necessity requires.

Carburettors That Cause Knocks.

When installing a new carburetter, it should be remembered that a knock, not apparent with the old carburetter in place, frequently develops. This generally may be traced to the fact that the new carburetter delivers more gas, or gas of a better quality, and as the explosions consequently are heavier, the knock is accentuated or developed as the case may be. Usually the cause of the knock is a deposit of carbon on top of the pistons.

994,546. Vehicle Shock Absorber. Harvey Terhorst, Milwaukee, Wis. Filed Feb. 2, 1910. Serial No. 541,947.

1. The combination of a shaft, a drum rotatably mounted thereon and having an internal cylindrical chamber, a radial abutment mounted on said drum within said chamber, a radial piston mounted on said shaft within said chamber, an inner cover-plate covering one side of said cylindrical chamber, an outer cover-plate secured over said inner cover-plate leaving between them a secondary chamber, there being a passageway from said secondary chamber to the low pressure said of the piston and a spring within said secondary chamber.

994,971. Advertising Device for Stamping Streets or Pavements. Orrien Smith Beck, Sacramento, Cal. Filed Oct. 26, 1910. Serial No. 589,188.

1. A device of the character described comprising a vehicle mounted on wheels, projecting arms on said vehicle, sprocket wheels mounted on said arms, a chain movable over said sprocket wheels, a type rack on each link of said chain, such rack comprising a spring ring split at one point to form a slot and self inking type carried by said rings.

994,974. Removable Rim. Eli J. Bushey, New York, N. Y. Filed Aug. 20, 1910. Serial No. 578,240.

1. In a wheel, the combination of a felly, a rim on the felly and provided with a flange at one side extending around the rim, the rim at the opposite side of the wheel having a flange located on one circumferential portion of the rim only, the rim at the opposite circumferential portion being provided with a lug at each of two

portions removed a short distance from the extremity of said short flange, a clencher rim surrounding the first-mentioned rim and held in place on one side by the said flange on the inner rim, and a locking member having at its extremities hook portions adapted to be inserted on said lugs by a movement radial of the wheel previous to positioning of the outer rim, the locking member being provided with wedge portions that serve to offset the clencher rim from the other rim between the said lug portions, and means for securing the locking member to one of the wheel members.

995,005. Valve. Henry K. Holsman, Plano, Ill., assignor to The Independent Harvester Company, Plano, Ill., a Corporation of Illinois. Original application filed Jan. 2, 1909, Serial No. 470,376. Divided and this application filed Dec. 19, 1910. Serial No. 598,047.

1. In a device of the class described, the combination with a valve casing having a valve-seat surface, a stem-guiding sleeve with a longitudinal slot therein, and an aperture between the surface and the sleeve adjacent the slot; of a valve member comprising a head and retaining flange at opposite ends of a stem, said stem being flattened to pass through said longitudinal slot, and means to prevent the stem turning after the parts are assembled.

995,009. Auto Drive Mechanism. Ben W. Janssen, Wentworth, S. D. Filed Aug. 17, 1909. Serial No. 513,277.

1. A power transmission including a front axle having eyes formed at its opposite ends, a horizontal shaft carried by the axle, vertical shafts engaging through the eyes, intermeshing pinions disposed upon the horizontal and vertical shafts, spaced collars positioned against the sides of the eyes and about the vertical shafts, depending arms carried by the lower ones of said collars and extending outwardly from the same, spaced bearings arranged in horizontal alinement upon the arms, spindles journaled through the bearings, intermeshing pinions carried upon the lower ends of the

vertical shafts and on the spindles for communicating motion thereto, wheels carried by the spindles, and clutches interposed between the spindles and the wheels.

995,010. Vehicle Wheel. Thomas B. Jeffery, Kenosha, Wis.; Kate E. Jeffery, Charles T. Jeffery, and Harold W. Jeffery, executors of said Thomas B. Jeffery, deceased. Filed Aug. 6, 1906. Serial No. 329,329.

1. In a vehicle wheel, a wheel body including spokes, a plurality of plates alining with said spokes and pivotally mounted on axes parallel to the axis of the wheel body, and a rim surrounding said wheel body in engagement with said plates.

995,037. Automobile. Isaac Smyth, Chicago, Ill. Filed Dec. 13, 1909. Serial No. 532,930.

1. In an automobile, a chassis and a body provided with a door way, a drum rotatably mounted on said chassis, a pulley suspended in said body adjacent to the top and at one side of the door way, a cord wound about said drum and passing over said pulley, a weight on the free end of said cord, a transverse shaft and said drum, a governor shaft, gearing connecting said governor shaft with said first mentioned shaft, co-acting beveled friction disks on said governor shaft and said drum, a governor on said governor shaft for actuating the said disk on said shaft, a drive shaft, gearing connecting said governor shaft and said drive shaft, traction wheels and gearing connecting said drive shaft and said traction wheels, substantially as described.

995,043. Clutch. William H. Swartz, York, Pa. Filed Apr. 5, 1910. Serial No. 553,630.

1. In a clutch, the combination, with stationary and longitudinally movable friction clutch members, of a positive locking device for preventing said friction clutch members from slipping, and means to automatically and unyieldingly secure said positive locking device in operative position when the friction clutch members are in driving connection.

995,074. Priming Attachment for Carburettors. Thomas J. McCarthy, Detroit, Mich., assignor to Star Carburetor Co., Detroit, Mich., a Corporation of Delaware. Filed May 21, 1910. Serial No. 562,580.

1. In an internal combustion engine, the combination of a cylinder formed with an intake pipe, a carburettor in communication with the intake pipe, the said carburettor being formed with a float chamber, a fuel supply chamber provided with a fitting having an auxiliary chamber therein which communicates with the fuel supply chamber, a liquid fuel reservoir in communication with the fuel supply chamber and arranged to supply fuel thereto under pressure, a valve automatically controlling communication between the fuel supply chamber and the float chamber of the carburettor, a pipe leading from the auxiliary chamber to the intake pipe of the cylinder, and a second valve controlling communication between the fuel supply chamber and the auxiliary chamber, the said second valve being normally closed and being adapted to be opened when starting the engine to provide a continuous supply of fuel direct from the reservoir to the intake of the cylinder independent of the float chamber of the carburettor.

995,119. Tire Protector. James F. Collins, Wilmerding, Pa. Filed Nov. 30, 1910. Serial No. 594,856.

1. The combination with a wheel rim having an intumed upper edge formed with a notch, of a tire mounted on the rim, a tire protector comprising a plurality of circumferentially disposed spaced members, anti-skidding projections on said members, and means for securing the spaced members to the wheel rim comprising a band

having an opening therein to receive an anti-skidding projection and a tongue formed on one end thereof, said tongue entered in the notch of the intumed edge and engaging the edge adjacent to the notch.

995,137. Chain Links. Henry E. Mayward, Philadelphia, Pa., assignor to Link-Belt Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 18, 1909. Serial No. 533,814.

1. The combination in a chain of a plurality of sets of links, alternate sets of said links including one or more plane links and two flanged links respectively mounted on the outer sides of said plane link or links, with means for connecting the various links.

995,152. Transmission Device. John W. Ketterman, Muncie, Ind. Filed Sept. 15, 1910. Serial No. 582,172.

1. In a transmission device, the combination of a driving shaft, opposed disks secured thereon, a shaft block carried on the driving shaft and between the disks, said shaft block being composed of two parts united but free to be moved slidingly on each other, a pair of driven shafts having their inner ends journaled in the two parts of the shaft block, a shift bar having its one end connected loosely to one of the shaft block parts, a fulcrum bar connected between the shift bar and the other part of the shaft block.

995,155. Automobile. Emil Koeb, Leipzig, and Ralph P. Thompson, Springfield, Ohio. Filed June 21, 1909. Serial No. 503,349.

1. In an automobile, the combination, with a main frame, a supplemental frame pivotally connected at one end to said main frame so that its other end may move vertically, and ground wheels connected with said supplemental frame near the free end thereof, of springs interposed between said main frame and said supplemental frame, connected to said main frame, pivotally connected to said supplemental frame at a point between the axial line of the ground wheels and the point of support of said supplemental frame upon said main frame and adapted to receive the vertical movement of the ground wheels in a lesser degree, and means for interconnecting said springs to cause them to move in unison.

995,372. Tire Chain. Alois B. Saliger, New York, N. Y. Filed Oct. 30, 1907. Serial No. 399,822.

A device of the class described comprising a plurality of links each of which consists of a bottom plate, a hook at one end, the bent over portion of said hook being parallel to said bottom plate; a lug, directed obliquely upward and provided with a hole at the other end; flanges on the side and upwardly directed; and links provided with a hook in place of the lug, and an attaching hook at each end of said device substantially as shown and described.

HERE'S PERFECT MOTOR SERVICE

Rutenber Motors are today recognized as the world's best. They are smooth-running, silent, efficient and truly economical. Perfect service and durability are assured by the Rutenber's mechanically right construction—helical gears, rigid bearings, compact valve lifters and enclosed oil system.

On speedways and in use in thousands of stock cars and commercial vehicles the reliable Rutenber has made a reputation for itself that is, indeed, most enviable. It stands at the very top of motor perfection.

No better, more thoroughly efficient motor can be made—and the experienced motorist and manufacturer have long since realized this. Hence the gigantic demand.

If there's a Rutenber Motor under the hood of the car YOU buy—you're getting full 100% value. Insist on a Rutenber!

Intensely interesting information sent gratis.

No. 13

CLAIMS PRIORITY IN NAME "HUPP"

Hupp Motor Car Co. Sues to Restrain Its Use by R. C. Hupp and Hupp Corporation—Confusion Alleged.

As the result of the launching of the "R. C. H." gasoline touring car by the Hupp Corporation, of Detroit, on Tuesday last, 19th inst., the Hupp Motor Car Co., of that city, applied to the Wayne County (Mich.) Circuit Court for a permanent injunction restraining R. C. Hupp and his associates from making use of the name "Hupp" in connection with the manufacture or sale of gasoline automobiles, or in any other manner that would injure the business of the Hupp Motor Car Co.; and especially in connection with the manufacture of the small car styled the "R. C. H.," which the Hupp Corporation has placed on the market, and which it is feared may be confused with the Hupmobile.

The bill of complaint alleges that R. C. Hupp and his brother, together with the Hupp Corporation, have violated the rights of the Hupp Motor Car Co. by the use of the name "Hupp" in the automobile business, inasmuch as the Hupp Motor Car Co. used that name at the request of Hupp when the company was incorporated, and has made the name well known to the trade and to the public in general; that the use of the name "Hupp" by Hupp in the new company, the Hupp Corporation, has been, and will be, a source of confusion and embarrassment to the Hupp Motor Car Co. and its dealers, to manufacturers and the general public with whom it does business; and that such use of the name "Hupp" as already made on the part of Hupp and his associates in the company called the Hupp Corporation is an attempt to trade illegally upon and benefit by the reputation of the Hupp Motor Car Co.

Among other things the bill of complaint states that the connection of R. C. Hupp with the Hupp Motor Car Co. was

terminated by the board of directors of that company, largely on account of Hupp's undue activities in promoting his personal interests in the Hupp Corporation through the influence and prestige created by the Hupp Motor Car Co. in connection with the name "Hupp," which the latter company claims the exclusive right to use.

Until five or six weeks ago, Hupp was vice-president and general manager of the Hupp Motor Car Co., at which time he retired. During his incumbency he had formed five separate companies, an electric car company, a machine company, a foundry company, a force company and a sales company, all of which were merged in May last under the style the Hupp Corporation. They are the "personal interests" to which the complaint refers.

Petrel and Beaver Become F. S. Motors.

Always closely related, the Petrel Motor Car Co. and the Beaver Motor Co., both of Milwaukee, have been consolidated under the style the F. S. Motors Co. Both were properties of the Filer-Stowel Co., which builds Corliss steam engines, and from which the merger takes its name. Its offices are the same as those of the parent company, viz.: Walter Reed, president; T. J. Neacy, secretary and treasurer. Ralph C. Lewis, formerly president of the Rider-Lewis Motor Car Co., of Anderson, Ind., has, however, just entered the F. S. Motors Co. as general manager. Heretofore the Petrel and Beaver companies have operated separate plants, the one producing cars, the other gas engines, but they are now housed in one big factory building, which recently was completed in West Allis, a suburb of Milwaukee. Petrel cars will continue to be marketed through Petrel agents, and Beaver motors will be sold to the trade in general.

Franklin Designer to Visit Europe.

W. H. Emond, designer for the Franklin Automobile Co., has booked passage for Europe and will sail on October 1st with an eye open for all that's worth while. He will visit London, Paris and Berlin.

CANADIANS' CONCERN GROUNDLESS

Licenses Prohibit Sale of American-Made Knights in Dominion and Other Countries—Inventor to Lecture Here.

When the Russell Motor Car Co., of Toronto, permitted it to become known that when an American-made car equipped with a Knight engine appeared at the border it probably would be stopped by an injunction, the officials of the Canadian company either were possessed of needless concern or adopted that means of calling attention to and emphasizing the rights granted to them by the Knight license which they acquired some two years ago. At any rate, F. E. Lonas, attorney for the Knight & Kilbourne Patents Co., which issues all such licenses, is authority for the statement that all United States licensees well understand that they have no more right to ship either Knight engines or cars equipped with them into Canada than the Russell company has the right to ship its productions into the United States; and Lonas does not believe they have any intention of doing so.

That the Knight licenses are designed to conserve home markets of the respective licensees and that in doing so they necessarily restrict the foreign markets in which the licensees' cars may be sold is also made clear by Mr. Lonas; it develops that under no circumstances are they privileged to sell their productions in other countries in which the Knight invention has been patented.

"The Russell Motor Car Co. has a license from Knight & Kilbourne Patents Co., the owner of the Knight patents for all countries, which permits it to build and market motor cars with Knight engines in the Dominion of Canada, and all countries in which there are no patents," says Mr. Lonas in his statement to the Motor World. "This license is granted directly by Knight & Kilbourne Patents Co., and not by the Daimler Motor Co., of England, which lat-

ter company has no right to grant licenses to any one, and is itself merely our English licensee.

"All of our American licensees have licenses to build cars equipped with Knight motors, and market them in the United States, but they have no right to ship either Knight motors or cars equipped with same into the Dominion of Canada, or any other country in which we have patents, under any circumstances whatever. This is perfectly well understood by our American licensees, and I feel certain no attempt will be made by any of them to market either cars or motors in the Dominion of Canada. The Russell Motor Car Co. has no right to import either cars or motors manufactured by it under the Knight patents, into the United States."

Mr. Lonas also declares that Charles Y. Knight, the inventor, has no relatives in New England and that therefore there can be no truth in the story that one of them located in that part of the country had more or less to do with the invention of the slide-valve engine. Knight himself now is en route on one of his periodical visits to this, his native country. He sailed from England on the 16th inst. While here he will address engineers' meetings in New York, Detroit and Chicago on the subject of his invention. He was preceded by W. Owen Thomas, who, it transpires, has become consulting engineer for the American licensees and who has spent some six months in familiarizing himself with the processes in vogue in the four foreign factories which make use of the Knight engine. Thomas himself is an inventor of some note and about two years ago, when located in Wisconsin, developed a car mounting a rotary valve engine and an integral frame and body.

McLaughlin Branches Get Pierce-Arrows.

Most of the branch houses or subsidiary companies of the McLaughlin Carriage Co., of Oshawa, Can., now are handling the Pierce-Arrow car on the other side of the border. Although the parent company finances the subsidiaries the agency contracts are placed directly with the latter, of which there are several, one in Winnipeg and another in Calgary, among the number. The subsidiaries sell the Pierce-Arrow direct as they are not permitted to appoint sub-agents. The fact that the owners of the McLaughlin Carriage Co. are also the owners of the McLaughlin Motor Car Co., which reproduces the Buick car in the Dominion, adds some interest to the situation.

Marquette Forms a Selling Company.

To market the product of the Marquette Motor Co., of Saginaw, Mich., which recently absorbed the Welch-Detroit Co., there has been organized and incorporated a selling company, the Marquette Co., which, like the others, will be a subsidiary of the General Motors Co., whose presi-

dent, treasurer and secretary occupy the same relative positions in the Marquette Co. They are as follows: Thomas Neal, president; O. C. Hutchinson, vice-president and manager; James T. Shaw, treasurer; Standish Backus, secretary; T. S. Merrill, assistant secretary-treasurer. At the time of the merging of the Marquette Motor Co.—which made the Rainier car—and the Welch-Detroit Co., it was stated that both of those cars would be styled Marquettes, but apparently that idea has been abandoned, as it now is given out that both the Rainier and Welch-Detroit will retain their identities and that in addition there will be a new model termed the Marquette. It will comprise two chassis, one having a 122-inch wheel base and mounting a 40-45 horsepower engine and listing at \$3,000; the other with a wheel base of 119 inches, an engine of 45-50 horsepower and selling for \$4,000. The offices of the Marquette Co. will be in Detroit and its management in the hands of O. C. Hutchinson, who filled the same role in the manufacturing company.

Briggs to Head New Detroit Company.

Claude S. Briggs, who organized the Krit Motor Car Co. and was its first president and who, after disposing of his holdings, became general manager of the Brush Runabout Co., has resigned that office to assume the presidency and general management of a new \$200,000 company which will make a popular-priced car styled the "Detroit." The name of the company has not been definitely decided nor the identity of Briggs's associates disclosed, but it is stated that they are men prominent in Detroit business and financial circles. The "Detroit" will be made in two models—a five passenger touring car at \$700 and a two passenger roadster at \$650, both of which will employ a long stroke motor of 25 horsepower.

General Motors Absorbs All of Bedford.

Bedford Motors, Ltd., of London, of which the General Motors Co., of Detroit, was part owner, has passed completely into the hands of the big American company, the transaction having been consummated by the latter's president, Thomas Neal, during a visit from which he returned last week. Bedford Motors, Ltd., will be used largely for the purpose of placing the Buick car on the foreign market. The Buick chassis will be exported directly from the Flint plant and completed in the London factory of the Bedford company, which is an extensive plant covering four acres of ground, and which also maintains a large salesroom on Longacre Square.

Victor's Failure Follows President's Arrest.

Following the arrest of its president, Frank J. Dorlan, who was jailed on a charge of embezzling the funds of the Hotel Manhattan, where he was employed as a clerk, the Victor Auto Supply Mfg. Co., 42

West 43rd street, New York, has been petitioned into bankruptcy and is in the hands of William Henkel, Jr., as receiver. Among other things, the petition alleged that the company had made preferential payments, transferred accounts and merchandise and removed a large part of its property; its assets are estimated to be \$2,500. The company was incorporated August 20, 1909, with \$25,000 capital stock, and acquired the plant of the Nonpareil Brass Co., of Providence, R. I., which, however, was operated for only a few months. Dorlan was president, manager and principal stockholder. How he contrived to be all of these things on a hotel clerk's salary was made clear at the time of his arrest. Most of the large sum which he is charged with embezzling is supposed to have been lost in the Victor company.

Aesthetic Sales Company "Goes Broke."

After an existence of 15 months, the Carhartt Automobile Sales Co., 1915 Broadway, New York, made an assignment on Monday last, 18th inst., to Louis H. Moos and later during the same day, creditors filed a petition in bankruptcy citing the assignment as an act of bankruptcy. The company, of which John V. Schenck is president, and which was capitalized at \$50,000, sold what was styled the "beautiful Carhartt" car and tried to do business on an aesthetic scale. It first established a salesroom in the beautiful Plaza Hotel and catered to "society" and later when it moved to the Broadway address, the store was painted in delicate tints to harmonize with the complexion of the "beautiful car." The liabilities of the company, nevertheless, are about \$70,000 and the assets but \$25,000.

Truck Company Organized in Virginia.

The P. F. Board Motor Truck Co., which has a factory in course of erection in Alexandria, Va., has been incorporated under the laws of that state with capital stock of \$100,000, of which \$25,000 has been paid in. The officers of the company are B. F. Board, president; T. C. Smith, vice-president; W. E. Bain, treasurer; George S. Hinkins, secretary; E. K. Callahan, assistant secretary. It is the intention to build trucks of 1,000 pounds and one, two and three ton capacity.

Russell Secures Remy's Australian Agency.

The Russell Motor Car Co., of Melbourne, has been appointed general agent for Australia for the Remy magneto and other electrical devices. The Melbourne house is a branch of the Canadian company of the same name.

Covert Opens Office in Detroit.

The Covert Motor Vehicle Co., of Lockport, N. Y., has established a sales office in the Ford building in Detroit. There will be displayed there, of course, a full line of Covert transmissions, jackshafts and rear axles.

WEED TACKLES TAXICAB COMPANIES

They Made Their Own Tire Chains and Parsons Licensee Hales Eleven to Court—Willis Enjoined.

Having rounded up most of the manufacturers of infringing devices, and enjoined also a large number of jobbers and dealers who by selling such devices rendered themselves guilty of infringing the now famous Parsons patent, the Weed Chain Tire Grip Co. last week turned its attention to the New York taxicab companies, and in the United States Circuit Court for the Southern District of New York obtained either preliminary injunctions or restraining orders against no less than eleven of them.

The taxicab companies naturally are the largest users of anti-skid devices, and it transpires that most, if not all, of them made their own tire chains; that is, they purchased the parts and assembled them, thereby effecting a considerable saving. Pending final settlement of the issues, the action of the Weed company, of course, will serve to prevent them from using such chains.

The companies affected are as follows: Universal Taximeter Cab Co., United States Motor Cab Co., Riverside Garage Co., Renault Taxi Service, Mutual Taximeter Co., Connecticut Cab Co., Broadway Taxicab Co., Western Express Co., Kayton Taxicab Co., Mason-Seaman Transportation Co., and the Imperial Taximeter Co.

On the 19th inst., the Weed company's suit against the Ernest J. Willis Co., of New York, for infringing the Parsons patent by reason of having sold the Whittaker tire chain, went to final hearing in the United States Circuit Court in New York, and resulted in the granting of a final injunction restraining Willis from having to do with infringing devices of any sort.

Durant Dickering for Big Factory Site.

W. C. Durant, once the leading spirit of the General Motors Co., in which at last accounts he still was a director, is reported to have purchased a plot of 40 acres on North Woodward avenue, Detroit, directly opposite the plant of the Ford Motor Co. Other reports say that he is merely negotiating for the land, which is owned by Henry Ford and a number of his associates. Durant is credited with acting in the interests of the recently formed Chevrolet Motor Co., of which he is supposed to be the chief backer and which now is occupying temporary quarters in Detroit.

General Motors Alters Fiscal Year.

In order to permit the manufacturing departments to take inventory at the most convenient time, the fiscal year of the General Motors Co. has been changed and will hereafter run from August 1 until July

31. The forthcoming statement of earnings therefore, will be for the ten months from October 1, 1910, to July 31, 1911. The report will be ready as soon as the detailed inventories now in progress are completed. Preliminary figures indicate that the results of the ten months' operation will be quite satisfactory, according to a statement issued by the company.

Another Electric Brougham from Detroit.

The first production of the Colonial Electric Car Co., which has located in a temporary plant at 66-70 Brainard street, Detroit, will be a shaft driven five passenger brougham of Colonial design which it is said will incorporate several features that are entirely new. Among the Detroiters interested in the company are A. D. Stansell, Albert Webb, Jr., F. C. Willis, Dr. L. C. Moore, Mark W. Allen and W. E. Storms, the latter being the mechanical expert.

Knox Sues Father of Former Agent.

The Knox Automobile Co., of Springfield, Mass., has filed suit against William Crane, of Milwaukee, Wis., to recover \$10,000, the amount of a bond executed by the defendant to cover a contract for the Knox agency entered into by his son, George A. Crane. The complaint alleges that the Knox company delivered a number of cars for which it failed to receive payment and that as Crane went into liquidation it has not been possible to make collections.

Fisk Gets Judgment Against Coates.

Judgment for \$855.25 in favor of the Fisk Rubber Co. and against the Coates-Goshen Mfg. Co., was entered in the New York Supreme Court on the 13th inst., the amount representing the value of tires supplied in 1910, which had not been paid for, plus interest. Joseph C. Coates, president of the defendant company, had been subpoenaed but failed to appear and Judge Clark, therefore, ordered judgment entered by default.

Gramm Increases Capital to \$1,250,000.

At the annual meeting last week of stockholders of the Gramm Motor Car Co., Lima, Ohio, an increase in capital stock from \$500,000 to \$1,250,000 was authorized, all of which will be used for equipment. The following officers and directors were elected: President, A. L. White; vice-president and general manager, B. A. Gramm; treasurer, W. T. Agerter; secretary, F. E. Lamb.

Stephenson Company Changes Title.

The Stephenson Motor Car Co., of South Milwaukee, Wis., has been dissolved and in its place has been created the Stephenson Motor Truck Co., trucks having been the line of the old concern, also. G. L. Stephenson is president of the new company and A. E. Halderman secretary and treasurer.

JUDGE RULES ON THREE CIRCULARS

They Grew Out of Klaxon-Newton Patent Litigation and Lead to Court Order—Justice Chatfield's Decision.

Three printed circulars growing out of the suits for infringement of the Klaxon patents filed by the Lovell-McConnell Mfg. Co. against the Automobile Supply Mfg. Co., and its president, Louis Rubes, of Brooklyn, N. Y., makers of the Newton horn, which circulars were issued to the trade in general, occupied the attention of Judge Chatfield in the United States Circuit Court for the Eastern District of New York, on Tuesday last, 19th inst. After hearing the counsel for both sides, the court entered the following order:

"This cause came on to be heard upon the respondents' rule to show cause and restraining order prohibiting complainants from sending out circulars to the trade, which rule to show cause and restraining order was signed upon the 4th day of September, 1911; and upon the complainants' motion for a preliminary injunction; and the court, after having heard Thomas J. Johnston and George C. Dean, Esqs., on behalf of the complainants, and C. A. L. Massie, Esq., on behalf of the respondents, and having considered thereon,

"It is now ordered, adjudged and decreed that the motion on the rule to show cause and the motion for a preliminary injunction stand adjourned for the further hearing upon September 25, 1911, at 10:30 o'clock in the forenoon, or as soon thereafter as the court can hear the same;

"And in the mean time it is further ordered, adjudged and decreed that the restraining order issued in connection with the rule to show cause and signed upon the 4th day of September, 1911, be and it is hereby modified and limited to a mere direction that the statement of approval by the court contained in the first paragraph of the complainants' circular letter dated August 14, 1911, be eliminated from any copies of the said circular letter which are hereafter sent out; leaving all questions as to the merits of the circular until further order on the motion.

"And it is further directed that all of the parties to this suit refrain from manufacturing any new literature pending the argument;

"And it is further ordered, adjudged and decreed that the respondents shall not circulate further the circular entitled 'Truth' and 'The Facts of the Case' or other letters making representations as to any of the issues of this suit pending the argument;

"And it is further ordered, adjudged and decreed that all the parties shall refrain from comment upon and from sending out information as to the argument of this motion;

"Except that this order of adjournment and modification of the restraining order shall recite the fact that counsel for complainants did present complainants' circular of August 14, 1911, to the court, that the court did not intend to express approval or disapproval of the same; that the restraining order of September 4, 1911, was based only on the fact that it contained the statement of the court's approval above ordered to be suppressed, that such statement was because of a misunderstanding of the court's action through no fault of counsel; and, when entered, this order may be published by either party, and it may be stated that they are authorized by the court so to do."

Changes Among Prominent Tradesmen.

F. A. Babcock, former manager of the Franklin Automobile Co.'s St. Louis branch, has been transferred to the factory sales department at Syracuse, N. Y. Albert M. Pearson succeeds to the St. Louis berth.

W. D. Mercer has been appointed district manager of the Westcott Motor Car Co., of Richmond, Ind., for Illinois, Southern Indiana and Southern Ohio. Previously he was connected with the Marquette Motor Co.

Major B. Hawzhurst, formerly of the Swiss Magneto Co., has been appointed Chicago manager for the Simms Magneto Co. His territory comprises the state of Indiana, Illinois, Wisconsin, Iowa, Missouri and Minnesota.

John A. Nichols, Jr., former district manager for the Franklin Automobile Co. in the Canadian and American Northwest, has been made superintendent of Franklin branches. He has headquarters at the factory at Syracuse.

Paul H. Bruske, who a year ago was identified with the E-M-F advertising and publicity department but who then resigned to re-engage in newspaper work, has returned to the Studebaker Corporation as assistant to Advertising Director Pelletier in Detroit. He will have full charge of the company contest work and publicity and will in no way displace W. G. Pettit, Pelletier's first assistant.

Harry W. Cooper has retired from the Excelsior General Supplies Co., of Chicago, and on the 30th inst. will sail for Australia, where he will become president of the Harry W. Cooper Automobile Co., which will establish depots in Melbourne and Sydney. He already has secured the agencies for three American cars and one electric and a line of motorcycles, also the United States Tire Co.'s account.

Parts Maker Files Bankruptcy Petition.

Lewis W. Flagg, of New Salem, Mass., who describes himself as a manufacturer of automobile fittings, filed a voluntary petition in bankruptcy on the 14th inst. His liabilities are \$5,394 and his assets \$3,430.

Detroit, Mich.—Suburban Motor Car Co., under Michigan laws, with \$500,000 capital.

Norwich, N. Y.—Navoe Auto Co., under New York laws, with \$500,000 capital; to manufacture and deal in motor vehicles.

Detroit, Mich.—Motor Times Co., under Michigan laws, with \$30,000 capital; to deal in motors and motor vehicles. Corporators—George A. Munch, Arthur N. Long, N. Munch.

Newark, N. J.—The Commercial Sales Co., under New Jersey laws, with \$5,000 capital; to deal in automobiles. Corporators—Joseph J. Rafter, John T. Walsh, John W. Phillips.

New York City, N. Y.—International Auto Sales Co., under New York laws, with \$25,000 capital; to deal in automobiles and other motor vehicles. Corporators—H. J. Levy, D. Schwartz, A. Klein.

Canton, Ohio.—Wise-Green Motor Car Co., under Ohio laws, with \$25,000 capital; to manufacture and deal in motor vehicles. Corporators—R. P. Wise, George M. Green, H. B. Fawcett, J. M. Blake, C. T. Carlson.

Boston, Mass.—Paddon Motor Co., under Massachusetts laws, with \$3,000 capital; to deal in automobiles and other motor vehicles. Corporators—Samuel N. Paddon, John Wilbur Paddon, Charles R. Codman.

Joliet, Ill.—Joliet Auto Truck Co., under Illinois laws, with \$10,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—Phil F. Carroll, Milo M. Case, Wilbur O. Dayton.

Lima, Ohio.—Lima Overland Co., under Ohio laws, with \$10,000 capital; to do a general automobile business. Corporators—Samuel Roeder, Howard P. Bears, George E. Bayley, W. E. Bayley, George Roeder.

Jersey City, N. J.—Mechanical Rubber Tire Co., under New Jersey laws, with \$100,000 capital; to manufacture automobile tires and other rubber goods. Corporators—W. T. Wheeler, F. B. Crawford, F. Carter.

Fargo, N. D.—Gate City Automobile Co., under North Dakota laws, with \$50,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—Joseph E. Fields, Fred R. Schofield, M. L. Feckler.

Portland, Me.—American Rim Co., under Maine laws, with \$125,000 capital; to manufacture and deal in wheel rims for automobiles and other vehicles. Corporators—President, J. L. Croteau; treasurer, A. F. Jones.

St. Louis, Mo.—Cherokee Automobile Co., under Missouri laws, with \$2,000 capital;

to build, sell, buy and deal in automobiles. Corporators—Eugen Huber, William Paffrath, H. G. Schneider, William Winkler, five shares each.

Piqua, Ohio.—Piqua Motor Co., under Ohio laws, with \$50,000 capital; to manufacture and deal in motor vehicles. Corporators—L. H. Wessel, O. C. Kalbfleisch, J. C. Fahnenstock, Rupert Fahnenstock, Edward K. Keifer.

Augusta, Me.—Briggs Magneto Co., under Maine laws, with \$600,000 capital; to manufacture electric apparatus and appliances. Corporators—President, L. J. Coleman; treasurer, M. M. Farrar; clerk, Charles L. Andrews.

Florence, Ala.—Florence Garage Co., under Alabama laws, with \$2,000 capital, of which \$1,000 has been paid in; to conduct a general automobile and garage business. Corporators—B. J. Smith, Paul Porch, Henry A. Bradshaw.

Chicago, Ill.—Packard Motor Car Co. of Chicago, under Illinois laws, with \$50,000 capital; to manufacture and deal in automobiles, motor vehicles and accessories. Corporators—Leslie J. Ayer, William Fogel, William H. Barnum, Jr.

Framingham, Mass.—Waverly Street Garage, Inc., under Massachusetts laws, with \$5,000 capital; to deal in automobiles and maintain a garage. Corporators—Lorenzo W. Prouty, Winnie E. Prouty, Frank P. Hewins, M. Louise Hewins.

Springfield, Mass.—Auto Spring Wheel Co., under Massachusetts laws, with \$250,000 capital; to manufacture automobile wheels. Corporators—John E. Stannard, George W. Upton, Francis J. Miller, Harry G. Martin, N. Seelye Hitchcock.

Brooklyn, N. Y.—Spring Tire Co., under New York laws, with \$8,000 capital; to deal in automobile tires. Corporators—Henry B. Hill, 180 Montague street; William Eiermann, 1981 Fulton street; William A. Crane, 49 Stone street, all of Brooklyn, N. Y.

Springfield, Mass.—Kutz Auto Tire Co., under Delaware laws, with \$1,000,000 capital; to manufacture woven leather tires for automobiles. Corporators—M. H. Kutz, Springfield, Mass.; Percy Heap, Holyoke, Mass.; Morris Freedberg, 150 Nassau street, New York City.

Portland, Me.—Triplex Tube Co., under Maine laws, with \$1,000,000 capital; divided into \$700,000 common and \$300,000 preferred; to manufacture, sell and deal in tires for all kinds of vehicles. Corporators—Edward J. Connor, C. F. Tennant, William H. Culliver, all of Portland.

Henderson, N. C.—Corbitt Automobile Co., under North Carolina laws, with \$250,000 capital; to manufacture, sell and deal in automobiles and other motor vehicles. Corporators—R. J. Corbitt, D. Y. Cooper, J. B. Owen, J. H. Bridges, A. C. Zollicoffer, S. T. Peace, M. W. Teachey, W. A. Hunt, A. A. Zollicoffer.

John Burnett has purchased the Pope Garage on Sixth street, Logansport, Ind.

Edward Zwiebel & Bro. have opened a garage on Chestnut street, Burlington, Wis.

The Marion Motor Car Sales Co., of Indianapolis, Ind., has filed a notice of dissolution.

A new garage is in course of construction at 1049 Humboldt street, Denver, Colo. R. D. Rees is building it at a cost of \$2,000.

Splitt & Boettcher have opened a garage and repair shop in Manitowoc, Wis. It is located in Washington street, near 12th street.

William F. Codori has opened a large garage on York street, Gettysburg, Pa. It will be in charge of his son, William Codori, Jr.

G. A. Lien has commenced work on a garage at Columbus Wis. It will be of brick and stone, one story and basement. 60 x 80 feet.

A garage 61 x 153 feet in dimensions, two stories high, of cement block, is in course of erection at Siegfried, Pa. Charles and Joseph Porter are building it.

The Hodgins-Fosdick Motor Co., Inc., Chalmers representative in Spokane, Wash., has added commercial cars to its line. Universal motor trucks will be handled.

A. R. & Fred McLennon, who conducted a garage at Fifth street and E avenue, Lawton, Okla., have sold their business to E. A. and Roy Robbins. Buick cars are handled.

J. H. Saris, the Ford agent in Beloit, Wis., and vicinity, has leased the former Broadway skating rink in that city. He will remodel it into a garage 130 x 49 feet.

Simultaneously with taking the agency for several other makes of cars, the Buick Motor Sales Co., of Grand Rapids, Mich., has changed its name to Grand Rapids Auto Co.

H. E. Smith, owner of the Erie Garage on North Ninth street, Sheboygan, Wis., has sold his business to Harry Black and J. E. Clarnbach, who took immediate possession.

C. W. Morton, of Ellsworth, Wis., and Alfred Larson, of Moeville, in the same state, have formed the Morton-Flanders Auto Co. They will handle E-M-F and Flanders cars.

Fred Noetzel, a traveling representative of the Thomas B. Jeffery Co., and A. H. Patch, have formed a company with headquarters in Bloomington, Wis. They will handle Rambler cars.

Louis Benoit has filed plans calling for the erection of a one-story concrete garage

at the corner of Coggeshall and Jean streets, New Bedford, Mass. It will cost, when complete, \$10,000.

W. S. Bechtold and Harry Tonks have formed a partnership and are building a brick garage at 210 Ridge street, Newark, N. J. It will be 52 by 73 feet and will accommodate thirty cars.

J. Arthur Scott, of Oxnard, Cal., and Burson Fowler, of Santa Paula, Cal., have formed a partnership and opened salesrooms in Oxnard. They have the agency for National cars in Ventura county.

The Fitchburg Cab & Auto Co., of Fitchburg, Mass., which hitherto has made a specialty of renting, repairing, storing and dealing in second-hand cars, has added a line of pleasure cars to its offerings. It will sell Stoddard-Daytons.

The Fisher Motor Car Co., said to be the oldest automobile concern in Philadelphia, Pa., has entered the commercial vehicle field and taken the agency for Universal and Federal trucks. Its salesrooms are at 310 North Eleventh street.

W. C. Blackmon, of Galveston, Tex., has purchased the garage of the Teague Motor Co. and that of McCullough Bros., both of Teague, Texas. He will consolidate them and operate them under the style the Teague Motor & Machine Co.

Following in the wake of the other Maxwell agencies and branches throughout the country, Maxwell-Briscoe, Inc., of New York City, has applied to the courts for permission to change its name to United Motor New York Co.

Allan Redmond, of Chippewa Falls, Wis., and Irvine Huebner, of Chicago, Ill., have established a garage and repair shop in the Chase building, Eau Claire, Wis. in addition to doing general repair work they will handle several makes of cars.

H. F. Ayres, who operated a garage in connection with his plumbing business at Muscatine, Ia., has sold the automobile part to H. W. Anundson, of Moline, Ill. Anundson formerly was connected with the Velie Motor Vehicle Co., of Moline.

George K. Foster, formerly connected with the St. Paul Auto Co., and Jack B. Lawrence, of the Minneapolis Ford agency, have formed a partnership under the style the Foster-Lawrence Co., with headquarters at 142 West Fifth street, Minneapolis, Minn. They will handle the Stearns car.

Finding its present quarters too small, the Cadillac Motor Car Co., of Illinois, has broken ground for a five-story service building at Michigan avenue and Twenty-third street, in Chicago. It will cost about

\$270,000, and will be one of the most complete automobile buildings in the Middle West.

Allen Tate, of the firm Leteber & Tate, Homer, Ill., has applied for the appointment of a receiver, the dissolution of the firm and an injunction restraining the senior member, Howard Leteber, from conducting the business. He charges his partner with selling goods at less than cost, with applying profits to own use and denying him (Tate) access to the books.

H. J. Mulock, owner of a garage on South Carolina avenue, Atlantic City, N. J., has been sued for \$10,000 damages by William Frazier, of Philadelphia, Pa., who complains that his automobile was stored in Mulock's garage one evening, and was taken out by unknown parties early next morning. As no trace of the car has been found, Frazier holds the garage owner responsible for the loss.

The Geo. W. Hawkins Co., South Texas distributor for the United States Motor Co., has leased a three-story building, 85x127 feet, at the corner of Main street and Dallas avenue, Houston, Tex., which it expects to occupy for ten years as salesrooms. In addition the company has erected a one-story brick garage, 65x127 feet, in the rear of the store, and a service building 50x100 feet on Washington street.

Simultaneously with the opening of new salesrooms in the Hotel Pasadena, Broadway and Sixty-first street, New York City, on October 1st, the Mitchell Motor Co., New York distributor of Mitchell cars, will throw open its new service building at Columbus avenue and Fifty-fifth street. The structure is seven stories high and fitted out with all modern equipment to take care of the needs of the many Mitchell owners in New York City.

Richard Brock, president of the Automobile Livery & Sales Co., New Orleans, La., has filed a petition asking that Charles H. Stock, vice-president of the company, be compelled to show cause why a receiver should not be appointed. Simultaneously with the personal petition, Brock, in the name of the company, filed a suit for \$725 against Stock et al., claiming that an automobile belonging to the company had been burned and that Stock and others had collected the insurance "through the machinations of Fred Stock, a trusted officer of the petitioner." Charles H. Stock and W. Fred Stock, in addition to being connected with the Automobile Livery & Sales Co., are interested in another concern, Stock & Co., Ltd., and Brock asks that the assets of this company be attached to guarantee his claim.

A Delivery System that Delivers is a Motor Truck System Equipped with **"Firestone"**

Quick-Removable Side-Wire Tires and Rims

WHETHER you own one truck or a dozen your delivery system is handicapped when you lay up a truck for tire repairs - lay up the tire and let the truck go on running.

Firestone Quick-Removable Side-Wire Tires can be changed in a few minutes, wherever the truck may happen to be, and your truck goes on earning, instead of costing you money.

May we tell you the details?

Reducing the Risk of Accident.

Into practically all sports an element of danger enters. Most of those who engage in such sports recognize the fact and peculiarly enough it is sports in which the element of danger is large, as, for instance, automobile racing or aeroplaning, that appear to hold the greatest fascination for the public. Men and women in large numbers pay to witness such sports and seldom do they reek of danger to which they expose themselves. The manner in which they hug the rails at racemeets is one evidence of the fact. The peril involved is well known; it often has been pointed out and distressing accidents have accentuated it, but it is safe to say that not even the fearful and deplorable tragedy at the Syracuse (N. Y.) meet on Saturday last will be taken to heart or serve to diminish the number of spectators at danger points.

Automobile authorities long ago recognized that only solid retaining walls will render such accidents practically avoid-

able, but when automobile racing and its dangers appear to hold such an attraction for the public, it is not fair to speak too harshly of promoters who provide such sport on such tracks as are available.

Lacking solid retaining walls, however, there are certain precautions that can be and should be observed. To permit the use of high-powered cars on half-mile tracks, for instance, is equivalent to placing a premium on disaster; yet it still is being permitted. Again, to permit racing on a slippery track, or one deep in dust, is equally blameworthy, in which connection it is timely to applaud the action of the two A. A. A. officials—one in Texas, the other in Minnesota—who but two weeks ago resolutely forbade racing on courses that were marred by such conditions; they demonstrated that the way to prevent accidents is to prevent them. The incompetent driver and the car that has gone wrong are two other sources of danger that are not beyond remedy.

The incompetent driver is not so quickly distinguished, but when a car is in trouble it is not so difficult to discover. Certainly, the risk involved in driving a racing car which has shed a tire or any part of it is fairly well known, is a known risk, and to suffer a car to be driven for several miles with a "flapping" tire, as at Syracuse, is a reflection on some one's discernment and judgment. It should have been some one's business to stop that car until the tire had been replaced by a sound one.

After they have happened, it usually is easy to say how accidents might have been avoided, but if racing men are disposed to "take chances" and spectators will tempt fate by occupying perilous places, they should be saved from themselves as much as possible. The way to at least minimize the risks even on existing tracks is fairly plain.

Possibilities of the Gas Turbine.

Believing that the turbine method of converting the kinetic energy of a gas into rotary motion is the most efficient and promising yet evolved, engineers continue to watch its development with keenest interest. Up to this time, however, the gas turbine, meaning that driven by products of combustion which still retain very high temperatures, has not made much headway. Many serious obstacles remain to be overcome though there seems no logical reason why they should not be surmounted in due process of time. What is re-

quired is the application of just such mutual effort as in their days have brought forth the no less marvelous developments in submarine and aerial navigation and wireless telegraphy.

Difficulties already encountered include those resulting from high temperatures and pressures from high natural velocities and from the inadequacy of the usual devices for securing the required high degree of compression. There is reason to expect that the solution of the latter problem ultimately will be found in the turbine principle itself, while the gradual accumulation of authentic data is destined to yield in the future such information as may lead to the solving of the other incidental problems. At present there is a lack of concentration on the subject, not as regards the individual, but collectively as regards the engineering world.

The reason is that at present commercial inducement is lacking. The introduction of the steam turbine was made to await the time when the reciprocating engine had attained what seemed its maximum of efficiency in large installations. The internal combustion engine, recognized years ago as a better machine than the external combustion engine, failed to attain general use until the development of the automobile made it imperative to seek a better substitute for the small steam power plant. The large internal combustion installation, more efficient than the large steam plant today, still remains to be adopted to anything like the extent that it merits.

Efficiency alone does not govern. Elements of first cost, reliability, upkeep, flexibility and general adaptability also enter into the business problem which really governs all questions of development and production. However certain the future of a process or product may be, its marketing must be made to wait on a peculiar combination of circumstances which cannot always be foreseen.

Whether the invention of Dr. Nikola Tesla will materially assist in advancing the day and date of the successful gas turbine it is impossible at present to determine. All that is certain is that he has conceived a wonderful new theory and that on it he has based a steam engine for which almost incredible claims have been made. At the same time there is every reason to suppose that the principle is as readily applicable to the products of combustion as to steam, and that once a suit-

able method of supplying such products has been accomplished the rest will be relatively easy and equally marvelous. It would appear that this invention has brought the gas turbine one step nearer a successful realization, and that it should be hailed with all the enthusiasm which it seems to deserve. At the same time, as one commentator has been unkind enough to indicate, "Mr. Tesla has acquired a reputation for revolutionary inventions that never quite arrived at the point of practical utility;" though it may be contended that the observation has no material bearing in this case.

Real Arrival of the Self-Starter.

According to a harmless provincial superstition, if you wait long enough and wish hard enough eventually you will obtain your heart's desire, it matters little what it may be. Such a fulfilment apparently will be the lot of the buyer of a 1912 motor car that is equipped with a full-fledged automatic engine starting device. Motorists who have wearied of turning the crank, to the point of outspoken protest, at length are having their way; certainly no more logical explanation than this is forthcoming as to why the fall of 1911, rather than the fall of 1909 or 1908, should be the season of popularizing the really dependable starting system.

Four years ago Alexander Winton, with the hardihood of the true pioneer manufacturer which he is, introduced a compressed-air engine starter—gave it away with the new six-cylinder model. The same device is in use today and has become a standard feature of the line. Spasmodically one or two other manufacturers followed the lead with starting systems that, for one reason or another, were not retained. Last year a second manufacturer installed an air-starter on his stock models. With the announcements of the present fall two other makers' names have been added to the same roster, while two more have announced the introduction of electrical systems of the same character. It is not to say that Winton deserves the credit for introducing the engine cranking device. Other inventions were on the market when his was adopted, and the idea had been freely and frequently discussed before and its advantages were patent to all, but he is deserving of mention as the real instigator of the present movement.

Something like a year ago another and eminent manufacturer in a club car con-

September 19-23, Burlington, Vt.—Burlington Merchants' Protective Association's reliability run.

September 23, Lowell, Mass.—Road races under auspices of Lowell Automobile Club.

September 23-25, Detroit, Mich.—State Automobile Association's racemeet.

September 30-October 7, Sydney, N. S. W.—International automobile exposition under auspices of Royal Agricultural Society.

October 2-7, St. Louis, Mo.—St. Louis Automobile Manufacturers and Dealers Association's open air show.

October 3-7, Danbury, Conn.—Track meet under auspices Danbury Agricultural Society.

versation let fall the intelligence that he himself had developed an engine starter, even to the point of mapping out the steps in its production. "And when the time comes to bring it out," he added, "it'll beat 'em all. But I don't have to adopt it just yet," he continued, "because, while the public wants it, it hasn't reached the point of forcing other makers to produce something of the sort. The self-starter is one of those things the public will clamor for but is not willing to pay for. Therefore, so long as competition does not force its adoption, why go to the expense of introducing it?"

That is the situation in a nut-shell. Several useful starting systems have been on the market for a number of years, but their adoption by the individual motorist entailed a certain amount of alteration to the car and just enough expense besides to suppress a really active demand. Furthermore the fact that a good motor frequently can be induced to shoot itself into action "on the spark" has afforded an apparently plausible argument against the added mechanism of a positive cranking device.

It would seem that the time is now ripe for a thorough revival of the starting question, however. Competition requires added stimulus and manufacturers uniformly are seeking it through the medium of added equipments. The public, weary of standing in the mud and "swinging" a heavy motor, has had its eyes opened to the truth that the ignition system, no matter how well made, cannot in the nature of things start the motor every time; it never could and

never will. The question is plainly "up to" the car builders themselves now, and those of them who do not adopt mechanical substitutes for the hand crank this year likely will be harder pressed to do so later.

Mr. "Ernie" Moross has become rarely jealous of the reputation of his chief charge, Mr. Bob Burman. To say that Mr. Burman negotiated one mile in 1:07 in the course of a three-mile race when the time actually was made in a one-mile time trial, Mr. Moross considers such an "extremely libelous statement" as to require the attention of his "New York lawyer." He has so informed the Motor World, which made that statement in its report of the Montreal meet on August 20th. And not because of Mr. Moross or his New York lawyer, but to preserve the reputation of Mr. Burman, the Motor World is pleased to make known that the time was made in a mile trial and was not an intermediate mile. The Motor World repeats, however, that "one mile records for half-mile tracks" do not count, and that the only recognized records and the only ones booked by the A. A. A. are those made on tracks of one mile or larger; if this be libelous, Mr. Moross can make the most of it. Also, it is pertinent to suggest that he himself might enhance the repute of his men if he ceased claiming such "records," and left them to Mr. B. Oldfield, on whom the Motor World has been disposed to consider both Moross and Burman welcome improvements.

TRAGEDY MARS MEET AT SYRACUSE

Lee Oldfield Charges Into Dense Crowd
and Twelve Deaths Result—De Palma
Three Times in Front.

Even though Burman did lower De Palma's two-mile record at Brighton Beach on Labor Day, he has nothing on the New Yorker. De Palma got right back at him on Saturday last, 16th inst., at Syracuse, N. Y., and administered as sound a drubbing to Moross's star as ever he received. He beat him in a 10-mile race, and he beat him in a 50-mile race, and then, just to show what he really could do, he accomplished what never has been done before: For the first time since the Remy Brassard fell into the hands of Moross's coterie of race drivers an "outsider" won a "leg" on it and that outsider was De Palma behind the

BURMAN (OPEL) BEATING TURNER (AMPLEX) IN FIVE MILES RACE

der Knox, Lee Oldfield, who, according to Berna himself, "has been advertised by greedy gold-thirsty promoters as my

of the 14 who were injured three died subsequently. Oldfield, whose exact lineage is shrouded in mystery, but who is said to be an Italian, escaped with a broken rib and minor bruises.

The specific cause of the accident was a blown-out right front tire. Oldfield had driven for several miles with a part of the tread flapping and though the danger of the proceeding was known to driver and officials alike he would not stop, nor was he stopped, instead, it is said, that interested people urged him on, inciting him to even greater speed, as De Palma then was closing up on him. In spite of the fact that it quickly became known that a number of persons had been hurt in the accident, the officials refused to stop the race and De Palma drove the last few laps with hundreds of spectators running excitedly over the track. Only an act of Providence saved them from themselves.

The track itself was not in the very best of condition. Though it was as smooth as could be expected, practically all of the wrinkles having been ironed out in anticipation of the meet, the advent of President Taft earlier in the afternoon, and the necessity for the sprinkling of an abundance of

DE PALMA AND OLDFIELD NEAR SCENE OF TRAGEDY

wheel of a Simplex. Incidentally, he established a new record for 50 miles on a circular dirt track, breaking Berna Oldfield's record made at Dallas, Tex., in 1909, and hanging up a new figure of 47 minutes and 21.65 seconds.

The meet at which De Palma did all these things was held in connection with the State fair at Syracuse and was witnessed by one of the largest crowds, if not the largest, that ever attended an automobile racemeet. Long before the opening event the stands were jammed and the rails for the entire distance around the mile track were lined five and six deep. It was the very immensity of the throng and the crowding of the rails that unhappily made possible the worst tragedy that ever has occurred in connection with automobile racing. It happened during the 50-mile race and changed what might have been remembered as one of the most successful racemeets into the most sorrowful one.

At the wheel of Fred Belcher's six-cylin-

brother, though he is not the slightest relation," plunged through the fence in the back stretch during the 47th mile of the 50-mile race and killed nine persons outright;

ROBERTS WINNING FROM KULICK IN 161-230 INCH CLASS

water in order that he might make a circuit of the course in comparative comfort resulted in a rather sloppy track. In fact it was so sloppy just prior to the 50 miles race that De Palma and Burman refused to compete. During the continuance of the argument, however, Old Sol got in his good work and by the time it had been decided to put the race on anyway, the track had dried out considerably and the two drivers decided to go on after all.

Of the other events, a 5-mile race for cars in the 301-450-inch class furnished the closest finish of the afternoon. Turner, who, like Burman, boasts the sobriquet of "Wild," hitched in front of an abbreviation of his first name, which is William, led very nearly the whole distance with an

race was put on and owing to its unhappy ending the remainder of the program was called off and De Palma did not get a chance to tighten his grip on the Remy trophy by winning another heat. The summary:

Five miles, class C, 161-230 inches displacement—Won by Mortimer Roberts, Abbott-Detroit; second, Frank Kulick, Ford. Time, 5:05:79.

Five miles, class C, 231-300 inches displacement—Won by Hughie Hughes, Mercer; second, Ralph De Palma, Mercer. Time, 4:57:22.

Five miles, class C, 301-450 inches displacement—Won by Robert Burman, Opel; second, William Turner, Amplex. Time, 5:01:75.

VIEW SHOWING IMMENSITY AND DENSITY OF CROWD

Amplex. In the last lap Burman in the Opel car, which apparently has been added to the Moross string since its recent good performance at Brighton Beach, closed up and managed to nose out Turner almost at the wire.

De Palma won his first victory of the afternoon in a 10-mile race for the big cars—600 inches displacement and under. Driving a red Simplex "50" he had a particularly easy time, Turner (Amplex) being the only other driver to finish. Burman and the Opel started, but tire trouble caused the withdrawal of Moross's newest German acquisition.

Earlier in the afternoon Burman went out in the big Benz for a record, but failed to get one because of a broken piston, though his time of 48.82 was very close to his own world's record figure of 48.62, made at Brighton Beach on Labor Day. Owing to the damage to the Benz, Burman elected to drive a Mercedes in the first heat for the Remy Brassard. De Palma in his Simplex and Kilpatrick in a Hotchkiss were the only other starters, the former winning in 2:54:57. Following this race the 50-mile

One mile record trial by Robert Burman (Benz). Time, 48:82 seconds.

Ten miles, class C, under 600 inches displacement—Won by Ralph De Palma, Simplex; second, William Turner, Amplex. Time, 9:39:56.

Three miles, free-for-all for Remy Brassard—First heat won by Ralph De Palma, Simplex; second, Robert Burman, Mercedes. Time, 2:54:57. No other heat run.

Fifty miles, class E—For cars under 300 inches displacement, won by Mortimer Roberts, Abbott-Detroit; second, Hughie Hughes, Mercer. For cars from 300 to 600 inches displacement, won by Ralph De Palma, Simplex; no second. Time, 47:21:65.

Savannah Removes Stock Car Stipulation.

The Savannah and Tiedeman trophy races which will be run in Georgia coincidentally with the Vanderbilt cup race on November 27th, are to be non-stock instead of stock chassis events as heretofore has been the rule. The change, which removes these two events from class B, stock chassis division 2B and 3B, and places them in class C non-stock chassis divisions 2C and

3C, was made at the request of a number of manufacturers and follows a conference between Chairman Butler of the American Automobile Association and President Harvey Granger of the Savannah Automobile Club. Under the amended rules the two light car races will differ from the Vanderbilt and Grand Prize events only as regards piston displacement and distance. The Savannah trophy race is for cars of from 231 to 300 inches displacement, and the Tiedeman trophy event comes in the next smaller classification—161-230 inches displacement; the International Grand Prize race is virtually a free-for-all, there being no restrictions, and the Vanderbilt cup cars are restricted only in the matter of piston displacement, which must be between 301 and 600 cubic inches. Two days will elapse between the running of the Grand Prize and Vanderbilt cup races, the former being scheduled for November 30th.

Burman Shows at Grand Rapids.

Drawn from all sections of Kent county, Michigan, thousands gathered at Comstock Park, Grand Rapids, Mich., 13th inst., to greet Robert Burman, a native son, and see him "do things" with his big Benz car. They were not disappointed, for Burman clipped off four-fifths of a second from the track record of 51 seconds which he established last summer. His time was 50½ seconds. The races were held in connection with the West Michigan Fair and were the feature of the day. Burman did not have a walkover, however. In the five miles for the Remy Brassard, best two out of three heats, he won two successive heats from H. J. Kilpatrick, Hotchkiss, and Lee Oldfield, Mercedes, who pressed him hard. In the five miles match between Joe Jagersberger, Case, and J. McNay, Cutting, the former won by a small margin. Ray Harroun, Marmon, drove a three miles match with Lou Heineman, Case. It was Harroun's only appearance and he drew a fine finish, Heineman being second by a few lengths. The free-for-all handicap, at five miles, in which there were but two starters, was won by L. Heineman. The summary:

Five miles match, Joe Jagersberger, Case, vs. J. McNay, Cutting—Won by Jagersberger. Time, 6:07¼.

Five miles, free-for-all, for Remy Grand Brassard, best two out of three heats—Won by Bob Burman, Benz, in two straight heats; second, H. J. Kilpatrick, Hotchkiss; third, Lee Oldfield, Mercedes. Time, first heat, 5:06¼; second heat, 5:03½.

Three miles match, Ray Harroun, Marmon, vs. Lou Heineman, Case—Won by Harroun. Time, 3:27¾.

One mile trials, to beat track record of 0:51—Bob Burman, Benz, 0:50½; Lee Oldfield, Mercedes, 0:56¼; H. J. Kilpatrick, Hotchkiss, 0:58¾.

Five miles, free-for-all handicap—Won by Lou Heineman, Case (10 seconds); second, Joe Jagersberger, Case (scratch). Time, 5:14.

CHICAGO'S TRUCK DEMONSTRATION

Thirty-two Vehicles Engage in it and Not All Survive—Horse-Drawn Truck Also Plays a Part.

Styled a "transportation sample" rather than a contest, the Chicago Motor Club's three days' reliability run for commercial vehicles, which was started on Monday, 18th inst., was finished yesterday (Wednesday), though the final scores have not yet been made public. Officially, the run was a "Grade 1" contest, which, according to the rules of the American Automobile Association, implies penalization for lateness at controls, for the replacement of parts, and if the final technical examination shows that any parts are out of kilter; also the trucks were required to carry loads equal to their rated capacity.

The reason for the unusual appellation was that the run was intended primarily as a demonstration of the superiority of motor trucks over horse-drawn trucks for city and suburban delivery. To make the demonstration all the more convincing a truck drawn by a team of horses and loaded with two tons of sand was started on Tuesday morning and required to make the run scheduled for the motor trucks on Wednesday in two days and finish at the same time.

The route covered each day embraced an average of about 65 miles in and about Chicago. The 32 trucks which started were as follows:

501-1,000 pounds capacity.		
No. Truck.	Driver.	
1—Mercury	Joe Alkofer	
2—Mercury	William Lott	
1,000-1,500 pounds capacity.		
3—Clark	Eugene Odin	
4—Buick	Albert Easterday	
5—Sampson	Hugh Kranskey	
6—McIntyre	C. A. Thomas	
7—Crown	Theo. Hallnagel	
8—Krickworth	J. M. Worth	
1,501-2,000 pounds capacity.		
9—Clark	McCue	
10—Clark	L. Wallwork	
11—Le Moon	A. R. Le Moon	
12—Little Giant	E. W. Alpin	
14—Adams	C. C. McLean	
15—Swanson	C. V. Severin	
16—Lauth Jurgens	William Jurgens	
17—Lauth Jurgens	F. W. Herrick	
18—Decatur	R. S. Mattson	
19—Monitor	C. M. Barnikow	
20—Chase	Mraz	
2,001-3,000 pounds capacity.		
21—McIntyre	William Smith	
3,001-4,000 pounds capacity.		
22—Stegeman	Oscar Stegeman	
23—Reliance	J. S. Carney	
4,001-5,000 pounds capacity.		
24—Mais	T. S. Davies	
5,001-7,000 pounds capacity.		
25—Alco	F. T. O'Mara	
26—Old Reliable	F. L. Kline	
27—Dayton	Haines	
28—Pope-Hartford	James L. Russell	

7,001-10,000 pounds capacity.

29—Saurer	F. C. Atwell
30—Stegeman	William Stegeman
31—Sampson	H. Shires
32—Alco	Thomas Rooney

10,001-15,000 pounds capacity.

33—Saurer	Fred. Berger
-----------	--------------

Fifty-two miles was covered on the first day, the out-and-home route leading by way of South Chicago, Whiting and East Chicago to Hammond, where the noon control was located. Owing to recent rain and many torn up streets undergoing repairs, the going was bad for nearly half the distance, and as a result three of the trucks were penalized. The Swanson truck, driven by C. V. Severin, skidded off the road just outside of Hammond and broke a radius rod and wheel. It was unable to continue and was withdrawn. C. M. Barnikow, in the Monitor, drew 668 points, 300 of them being for lateness at control and 368 for clutch trouble and a fractured rear axle. J. S. Carney's Reliance was assessed three points for taking on oil out of control. Incidentally, the Reliance is the oldest truck in the run, it having been in continual use for the past six years.

On Tuesday the trucks went to Evanston and then back to Chicago in the morning, and were parked in the stock yards during the noon control. In the afternoon the program consisted of a run to Oak Park and return.

The roads were even worse than they were on the first day, and five more of the trucks lost their perfect scores. Three of them, the Alco, No. 21 McIntyre and the Monitor were withdrawn and No. 23 Reliance increased its penalty by 316 points for replacing a bearing. The withdrawal of the Alco was caused by a burned out bearing, and the McIntyre was taken out because of a bent steering gear caused by a collision with a wagon. No. 2 Mercury picked up 72 points for coil trouble, while No. 6 McIntyre was given 24 demerits for time lost when the truck ran into a man. The driver stopped his machine long enough to ascertain that the man was not hurt seriously, after which the pedestrian was taken to his home in the contesting truck. No. 14 Adams was taxed 14 points for taking on oil outside of control. The route on the final day was to Chicago Heights and return.

Few Motor Cars in Switzerland.

According to recent statistics, there are but 2,602 motor vehicles in Switzerland, this number comprising 326 trucks and 2,276 pleasure cars. The number of imported machines in service is 1,454 as against 1,148 of Swiss manufacture. An interesting detail of the report is the table indicating the horsepower of the pleasure cars, which discloses that 45 per cent. of those in use in the mountainous republic are between 11 horsepower and 20 horsepower, while 26 per cent. range between six horsepower and 10 horsepower.

MORE THAN 900 MILES IN 12 HOURS

Britisher Breaks a Long Standing Record on Brooklands Track—Upsets Theories by Using Moderate Powered Car.

After having stood for over four years, the world's record of 799 miles and 1,600 yards for 12 hours' continuous running, which was made by S. F. Edge on the Brooklands track in England, was bettered on Friday, 1st inst., by the very comfortable margin of 107 miles and 1,695 yards. The new record is 907 miles 1,535 yards, and was made on the same track by L. Coatelen with a six-cylinder Sunbeam car. Edge's old record was made on June 28, 1907, with a six-cylinder 60 horsepower Napier in a 24 hour exhibition. Coatelen's record also was made in an exhibition, though of only half the duration of the other.

Upsetting a theory of British motorists that Edge's record could not be bettered except with a car of greater power, Coatelen's performance is noteworthy in view of the fact that his Sunbeam car was rated at but 30 horsepower according to the Royal Automobile Club formula. At the end of the third hour, at which time 223 miles and 594 yards had been covered, Coatelen was nearly 39 miles behind the existing record, but as there was a gap of but 10 miles in the old record between the third and fourth hours, he easily got inside the old figures at that point and thereafter he steadily increased his lead, breaking all intermediate marks between the fourth and twelfth hours. His average speed, including seven stops for tire changes and the replenishment of oil and gasoline supply, was close to 76 miles an hour. The new records and the old ones are given in the following table, the old records for the first three hours having been made by A. Smith with a Thames car rated at 59.1 horsepower and the others being Edge's:

Hour.	Distances. Existing Records.			
	Miles.	Yards.	Miles.	Yards.
1	74	1,076	89	892
2	150	430	173	810
3	223	594	261	1,653
	New Records.		Old Records.	
	Miles.	Yards.	Miles.	Yards.
4	300	1,421	271	1,160
5	373	135	342	1,350
6	451	445	407	60
7	525	568	474	360
8	602	975	537	1,210
9	678	168	609	720
10	757	928	670	1,200
11	832	1,704	737	480
12	907	1,535	799	1,600

No Racemeet at Knoxville Fair.

There was no automobile racing at Knoxville, Tenn., during the Appalachian exposition. A meet had been announced for the 15th inst., but after correspondence with the contest board of the A. A. A., the exposition managers concluded to abandon the plan.

NO CLEAN SCORES IN OMAHA CONTEST

**Technical Examination Decides the Awards
and Spoils Hopes of Four Contenders
—Gottberg Gets Biggest Purse.**

Four of the contestants in the Omaha (Neb.) endurance run, 12th to 15th inst., certainly were jarred when the technical committee put a crimp in their perfect scores after traveling over nearly 700 miles of give and take roads between Omaha and North Platte, Neb. Each had made the entire distance without trouble of any kind and saw the glory coming his way, but when the mechanical examination was finished they had been penalized to such an extent that they were merely in the "also ran" class. The run was conducted by the Omaha Motor Club, although promoted by the World-Herald, which in addition to offering cash prizes to the two drivers having the lowest penalties, awarded two other purses—one to the county and the other to the township having the best roads.

Max Gottberg, at the wheel of a Ford, who lost one point on the road, passed the technical examination with the least debit—13 points—and therefore was awarded first honors. The second went to the Marion Auto Co., whose car had two points charged against it for road performance and 33 for loose bolts, nuts, etc. The four having perfect road scores were: B. M. Burbank, Paige-Detroit; Maxwell Co., Maxwell; Jack Sharp, Alco; E. H. Sprague, Chalmers. Although they were able to negotiate the roads without mishap, the rough going caused broken springs and loose joints for which they were assessed by the technical committee 50, 54, 98 and 195 points respectively.

Grand Island, the night control Tuesday, 12th inst., was reached by all in good style: each driver covered the 151.9 miles without penalty. Except for wet spots near the control, caused by rain during the two preceding days, the roads were in excellent condition. Wednesday, however, the route of 168 miles to North Platte was more strenuous. From Grand Island to Shelton it was easy going but from there to North Platte most of the motorists were unfamiliar with the country and frequently lost the route through the foothills. On the return, Thursday, Hastings (174.6 miles) was the night control, and like the preceding day all but those who made the entire trip without penalization lost one or more points. From Hastings to Omaha (172.4 miles) was the route on Friday.

Bert Murphy, who piloted a three-ton Kelley motor truck as a non-contestant, secured a perfect road score but the technical committee found one loose nut on the sprocket and assessed one point.

The contestants and their penalties were as follows:

Driver and Car.	Penalties.	
	Road.	Tech. Total.
Max Gottberg, Ford.....	1	13 14
Marion Auto Co., Marion..	2	33 35
H. S. Baker, Velie.....	3	35 38
E. R. Wilson, Lexington..	17	25 42
B. M. Burbank, Paige-Det.	0	50 50
Maxwell Co., Maxwell....	0	54 54
J. Kopak, Ford.....	22	37 59
Jack Sharp, Alco.....	0	98 98
E. H. Sprague, Chalmers..	0	195 195
C. D. Wood, Case.....	57	139 196
R. R. Held, Lion.....	17	192 209
Bruce Malcolm, Paige-Det.	138	100 238

The penalties as reported by the technical committee were as follows:

Max Gottberg, Columbus, Neb., Ford—Loose bearing, left front wheel, 5; two leaky hose connections, 3; loose propeller shaft housing, 4; nuts off two bolts, filler board, 2. Total, 13. Road score, 1. Grand total, 14 points.

Marion Auto Co., Marion—Both front wheels loose, 5; oil pipe disconnected, 3; wire bracket gone on boiler, 2; hood fastener gone, 2; loose terminal, 4; broken presto clamp, 5; pumping up tire while in control, 2. Total, 33. Road score perfect. Grand total, 33.

H. S. Baker, Velie—Two front wheels loose in bearing, 10; right rear axle loose bearing, 5; loose oil connection, 1; cut-out rod unscrewed, 1; rear bearing loose in transmission, 5; fan bracket loose, 4; break in gas light line, 3; spring saddle loose in right wheel, 4; lost oil cup, 2. Total, technical, 35. Road score, 3. Grand total, 38 points.

E. R. Wilson Auto Co., Lexington—Steering gear loose in frame, 2; leaky radiator, 20; tail pipe on muffler loose, 1; straps off right rear wheels, 2. Total, technical, 25. Road score, 17. Grand total, 42 points.

B. M. Burbank, Paige-Detroit—Both body side members broken, 20; right front steering pivot loose, 15; front main bearing in motor loose, 5; exhaust pipe coupling loose, 1; spring broken on side of gear control, 5; leaky oil pipe, 1; leaky gas line, 1; strut rod loose, 2. Total, 50. Road score, perfect. Grand total, 50.

Maxwell Co., Maxwell—Both rear wheels loose, 10; rear axle, loose bearing in differential, 5; steering pivots loose, 30; leaky oil pipe, sight feed leaking, 2; disk loose on magneto, 2; rear universal loose, 5. Total technical, 54. Road score, perfect. Grand total, 54.

J. Kopak, Ford—Two front wheels loose, 10; right rear wheel loose, 5; bolts loose on tie rod, 2; emergency brake, 13; left fender cracked, 5; one loose terminal, 1; horn bulb broken, 1. Total, 37. Road score, 22. Grand total, 59.

Jack Sharp, Alco—Right rear wheel loose on bearing, 5; left front spring clip broken and right rear spring clip loose, 15; steering pivots loose, 30; hanger bracket loose on muffler, 1; transmission bearing loose, 5; emergency brake test, 11; distance in wheels, 25; lamp nut loose, 1; nut loose in wind shield, 1; magneto shaft leaking oil, 1; breathing tube loose, 1; fan belt loose, 1.

Total technical, 98. Road score, perfect. Grand total, 98 points.

E. H. Sprague, Chalmers—Right rear, right front and left front wheel bearings loose, 15; six leaves broken in left, one leaf broken in right rear spring, 35; right side rear axle housing loose, 60; right rear door and dust guard broken, 50; exhaust pipe loose, 1; propeller shaft loose both ends, 10; distance between axles, 10; bent and broken right fender, 6; nut gone left front lamp, 1; shock absorber bent, 3; pressure pipe cracked, 3; radiator loose on support, 4; right lamp bracket broken, 3; dust pan bent, 3; wire broken on cut-out, 1. Total technical, 195. Road score, perfect. Grand total, 195 points.

C. D. Wood, Lincoln, Neb., Case—Right rear wheel loose, 5; one leaf broken left front spring clip loose, 5; one cylinder missing fire, 1; leaky hose connection, 1; transmission leaking oil, 1; emergency brake rod broken, 100; foot brake, 7 points; distance in wheels, 5; lamp bracket broken, 3; footboard bracket loose, 3; muffler rod loose, 1; loose oil connection, 1. Total technical, 139 points. Road score, 57. Grand total, 196.

R. R. Held, Lion—Right front and left rear wheel loose, 10; steering gear loose on frame, 2; three rocker arm bolts loose, 2; two loose connections, 2; front brake, 51; emergency brake, 15; spreading wheel, 60; pan loose, left side, 3; muffler bracket broken, 30; nut loose on brake rod, 1; screw loose on footboard, 1; bolt broken, lamp bracket, 1. Total, 192. Road score, 17. Grand total, 209.

Traynor Auto Co., Paige-Detroit—All four wheels loose in bearings, 20; right front steering pivot loose, 15; body loose on frame, 2; knob off door handle, 1; loose terminal, 1; leaky water jacket, 50; carburettor poor, 5; foot brake test, 5; hood catch gone, 1; bolts out truss rod, left side, 1; pan down, right side, 3; left front lamp bracket loose, 3; fender iron broken, 6; loose fan belt, 2. Total technical, 100. Road score, 138. Grand total, 238.

Bert Murphy, Kelley truck—One loose nut on sprocket, 1. Road score, perfect. Grand total, 1.

Lamps for All in Minnesota.

Unnoticed and with as little noise as possible a small sentence was slipped into the new motor vehicle law of Minnesota, and as a result all vehicles, whether motor or horse driven, must carry a white light visible from the front and rear. The law specifically declares the light must be so visible, regardless of whether it is carried in the hand, on a mast rigged up or carried between the wheels. The law was passed some time since, and it is only now that Minnesotans have awakened to the lamp clause contained in it, and a storm of protest is brewing. The law will go into effect on January 1, 1912, and it is stated that few teamsters have heard of it.

OWNERS IN CONSISTENCY CONTEST

Denver Dealer Stimulates Amateur Spirit and Promotes Sociability Between Customers—Two Tie for Trophy.

One of those highly desirable and equally rare affairs, a purely amateur contest, into which even a professional burglar would have been put to considerable pains to jimmy his way, was held in Denver, Colo., on Thursday and Friday last, 14th and 15th inst. Only one brand of car, the Chalmers, was eligible, and the run, which was the second annual affair of its kind, was styled the Chalmers Owners' Consistency Run. The McDuffee Motor Co.,

and Denver was reached late on the afternoon of the same day.

The result of the contest was a tie between Allen de Berry Bowen and Dr. Edward Lazelle, each of whom finished the tour with only two points debit. Third place went to F. C. Dreher, who had three points charged against him, the rest of the 21 contestants drawing varying penalties up to 46 points, which number was meted out to Willis V. Elliot, district attorney for the city of Denver, who drove car No. 13, and received the booby prize. The winner will be decided by a run-off, which will take place probably within a week, and will be a sort of pocket edition of the original tour as many of the contesting cars will accompany these two during their private contest.

DR. EDWARD LAZELLE, A. DE B. BOWEN AND THE CHALMERS OWNERS' CUP

Denver agents for Chalmers cars, fathered the event.

Though there were nine secret controls and contestants were required to pass them on time under penalty of losing two points for each two minutes early or late, the run was not a guessability contest as ordinarily is understood. Instead, it was a big improvement on such affairs as drivers were told what speed to make and were given some opportunity to use their judgment. In reality the run smacked more of the genuine sociability run as all of the 24 cars entered carried in addition to the owner-driver, some of his immediate friends, and in the majority of cases his wife and children, and the promoters dispensed hospitality en route.

The total distance traversed was about 200 miles, the route out from Denver leading through the Big Thompson Canon to Estes Park, where tents were erected and the night was spent. The trip outward, or for that matter, the whole trip from end to end, was unmarred by mechanical derangements, one or two punctures and a single blow-out being the only troubles experienced. For the return journey, which was started the next morning, the alternate route by way of Boulder was chosen

Including the four names already mentioned, the drivers were as follows: Mrs. R. H. John, Merle Turner, A. J. Myerpeter, J. L. Bickerdike, Dr. Charles Jaeger, E. A. Inskeep, Robert Koenne, G. W. Parfet, Harry Heert, Stewart Way, Norman Estey, George R. Funk, E. C. Healey, George E. Bermot, E. B. Field, Jr., J. E. Allen, Norman Estey, A. Ksinsky, John F. Mail, Claudius Raymond, G. W. Hamilton. C. C. Hildebrand, from the Chalmers factory; Alex Nesbit, referee, and J. H. McDuffee, the promoter of the contest, occupied the official car.

Motorist Beats A Fire Department Law.

Arrested on a charge of driving his automobile over two lines of fire hose, while they were being used at a fire, Dr. L. H. Redmon, of Elizabethtown, Ind., had to be discharged by the Columbus (Ind.) authorities, because the ordinance did not specifically name automobiles among the vehicles forbidden to run over fire hose. The ordinance was issued years ago when automobiles were few and far between. As soon as the deficiency was discovered the fire department took steps to have the ordinance amended so as to include motor cars and motorcycles.

METROPOLITAN SPEEDWAY IN SIGHT

Movement That Promises Consummation of Oft-Planned Project—Option Secured on Site for Two Miles Track.

Although the Long Island Motor Parkway has fallen far short of anticipations as a profitable speed course and though many gigantic speedway schemes have been born only to die with the scheming, it appears that Metropolitan motorists now are much nearer than ever before to seeing such a circular course with their eyes instead of in their mind's eye. The waste lands between the Hackensack and Passaic rivers and lying between Jersey City and Newark is the likely place and the Metropolitan Speedway Association which just has been incorporated under New Jersey laws with \$1,500,000 capital, is fathering the project.

Far from being as mythical as were so many other ventures of the sort, an option on 330 acres of land actually has been acquired and those concerned in the project prophecy that the deal will be closed and work commenced in time to permit the initial racemeet to be held early in the fall of 1912. The property is a salt marsh meadow which will have to be filled. According to present plans, the speedway will be similar to that at Indianapolis, except that it will be half a mile shorter in circumference; like the other, it is to be surfaced with vitrified brick. It is stated that Carl Fisher, president of the Indianapolis Speedway, will be consulted, and that the two courses will be operated without conflict. Among those identified with the enterprise are a number of Jersey City capitalists and men connected with the trade, including A. L. Oliver, who is a director in several banks; W. A. Van Kuren, a wealthy Jersey City contractor; Walter M. Dear, of the Jersey City Journal; F. J. Wagner, George Paddock, H. W. Runyan, F. Dunham, Thomas H. Williams, Addison Johnson, Charles E. Collard, Isaac N. Quimby and J. W. Kelly. A meeting of the stockholders will be held in a few days when officers will be chosen.

Milwaukee Ordinance Declared Invalid.

Judge Backus, of Milwaukee, Wis., on Wednesday of last week declared the Milwaukee city ordinance, which provided for a jail sentence for a second offense of speeding, to be unconstitutional and invalid. The opinion was called forth by the case of Frank Meyer, a chauffeur, sentenced to jail for 10 days for speeding. The city attorney, when his attention was called to the new state automobile law, admitted that there was a doubt as to the constitutionality of the local ordinance, and moved the dismissal of five other cases of similar nature, which had been awaiting the outcome of the Meyer case.

CROSS CONTINENT TOURING EASY

Recent Performances Indicate Journey Has Lost Its Terrors—McNamara Outlines Routes and Offers Suggestions.

During the heyday of the bicycle one of the English papers which desired to display its knowledge of American geography informed its readers that one of the New Yorkers' favorite Sunday runs was to Pike's Peak and back. The item was printed in all seriousness and for years stood as one of the classic "bulls," the memory of which has not been wholly effaced. Pike's Peak still remains some 2,000 miles distant from New York but, thanks to the motor car, the miles are very much shorter than they used to be. How greatly distance has been shortened was never better illustrated than by the manner and frequency with which motorists have made the 3,500 miles journey from ocean to ocean during the past year or two. Not so long ago it was considered in the nature of a feat worthy of being heralded far and wide; nowadays it is little more than an accomplishment or a vacation outing that excites only passing comment and except under unusual circumstances, as, for instance, the recent transcontinental tour, in which 12 carloads of motorists engaged, the journey is undertaken and accomplished without notice or any considerable flourish of trumpets. Thus, within recent weeks, C. A. Mulford and his mother, returning from a visit to Honolulu, made the overland journey to New York in a 50 horsepower Kissel car, and nothing was known of it until they reached home. Similarly, Mr. and Mrs. Frank Robertson, of Portland, Ore., leisurely and by a zigzag route, drove from that city to Maine, in a Pope-Hartford, and nothing was known of their 7,000 mile tour, until it was completed a few days ago. Another instance of unusual but unheralded ocean to ocean journey was that accomplished by a three-ton Packard truck, under the guiding hand of E. L. Burnett, which, following the northern route, and unknown to the general public, left New York on July 8 and reached San Francisco on August 24. Nothing was known of the undertaking until it had been accomplished.

That the transcontinental journey is not nearly so rigorous as is generally believed is the opinion of Ray McNamara, who piloted the Premier party, and who has traveled both of the routes from sea to sea and therefore knows them from intimate personal experience.

"In planning a cross-country trip one might choose any of several routes from New York to the Missouri river," he says. "From a scenic standpoint the route followed by the Premier ocean-to-ocean tourists in July is best. Through the Blue Ridge and Allegheny mountains of Mary-

land and Pennsylvania the route runs over the rolling hills of West Virginia and eastern Ohio, over good, level, straight roads in western Ohio to Indianapolis, then north to Chicago, west to Davenport, Iowa, then over the famous river-to-river road to Council Bluffs, Iowa, and Omaha, Nebraska. Or from Chicago, Omaha could be reached by a more direct route, going via Clinton and Marshalltown, Iowa.

"The roads across Pennsylvania are anything but ideal and I might say they are as bad or probably worse than any other transcontinental roads. However, this bad strip of roads can be avoided by following the route laid out by A. L. Westgard's transcontinental Premier last fall, going from New York up the Hudson to Albany, through the Mohawk Valley, Utica, Syracuse, Rochester, Buffalo, Erie, Cleveland, Columbus, Indianapolis and St. Louis. This route is free from long climbs on second speed and has very few 'thank-you ma'ams.' However, the most important thing is choosing your route west of the Missouri river.

"If one is going to rough it and enjoys camping and a few days away from civilization the Santa Fe is the route to follow. From Indianapolis to St. Louis and Kansas City, roads and accommodations are good. Leaving Kansas City, the old trail is picked up at Ottawa, Kansas, and from this point on the tourists have splendid hotel accommodations at each night's stop. The Harvey hotels are just far enough apart to make a good day's run and are located at Newton, Hutchinson, Dodge City and Syracuse, Kansas; Lajunta and Trinidad, Colorado, and Las Vegas and Albuquerque, New Mexico. Beyond Albuquerque a camping outfit is needed as no hotel accommodations can be had for several days. The worst sand of the trip is encountered a few miles west of Albuquerque. Sixty miles farther the railroad is left behind for a stretch of 500 miles. A lava bed is followed for 100 miles and the continental divide is crossed at 10,400 feet. Trails are hard to follow in many places and for quite a few miles it is necessary to travel by directions until Springerville is reached in Arizona.

"At Springerville tourists can stop at a boarding house and enjoy a night with the cow punchers. Leaving Springerville there is a twenty mile climb to the summit of the White Mountains. In November there is much snow on the summit for eight miles through the forest reservation, but when Cooley's Ranch is reached on the west side of the mountains the road conditions change for the better. The road would be fair in wet weather and good in dry weather. From Fort Apache to Globe, to Roosevelt Dam and to Phoenix, there are good government-built roads for the purpose of freightng supplies into the Fort from Globe and for hauling freight and building materials from Phoenix into the Salt River Valley and Roosevelt Dam country. From

Phoenix across the desert into Southern California traveling by motor car is easy except in a few places where it is necessary to run in the washes from the mountains. However, the roads are hard and good most of the way and after crossing the summit of the San Bernardino Mountains the roads are oiled and marked with signboards all the way to Los Angeles.

"On the central route hotel accommodations can be had all the way through; from Omaha to Denver the roads are good; from Denver to Forks Hotel and then through the foothills of the Rockies to Tie Siding and the Laramie plains in Wyoming, where the highest elevation, 8,000 feet, is reached, the conditions also are satisfactory. The trail from Laramie to Medicine Bow, Wyoming, is very good, but beyond this point the roads are somewhat bad up to Evanston, Wyoming, near the Utah line. From Evanston to Salt Lake City scenery and road conditions are fine.

"Probably the worst roads on the whole route are around the north end of the great Salt Lake. Most cross-country tourists ship across the lake, but this is not necessary. The run can be made by starting early, with easy driving through the washouts. Not one of our twelve Premiers had a flat tire on this day's run. From Ogden to Lucin, Utah; from Montello, Nevada, through Wells, Elko, Eureka, Ausin, and to Reno the roads are good except for a few alkali flats where the dust is very heavy. Hotel accommodations are good at any of these points. From Reno to Truckee, Lake Tahoe and the summit of the Sierra Nevada Mountains the scenery is beautiful and the roads are very good. They keep improving to Sacramento and Frisco.

"It would be hard to say which route is better from the Missouri river west. The old Santa Fe Trail is very interesting all the way, and from La Junta, Colorado, the Indian life begins. There are found adobe buildings and buildings of the mission style, good hotels and good roads to Albuquerque, New Mexico. From this point on it is necessary to camp out and this is certainly ideal country for camping. November nights are almost as light as day, due to a bright moon and the high elevation. There are clumps of cedars on New Mexico's mountains and deserts that make the finest camp fires. Nights are cool and days are very pleasant. Lava beds, extinct volcanoes, salt lakes, forest reservations, red buttes, land buttes, mesas, rocky canons, desert basins, deep arroyos, Indian reservations, giant cacti and a dozen other species are many of the interesting features that can be seen only along the old Santa Fe Trail. This route has one forty-five mile climb, about three twenty-mile climbs and many three mile climbs, but being so far south can probably be covered at any time of the year.

"The central route is more practical. It is free from long climbing on the low and

second speeds. The continental divide is crossed at 7,500 feet and the Sierra Nevada Mountains at 7,600 feet, but the highest elevation is reached at Tie Siding, Wyoming, which is on the plains 8,000 feet above sea level. The climb is so gradual over the Laramie plains that one does not realize the grade or the rarified atmosphere.

"The steepest grades are in the Sierras in Nevada but are easy to negotiate, so there is nothing to fear on this route, except the summer rains in Iowa, but the Sierra Nevada summit must be crossed before the middle of October to avoid the heavy snow storms, as winter sets in early up there and lasts a long time. Even in the first week of August we found a bank of snow several feet deep on the shady side of the mountains near the summit, the remains of last winter's snows.

"On the central route large cities and fine hotel accommodations can be figured on at the end of each week. For instance, Indianapolis was the first Sunday stop of the Premier ocean-to-ocean caravan, Omaha the next, Denver, Salt Lake City and San Francisco following in order.

"These accommodations can only be had up to Albuquerque, N. M., on the southern route. Then again it is necessary to roll boulders and build roads in spots on the Santa Fe Trail, while the central route can be traveled without block and tackle, shovel or any road building. From a scenic point of view the central route does not average up to the lower road. The first glimpse of the Rockies from the plains is quite inspiring, also the approach to the foothills and finally the crossing of the Great Divide. However, the tourist also gets all of this on the southern route.

"The ride through Echo Canyon, Utah, and the coast of twelve miles down Parley's Canyon from the summit of the Wasach Mountains into Salt Lake City, the novelty of crossing the alkali flats at speed, then the change from the desert into the Sierra Nevada Mountains is the grandest experience of the entire route and might be mentioned as the real wonder of the trip.

"It would be hard to make any distinctions, as both have their advantages and disadvantages. The Santa Fe Trail might be classed as the scenic route and the central as the more practical route. It would not cost a great deal of money to put both routes in fine shape. The land consists of material better than macadam for road surface, and it would only be necessary to grade the trails and put in a few bridges and sign boards. With this work completed hundreds of automobiles would make the trip each year. As it is the conditions are not bad and there is no reason why anybody should have any trouble in making the trip, providing reasonable time is taken and a good car is used.

"The trip can be made in from twenty to twenty-five days easily, taking a direct route from New York, or in thirty days taking time for detours."

HOW FRANCE REVISED RULE OF ROAD

Remodeled Law Does More Than Abolish Speed Limit and Change Direction—Some Other of Its Provisions.

While first reports regarding the new French rule of the road only cited the abolishment of the "30-kilometer-per-hour" clause and the change from right to left, to correspond with the British custom, later particulars make evident that the whole law relating to vehicular traffic has been remodeled in almost revolutionary manner. The most significant and important of the changes undoubtedly is the rule regarding pedestrians on public highways. While hitherto it has been held that pedestrians have certain inalienable rights on public roads, regardless of the fact that the central part of such highways from time immemorial has been used by vehicular traffic, it now is decreed by the French Minister of Public Works that automobiles and other vehicles have the absolute right of way on French highways, and that any pedestrian using the middle part of such highways to walk upon, does so at his own risk.

It furthermore has been decreed that henceforth the rule of the road will be the reverse of what has obtained heretofore; which is to say, vehicles will be driven along the left side of the road, will turn to the left when other vehicles approach from the opposite direction, and will pass on the right side of all slower moving vehicles going in the same direction. This rule is in force in Great Britain and the British colonies, and the sudden change in France is but one indication of the tendency of the rest of the world to adopt the same system. Several of the Federated States of the German Empire have had the system under consideration for some time, and it is believed that the whole Fatherland soon will endorse the British rule of road.

Another section of the new law places a curb on the careless driver of horse-drawn vehicles, who reclines at full length within his wagon or on the seat, leaving the reins tied to some part of the wagon and allowing the horse to pick its own way. Realizing the great danger of such carelessly handled vehicles to other traffic, the new law makes it compulsory on the part of the driver at all times to have the reins in the hands of a capable person. Furthermore, the law discourages the "road hog," in that it distinctly stipulates that each vehicle must allow passing vehicles no less than one-half of the road, and in any case must pull as far to the left as possible at the approach of other vehicles.

All roads and streets are divided into six classes, according to their importance, and all drivers must make sure that the way is clear for them before turning from their

own road into that of a more important class. Should the two cross roads be of the same respective class, the driver must keep to the left of the center of the road which he is entering.

Every vehicle, regardless of its manner of propulsion, must bear on its right side a metal plate, on which the owner's full name, profession and address are printed or legibly written.

All pedestrians must make way for all wheeled traffic of all kinds, while on the other hand drivers must give due warning of their approach.

Animals are not permitted at large on the highway, and if any automobile or vehicle should run over and kill or injure such animal, the owner will have no cause for damages. If large numbers of domestic animals are driven along public highways, they must be in charge of a sufficient number of competent persons who must manage them in such a way as not to take up more than one-half of the road width.

Simultaneously with making these important changes, the French authorities have come to the conclusion that the clause in their automobile law limiting the speed of automobiles on the open highways to thirty kilometers (19 miles) an hour, is a dead letter and never is enforced. The clause only works to the disadvantage of the community, in that it gives a driver a chance to dodge responsibility for accidents by proving that he drove within the legal speed limit. The new law abolishes a definite speed limit, but holds the driver strictly responsible for accidents caused by him, or for any damages inflicted to bridges, lamp posts, telegraph poles, or other structures connected with the highways.

Short Circuit Causes Chauffeur's Death.

Electrocuted, it is supposed, by a short-circuited power current, Samuel Parker, a Ludington (Mich.) chauffeur, met death in an almost unprecedented manner on the 14th inst., while repairing a car in a local garage. Parker used an extension light, which was led inside the chassis. In stepping into the machine a ground was established through his body and he received a shock from which he died soon after. A defective transformer is supposed to have caused the high-tension current to flow through the wire of the extension light, while the tires prevented it from grounding until other contact was established.

Owners Open Club to Chauffeurs.

Automobile owners of Santa Barbara, Cal., who some time ago organized the Santa Barbara Automobile Club, with Philip Rice, the millionaire planter and banker, as president, have decided to admit chauffeurs as active members. Two drivers already have been enrolled. This is the first club of the sort to announce publicly that its doors will be opened to professional chauffeurs.

TESLA POINTS WAY TO TURBINES

Famous Scientist Invents Radical Steam Engine With Gasolene Possibilities—
New Principle in Fluid Propulsion.

Safe to say, no form of engine could be more attractive either to motorist or automobile manufacturer than that which Dr. Nikola Tesla has evolved in applying his new method of fluid propulsion. A simple form of casing, hardly more complicated than the housing over an emery wheel, a rotating shaft, a number of plain circular disks equally spaced apart and fastened to the shaft and suitable arrangements for the

On the hypothesis that a practical form of gas engine ultimately may be developed it is apparent that space economy as well as high efficiency and low cost will be among its leading features.

In explaining the underlying method Tesla prefers to deal first with its application to pumping. The first authoritative description of the system, in which the Electrical Review quotes the inventor's own language, in part is as follows:

"In the practical application of mechanical power based on the use of a fluid as vehicle of energy it has been demonstrated that, in order to attain the highest economy, the changes in velocity and direction of movement of the fluid should be as gradual as possible. In the present form

hesion and viscosity. Owing to these a body propelled through such a medium encounters a peculiar impediment known as 'lateral,' or 'skin resistance,' which is twofold: one arising from the shock of the fluid against the asperities of the solid substance, the other from internal forces opposing molecular separation. As an inevitable consequence a certain amount of the fluid is dragged along by the moving body. Conversely, if the body be placed in a fluid in motion, for the same reasons, it is impelled in the direction of movement. The accompanying drawings illustrate operative and efficient embodiments of the idea.

"Fig. 1 is a partial end view, and Fig. 2 a vertical cross-section of a pump or compressor, while Figs. 3 and 4 represent, in corresponding views, a rotary engine or turbine, both machines being constructed and adapted to be operated in accordance with the invention.

"Figs. 1 and 2 show a runner composed of a plurality of flat rigid disks, 1, of a suitable diameter, keyed to a shaft, 2, and held in position by a threaded nut, 3, a shoulder, 4, and washers, 5, of the requisite thickness. Each disk has a number of central openings, 6, the solid portions between which form spokes, 7, preferably curved, as shown, for the purpose of reducing the loss of energy due to the impact of the fluid.

"This runner is mounted in a two-part volute casing, 8, having stuffing boxes, 9, and inlets, 10, leading to its central portion. In addition a gradually widening and rounding outlet, 11, is provided formed with a flange for connection to a pipe as usual. The casing, 8, rests upon a base, 12, shown only in part and supporting the bearings for the shaft, 2, which, being of ordinary construction, are omitted from the drawings.

"An understanding of the principle embodied in this apparatus will be gained from the following description of its mode of operation.

"Power being applied to the shaft and the runner set in rotation in the direction of the solid arrow, the fluid, by reason of its properties of adherence and viscosity, upon entering through the inlets, 10, and coming in contact with the disks, 1, is taken hold of by the same and subjected to two forces, one acting tangentially in the direction of rotation, and the other radially outward. The combined effect of these tangential and centrifugal forces is to propel the fluid with continuously increasing velocity in a spiral path until it reaches the outlet, 11, from which it is ejected. This spiral movement, free and undisturbed and essentially dependent on these properties of the fluid, permitting it to adjust itself to natural paths or stream lines and to change its velocity and direction by insensible degrees, is characteristic of this method of propulsion and advantageous in its application.

"It may also be pointed out that such a

FIG. 1

FIG. 2

admission of the working fluid and release of the waste products—these few elements constitute the sole requisites of a complete and efficient engine, if the Serbian-American scientist is correct in his reasoning. That there is nothing in the underlying principle to qualify the new form of engine more particularly for steam than for gas and that early tests have shown enormous power to be derivable from very small units lends strength to predictions that the Tesla system ultimately may exert a revolutionizing influence on the automobile industry.

So new is the invention that it is impossible to determine what are the limitations of the system nor in exactly what manner it will prove applicable. Tesla himself is authority for the statement that the action will be essentially the same whether the pressure of the working fluid be constant, fluctuating or intermittent; the latter condition being such as might obtain were the system applied to the internal combustion engine. One of the experimental steam engines, having disks, or blades, $9\frac{3}{4}$ inches in diameter and occupying a lateral space of two inches has developed 110 horsepower, as told by the Motor World last week.

of such apparatus more or less sudden changes, shocks and vibrations are unavoidable. Besides, the employment of the usual devices for imparting to, or deriving energy from a fluid, as pistons, paddles, vanes and blades, necessarily introduces numerous defects and limitations and adds to the complication, cost of production and maintenance of the machine.

"The purpose of the invention is to overcome these deficiencies and to effect the transmission and transformation of mechanical energy through the agency of fluids in a more perfect manner, and by means simpler and more economical than those heretofore employed.

"This is accomplished by causing the propelled or propelling fluid to move in natural paths or stream lines of least resistance, free from constraint and disturbance such as is occasioned by vanes or kindred devices, and to change its velocity and direction of movement by imperceptible degrees, thus avoiding the losses due to sudden variations while the fluid is receiving or imparting energy.

"It is well known that a fluid possesses among others two salient properties: ad-

pump can be made without openings and spokes in the runner, as by using one or more solid disks, each in its own casing, in which form the machine will be eminently adapted for sewage, dredging and the like, when the water is charged with foreign bodies and spokes or vanes are especially objectionable.

"Another application of this principle, thoroughly practicable and efficient, is the utilization of machines such as described for the compression or rarefaction of air, or gases in general. In such cases most of the general considerations obtaining in the case of liquids, properly interpreted, hold true.

"When, irrespective of the character of the fluid, considerable pressures are de-

path of the particles will be comparatively long, consisting of many almost circular turns. If the load is put on and the runner slowed down, the motion of the fluid is retarded, the turns are reduced, and the path is shortened. . . .

"When apparatus of the kind described is employed for the transmission of power, certain departures from similarity between transmitter and receiver may be necessary for securing the best result. It is evident that, when transmitting power from one shaft to another by such machines, any desired ratio between the speeds of rotation may be obtained by proper selection of the diameters of the disks, or by suitably staging the transmitter, the receiver, or both. But it may be pointed out that in one

shown, and are separated by washers, 17, conforming in shape with the spokes and firmly united thereto by rivets, 18. For the sake of clearness but a few disks, with comparatively wide intervening spaces, are indicated.

"The runner is mounted in a casing comprising two end-castings, 19, with outlets, 20, and stuffing boxes, 21, and a central ring, 22, which is bored out to a circle of a diameter slightly larger than that of the disks, and has flanged extensions, 23, and inlets, 24, into which finished ports, or nozzles, 25, are inserted. Circular grooves, 26, and labyrinth packings, 27, are provided on the sides of the runner. Supply pipes, 28, with valves, 29, are connected to the flanged extensions of the central ring, one of the valves being normally closed.

"With the exception of certain particulars, which will be elucidated, the mode of operation will be understood from the preceding description. Steam or gas under pressure being allowed to pass through the valve at the side of the solid arrow, the runner is set in rotation clockwise direction.

"In order to bring out a distinctive feature assume, in the first place, that the motive medium is admitted to the disk chamber through a port, that is, a channel which it traverses with nearly uniform velocity. In this case, the machine will operate as a rotary engine, the fluid continuously expanding on its tortuous path to the central outlet. The expansion takes place chiefly along the spiral path, for the spread inward is opposed by the centrifugal force due to the velocity of the whirl and by the great resistance to radial exhaust. It is to be observed that the resistance to the passage of the fluid between the plates is approximately proportional to the square of the relative speed, which is maximum in the direction towards the center and equal to the full tangential velocity of the fluid. The path of least resistance, necessarily taken in obedience to a universal law of motion, is virtually also that of least relative velocity.

"Next assume that the fluid is admitted to the disk chamber not through a port, but a diverging nozzle, a device converting, wholly or in part, the expansive energy into velocity-energy. The machine will then work rather like a turbine, absorbing the energy of kinetic momentum of the particles as they whirl, with continuously decreasing speed, to the exhaust. . . .

"In the preceding it has been assumed that the pressure of supply is constant or continuous, but it will be understood that the operation will be, essentially, the same if the pressure be fluctuating or intermittent, as that due to explosions occurring in more or less rapid succession.

"A very desirable feature, characteristic of machines constructed and operated in accordance with this invention, is their capability of reversal of rotation. Fig. 2, while illustrative of a special case, may be

FIG. 3

FIG. 4

sired, staging or compounding may be resorted to in the usual way, the individual runners being, preferably, mounted on the same shaft. It should be added that the same end may be attained with one single runner by suitable deflection of the fluid through rotative or stationary passages.

"The principles underlying the invention are capable of embodiment also in that field of mechanical engineering which is concerned in the use of fluids as motive agents, for while in some respects the actions in the latter case are directly opposite to those met with in the propulsion of fluids, the fundamental laws applicable in the two cases are the same. In other words, the operation above described is reversible, for if water or air under pressure be admitted to the opening, 11, the runner is set in rotation in the direction of the dotted arrow by reason of the peculiar properties of the fluid which, traveling in a spiral path and with continuously diminishing velocity, reaches the orifices 6 and 10 through which it is discharged. If the runner be allowed to turn freely, in nearly frictionless bearings, its rim will attain a speed closely approximating the maximum of that of the fluid in the volute channel and the spiral

respect, at least, the two machines are essentially different. In the pump, the radial or static pressure, due to centrifugal force, is added to the tangential or dynamic, thus increasing the effective head and assisting in the expulsion of the fluid. In the motor, on the contrary, the first named pressure, being opposed to that of supply, reduces the effective head and the velocity of radial flow towards the center. Again, in the propelled machine a great torque is always desirable, this calling for an increased number of disks and smaller distance of separation, while in the propelling machine, for numerous economic reasons, the rotary effort should be the smallest and the speed the greatest practicable. . . .

"The greatest value of this invention will be found in its use for the thermodynamic conversion of energy. Reference is now made to Figs. 3 and 4, illustrative of the manner in which it is, or may be, so applied.

"As in the previous figures, a runner is provided made up of disks, 13, with openings, 14, and spokes, 15, which, in this case, may be straight. The disks are keyed to and held in position on a shaft, 16, mounted to turn freely in suitable bearings not

regarded as typical in this respect. If the right hand valve be shut off and the fluid supplied through the second pipe, the runner is rotated in the direction of the dotted arrow, the operation, and also the performance, remaining the same as before, the central ring being bored to a circle with this purpose in view. The same result may be obtained in many other ways by specially designed valves, ports or nozzles for reversing the flow, the description of which is omitted here in the interest of simplicity and clearness. . . .

"Still another valuable and probably unique quality of such motors or prime movers may be described. By proper construction and observance of working conditions the centrifugal pressure, opposing the passage of the fluid, may, as already indicated, be made nearly equal to the pressure of supply when the machine is running idle. If the inlet section be large, small changes in the speed of revolution will produce great differences of flow which are further enhanced by the concomitant variations in the length of the spiral path. A self-regulating machine is thus obtained bearing a striking resemblance to a direct-current electric motor in this respect, that, with great differences of impulsive pressure in a wide open channel, the flow of the fluid through the same is prevented by virtue of rotation. . . .

"Besides these, such a prime mover possesses other advantages, both constructive and operative. It is simple, light and compact, subject to but little wear, cheap and exceptionally easy to manufacture, as small clearances and accurate milling work are not essential to good performance. In operation it is reliable, there being no valves, sliding contacts or troublesome vanes. It is almost free of windage, largely independent of nozzle efficiency and suitable for high as well as for low fluid velocities and speeds of revolution. The principles of construction and operation are capable of embodiment in machines of the most widely different forms, and adapted for the greatest variety of purposes."

French Exports Maintain Their Strength.

Despite the stress of competition, France's export trade is maintaining its remarkable strength. For the seven months ending with July, its foreign business in cars and parts attained a value of \$20,600,000, as against 20,229,000 for the corresponding period of 1910. Great Britain, which is by far the largest customer, has slightly reduced its purchases, but increases are shown in the shipments to Algeria, Brazil, Germany, the Argentine, Austria and Turkey. On the other hand, smaller shipments have been made to Belgium, Russia, Italy, Switzerland, Spain and the United States. The imports of foreign motor-cars and parts into France have advanced also—from \$983,800 in the first seven months of 1910, to \$1,672,200 in the corresponding period of the current year.

LEAK PRINCIPLE IN CARBURETTER

American-Made Zenith Turns Simple Idea to Good Advantage—Regulates Flow of Fuel Instead of Air.

A leak in a bucket is recognized as producing a stated loss of the contents in any given time, or, in other words, a constant rate of flow. On this principle the Zenith carburetter is provided with a compensating device in which the fuel supply is regulated in proportion to the speed, instead of the air, as more commonly is the case. In introducing the principle in this country the recently organized Zenith Carburetter Co., of Detroit, Mich., has undertaken to reproduce by American manufacturing methods a device which in something over

THE AMERICAN ZENITH CARBURETTER

four years of existence in Europe has more than given a good account of itself, now being made both in France, where it originated, and in England.

The ordinary plain carburetter jet, which in the Zenith construction is placed at C, as shown by the accompany illustration, has the fault of delivering increasingly rich mixtures as engine speeds increase. To correct this defect the principle of the leaking bucket is employed. A second jet which is just above the plug marked in the drawing, permits a constant flow of fuel to take place from the duct which leads from the float chamber and to discharge into the base of the well, J, which is open to the atmosphere at the top. This corresponds to the "leak" above mentioned, and results in the contribution of small additional quantities of fuel to the mixing chamber, A, through the passage, F, and the annular space, H, which surrounds the main jet and leads to a circular opening at the nozzle, S.

When the engine is at rest, the flow through the fixed opening continues until the level of fuel in the well, J, reaches the

height of that in the float chamber. When the engine is started the suction in the mixing chamber causes the contents of the well to be discharged through the jet, thus affording a rich starting mixture, but one which "thins out" as speeds increase, because the free air supply in the well prevents the suction from affecting the flow through the supplementary orifice. A mixture which is said to be of remarkable consistency is the result.

As the level of the fuel is considerably below the nozzle in the standpipe a feeding device also is added to assist in starting without priming and also to serve when the motor is turning over idly at very low speed. With this object the wall of the intake pipe is drilled with a small hole, U, which comes just under the edge of the throttle, T, when the latter is in its closed position. Communicating with this hole is a groove in the wall of the well, which, by the insertion of a tube, K, in the well, is formed into a closed tube. A spiral slot in the tube registers at some point with the slot; the rotation of the tube, after releasing an adjusting screw, serving to locate the height of the opening from the well to the slot which thus is formed. This tiny passage leading directly to the intake pipe permits small quantities of fuel to be fed to the cylinders when the well is filled and when the suction is insufficient to cause the main jet to operate.

Interchangeable nozzles are provided so that the carburetter may be adapted to any engine. Once adjusted in the proper way it has the merit of possessing but one moving part outside the float chamber—that being the throttle itself.

Why Tire Chains Should Be Whole.

Full dependence may be placed on chains as devices competent to prevent skidding only when the chains are perfect; which is to say that if one or more cross chains is missing the efficiency of the whole is decreased far out of proportion to the loss of even a single cross chain. This is due to the fact that when the brakes are applied the chains will hold the car until that spot is reached where there is no chain. When the tire will come on contact with the road and a skid will be imminent. As new cross chains are cheap and their application is simple, the efficiency of the non-skid devices may be insured at all times by the expenditure of a minimum of money and time.

Foot Pedals as Cause of Rattling.

One of the most annoying sources of rattles, which contrary to the usual rule generally is easy to locate, may be caused by the foot pedals where they extend through the floorboard. Sometimes the noise may be stopped by tightening the pedals on their shafts, but where they already are tight practically the only remedy which remains is to enlarge the slots, though the pedals sometimes may be taped.

USES SPENT GAS TO START ENGINE

Everitt Self-Starter Employs Novel But Proven Principle—How it is Applied and How It Operates.

Operating on a principle not far removed from that on which a steam engine operates, steam being a compressible gas, which, being admitted by suitable valves behind the pistons causes them to move, the self-starting device with which the 1912 Everitt four and six-cylinder engines are equipped is best described as being of the compressed gas type. The difference, however, is that the agent used in the Everitt

or "distributor," which operates much in the manner of a timer and like one is actuated by the camshaft. As the crankshaft revolves, the distributor exposes in turn four openings for the four-cylinder motor and six for the six-cylinder motor, the openings being connected to small copper pipes leading to the cylinders. The timing is so arranged that the gas is admitted first to the cylinder in which the piston is at the top of its stroke, and following this to the other cylinders as the pistons rise and pass top dead center.

In operation, the distributor valve rotating in unison with the camshaft necessarily stops in such a position that the opening leading into the cylinder in which the piston is nearest its top center with the

over about 100 times, the pressure being automatically maintained once the engine has started.

Motor Cars Conspicuous at Michigan Fair.

By far the largest and most notable display of automobiles ever held in connection with a state fair was inaugurated on Monday, 18th inst., at Detroit, Mich., where the annual Michigan State Fair is holding sway this week. The great majority of the cars exhibited were 1912 models, while a surprisingly large number of trucks served to attract the attention of the business man. Every foot of space in Motor Hall is filled by the 50-odd exhibitors, who are staging the following cars:

Gasolene pleasure cars—Abbott-Detroit,

SIMPLICITY OF EVERITT ENGINE STARTING DEVICE

ARRANGEMENT OF OPERATING BUTTON AND PRESSURE GAUGE

starter is spent or burned gas and in making use of it a hitherto unused source of power is utilized without affecting the efficiency of the engine.

Situated just above top dead center of the pistons, a check valve arranged on the third cylinder of four cylinder motors and on the fifth cylinder of the "sixes," permits a small portion of the burned gas to pass through a pipe into a steel cylinder where it is stored. As the check is so adjusted that the ordinary compression in the cylinder is not sufficient to force gas past it unless the pressure has been materially increased as is the case when the charge in the cylinder is fired, there is no possibility of "live" gas gaining entrance to the reservoir. Hence it is only burned or used gas which is utilized and as the quantity taken from each explosion, though very small in any case, is reduced as the tank becomes charged and none is taken after about 10 minutes running when the tank has become full, the effect on the efficiency of the engine is nil.

The compressed gas in the tank is admitted to the cylinders in turn by means of suitably placed pipes and a rotating valve

engine valves closed, is uncovered. Then when the compressed gas is released through the distributor valve, by means of a small foot pedal, the piston is forced down and gas is admitted to the next cylinder, the operation being repeated until the engine takes up its own cycle of operations and commences to fire. To preclude the possibility of the gas escaping while the car is standing idle for long periods, a needle valve on the dash permits the tank to be shut off; a pressure gauge, also on the dash indicates the amount of pressure available at all times.

On the six-cylinder engines, owing to their design, one piston always being in the proper position, the self-starter is infallible. With the four-cylinder engine, however, the possibility of the engine stopping on "dead center" cannot be denied though the likelihood of this occurrence is remote owing to the fact that the compression tends to cause the pistons to rock slightly before finally coming to rest when they almost invariably assume a balanced position half way down the cylinders. The tank in which the compressed gas is stored is of sufficient capacity to turn the engine

Cole Engine-Starter Almost Ready.

Continuing its experiments with engine-starting devices for Cole cars, the Henderson Motor Sales Co., of Indianapolis, Ind., has announced that a system is being developed which is so constituted that it can be applied to any of the cars, and which it is hoped will be ready for introduction within a short time. The new system is not electrical, it is explained, for which reason, cars that are to be equipped with electric lights will have storage battery outfits. Beyond the statement that the starting outfit will be neither expensive nor difficult to instal the details of its construction are not disclosed.

Developments and Trends in Engine Design

That modern automobile engines show a distinct degree of similarity when viewed in the concrete has on more than one occasion been the cause of comment. Even the sameness of details has been remarked, but whereas the general similarity of engine design does exist, and is legitimate in view of the fact that all four-cycle engines operate on the same principle and therefore require practically the same relative arrangement of parts, the approximation to the average in uniformity of details is not nearly as marked at present as was the

also are cored in, giving the engine the appearance of an oblong box.

From the engineering point of view, the system of casting cylinders en bloc has many advantages. Primarily it permits of more rigid construction and therefore there is less liability of frame distortion affecting wear on bearings. Manufacturing cost, too, is reduced, as manifestly it is cheaper to make and mount a single casting than it is to cast several separately and assemble them on a common bed. From the user's point of view, as may be

side. The intake passages are cored through to the valves which thereby are made more accessible, owing to the absence of the carburetter and intake manifolds, which generally are placed in front of the valves. An entirely different arrangement of cored intake passages is shown on the Stearns 15-30 horsepower engine illustrated in Fig. 9. Though the carburetter is mounted on the same side as the valves, the intake manifold is eliminated by attaching the carburetter directly to the block cylinder casting.

FIG. 1—HUDSON BLOCK CYLINDER CASTING

FIG. 2—EVERITT INTEGRAL CYLINDERS AND CRANK CASE

case a few years ago. Though the advances which engineering practice has made in the use of better materials scarcely are apparent to the eye, the tendencies toward lighter construction embodying a greater degree of strength, the reduction of wear and the protection of component parts are self-evident.

Probably the most noticeable change in general design is the growing trend toward the casting of cylinders either in single block or in blocks of two or three cylinders. While the method is not new in the sense that it has only just made its appearance, having been in vogue for several years both in this country and abroad, it is only recently that its merits have been widely recognized. Indicative of the favor which the method has obtained it is noteworthy that today there are more manufacturers using block cylinder castings than ever before. The possibilities of the system are indicated by several foreign manufacturers who have embodied six cylinders in a single casting, and in some cases the gas and water passages

seen in the accompanying illustrations, Figs. 1 and 2, the block casting provides an unusually smooth exterior which is easily kept clean, and as dirt is the foe of efficiency, the advantage in this respect is undisputed.

Though in both of the engines illustrated in Figs. 1 and 2, the former being the Hudson and the latter the Everitt "30," the cylinders are cast en bloc, the Hudson cylinders alone form a unit, whereas the Everitt casting, which is unusual, also includes the top half of the crank case and therefore provides even more rigid construction than when the cylinders alone are cast together and afterward bolted down to a bed formed of the top half of the crank case.

Providing an even smoother exterior, the practice of including intake and exhaust passages in the casting—of coring them integral—also is increasing. In both the Hudson and Everitt engines, which are of the L-head type, the intake manifold and the carburetter are placed on the right side and the exhaust manifold is on the opposite

Though it has been suggested that the enclosing of gas passages gains compactness and permits a minimum of outside parts at the expense of efficiency, it has yet to be proven that such is the case. Passages are made large enough and straight enough to preclude the possibility of choking, and the success with which the system has met sets at naught such contentions.

Regarding valve location, the tendency toward the L-head motor is more marked than ever before, the location of the valves all on one side being admirably suited to the block method of casting cylinders. While considerable has been said concerning the better thermal efficiency of engines having only one valve pocket to each cylinder, the real reason for the change most likely is to be found in the fact that one method requires one cam shaft and the other requires two. Naturally the extra cam shaft entails increased manufacturing cost and at the same time its driving gears are likely to increase noise.

Another evident reason for locating the

FIG. 8—CHALMERS L-HEAD CYLINDERS AND OVERHEAD INTAKES

valves all on one side is the case with which the valve stems and push rods may be entirely enclosed and therefore protected, while at the same time even the little noise which may emanate from them is reduced to the smallest possible degree. The favorite manner of enclosing the valve stems is by means of a detachable plate held in place by a thumb screw as shown on the Cole engine, illustrated in Fig. 3. With slight modifications, the same method is used by a number of other manufacturers, and according to present indications the number will be still larger for the coming season. An alternate method consists in enclosing the valve stems and push rods in two brass sleeves which, when extended, form separate housings for each valve stem, and when telescoped leave the stems easily accessible. This method is illustrated on the Chalmers "40" engine, shown in Fig. 5, and has come into very wide use among other manufacturers within the past year.

For the larger sized motors, separately cast cylinders of the T-head or valve-in-the-head type are largely in favor, en bloc casting being confined principally to the lighter power engines, though there are several excellent examples of block casting in the larger sized engines as well. Of the two types of motor, T-head and valve-in-the-head, the former is the more numerous, probably because of the fact that manufacturing cost may be made slightly lower with this construction.

The T-head arrangement has the advantage that fewer moving valve parts are required and also that more direct connection with the cam shafts is possible. Also it is claimed by advocates of the T-head arrangement that the degree of silence which is obtainable with this construction is greater than can be obtained with overhead valves. On the score of silence alone, however, neither has the advantage, as is evidenced in the late types of valve-in-the-head motors which are second to none as regards silence of operation.

Overhead valves generally are arranged to open directly into the cylinders from a vertical position on top, as shown in Fig. 11, illustrative of Knox construction, or are arranged at an angle of 45 degrees, when they take their name from their angle of inclination and are styled 45 degree valves. Such an arrangement, used on Jackson cars, is shown in Fig. 10. As may be seen from these two illustrations, the overhead arrangement provides an unusually clear compression space devoid of pockets, which in itself is an advantage, inasmuch as the efficiency of an engine depends largely on the unobstructed passage of the gases, whether fresh or burned.

On this score alone, however, overhead valves are little in advance of the T-head arrangement, owing to the degree of perfection which the T-head motor has attained in the last few years. But as regards accessibility, the overhead arrangement is ahead of the other, as the valves

are on top and may be easily and quickly removed, generally without the necessity for special tools, such as valve lifters. In the Jackson arrangement, and in a number of others which are quite similar, the valves are carried in cages, and valve and seat may be removed at once for regrinding or replacement. While the Knox arrangement (Fig. 10) requires the removal of the cylinder heads to get at the valves, the operation is comparatively simple and results in more of an advantage than a disadvantage, as the combustion space is made readily accessible for the removal of carbon deposit.

There are two general methods of operating overhead valves, viz., by means of a

satisfactory for several years. A single camshaft serves to operate both sets of valves.

As a further indication of the development of modern engines, the mounting of auxiliary apparatus is receiving greater attention than ever before. Whereas a few years ago manufacturers confined themselves to providing a bracket for a magneto, which in many cases was not supplied with the engine, today brackets are supplied and provision made for the driving of tire pumps and lighting dynamos as well, and in some cases these fixtures, as well as engine starters, are included in the purchase price.

FIG. 9—A BLOCK MOTOR WITH CORED INTAKE PASSAGE—THE STEARNS "15-30"

single cam shaft, or by means of two separate cam shafts, the movement in either case being transmitted to the valve stems by suitably placed rocker arms. On Stoddard-Dayton poppet valve engines, the overhead valves are actuated by means of separate cam shafts, as shown in Fig. 4, one for the intake valves and the other for the exhaust valves. In the Parry engine, which is illustrated in Fig. 7, a single camshaft serves to operate both sets of valves.

The arrangement of a single camshaft on top of the engine and between the overhead valves is rare and is used only on a few engines. The arrangement is good, however, as it permits of the advantages of overhead valves while at the same time the whole valve mechanism may be enclosed quite easily, a feature which at least one manufacturer has incorporated. The Chalmers "30" motor, illustrated in Fig. 8 embodies a combination of L-head cylinders with the exhaust valves at the side and overhead intake valves, an arrangement which has proven eminently

Several engines hitherto without such fixtures will have starters of the exhaust gas type for the coming season, and at least one of them provides for the inflation of tires from the same tank of compressed gas or air by means of which the engine is started. Others embody separate tire pumps, actuated either from the camshaft, as in the Columbia engine shown in Fig. 6, or from a shaft in the change gear set, or from the engine flywheel by friction. Similarly, by an ingenious arrangement of automatic switches, lighting dynamos which in addition to furnishing current for ignition purposes, also serve as engine starters, will be used on several cars.

Another of the equally noticeable tendencies in engine design is toward increasing the stroke-bore ratio. "Square" motors, in which the bore and stroke are the same, fast are disappearing, and in their place there are long stroke motors. Some of them it is true are long stroke in name only, having strokes only a fraction of an inch greater than their bores, but the gen-

eral tendency is toward the real long stroke motor. One of the more prominent manufacturers has announced a motor with a bore of five inches and a stroke of seven inches for the coming season, and many others will have engines in which the stroke-bore ratio is very nearly the same.

Also the six-cylinder engine is very much more in evidence now than heretofore; several manufacturers of moderate priced cars, whose output in past years has not included "sixes," have announced them for the coming year, and it is reasonably certain that others presently will include six-cylinder cars in their lines. The most probable reason for the increased popularity of the "six" is the greater smoothness of operation and flexibility which it provides. In-

have to grapple is the elimination of vibration.

Open Throttle for Braking With Engine.

When the engine is used "dead" as a brake the throttle should be opened to its fullest limit, as the maximum amount of gas then is drawn into the cylinders and consequently the maximum compression and retarding effect is obtained. When the throttle is partly closed the suction of the pistons results in a partial vacuum in the cylinders and as there is less work for the engine to do in compressing the smaller charge the retarding effect is correspondingly decreased. Obviously if the throttle is kept wide open the consumption of gasoline will be increased; therefore it is well

if the engine is "turned over" slowly by hand. As the irregular running of an engine causes undue and excessive wear on bearings, and incidentally on tires, it is well to take pains to see that the compression in all cylinders is the same. Generally the trouble is caused by leaky valves, in which case they should be reground. If after such treatment the irregularity continues, and provided spark plugs are gas tight, the piston rings should be examined. Breakage of the rings is the least frequent cause of trouble, which generally may be traced to an accumulation of oil which prevents the rings from spreading and touching the cylinder walls. A liberal dose of kerosene injected through the spark plug openings and allowed to remain over night generally is sufficient to loosen the tightest rings.

Restoring Rubber That Has Hardened.

That tires or other rubber articles which have become slightly hardened through exposure to the atmosphere may in some cases be restored to their original state of elasticity by the simple expedient of immersing them for a short time in an alkaline solution composed of one part ammonia to two parts of water, is the experience of a writer in the *Pharmaceutical Journal*. The article which was tested was an old bicycle tube which seemed beyond restoration yet half an hour's immersion in such a solution sufficed to render it fit for use. The theory of the system is that the alkaline solution neutralizes the tendency toward the formation of acids which are harmful to the rubber. To obtain the same neutralizing effect and the beneficial results it is suggested that when tubes or other rubber articles are stored a small quantity of quick lime or ammonium carbonate be included in the wrappings, though it should be kept separate so that it does not come in actual contact with the rubber. Also it is suggested that periodic washing with ammonia and water is an excellent preventative of hardening.

Simple Cause of Balking Engine.

Though present day motors seldom fail to start after having been "turned over" once or twice, a balky one occasionally is encountered, and it was with one of these that a motorist recently had a protracted session. "I tried everything that ever has been advised to induce the engine to start," he said, "and then I sat down and thought for a few minutes. The explanation seemed ridiculously simple—the car had been standing idle for some time and the gasoline in the carburetter had become 'stale.' I drained the carburetter, after having first turned off the gasoline, and refilled it, and as the engine went off at the first turn my conjecture must have been pretty nearly right. At any rate, the same procedure always has worked since and I have had need to rely on it on more than one occasion."

FIGS. 10 AND 11—JACKSON AND KNOX OVERHEAD VALVE MECHANISM

identally, owing to the use of better materials and to better design in general, all engines give considerably less trouble than they did a few years ago, and the advantages which the addition of two or more cylinders give are far greater in reality than is the possibility of one-third more trouble.

That modern engines have been wonderfully improved within a very short time is evident if those of even one or two years ago are compared with the newest creations. Efficiency and durability have been increased, and though it now is possible to get very much more power from the same size cylinders, the increased piston speed which is necessary often results in very marked vibration. Though this question of vibration has been given considerable attention within the last year, and the balancing of parts now is carried to a greater extent than ever before, no perfectly satisfactory remedy has yet been found. Just as with other parts of the engine the improvement in this respect has been apparent, though the result still is very far from perfect. Owing to the tendency toward gearing cars lower in order to gain greater flexibility, it is probable that, if not at present, then in the very near future, the greatest problem with which designers will

to fit into the intake pipe a three-way cock which may be opened to admit pure air into the cylinders and at the same time close the throttle. Such an arrangement will have the further advantage that the cylinders will be thoroughly scavenged and cooled when the throttle is closed as when coasting down hill.

Equalizing Compression in Cylinders.

Engines should be tested periodically for equality of cylinder compression. While a slight difference in compression between two cylinders will cause a corresponding difference in power, it may be so small as to make no appreciable difference in the running of the engine and therefore may be neglected if the car is to be used for ordinary purposes. But for speed work or for use in hilly country, such differences should be corrected, and if slight their determination will require the use of a pressure gauge. Differences in compression which are great enough to cause the engine to run irregularly always may be detected through the sound of the exhaust. The cylinders in which the compression is weak will make considerably less noise than those in which it is normal. If the exhaust is closely muffled and no cut-out is provided, the difference will be apparent

AMERICAN SAURERS ABOUT READY

Actual Reproduction of Swiss Truck Commenced in New Jersey—Its Air Brakes and Other Special Features.

Saurer trucks long have been favorably known as importations to this country, and while the licensee, the Saurer Motor Co., of New York City, has assembled a few chassis in its Plainfield (N. J.) works from imported parts, its preparations to build an American version of the foreign product are only just reaching a stage of completion. Since Adolph Saurer, of Arbon, Switzerland, developed his first motor ve-

hicle, starting system, which is one of several original features of the truck, rendering the use of batteries to facilitate starting unnecessary.

Cone clutches, leather faced over rubber cushions, four-speed selective gearsets, long semi-elliptical springs with helical buffer springs in the rear, solid frame construction and low suspension are features which do not differ materially from those found in other trucks of good construction. The wheel base of the smallest of the three sizes is 141 inches, while the $4\frac{1}{2}$ and $6\frac{1}{2}$ ton sizes have 153 and 159-inch bases, respectively. The two larger machines have 64-inch treads, while the $2\frac{1}{2}$ ton size has 58-inch tread. Such is the effect of the low-hung suspension that the

starter is of the compressed-air type, but entirely original in detailed construction. It embodies an air pump driven by the engine and a special form of distributor valve which automatically selects for compressed air starting charges the cylinders in their proper firing order. Differing from other and somewhat similar devices, it is capable of spinning the crank shaft at speeds up to 600 revolutions per minute, while the normal engine speed is only 1,000 revolutions.

The air brake effect is obtained by the ingenious device of converting the engine temporarily into a two-cycle compressor. As the throttle lever is brought back to the position of full closure, the first effect is to open an air port in the intake manifold,

SAURER $4\frac{1}{2}$ TON TRUCK WITH WIDE PLATFORM BODY

SPECIAL $6\frac{1}{2}$ TON TANK WAGON EQUIPMENT

hicle, for the delivery of embroidery making machinery, in practical competition with horse haulage in that mountainous country, the name has become even better known for the trucks which have won distinction for it than for the older industry with which the family was long associated. Furthermore, the product bears the impress of the severe local conditions encountered by the first machines of the line, and which, it may be added, took the road 17 years ago. At present five different factories are producing Saurer trucks, four being located respectively in Switzerland, France, Germany and Austria, and it is noteworthy that production is so regulated that all parts will interchange, no matter in which of the five factories they are produced.

Three models are manufactured, of $2\frac{1}{2}$, $4\frac{1}{2}$ and $6\frac{1}{2}$ tons capacity. They are of generally uniform design, the same motor, indeed, being employed in the two larger models. The smallest of the three, however, is of shaft driven, instead of chain, construction, and has a block type of motor. The cylinder dimensions of the latter are $3\frac{1}{2} \times 5\frac{5}{16}$ inches and the block casting is of T-head form, the valves being on opposite sides. The larger motor, which rates at 37 horsepower, has cylinders which are cast in pairs and which are of $4\frac{3}{8} \times 5\frac{1}{2}$ inches bore and stroke. Ball bearing crank shafts are used on both engines, one of the smaller size, it is said, having done $3\frac{1}{2}$ years' service without renewals. Magneto ignition is used exclusively, the engine

lowest type of body for the $4\frac{1}{2}$ -ton truck can be built with a loading platform only, 32 inches above the ground, while the lowest body floor for the larger size is 34 inches.

More noteworthy features of construc-

THE SAURER CARBURETTER

tion which have served to add materially to the prestige of the line include the engine starter, the air-brake system, the carburettor and the speed regulator, four details of unquestioned excellence. The

and the second, obtained by further movement, to cause the exhaust cam shaft to be displaced, bringing a special set of cam faces under the valve lifters. The result of this is to cause the exhaust valves to open and close in a new sequence and so to cause the pistons to induct charges of air on each down stroke, compress them on each up stroke and release them at the end of the up stroke. As the action is secured progressively in proportion to the movement of the throttle lever the braking action may be graduated as desired. From 80 to 90 per cent. of the full power of the engine may be utilized for retardation by this system, it is claimed. Supplementary to the air brake system are a countershaft brake and a pair of rear wheel brakes of the usual types—contracting on a shaft and expanding in drums on the rear wheels.

The carburettor is distinguished by a double-jet arrangement, the unusual feature of which is that the secondary jet is enclosed in a separate compartment from the main mixing chamber and separated from it by a clack valve which is controlled by a spring and dash-pot arrangement. At low and moderate speeds, therefore, only one jet is in use, as in the simple type of carburettor. At higher speeds, however, the added suction causes the clack valve to open, thus bringing the supplementary jet into service.

The speed regulating system takes the form of a centrifugal governor mounted within the driving gear on the inlet cam shaft and acting on the throttle through a

lever arrangement. Its peculiarity is that it is interconnected with the change gear lever. When the lever is in low speed the governor regulation is normal and the engine is thus permitted to attain its maximum speed and power. In the higher gear positions, however, the effect is to cut down the engine speed by suitable amounts, while placing the lever in the neutral position automatically reduces the engine speed to about 400 revolutions per minute. Thus racing of the engine while it is out of gear is prevented, while for starting, hill climbing and heavy duty work the full speed range is attainable. At the same time the vehicle is safeguarded against excessive speeds and one salient cause of rapid deterioration is thus automatically avoided. The maximum speeds of the three sizes of truck when running on fourth speed and with engine speeds of 1,000 revolutions per minute, by means of the governing system

ERNOULT EVOLVES TUBULAR SPRING

French Inventor Departs Radically from Beaten Paths—Theory and Alleged Advantages of the New Spring.

With the characteristic freedom from convention of his race, a French inventor has developed a tubular form of helical spring of which much is expected by those who have had opportunity to study its properties. Hitherto, while the advantages of tubing, as compared with a plain bar of equal diameter, have been pretty thoroughly appreciated, it has been supposed that the additional rigidity obtained by the tubular form was available only for purposes of fixed support. It remained for M. Francois Ernoul to prove that the tubular form is

size as a solid bar is more flexible than the latter.

"Mr. Ernoul has made a convincing comparative test at the Arts et Metiers laboratory. Two springs absolutely the same in appearance, the one of solid ware, the other of tubing one-millimeter in wall-thickness, were tested. Under a pull of 660 pounds the tubular spring yielded by nearly three inches, the solid spring by less than an inch and a half. After this amount of flexion, the tubular spring showed a permanent deformation of 1/25 inch, whereas after a flexure of 1½ inches the permanent deformation of the solid spring reached ¼ inch.

"For equal exterior dimensions, the tube is therefore more flexible; it bends more and recovers better. On the contrary, for equal weights, the tubular spring will resist a stronger pull. For equal strength it gives a serious economy of weight—an

described, are restricted to, respectively, 25, 16 and 10 miles an hour.

Program for Electric Car Convention.

In connection with the opening of the forthcoming electrical show in the new Grand Central Palace, New York City, the Electric Vehicle Association of America will hold its second annual convention in the same building, the date of the meeting being October 10th, while the show is scheduled to open on the following day. The exhibits of automobiles and batteries in connection with the show and the working demonstration of cars of various types on the testing track to be built on the top floor will be a special feature. Ten papers on pertinent topics are included in the set program, including one on "Electric Vehicle Commercial Problems," by L. L. Lloyd and John Meyer, of the Philadelphia Electric Co.; another by E. S. Mansfield, of the Boston Edison Co.; a third by E. W. Curtis, Jr., of the General Vehicle Co., and still another by J. G. Henninger, of the National Electric Lamp Co., of Cleveland, O., on "The Proper Equipment and Lighting for an Electric Garage."

equally useful when subjected to varying loads acting under varying degrees of deflection.

The result of Ernoul's experiments has created a good deal of favorable comment in the French technical and scientific press, the result of which is summarized in a translation appearing in the Literary Digest. "The use of steel tubing is very extensive in these later years," says this authority, "but hitherto the word 'tube' has evoked an idea of stiffness, of rigidity. This idea is explained by the fact that for equal weight a tube is much more stiff and strong than a solid bar; so the tube is always used when we wish to obtain great strength with slight weight. This is the case with a large number of pieces of bicycles, automobiles, aeronautic and similar apparatus.

"Now an engineer, Mr. Francois Ernoul, has made of the tubular section an application that would appear somewhat unexpected, in the manufacture of springs. 'A tube,' we shall be told, 'cannot be used for a spring; it can be only stiff and will break sooner than bend!' Now this is a fallacy. The truth is that a tube of the same outer

appreciable advantage in certain applications, such as aviation (buffer springs for landing, etc.). Its smaller inertia enables it to react flexibly in very rapid movements where mass-inertia would interfere.

"The theory of the hollow spring depends on the theory of the tube. It is well known that in a solid bar that does work by twisting, for example, the fibers of the metal that 'tire' most and consequently determine the limit of resistance are found at the edge. The fibers do less and less work as they approach the center, where the so-called 'neutral fibers' do scarcely any work at all.

"The superiority and the economy of the tube are due to the suppression of the neutral fibers and those that are most inactive and the preservation of those fibers alone that do the most work.

"In spiral springs, the metal does its work precisely in the desired conditions for making the tubular arrangement manifest its advantages. The same principle of economy may be applied in some sort to flat springs; in place of making them of flat plates, they may be given a curved profile in transverse section."

TO "GET EVEN" WITH BIG RAILROAD

Gigantic Scheme Hatching in California to Avoid Southern Pacific—Motor Trucks a Means of Retaliation.

In recounting his impressions of a leisurely trip to the Pacific Coast and return, George K. Birge, president of the Pierce-Arrow Motor Car Co., Buffalo, N. Y., expresses a great interest in a remarkable step that is being taken by Los Angeles, whereby motor vehicles, in connection with a chain of transportation involving the Panama Canal, are to be an important factor in gaining public independence from the alleged monopolistic tyranny of the Southern Pacific railroad. Furthermore, the people of Southern California are not only co-operating with Los Angeles in the scheme but are planning to use motor vehicles in a way that will give good transportation to many districts that, having prayed for railroads in vain, have heretofore been under the blight of isolation.

"If ever there was a boomerang, it is the ill-treatment the Southern Pacific is accused of having given the public and the California shippers in earlier years," Birge explained, "and it is coming back to them hard. It used to be that the railroad was oppressing and abusing the people, according to the latter, but such has been the vigor of their revolt that not only has the railroad lost political control of the state executive, the legislature and the officers in the municipalities, but it is actually being persecuted and harried in a way that is full revenge for all past wrongs. And now motor vehicles are to be used in a gigantic plan to avoid the necessity of using the Southern Pacific at all for shipments from Los Angeles to the East.

"With the co-operation and support of its own business men and of the fruit growers in the territory of which it is the largest city, Los Angeles has arranged for the outright purchase of a great broad highway for motor vehicles from the city to the Pacific Ocean, the city being some 15 or 20 miles inland. At the ocean itself the city has bought a whole harbor bay, so that the Southern Pacific cannot shut off the boats. Immense motor trucks will be used to convey fruit shipments and merchandise from the city to the steamers, some of which will make regular trips to New York via the Panama Canal and others of which will go up the Pacific Coast to points where it is possible to connect with railroads other than the Southern Pacific, such as the Great Northern or the Canadian Pacific. This plan is hailed by the fruit men as breaking the Southern Pacific's power to say when and at what price fruit shall be shipped, a power which practically placed the fruit market in the railroad's hands.

"With this Los Angeles-to-the-Ocean motor vehicle system in good working order, the fruit men plan to project a number of motor vehicle service lines across the state. Owing to the topography of California, the railroad system runs up and down the state, parallel with the coast, and is very meager in crosslines. Only a few of the many attempts to get the Southern Pacific to build side extensions into the interior of the state have been successful, and the railroad has been successful in preventing independent capital from getting charters and building such roads. The landowners of the interior now see in the motor vehicle a means of accomplishing results that otherwise could only be brought about by the building of railroads."

Arrests Uncover a "Used Car Plant."

Daniel S. Richards, of Yonkers, N. Y., and Charles Ross, a chauffeur, giving as his address the Hotel Navarre, New York City, were arrested on Friday last, 8th inst., charged with grand larceny, the arrests growing out of the theft of an automobile belonging to George Taylor, of 347 Fifth avenue, while the latter was at the Brighton Beach races, on Labor Day. The police of New York and Yonkers were in possession of clues leading to a house on the thinly populated Grassy Spring road, and there found Taylor's car, as well as one other car freshly painted. Taylor's car had been scraped clean and a quantity of fresh paint was in the shed ready to be put on the car. It is claimed by police officers that they have unearthed the headquarters of a gang which made a lucrative business of stealing cars, altering their external appearance and obtaining new licenses, after which they would dispose of them at second-hand establishments. John S. Richards, a director of the Teal-Coryell Lumber Co., and father of the accused Daniel Richards, stated that his son recently had gone into the automobile business and made a specialty of buying second-hand cars.

Tall Tale of Truckload of Tires.

Mrs. Kate Filberk, of 266 Forty-seventh street, Brooklyn, N. Y., was arrested last week on a charge of receiving stolen goods, and she finds it rather difficult to convince a skeptical magistrate of her innocence. In fact, the latter entertained the charge made by several detectives and Gilbert C. McCullough, a tire dealer at 1700 Broadway, New York City, who assert that they found fully \$700 worth of stolen automobile tires in the cellar of her home. Mrs. Filberk declares that on August 16th, while her husband was away on his vacation, a truck loaded with tires appeared at her door, and the driver stated he had permission from Mr. Filberk to store the tires in her cellar for a few days. The return of Mr. Filberk from his vacation and the visit from the detectives occurred the same evening, and an hour later Mrs. Filberk was locked up.

GILBERT ESTIMATES TIRE OUTPUT

Reckons 1912 Needs Will Approximate 4,000,000 Tires—Big Factories to Operate Full Time All Winter.

Approximately 4,000,000 pneumatic tires will be required to shoe the automobiles running in America during the year 1912, according to the estimate of J. M. Gilbert, general manager of the United States Tire Co.; and as an indication that he really believes the coming year will develop some wonderful sales records, arrangements have been completed whereby the company's immense factories will be run throughout the winter months on full summer schedule. Winter generally is supposed to be the "off season" in the tire business and this will be the first instance where rubber plants of this magnitude have maintained the same working forces from September to April that were employed during the remainder of the year. Each of the company's factories will also be increased in both extent and equipment, so that the combined output for 1912 will be far in excess of this year's record.

Although naturally conservative, Gilbert is extremely optimistic over the immediate outlook and is of the opinion that the coming year will see the automobile industry taking the longest strides in its history.

"When the United States Tire Co. was formed we increased our producing facilities until we felt reasonably sure that we would be able to meet the demand for our four brands of tires," he says. "How far off we were in this estimate is best illustrated by the statement that during the past six months, ending September 1, we have fallen short of filling our orders to the extent of about \$2,000,000. And this in spite of the fact that we have been working three eight hour shifts at each of our factories throughout the summer. We do not intend that such a condition shall arise again. That is why we have decided to operate our factories with a full working force throughout the winter. We will also enlarge the factories and install a great deal of new machinery and tire making equipment.

"We have considered the future of the automobile from about every angle and while we do not share the ultra optimistic views of some of those connected with the industry, we are convinced that next year will be an exceedingly big one for all branches of the trade and that at least 150,000 new cars will be in use."

Cortland Wagon Gets Plant in Pittsfield.

The Cortland Motor Wagon Co. has been removed from Cortland, N. Y., to Pittsfield, Mass. Additional machinery has been installed with a view of increasing the output.

MOTOR CAR THAT DOES FARM WORK

Oregon Ranch Owner Puts it to an Astonishing Variety of Uses—Some of Its Many "Chores."

The truth of the old French proverb, "the appetite comes while eating," again is proved in the case of James Thompson,

that is necessary to make it ready for instant departure.

Millionaire's Private Automobile Road.

There are very few people in this country—or in any other for that matter—who are able to build an automobile highway, twenty-two miles in extent, all of which lies within the bounds of their own estate, and George W. Vanderbilt is one of these

The road was blasted into tremendous cliffs and has several sharp turns on the edge of sheer precipices, which are extremely difficult to negotiate with a high-powered car of long wheelbase. All but two miles of this road is within Mr. Vanderbilt's 140,000 acre estate, and another \$20,000 is to be spent in constructing a two-mile cut-off, so that the entire road will be on his domain

Extortion Charge for Jersey Justice.

After doing a land office business in fines for alleged violations of the speed law, Magistrate Joseph F. Weeks, of Pleasantville, N. J., is now in the limelight as a defendant on a charge of extorting illegal costs from automobile owners. He had become widely known through his alleged practice of "holding up" and fining motorists by letter after a manner not unknown in New Jersey, and many complaints have been laid against him. The principal complainant in the present case is Dr. Henry H. Grace, president of the Camden Motor Club, who is acting upon the complaints of Walter T. Reed, of Atlantic City; Harry Humphreys, of Camden, N. J., and J. Winton Schwartz, of North Philadelphia. In each incident Weeks is charged with collecting fines of upwards of \$15 and costs. Reed, in response to a summons from 'Squire Weeks, showed that his automobile was not in use on the day mentioned in the complaint, as the weather was bad. This, however, did not excuse him, but only served

THOMPSON'S CAR OPERATING HIS FARM MACHINERY

of Pendleton, Ore., who a few weeks ago rigged up his Franklin touring car so as to run his barley chopper, thereby displacing no less than 14 mules. The progressive farmer since has installed a big buzz saw, a grain cutter, corn sheller and even contemplates running a threshing machine, all with the power placed at his disposal by his automobile. There is little doubt in his mind as to the economy of automobiles in farm life, for he keeps the 28 horsepower motor going every day—if not employed in driving the car to the nearby town or over his extensive ranch, then in doing the chores around the house and barn.

As will be seen in the accompanying illustrations the rear axle of the car is lifted clear off the ground, and across the end of the opposite end the wooden frame on which the axle rests is a jack shaft with three wheels, one at each end and one in the middle. Belts run from each rear wheel of the automobile to the wheels on the ends of the jack shaft, and from the wheel in the center of the shaft a long belt runs to the machinery which is to be operated. The size of the wheels effects a considerable increase in the number of revolutions of the belt wheel on the machinery, as compared with the turning of the rear wheels of the automobile.

When the car is needed for road duty, a simple throwing off of the belts is all

HOW THOMPSON EMPLOYS HIS CAR FOR SAWING WOOD

few. He just has finished the construction of a highway, 22 miles long, which leads from Biltmore House to his hunting lodge on the summit of Mt. Pisgah, North Carolina, 3,000 feet above the country house.

to have the fine reduced to \$10 and costs. After the fine was paid the matter was laid before the Camden club, which immediately took the necessary measures to stop such high-handed "justice."

995,224. Tire Alarm. Leonard Eugene Cowey, Kew Gardens, England. Filed May 15, 1908. Serial No. 433,075.

1. In an inflatable tire, the combination with the air tube, of a bell, a resilient expansible member in communication with the air tube, and an operating member for said bell which is normally secured from movement by the resilient expansible member but released thereby upon a reduction of pressure in the air tube so as to operate the bell.

995,308. Windshield. Raymond M. Watkins, Pittsburgh, Pa. Filed Feb. 26, 1910. Serial No. 546,077.

1. A windshield comprising upper and lower foldable sections, brackets secured to the upper portion of the lower section, braces pivoted to the upper section and adapted to engage the said brackets to hold

the two sections extended, and spring clips provided upon the upper section to engage the free ends of said braces and to hold the latter in folded position.

995,371. Fender. Oscar A. Ross, Chicago, Ill., assignor of one-half to C. Vallette Kasson, Chicago, Ill. Filed Dec. 23, 1908. Serial No. 468,891.

1. In a device of the kind described and in combination, a fender member and means for securing the same to a vehicle comprising a plurality of brackets carried by the vehicle, each provided with a circumferential groove therein, a coiled resilient supporting member for each of said brackets arranged thereon in said groove and means for securing said coiled members to the fender, said means comprising rail clamping members each comprising two members engaging with a tongue and groove connection at one side thereof and provided with means at substantially the opposite side for drawing and securing said parts together and with a circumferential groove for said coiled member.

995,400. Ignition Device. John F. Cavanagh, Providence, R. I., assignor of three-fourths to The Lindsley and Allen Electric

Company, Providence, R. I., a Corporation of Rhode Island. Filed Oct. 13, 1910. Serial No. 586,894.

1. In an ignition device, a coil-carrying casing having a contact carrying socket for readily receiving and completing the circuit through a spark plug, the axis of said socket being in a different plane from that of the coil casing, and a contact adapted to complete a circuit with a spark plug.

995,464. Mechanical Cranking Device for Engines. Frank Hull and George P. Hull, Constantine, Mich. Filed Sept. 20, 1910. Serial No. 582,916.

1. A cranking device including a main shaft, a friction pulley rigid on the main shaft, a second friction pulley loose upon the main shaft, operating means connected to the second pulley for rotating the same in the direction of the shaft, interlocking means disposed between said pulleys for movement in the same direction, a lever connected to the interlocking means for releasing the same, and an idler arranged between the pulleys and connected to the lever for connecting the pulleys for opposite rotation to one another upon the releasing of the interlocking mechanism.

SAURER-MACK MERGER ASSURED

Consolidation to be Styled International Motor Truck Co.—Basis of Transaction and Some Other Particulars.

Negotiations toward the consolidation of the Saurer Motor Co., of New York, and Mack Bros. Motor Co., of Allentown, Pa., which it is known have been in progress for several months, have practically reached the point of consummation.

While it is not definitely settled, it is practically certain that the merger will be styled the International Motor Truck Co., and that C. P. Coleman, president of the Saurer company, will hold the same office in the International company, and that J. M. Mack will be its vice-president.

The capitalization of the new company will be based upon the net quick assets of the merged concerns, and without reference to their present capitalization, which in the case of Saurer is \$1,600,000, and in the case of Mack \$1,000,000.

The Sphinx Motor Co., which is controlled by Saurer interests, and which has the American rights to the Reno-Bois slide valve engine, is not involved in the transaction, although it is admitted that the right to use the engine in commercial vehicles will be reserved for the new International company. So far as pleasure cars are concerned, it will remain as at present, licenses being available to all desirable car manufacturers.

It is generally considered that the merger of the Saurer and Mack interests will constitute a strong combination. The former, which only this year set up a plant in Plainfield, N. J., holds the American rights to the Saurer truck, which is of Swiss invention, and one of the best known and most reputable of carriers of the heavy type. The Mack output, on the other hand, is much more varied. It grew from the construction and operation in Brooklyn, N. Y., of a number of so-called "rub-

ber-neck wagons," but after the plant was removed to Allentown the scope was immensely broadened and the productions now include commercial vehicles of practically every type save the heaviest trucks.

When the merger becomes effective, which will be some time next month, both factories will continue to be operated and the names of both vehicles will be retained, the Saurer plant becoming the Saurer division of the International Motor Truck Co., and the Mack factory the Mack division of the same corporation.

One Firestone Quits Tires for Trucks.

Robert J. Firestone, sales manager of the Firestone Tire & Rubber Co., of Akron, Ohio, and a brother of the president of that company, has relinquished all connection with it and gone into the commercial vehicle business on his own account. He has purchased outright the United States Motor Truck Co., of Cincinnati, to which he will devote himself entirely. His brother, Harvey S. Firestone, tried to induce him to remain in the tire business, but Robert J. has become so enrapt in trucks and so bent on having a business of his own—and possibly had grown tired of being known chiefly as the brother of H. S.—that he struck out for himself; he hopes to make his truck company a real factor in the industry.

Detroit Heads Connecticut Project.

Eugene Sibley, who previously was identified with the Sibley Motor Car Co., of Detroit, and Joseph T. Curtiss, an automobile dealer in Simsbury, Conn., have formed the Sibley-Curtiss Motor Co., in the latter town, where they are preparing to manufacture cars. They have the production of three models in view at prices from \$1,250 to \$1,350.

Georgians Launch Company at Fairburn.

Robert F. Butler, W. L. Moor and J. H. Knight, who have organized the Piedmont Auto Mfg. Co., under the laws of Georgia, purpose establishing a plant at Fairburn in that state and sales offices in Atlanta. The company is capitalized at \$100,000.

STREATOR IN FINANCIAL STRAITS

Files Petition Under New Bankruptcy Provision to Relieve Its Embarrassment—Receiver Appointed and Removed.

Because about 20 per cent. of its creditors refused to accept an apparently generous proposal which had been submitted to all creditors, and because this minority threatened to take matters into their own hands, the Streator Motor Car Co., of Streator, Ill., makers of the Halladay car, on Saturday last, 23rd inst., hurriedly filed a petition in voluntary bankruptcy, which, however, does not, as usual, imply that it is desired that the company be adjudged a bankrupt.

At the same time, J. C. Barlow and Paul R. Chubbuck, president and vice-president, respectively, of the company, filed personal petitions in bankruptcy. They are its principal stockholders and had endorsed its paper to the extent of \$200,000. The petition filed in behalf of the company itself stated that it would require at least four days before an authentic statement of its liabilities and assets could be compiled and submitted.

The Streator company is capitalized at \$500,000, and is said to have assets amounting to about \$750,000. Its liabilities approximate \$300,000. Messrs. Barlow and Chubbuck have large real estate holdings in and around Streator, but they could not realize on the property in order to further assist the company, which, while doing a big business, had run short of available capital.

The Streator Metal Stamping Co., which is owned by the same interests, went into the hands of a receiver on the 8th inst., and while this foreshadowed trouble for the motor car company, it was hoped it might be averted, but the action of the minority creditors made the hope a vain one. When it was found that matters were approaching a climax President Barlow

and Vice President Chubbuck approached the larger creditors of the motor car company with a proposition to bond their real estate holdings for \$425,000 and give the bonds to the creditors of the company in payment of its debts, thus putting the company on its feet financially. About 80 per cent. of the creditors in number and amount accepted, but the minority blocked the proposed settlement. The result was the filing of the petition in bankruptcy.

It was the first case presented in this jurisdiction under the amendment of the bankruptcy act in 1910. The petitioners did not ask to be adjudged bankrupt, but simply that a meeting of their creditors be called to prove up their claims, and that at such meeting they proposed to submit to the creditors the proposition of accepting the bonds in payment of their claims against the motor company. Under the amendment referred to, a bankruptcy court in a case of this kind has the authority, where a majority of creditors in number and amount agree to accept such a proposition, to compel the minority also to accept. Such proceedings are common in England, and it was from English practice that the amendment to the American law was taken.

It is understood that a meeting of the Streater creditors will be called in about ten days.

The legal proceedings affecting the Streater Motor Car Co. were somewhat complicated by the action of one of the creditors, who, about two hours after the voluntary petition had been filed, presented a petition for the appointment of a receiver, at which time the Central Trust Co., of Chicago, was appointed by Judge Landis. On Tuesday, however, in a petition in which it was joined by its principal creditors, the Streater company asked that the order for the appointment of the receiver be vacated. After considering the matter over night, Judge Landis granted the petition and ordered the receiver removed, at the same time scolding the attorney who presented the petition for the receiver for not originally giving him all the facts in the case.

Gigantic Parts Plant for Toledo.

A. C. Berry, who was said to represent Pittsburg capitalists—who, however, are believed to be very much nearer New York—is credited with having purchased, last week, a plot of 27 acres in Toledo, O., on which, he let it become known, there will be erected a huge automobile parts factory—how huge is suggested by the fact that he is negotiating for 90 additional acres. The plot, already secured, is located on Manhattan boulevard and Stickney avenue. A \$500,000 company will be formed to operate the plant, which will be erected, and for which plans for three concrete buildings are said to be already in existence; one of them will be four stories, 220x600 feet, another of two stories, 185x600. The

identity of the real purchasers is shrouded in mystery, even in Toledo. The fact that the United States Motor Co. is preparing to build an exclusively spare parts factory at some "central point"—as was exclusively stated in the Motor World two weeks since—has led to the assumption that the Toledo purchase was made in its interest, but Alfred Reeves, of that big company, who is in a position to know, unqualifiedly denies the report. The United States Motor's parts project has not, he says, advanced that far.

"Family Troubles" Jar Findlay Company.

When early last summer it was given out that the Findlay Motor Co., of Findlay, Ohio, of which L. E. Ewing was president, had been reorganized under the style the Ewing-American Motor Co., with Ewing as president, apparently not all the facts in the case were made known. At any rate the merger or reorganization was not of such a character as to prevent the Ewing-American Motor Co., of New York, from throwing the Findlay Motor Co., of Findlay, into the hands of a receiver. This was done on the 19th inst., when, following the action of the Ewing-American company, John M. Barr was appointed receiver of the Findlay concern.

The petition to the court recites that the latter had debts of \$50,000 and lacked sufficient working capital to continue operations. Other sources allege, however, that lack of working capital has not been the only cause of unhappiness, some of which, and also the basis of the merger and the disposition of the stock, may be disclosed by the legal proceedings. The Findlay Motor Co. had not cut a very wide swath in the industry, but when early this year it absorbed the American Motor Truck Co., of Lockport, N. Y., of which L. E. Ewing at once became president, and whose plant was removed to Findlay, greater things were promised. The organization of the hyphenated Ewing-American company, with \$1,500,000 capital stock, followed several weeks later, but the heavier production of trucks, taxicabs, etc., has not conspicuously materialized.

Walker Brothers Become Pope Directors.

Charles E. Walker, vice-president of the Pope Manufacturing Co., Wilbur C. Walker, secretary of the company, and Frank A. Drury, president of the Merchants National Bank of Worcester, Mass., have been elected directors of the Pope Manufacturing Co., of Hartford, Conn., to succeed Harry Bronner, August Heckscher and H. L. Freedman, who have resigned from the board. The retiring directors are representatives of the New York bankers who were concerned in the reorganization of the company several years ago; their resignations are due to the fact that conditions no longer require their services.

The annual report of the company will be issued in a few days and will show earn-

ings somewhat smaller than last year, when 13 per cent. was earned for the common stock. The showing is said to be satisfactory in view of existing conditions.

Moreland to Make Trucks in Los Angeles.

Watt Moreland, who designed the Tourist car, which was manufactured in Los Angeles for several years, has transferred his attention to commercial vehicles, and has so greatly interested a number of residents of that city in a truck of his creation, that a company is being organized to build it, a site for a factory, 250 x 300 feet, at Willard and North Main streets, already having been secured. E. M. Champion and Sheldon Morris are among the men interested in the project. The Moreland truck, as it will be called, will be built in two, three and one-half and five ton sizes, the latter of which will employ double chain drive and will be distinguished by an electrical device to prevent undue speed.

Court Orders Sale of Norwalk Plant.

The property of the Norwalk Motor Car Co., of Norwalk, Ohio, which on the eve of its purchase by several West Virginia investors was thrown into bankruptcy, largely because of dissensions among the stockholders, has been ordered sold by the Federal receiver. The creditors are not likely to extract much satisfaction from the sale, as the property is appraised for only \$9,063, while the company's debts exceed \$27,000.

Rubber Goods Increases Dividend.

A quarterly dividend of 2 per cent. has been declared on the stock of the Rubber Goods Manufacturing Co., which controls the four United States Tire Co.'s factories. This is double the dividend declared three months ago, when the rate was reduced from 2 per cent., paid in the first quarter of the year, to 1 per cent. The regular dividend of 1¼ per cent. was declared on the preferred stock.

Cole Officials Off on Long Journey.

L. Carter, president of the Henderson Motor Sales Co., of Indianapolis, and Charles P. Henderson, vice-president and general manager, have departed for a two months' journey that will permit them to visit all of the principal Cole agencies in the western half of the United States. They will go as far north as Portland, Ore., and as far south as New Orleans, La.

Sheldon Axle Office in Detroit.

The Sheldon Axle Co., of Wilkes-Barre, Pa., has established a branch office at 1215 Woodward avenue, Detroit, where a line of its axles, jackshafts and springs will be displayed and where an engineer and draftsman will be stationed. David Landau, the company's consulting spring engineer, also will visit the Detroit office at least every third week.

DR. TESLA TALKS OF GAS TURBINES

So Confident, He Offers to Build Them for Motor Cars—Considers New Power His Greatest Invention.

Gas turbines of practical and efficient construction, light, flexible and in every way suitable for automobile propulsion, are not a dream of the future only but a probability of only a very few years hence. At least such is the conviction of Dr. Nikola Tesla, whose newly developed method of fluid propulsion, as he calls it, and which was illustrated and described in last week's *Motor World*, is attracting so much attention in scientific circles. Dr. Tesla himself considers it the greatest of all his inventions. By his own statement the scientist already has built, run and carefully tested internal combustion engines operating on the new turbine principle and so confident is he of the thorough practicality of the idea that on Friday of last week he informed a *Motor World* man that he would even be willing today to sign a contract to build and instal turbines for automobiles. He readily admits, however, that he would like to have more time, considerable more time probably, in which to develop a method of combustion entirely suited to the turbine.

Automobile motors, as a matter of fact, play a distinct part in the inventor's plans for the future. So do airship motors, pumps of various sorts, steam engines in every conceivable size, shape and capacity, and apparatus of other and varied uses. If in steam engines and pumps wonderful results already have been obtained, it is his expectation later to accomplish equally wonderful results with internal combustion engines.

Bearing in mind that a 110 horsepower steam engine already has been built so diminutive that its rotor or active part would drop into an ordinary water bucket, it would seem that the part of the program which might be supposed to concern the automobile industry would be well worth investigating. It was the tempting prospect of a pocket-size motor, therefore, which led a representative of the *Motor World* to seek the famous scientist in his offices high up in the Metropolitan tower in New York.

Contrary to popular impression, not all great and famous men are inaccessible, and Tesla proved not only thoroughly approachable but extremely ready to discuss the new turbine principle in many of its bearings. His easy predictions of the future developments of the system and his confident bearing when he declared it to be the greatest of his accomplishments, might have been merely the vaporings of an over-enthusiastic inventor; but the broad bear-

ing of the man, his record and the depth of perception revealed in some of his conclusions would have laid at rest such doubts. The new principle unquestionably is a great contribution to science and engineering, great in its simplicity and breadth of application. Just when its fullest realization will be given to the markets of the world is another question; one

(Continued on page 37)

Who's Making Ready to Leave Detroit?

If reports circulating in Gary, Ind., are correct, "one of the largest automobile manufacturing establishments in Detroit" is preparing to leave Detroit and may locate in Gary if it can acquire a site there upon which to erect a plant "costing \$2,000,000 and employing 2,000 men." Two other cities are said to be bidding for the enterprise, but Gary has high hopes, its local chamber of commerce having the matter in hand. The name of the Detroit company will not be made public unless the negotiations are consummated. Gary also has heard that an Anderson (Ind.) automobile company is anxious to locate "in its midst."

New York Supply Co. in Bankruptcy.

The New York Auto Supply Co., 219 W. Forty-sixth street, New York, on Tuesday last, 26th inst., filed a petition in bankruptcy with liabilities of \$12,356 and assets of \$7,314, consisting of stock, \$2,500, fixtures, \$469; accounts, \$4,259; personal property, \$75, and cash in bank, \$11. The company was incorporated in July, 1908, with capital stock of \$12,000. Benjamin D. Underhill is president and George H. Sprague treasurer. There are 135 creditors.

California Company Buys Oakland Plant.

The California Motor Car Co., of which Walter C. Sachs is president, and which recently commenced operations in a small way in a disused cotton mill in Oakland, has purchased the property and the adjoining land and now will enter the trade in real earnest; it expects to employ between 75 and 100 men, under the superintendence of A. J. Schram, and to turn out its first car by December 1.

Corbitt Separates Its Productions.

The Corbitt Buggy Co., of Henderson, N. C., which has been manufacturing both horse-drawn and motor-driven buggies, has separated those interests and formed the Corbitt Automobile Co. to handle and enlarge the motor buggy end of the business. The company has been incorporated under the laws of North Carolina, with \$250,000 capital.

Republic Begins Enlargement of Plant.

The Republic Motor Car Co. has commenced work on an addition to its plant at Hamilton, Ohio. The new building will be a brick structure, 60 x 350 feet.

PURCHASING AGENCY FOR TAXICABS

James Launches Supply-Buying Project of World-Wide Scope—Enormous Possibilities Are Outlined.

Having compiled statistics showing that the various taxicab, trucking and other public service companies operating motor vehicles in this country, annually purchase supplies to the value of at least \$12,000,000, Charles C. James, formerly of St. Louis and more recently of New York, has grasped the opportunity which the situation presents and means to make the most of it. He has organized the International Motor Service Association, which it is proposed to make the medium for the purchase and re-sale or distribution of not only such supplies, but cabs, trucks and other vehicles, at prices commensurate with the volume and which will effect a considerable saving for all of the service companies linked with the organization.

The association has applied for a New York charter, and until it is issued, James will not make public the names of any of the men associated with him in the enterprise. He admits that he is likely to become its president at the election of officers which will occur on October 10th, but will say nothing concerning the identity of the other probable officials. He did indicate, however, that the organization will lose no time in getting down to actual business. It has established headquarters in the Thoroughfare building in New York, and James stated that already it had perfected arrangements with the United States Tire Co. which will permit of the publication of its first tire catalog on October 10th.

Ten New York taxicab and rental companies form the nucleus of the International Motor Service Association, but the applications of others are in hand and as its title indicates it purposes being not merely national but of world-wide scope; the development of its European branch, however, is not a matter of the immediate future. The ten New York concerns referred to are the Packard Renting Co., Peerless Rental Service, Renault Taxicab Co., Thomas Flyer Renting Co., Universal Taximeter Cab Co., Interborough Taxi-Cab Co., Imperial Taximeter Co., Crawford Taxicab Co., Broadway Taxi Operating Co., and Natilus Taxicab Co.

The operating plan provides for the purchase of supplies by association members from local houses with which arrangements have been effected, the members obtaining a memorandum of each purchase, which they, in turn, forward to the association's headquarters, receiving by return mail checks from the association for the difference between what the members paid for their purchases and the association's spe-

cial price, which, naturally, is less than the price quoted to individual members.

James, the promoter of this huge project, has been identified with the taxicab movement from its infancy. He organized cab companies in St. Louis and several other Southern cities, and about two years ago came to New York, where he outlined plans that would permit of the formation of taxicab and parcel delivery companies in almost every town worthy of the term; the plans commanded the attention of the United States Motor Co., which has worked with James to the extent of developing low priced cabs and deliveries to meet the occasion. The big company is, however, in no way identified with James's international co-operating purchasing association, the scope for which is indicated by James's statistics, which show that the supplies purchased by the motor service companies include 18,000,000 gallons of gasoline, 200,000 gallons of lubricating oil, 250,000 tires, 500,000 inner tubes, 25,000 Weed tire chains, 1,000 motor cars, taxicabs, etc., and insurance premiums to the amount of \$1,000,000.

Site Purchased for Herreshoff Factory.

James Hamilton, of Pontiac, Mich., president of the Herreshoff Motor Co., of Detroit, has purchased a site on Woodward avenue, between Belmont and Trowbridge avenues, in that city, on which, it is stated, a new Herreshoff factory will be erected. The site comprises a ground area of 47,600 square feet. As the new site is in the midst of the residential section, a strong opposition has made itself manifest, and legal obstacles probably will be placed in the company's way.

Truck Company Seeks California Site.

The S. & D. Motor Vehicle Co., which has been incorporated with \$500,000 capital stock, is prospecting for a factory site in Oakland, Cal. It owns the patent on a four wheel drive truck invented by one Carlos Schmidt and is threatening to build "a large factory which will employ several hundred men." Schmidt, B. E. Duckworth and A. A. Montague, all of Oakland, are the incorporators of the company.

Luck May Locate Plant in Texas.

According to Texas prints, H. E. Luck, of Cleburne, contemplates the establishment of an automobile plant in that Texas city. Luck recently visited the factories in Michigan and elsewhere and is said to have become so filled with enthusing facts and figures as to believe that a factory in the Lone Star State will earn good profits.

Connecticut Opens Branch in Boston.

The Connecticut Telephone & Electric Co. and the Connecticut Shock Absorber Co., of Meriden, Conn., jointly have opened a branch at 819A Boylston street, Boston, Mass. It is in charge of Wm. A. Ellis, who formerly was sales manager for the Bi-Motor Equipment Co., of Boston.

Detroit, Mich.—Krit Motor Sales Co., under Michigan laws, with \$15,000 capital.

Adrian, Mich.—Union Garage Co., under Michigan laws, with \$20,000 capital; to operate a garage and storage warehouse for automobiles.

Grand Rapids, Mich.—National Motor Starter Co., under Michigan laws, with \$10,000 capital; to manufacture an automobile starting device.

Charleston, S. C.—King Automobile and Repair Co., under South Carolina laws, with \$5,000 capital; to deal in automobiles. Corporators—B. S. King, Jr., W. A. King.

Portland, Ore.—Ewbank Power Transmission Co., under Oregon laws, with \$250,000 capital; to manufacture and deal in motor vehicles. Corporators—Herbert B. Ewbank, Jr., Herbert Ewbank, Sr., G. W. Stapleton.

Anderson, Ind.—J. H. Cloud Top Co., under Indiana laws, with \$10,000 capital; to manufacture automobile parts and accessories. Corporators—J. H. Cloud, W. A. Hester, P. B. O'Neill.

Hartford, Conn.—City Auto Repair Co., under Connecticut laws, with \$1,000 capital; to deal in automobiles. Corporators—Charles V. Kierstead, Grant U. Kierstead, Florence C. Kierstead.

Chicago, Ill.—Sheridan Park Garage Co., under Illinois laws, with \$5000 capital; to deal in motor vehicles and maintain a garage. Corporators—Harold H. Hart, James P. Doane, Marie Phillips.

Camden, N. J.—Stone Harbor Garage and Marine Railways Co., under New Jersey laws, with \$75,000 capital. To operate garages and marine railways. Corporators—Charles H. Large, Louis H. Mathez, John D. Yarrow.

Grand Rapids, Mich.—Creston Auto Co., under Michigan laws, with \$4,000 capital; to deal in automobiles and motor vehicles. Corporators—James Vander Waals, Charles M. Smith, Claude McAuley.

Indianapolis, Ind.—Automobile and Supply Co., under Indiana laws, with \$5,000 capital; to deal in automobiles and motor accessories. Corporators—E. E. Helm, J. F. Ireland, Lavina Ireland.

Green Bay, Wis.—Green Bay Motor Car Co., under Wisconsin laws, with \$25,000 capital; to operate and deal in motor vehicles. Corporators—John Brogan, W. H. St. John, Augusta St. John.

Montpelier, Ind.—Automobile and Supply Co., under Indiana laws, with \$5,000 capital; to deal in automobiles and accessories. Corporators—Evert E. Helm, John F. Ireland, Lavina Ireland.

Camden, N. J.—Detroit Electric Car Co. of Philadelphia, under New Jersey laws, with \$25,000 capital; to manufacture elec-

—SIMMS MAGNETO CO.'S RECENTLY COMPLETED PLANT IN BLOOMFIELD, N. J.
The Main Building, of Concrete Construction, Covers 4½ Acres

tric vehicles. Corporators—A. M. Garrison, J. M. Russell, A. S. Flowers.

Atlanta, Ga.—Piedmont Auto Manufacturing Co., under Georgia laws, with \$100,000 capital; to manufacture automobiles and motor vehicles. Corporators—Robert F. Butler, W. L. Moor, J. H. Knight.

New York City, N. Y.—Smith Gasolene Meter Co., under New York laws, with \$350,000 capital; to manufacture and deal in automobile parts, etc. Corporators—W. H. White, Jr., D. M. Baldwin, W. H. Brady, all of New York City.

Dayton, Ohio.—Heathman-Solliday Motor Co., under Ohio laws, with \$20,000 capital; to deal in motor vehicles. Corporators—Charles H. Solliday, Grace B. Heathman, Frank B. Heathman, Zora Y. Solliday, Joseph J. Chamberlain.

Rochester, N. Y.—Overland Rochester Co., under New York laws, with \$30,000 capital; to deal in automobiles and machinery. Corporators—Edward D. Creed, Clifford F. Cribb, both of Rochester; Royal R. Scott, of Canandaigua, N. Y.

W. P. Herman is building a garage in Mena, Ark. He will handle Buick cars.

Miller's Garage, on New York avenue, Deland, Fla., has been sold to Yeargin Bros.

The Universal Truck Co. has opened a New York salesroom at 1777 Broadway. Howard W. Walton is in charge.

F. H. Trout, who conducted a garage at Tremont, Ill., has sold his business to D. A. Stormer and Albert Wilson.

The Lincoln Auto Co., of the Nebraska city of that name, has added commercial cars to its lines of pleasure vehicles. It will sell Grabowsky trucks.

The Borland-Grannis Co., which manufactures the Borland electric car, will open a salesroom in Chicago on October 1. It will be located at 2636 Michigan avenue.

J. W. Atherton has purchased an interest in the A. H. Vale Garage, at Albany, Wis. The name of the company has been changed to Green County Automobile Co.

Major W. Hess has purchased the garage business of Benjamin F. Campbell on Woodlawn avenue, Chicago, Ill. Hess will continue the business under his own name.

J. S. Quiggle, owner of a garage at Iowa Falls, Ia., has disposed of his interests to J. F. Crisp, of Waterloo, who will continue the business under his own name.

At a cost of \$9,000 William Reidt is building a garage in North Albina, Ore. It will be of brick and will occupy the corner of Albina avenue and Willamette boulevard.

G. Frank Davenport and Robert B. Parker have formed the Boston Motor Wagon Co., with headquarters in the Motor Mart. They will handle the Detroit Motor Wagon.

August Leberman has opened a garage and salesroom at 113 Ripley street, Davenport, Ia., under the style the Star Auto Garage. He will handle McIntyre cars exclusively.

The Geyer Sales Co., Dayton, Ohio, has been declared bankrupt and a receiver has been appointed for it. The company admitted its insolvency and consented to the receivership.

The Spokane Everitt Motor Co. has been organized in the Washington city of that name to handle Everitt cars. Vance Wolverton and C. E. Lane are the men behind the enterprise.

C. M. Wyckoff and L. P. Wyckoff have purchased the half interest held by George Cord in the Wyckoff-Cord Auto Co., Sioux City, Iowa. They will continue the business under the same style.

Grayson H. Staley, Samuel G. Duval, Elias B. Ramsburg and several other citizens of Frederick, Md., have formed a partnership and purchased the garage of Ira Fahrney, of the same town.

The L. D. McCarthy Auto Co., which handles Rambler cars in Spokane, Wash., has added commercial cars to its offerings. It will distribute Kelley trucks in Washington, Northern Idaho and Oregon.

Dr. Horton, a veterinarian, of Atchison, Kan., has found the doctoring of horses in this age of motor cars too unremunerative business and has opened a salesroom and garage for horseless cars in DeKalb, Kan.

The Traynor Auto Co., of Omaha, Neb., has relinquished its agency for Paige-Detroit cars to E. B. Heath. Under the style Heath Brothers the latter has opened an up-to-date garage and salesroom at Uehling, Neb.

Anthony Schrupp and W. J. Schuh have opened a garage on Iowa street, Dubuque, Iowa, in the former headquarters of the Brandt & Sheldon Auto & Garage Co. They have the agency for E-M-F and Flanders cars.

J. P. Mullen has been elected president of the Western Reserve Motor Car Co., Garford distributors in Cleveland, Ohio. He formerly was assistant manager of the Studebaker branch on East 19th street, in the same city.

H. P. Teichner, for 19 years a salesman for the White Co., has gone into business on his own account and opened salesrooms at 192 Twelfth street, Oakland, Cal. As might be expected, he will handle White cars exclusively.

Under the style the Marion Motor Sales Co., a new company has been formed at Cleveland, Ohio, with J. H. Poppenhagen as president. The company has opened salesrooms at 1851 East 65th street, where it will sell Marion cars.

The Vestal Motor Car Co., Pittsburg distributor of Universal motor trucks, has purchased a large plot of ground at the corner of Grand boulevard and Craig street, on which it will erect a service building at a cost of \$25,000.

Charles E. Miller, the New York supply man, has opened his 14th retail branch. It is in New York, making his second branch in the Metropolis in addition to his main headquarters at 97 Reade street. It is located far uptown—at 2782 Broadway, between 107th and 108th streets.

E. Byars, of Amarillo, Tex., and A. T. Ratliff, of Fort Wayne, Ind., have formed the Byars-Ratliff Auto & Sales Co., with headquarters at 307 Polk street, Amarillo,

Texas. Byars has the Maxwell agency for the Panhandle territory.

The Pope-Hartford Auto Co., of New York City, has taken over the business of the Pope Motor Co. of Jersey City, at Hudson boulevard and Communipaw avenue, and will continue it as a branch. B. F. Ellsworth is in charge of it.

Under the style the Galvez Garage a huge building is to be opened in the near future in Galveston, Texas. It will be occupied by the Inter-State Automobile Co., of which Moritz O. Kopperl is president and Harry Endicott manager.

R. A. Miller, of Denver, Colo., has purchased the garage and repair shop formerly conducted by C. C. Funnell & Co., at the Park Garage, San Diego, Cal. Funnell & Co., however, retain their salesrooms and the agency for White cars.

Incorporated under the laws of Ohio, the A. R. Davis Motor Co. has "opened up" in Cleveland, at 2034-36 Euclid avenue; A. R. Davis is president, and J. H. Kirkpatrick the secretary. The company has taken over the business of the Studebaker branch in East 19th street, which will be discontinued. A. L. Englander has been appointed sales manager.

The Standard Motor Car Co., of Spokane, Wash., has closed its doors and the Consolidated Motor Car Co., of the same city, has taken possession of the vacated quarters at 814 Second avenue, and will display there is White cars. The Standard Company formerly handled American, Stoddard-Dayton, Mitchell and Reo cars, but one by one these agencies were released until only Stoddard-Dayton cars remained. The Stoddard-Dayton agency now has been taken over by the C. H. Hornburg Co., which handles the other United Motors products. Frank W. Schultz, sole owner of the Standard company, has retired from business.

Recent Losses by Fire.

Secane, Pa.—Byard Street's garage completely gutted. Loss, \$4,500.

Whitehouse, N. J.—James N. Pidcock's garage and two cars burned.

Hillsboro, Texas—W. J. Russell's garage and contents destroyed. Loss, \$4,000.

Exeter, N. H.—B. A. Hawkins's garage and two automobiles destroyed; total loss.

Chippewa Falls, Wis.—Northwestern Wisconsin Auto Co.'s garage burned. Loss, \$2,000.

Los Angeles, Cal.—American Ever-Ready Co.'s storerooms, 1044 Main street, gutted, one automobile and large stock of supplies burned. Loss, \$13,000.

THE MARMON

"The Easiest Riding Car In The World"

3700 Miles of Proof

That's the distance covered by the Marmon at an average speed over 66 miles per hour, in winning the world's greatest list of victories.

This unequaled demonstration has proved beyond a doubt, the staunch reliability of Marmon construction combined with the perfect balance that insures luxurious comfort as well as economy of tires, fuel, oil and upkeep.

Can you ask for greater proof of value than the fact that this demonstration is by comparison with the best and highest priced cars of Europe and America?

If you desire any further proof—go to the Marmon owner and learn of the value of his car in daily service.

Five body styles—one chassis. Five Passenger Touring Car—Four Passenger Suburban—Two or Three Passenger Roadster—\$2,750. Also Landulet and Limousine Models.

Non-Skids and Nature's First Law.

To recall that only two or three years ago the solons who make our laws were legislating against the use of chains and other non-skid devices is only less remarkable than that today there should remain a very considerable number of motorists who, if they do not disclaim to employ such life-saving devices, are uncommonly careless in not employing them when conditions warrant.

Observation in city or country during a wet day or when streets are greasy or roads are deep in surface mud, or sub-surface mud, will disclose an astonishing number of such persons. The wonder is that more of them do not meet the fate which they court, and doubtless if the facts were available, it would be found that many accidents, if they were not caused by the absence of non-skid devices, at least could have been prevented by their use. There is knowledge of at least one fatality which

is in this category and which was attributed to a wholly different cause.

Many motorists are unduly given to taking what are termed "long chances" and few chances that they take are "longer" than those of negotiating slippery surfaces with tires devoid of non-skid devices; on such surfaces even the skill avails little, certainly not enough to justify the peril involved, which is peril alike to driver and passer-by. It is a fine thing to be so unconscious of danger as to defy the first law of nature, but a "skidding" car is no common danger, and it is too easily overcome to be countenanced. The lengths to which such "unconsciousness" may be carried recently was witnessed in the case of a gentlewoman who, on a slippery, muddy road, was driving a car devoid of non-skids, overful of women and children, one of the latter actually being held in her own lap.

It may be impossible to save such persons from their own folly, but perhaps it is not such a far cry to the day when the same legislators who sought to make the use of non-skids illegal will be enacting laws requiring their use when weather or roads necessitate their use and fixing a penalty for their non-employment.

Visiting Engineers and Factory "Secrets."

As against the days when automobile factories guarded their methods and "secrets" as a bank guards its gold, the doors of foreign automobile factories are to be thrown open to the members of the Society of Automobile Engineers who sail from New York next November to visit the Olympia show. Not alone English factories, but some French factories are to welcome the American visitors, showing what a difference in attitude a few years can make, and raising the question as to how far automobile factory secrecy on the one hand and openness on the other are justified.

At the time when the French especially were doing important pioneer work in motor car manufacturing and designing, they had adequate reason to conceal their factory operations and methods as much as possible. The whole industry was so new that individual success depended largely on secrets and on discoveries in relation to automobile building. The French makers kept their secrets pretty well, except as the latter were disclosed by the cars themselves. But even when imitators saw what had been done, they were often in doubt as

to how and by what means the result had been accomplished.

As the basic data for automobile engineering have accumulated, however, and have become common property, the further "discoveries" of principles and processes are becoming correspondingly rarer, and the engineers, as well as the companies in whose interests their efforts are expended, find that a partial pooling of interests so far as relates to the general problems of automobile building, is individually profitable. The automobile engineer is now less a discoverer of basic automobile principles and inventor of, heretofore unknown mechanisms or methods than he is an adapter of recognized elements and constructions in forms suited to the peculiar needs of his company's demands on him.

It is not too much to say that the foreign engineers now have quite as much to learn and would profit quite as much by visiting American automobile factories as the American visitors will profit in going through the English and French factories. It is quite certain that if any of the makers across the water have anything that is really revolutionary in character on the draughting boards, it will not be included in what the visitors will see, nor is any premature disclosure of such a nature to be asked for. Nevertheless, the value of the opportunity that will be given the Americans is very real, even if it only results in self-satisfied comparison with their own factories at home. The larger significance is in the fact that foreign as well as American engineers are recognizing the general benefit that results when the experience and specialized knowledge of all the engineers concerned in motor vehicle construction can be made available in some degree to each of them in attacking his individual problems.

Suggestions of the "American Invasion."

Nationally the world is divided into groups of citizens who share in common the feelings of the gentle Quakeress. "All the world's crazy save thee and me, John, and sometimes I think thee's a little queer." That is why the German's pipe, the Frenchman's tall hat, the Briton's checkered waistcoat, and Uncle Sam's chin whiskers always are intensely funny. Industrial developments in particular, as first viewed from distant lands, invariably seem more or less to savor of the madhouse. This attitude prevails up to the point where an inter-

change of products forces recognition of mutual sanity.

The attitude of the English trade toward the American branch of the automobile industry claims particular attention just now because of certain utterances of the press regarding the Yankee product. Periodically English dealers experience an attack of the shivers over what they term an American invasion which seems to them to be impending. Always at such times they recall certain unpleasant experiences with cheaply constructed American wares and always they reason from the particular to the general in order to conclude that their several family roasts are endangered.

Max Pemberton, the author, who lately has been devoting much time to automobile subjects, has taken recent occasion to comment on the outcome of the latest of the "invasion" scares. The scare has passed, he thinks, but he concludes that a real and very present menace to British industry exists; American cars of a certain class are rapidly gaining a foothold in a section of the field which he more than intimates the British builder has been too slow to cultivate. It is his idea that his countrymen are making the great mistake of preserving an attitude of indifference when they should be actively engaged in meeting a fast-growing competition.

Simultaneously, Arthur Ludlow Clayden, engineer-editor, announces his views of the American industry as he himself has seen it, and plainly states that in certain respects, at least, the British manufacturer might "go to school" in the United States. His criticism of American practice may not be without bias, but certainly it contains the elements of wholesome advice. His ideas as to the shortcomings of the American engine are no less frank and genuine than his approval of certain other, albeit minor, features, and they are equally to be assimilated with mature and careful consideration.

With the arousal of the British trade to a recognition of the wisdom of American aims and accomplishments should come an equally effectual awakening on this side of the water to the needs of British and other foreign markets and business methods. The supposed "queerness" of foreign things arises mainly from unfamiliarity with them and with the conditions that have brought them forth. In the past American automobile builders have copied many things blindly from overseas prac-

October 13-14, Atlanta, Ga.—Race-meet under management H. C. George.

October 14, Santa Monica, Cal.—Motor Car Dealers' Association's annual road races.

October 14, Santa Monica, Cal.—Santa Monica road races under auspices of Santa Monica Motor Car Dealers' Association.

October 14-25, New York City to Jacksonville, Fla.—American Automobile Association's eighth annual national reliability tour for the Glidden trophy.

October 16-18, Harrisburg, Pa.—Reliability contest under auspices Motor Club of Harrisburg.

October 27-November 3, Chicago, Ill.—1,000 mile reliability contest under auspices Chicago Motor Club.

November 1, Waco, Texas—Race-meet under auspices Waco Automobile Club.

November 2-4, Philadelphia, Pa.—Reliability contest under auspices Quaker City Motor Club.

Nov. 3-11, London, England—Society of Motor Manufacturers' and Traders' annual show in Olympia Hall.

November 4-6, Los Angeles, Cal.—The Phoenix road races under auspices Maricopa Automobile Club.

November 9, Phoenix, Ariz.—Track races under auspices Maricopa Automobile Club.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

November 29, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

November 30, Los Angeles, Cal.—Race-meet at Los Angeles Motordrome.

December 25-26, Los Angeles, Cal.—Race-meet at Los Angeles Motordrome.

January 6-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden.

tice, and not always with good success. However slow the Briton may be to grasp another's idea, his grasp is firm once attained, and his application intelligent, generally speaking. Automobile practice in different countries fast is being unified by the exchange of manufactures and theories, and it is plain to see that the growing strength of the industry of these United States can be maintained only by building better and better cars, not simply by building all cars of a single mark alike to standards of indistinguishable accuracy.

If non-contestants are desirable adjuncts to reliability tours, endurance runs and similar road contests, they should be non-contestants in fact as well as in name. Which is to say, they should not be timed, scored or subjected to technical examinations nor permitted to figure in any table of scores which may be evolved or issued.

It so often happens that scores of non-contestants are better than those of the real contenders that the glory of the latter is dimmed and credit given where properly none is due. The unfairness of procedure that renders possible such a state of affairs is so manifest that it would appear that either the A. A. A. or the M. C. A., or both in conjunction, should lose no time in correcting it.

When contracts are executed between promoters or managers and racing men binding the party of the second part to lose races, not to win them, no self-respecting sport-governing organization can shut its eyes to even the alleged existence of such a document, nor close its nostrils to the odor that emanates from it. Such contracts constitute what in the vernacular is known as "the limit"—the extreme limit—in sport.

DEPALMA ENTERTAINS THE QUAKERS

**Bags Four Firsts at Philadelphia Meet—
Tower Takes Two—Referee Rules Out
Car With Doubtful Tire.**

Although Ralph De Palma is credited with winning four out of the nine races at the Point Breeze track meeting on the 23rd inst., he really was more than four-ninths of the show. It was the first meet promoted by the Automobile Trades Association of Philadelphia, Pa., and without De Palma's presence it would have been much less notable.

In addition to bagging four firsts, the New Yorker established a new track record for a mile of 57.70 seconds, which is 1.10 seconds less than the old figures. In the 10 mile race for big cars—600 inches displacement and under—Irving Bergdoll,

was 10 seconds ahead of his nearest opponent, and without leaving the track, Tower came

W. D. Morton, Kline, was second, and Mortimer Roberts, Abbott-Detroit, third.

The match between De Palma and Louis Disbrow, Opel, which had been announced as a feature, was abandoned. Disbrow was at the track but his machine was not. Referee Pardington announced that the Opel had met with an accident and was not in condition to compete.

In the ten mile race for cars under \$2,000 only one of the entries, J. R. Raimey, Cino, appeared, and Willie Haupt, Buick, was permitted to start to make it a contest. It proved a runaway for Raimey, who also won the 25 mile Class E, 161-300 inches, event. Raimey secured the lead during the first mile and stayed there. George Parger, Ohio, and Earl Seachrist, Kline, trailed him in that order.

There was a good crowd in attendance, and not even knowledge of the dreadful tragedy at Syracuse the week previous served to keep the spectators from lining the rails.

The summary:

One mile time trials—Won by Ralph De

PART OF THE LARGE CROWD THAT LOOKED ON

Palma. There had been three entries, but taking a leaf from the book of sad experience as written at Syracuse, Referee Pardington ruled out Joseph Napoli because of the doubtful condition of the right rear tire of the Knox car, which he thought endangered the machine. In the first mile De Palma secured a lead of about 50 yards, which he never relinquished. The 25 miles and the four miles free-for-all also were easy picking for him. In the five miles handicap, De Palma, however, could not overcome the 55 seconds allowed George Parger, Ohio, and the 1 minute and 10 seconds given Willie Haupt, Buick, and he finished third; Parger and Haupt being first and second, respectively.

There were honors for others, however, Jack Tower, at the wheel of an E-M-F, twice showing the way to the small cars. In the five miles for cars under \$1,000 he simply ran away from H. B. Baker, Metz, and Peary, Hupmobile, finishing two sec-

onds ahead of his nearest opponent, and without leaving the track, Tower came

DE PALMA (SIMPLEX) ROMPING HOME IN THE 25 MILES

TOWERS (E-M-F) LEADING ROBERTS (ABBOTT) IN LIGHT CAR RACE

Palma, Simplex, time, 57.70 seconds; second, J. R. Raimey, Cino, time, 1:03.76; third, Irving Bergdoll, Benz, time, 1:04.70.

Five miles, cars under \$1,000—Won by Jack Tower, E-M-F; second, H. B. Baker, Metz; third, Peary, Hupmobile. Time, 6:30.36.

Five miles, cars under \$1,500—Won by Jack Tower, E-M-F; second, W. D. Morton, Kline; third, Mortimer Roberts, Abbott-Detroit. Time, 5:58.93.

Ten miles, cars under \$2,000—Won by J. R. Raimey, Cino; second, Willie Haupt, Buick. Time, 11:35.05.

Ten miles, non-stock, 451-600 inches displacement—Won by Ralph De Palma, Simplex; second, Irving Bergdoll, Benz. Time, 10:42.07.

Twenty-five miles, class E, 161-300 inches displacement—Won by J. R. Raimey, Cino; second, George Parker, Ohio; third, Earl Seachrist, Kline. Time, 28:25.18.

Twenty-five miles, class C, 301-600 inches displacement—Won by Ralph De Palma, Simplex; second, W. D. Morton, Kline; third, Willie Haupt, Buick. Time, 27:22.55.

Five miles, free-for-all—Won by Ralph De Palma, Simplex; second, Irving Bergdoll, Benz; third, J. R. Raimey, Cino. Time, 5:24.18.

Ten miles, free-for-all handicap—Won by George Parger, Ohio (55 sec.); second, Willie Haupt, Buick (1 min. 10 sec.); third, Ralph De Palma, Simplex (scratch). Time, 11:07.77.

Reliability Proves Sociability Run.

Though the run of the Merchants' Protective Association of Burlington, Vt., was scheduled as a Grade 4 reliability contest, when it took place on the 19th, 21st and 23rd inst., it was more in the nature of a sociability tour. The run occupied three days, with a day intervening, starting and finishing at Burlington. Alburgh was the turning point on the 19th inst.; Barre, by way of Montpelier, on the 21st inst., and Rutland on the 23rd inst. With the exception of tire troubles, no mishap occurred. The owners and automobiles participating were: W. B. Johnson (Velie), Dr. W. G. E. Flanders (Flanders), Charles L. Woodbury (Premier), George D. Jarvis (Haynes), Mrs. R. W. Parish (Ford), George D. Sherwin (E. M. F.), H. C. Humphrey (Cadillac), Max L. Powell (Atlas), Burlington Machine & Repair Co. (Stanley), E. A. Brodie (Hupmobile), F. B. Gillett (Stanley), John B. Moquin (Buick), H. S. Morgan (Hudson), Miss Lulu R. Jarvis (Ford), B. L. Kent (E. M. F.), M. J. Daly (Everitt), John Reynolds (Everitt), J. B. Henderson (Regal), Van Ness Garage Co. (Reo), Carl R. Schilhaner of Jericho (Buick).

Kansas Contributes More Queer Rules.

Wichita, Kan., has passed an ordinance requiring motorists to give a signal before starting from a street surbing; they are also forbidden to "back up" more than 20 feet.

OLDFIELD "BUTTS IN" AT DETROIT

"Outlaw" Makes Another Bid for Notoriety—Good Sport Follows One Day Postponement of Racemeet.

Rather than disappoint a vast throng which gathered at the grounds of the Michigan State Fair Association, Detroit, Mich., on the 25th inst., to witness the races promoted by the Michigan State Automobile Association, Robert Burman, Ray Harroun, H. J. Fitzpatrick and other noted drivers gave exhibitions. The races were carded for the 25th and 26th inst., but rain on the morning of the first day made the track dangerous and they were postponed until the 26th and 27th inst. In the exhibitions Burman, driving the Benz, was clocked five miles in 4 minutes and 31 seconds, which is 10 seconds less than the previous "dirt track record." Burman also started to tear off a 50-mile exhibition, but was interrupted by the appearance on the course of Barney (Berna) Oldfield. Chairman Butler of the A. A. A. ordered Oldfield off, but the latter drove once around the track before submitting. Butler characterized the event as "a try for cheap notoriety," and intimated that the end had not been heard of it.

Frank Kulick, at the wheel of a Ford, secured all the honors when the meet really began on Tuesday, 26th inst., for he not only proved fastest on the one-mile time trials, covering the distance in 50 seconds, but he won two of the three races in which he started. In the time trial he was 1½ seconds faster than Burman. Afterward Henry Ford, manufacturer of the car which Kulick drove, gave him \$1,000 with the remark, "Frank, take this, I don't want you to do any more racing. When a man covers a mile on this track in 50 seconds it is too fast on any other track." The five miles, free-for-all handicap, showed some fine handicapping. L. Soules, Flanders, with 55 seconds, won. He was followed closely by Frank Witt, Flanders, who also had 55 seconds, and Frank Kulick, Ford, 22 seconds. Kulick was close the entire distance, but could not overcome the handicap. The time, 5:32, was slower than he made in the first two races at five miles for small cars. They were, 4:52½, and 4:55½ respectively.

Tuesday, September 26.

Five miles, Class C, under 300 inches displacement—Won by Frank Kulick, Ford; second, Joe Jagersberger, Case; third, Lou Heineman. Time, 4:52½.

Five miles, Class C, under 231 inches displacement—Won by Frank Kulick, Ford; second, H. J. Borusch, Warren-Detroit; third, Bill Smith, Abbott-Detroit. Time, 4:55½.

Five miles, free-for-all handicap—Won

by L. Soules (Flanders), 55 seconds; second, Frank Witt (Flanders), 55 seconds; third, Frank Kulick (Ford), 25 seconds. Time, 5:32.

One mile time trial, standing start—Won by Frank Kulick (Ford), time, 50 seconds; second, Robert Burman (Benz), 51½ seconds; H. J. Kilpatrick (Hotchkiss), 56 seconds.

Ten miles, Australian pursuit—Won by Robert Burman, Benz; second, J. McNay, Benz; third, H. J. Kilpatrick, Hotchkiss. Time, 9:01½.

Three miles match, Ray Harroun, Marmon, vs. Lou Heineman, Case—Won by Harroun.

Three miles match, Robert Burman, Benz, vs. H. J. Kilpatrick, Hotchkiss—Won by Burman. Time, 2:48¾.

Two miles time trial—Robert Burman, Benz. Time, 1:43¾.

Five miles match, Frank Witt, Flanders, vs. L. Soules, Flanders—Won by Soules. Time, 5:44.

Three miles match, Ray Harroun, Marmon (scratch), vs. Joe Jagersberger, Case (½ mile)—Won by Harroun.

Five miles, with change of tire—Ray Harroun, Marmon. Time, 5:40.

Twenty miles time trial—Robert Burman, Benz, 17:57¾.

De Palma and Hobble Skirt at Hartford.

There was a hobble skirt race at the race-meet of the Automobile Club of Hartford, at Charter Oak Park, Hartford, Conn., on the 21st inst., and the man who won it still lives. Automobile races were to have marked the closing of the Connecticut State Fair on the 9th inst., but on account of the bad condition of the course, were abandoned. The Automobile Club then took up the matter and arranged a program of seven races for the 21st inst. Only two of them filled, however, and in order to give the 3,000 spectators their money's worth, a hobble skirt race, a potato race, and several motorcycle events, also a parade of 1912 automobiles, were added. These and Ralph De Palma and his two racing cars—the Simplex and the Mercer—afforded fairly good sport.

The summary:

One mile exhibition by Ralph De Palma, Simplex. Time, 0:52¼.

Potato race—Won by William Miner, Pierce-Arrow; second, Al Peard, Firestone-Columbus; third, John James, Maxwell.

Five miles, non-stock, Class C—Won by Ralph De Palma, Mercer; second, G. P. Brainerd, Cole; third, John F. Beach, Mercer. Time, 5:19½.

Five miles exhibition by Ralph De Palma, Simplex. Time, 4:23.

Five miles, free-for-all—Won by Ralph De Palma, Mercer; second, G. P. Brainerd, Cole; third, John F. Beach, Mercer. Time, 5:14.

Fifteen miles exhibition by Ralph De Palma, Simplex, abandoned at end of 12 miles.

RACING MEN LET LOOSE A SCANDAL

Moross Charged With Requiring Contract Shielding Burman from Defeat—Drivers Discuss Racing Safeguards.

At the last meeting of the Motor Racing Drivers' Association of America, which was held in New York on Wednesday evening, 20th inst., one of the principal topics discussed was the disaster which occurred at the Syracuse racemeet, and the best methods of preventing such accidents. The most astounding thing that was brought out, however, was that at the Labor Day meet at Brighton Beach at least one of the drivers actually was under contract not to win the races in which he competed in order that Robert Burman might not be defeated. Subsequent questioning by a Motor World representative of the man who made the charge resulted in his repeating it, but he declined to be quoted on the subject or to permit his name to be used.

He signed the contract, he said, thinking it was largely a joke, owing to the fact that the combination of Burman and his Benz against which he would race had almost a national reputation for speed, and he felt that as in his estimation there was no possible chance for him to win, in any case there was no harm done in signing the document. Later, according to his own story, he discovered that his mount really was capable of much greater speed than he had expected and he promptly announced to Burman his intention of beating him, "and beating him proper, contract or no contract."

It was then that the fur commenced to fly. Burman held a consultation with his manager, E. A. Moross, who also was the promoter of the meet, and as the cars were being taken out of the paddock the manager climbed onto the insurgent's car, and switching off the ignition current himself, informed the driver that he was free to leave the track. After denouncing Moross in no uncertain terms, and refusing to appear at the Syracuse meet, for which he had been booked by Moross, he left the track. Burman won the race, a five-mile handicap.

Another matter which came up before the meeting, and one which has been more or less the principal subject discussed at all the meetings of the organization since it first saw the light of day, was the question of the segregation of racing drivers into classes according to their experience. It may be remembered that at the meeting of the rules committee of the Motor Contest Association held in Detroit a short time ago, George Robertson, president of the Racing Drivers' Association, recommended that drivers be divided into three classes, first class, second class and amateur, the first class to include only such drivers as

had "gone through the mill" and proven their ability to handle fast cars in big races, while the second class would be composed of drivers who had just entered the professional ranks and still had their spurs to win. After they had demonstrated that they could drive to the satisfaction of a committee composed jointly of officials of the American Automobile Association and the Motor Racing Drivers' Association they would be permitted to compete in the same races as those in which drivers of the first class were entered.

The recent fatality at Syracuse, which has been proven to have resulted largely from the inexperience of the driver, "Lee Oldfield," could not have happened, according to Robertson, or at least the likelihood of the happening would have been materially lessened had only experienced drivers been permitted to start in the race. Briefly, it is the exclusion of inexperienced drivers, for the protection of the public and the drivers themselves that the association is working for and it is not unlikely that before many moons the A. A. A. will amend its rules to conform with the suggestions made by the Racing Drivers' Association in this respect. The identity of the so-called "Lee Oldfield" also was discussed at the association's meeting, and though it is known that his name is not Oldfield, his correct name had slipped the memory of the one man who had known it.

The meeting was attended by about a dozen prominent drivers, among whom were Geo. Robertson, Louis Disbrow, Hughie Hughes, Glen Ormsby, Charles Lund, Harry Hartman and Leland Mitchell, and after the serious business of the evening had been disposed of the meeting was changed into a theater party. A production entitled "Speed" was witnessed.

Boursch the "Whole Thing" at Galesburg.

H. G. Boursch was the "whole thing" at the Galesburg (Ill.) meet on the 20th inst. He drove a Warren-Detroit and bagged two of the three events which constituted the program. The event which escaped him was not a speed contest, but a slow race on high gear in performing which stunt Buram (Franklin) proved most expert. The summary:

Ten miles, free-for-all—Won by Boursch (Warren-Detroit); second, Wonderlich (Marquette-Buick); third, Hobbie (Buick). Time: 11:09½.

Slow mile on high speed—Won by Byram (Franklin), 11:31½; second, Hjerpe (Carter), 11:09.

Five miles, free-for-all—Won by Boursch (Warren-Detroit); second, Hobbie (Buick); third, Nelson (Illinois). Time, 5:03½.

Chicago Contest Deferred Three Weeks.

Although having 10 entries and a promise of 14 others for its 1,000 mile reliability contest, October 6 to 13, the Chicago Motor Club has concluded to postpone the event until October 27-November 3.

MANY NOTED DRIVERS CHANGE CARS

Surprising Shifts Disclosed in Make-up of Teams for Fall Road Races—Grant Does Not Retire.

"Change cars" at present seems to be the slogan of a by no means small proportion of the clan of racing drivers. Seldom before has such a number of changes been recorded at one time. The first of the changes will become apparent when Harry Grant, who won his fame at the wheel of an Alco, is seen in a Lozier at the Fairmount Park race, on October 7. Similarly, the Santa Monica races out in California, on October 14, will disclose changes in several of the teams which have been entered. The Marmon team shows the greatest number of converts of them all. Ray Harroun, of Indianapolis Speedway fame, will be in charge, but he will do no racing, and of course Joe Dawson will pilot one of the yellow cars. As to the others, all are new to Marmon cars. William Endicott used to be a very consistent driver of Cole cars, but he has left them, temporarily at least; Joe Nikrent has been seen most at the wheel of a Knox, but he, too, will pilot a Marmon; Cyrus Patschke is the fourth driver, but he is not exactly new to the Marmon team, as he drove Harroun's winning car part of the way in the 500 miles race at Indianapolis on Decoration Day.

Johnny Jenkins stays with the Cole team for the Western races, but he has a new team mate in the person of Harvey Herick, who last year made quite a name for himself with a Kissell. Howard Wilcox, familiarly dubbed "Howdy," and Charles Merz apparently are inseparable from their National mounts; they both will start in the Santa Monica, but John Aitken, it is said, will race no more. Len Zengle and Don Herr will, however, amply fill the breach. The Fiat teams for the Vanderbilt and Grand Prize races at Savannah in November also show a number of changes and one recruit. Teddy Tetzlaff, who leaped into fame and glory with a Lozier at Santa Monica last year, is the new addition, and he, with David Bruce-Brown and E. H. Parker, will drive Fiats against the field for the Vanderbilt cup. Bruce-Brown last year won the Grand Prize race with a Benz, but this year he will have a specially constructed Fiat which he will drive in both races. Felice Nazzaro and E. H. Parker are the second and third members of the Fiat Grand Prize team.

Lowell Road Races Abandoned.

There were no road races nor any other races at Lowell, Mass., on the 23rd inst. The supposed fixture had been inadvertently carried on the A. A. A. sanction list, although none had been asked for nor granted.

BROKEN BRIDGE HALTED TRUCKS

Chicago Demonstration Illustrates Truck Reliability and Bridge Weakness—
Twenty Clean Scores.

It was over far worse roads than marked the routes of the two previous days' journeys that the remaining 28 trucks in the Chicago Motor Club's commercial vehicle demonstration were forced to run on Wednesday, 20th inst., the third and last day. In spite of the very rough roads, made slippery by rain, only one other truck was penalized, 24 of them finishing the three days' journey of about 200 miles with their road scores unblemished. The Sampson, driven by Hugh Kranskey, was the one to incur a road penalty on the last day; 10 points were meted out to it because the driver replaced a bolt in a torsion rod. As a result of the technical examination which was made at the end of the third day, four hitherto perfect scores were marred, leav-

ing a total of 20 perfect score vehicles out of the 32 which started in the run on Monday, 18th inst.

The four which suffered by the technical examination were No. 8-Krickworth, No. 3-Clark, No. 17-Lauth-Juergens, and No. 18-Decatur. The Krickworth was debited 100 points for a broken spring hanger and a bent tie rod sustained when the car skidded into a trolley car on the second day's run. On the final day's run, the Lauth-Juergens ran into a deep ditch and two spring leaves were broken, for which 10 points was charged. The Clark also got into difficulties on the last day, a fractured brake connection and a broken spring resulting in 105 points penalization. The Decatur lost 30 points for broken spring shackles, this damage also being caused on the last day's run. No. 5-Sampson and No. 14-Adams each were assessed five points for clutch troubles.

The return from Chicago Heights, at which place the noon control was located, was very much more difficult than the morning run from Chicago, and it was during this part of the journey that the

only accident of the three days' contest occurred. Driven by Fred Berger, and well in front of a large part of the procession, Saurer truck No. 33, the biggest and most heavily laden of them all, crashed through the woodwork of a bridge and came to rest "hub deep" on the iron girders. It was not till two hours later, after the six ton load of sand had been removed and the truck dargged out of the hole, that the contest was able to go on. As the defect was in the bridge rather than in the truck, no penalization was incurred.

Of course the horse-drawn truck which "competed" with the motor trucks was overwhelmingly defeated; it took the horses two whole days to drag two tons of sand over the same route that the motor trucks covered in less than one day. It certainly did compete, however, as it was designated "No. 13," and in addition was subjected to a technical examination. With the horses walking, the foot brake (according to the official score sheets) stopped the truck in 15 feet, while with the horses trotting the truck was stopped in 28 feet. The complete scores are as follows:

SUMMARY OF RESULTS OF CHICAGO MOTOR CLUB'S TRUCK DEMONSTRATION, SEPT. 18-20

501-1,000 Pounds Capacity						Brake Test			Penalization

MOTORIZING NEW YORK'S FIREMEN

Ousting of Horse-Drawn Apparatus Under Way, Education of the Men Begins—
The School of Instruction.

Having definitely decided to replace its horse-drawn apparatus by motor driven vehicles, the New York Fire Department is losing no time in preparing a number of its men for the duties which will be imposed upon them with the complete installation of the new apparatus. The com-

firemen in which they are taught the mysteries of gasoline motors, magneto ignition and the handling of the steering wheel.

This school, which is depicted in the accompanying photographs, is located in the big building at the corner of Twelfth avenue and 56th street, New York, where all repairs to the department's steam engines, ladder trucks, water towers, etc., are performed. On the second floor one of the rooms has been fitted up as a schoolroom with two blackboards and tables or demonstrating stands on which motors, dynamos, pumps and magnetos are exhibited; at

It is the intention of the department to develop not only a sufficient number of competent drivers for the new engines to be delivered during the next year, but chiefly to make every man, if possible, acquainted with the construction and handling of gasoline motors and engines, so that in case of accident to one or more of the regular men there would be always a number of others ready to fill any emergency that may arise.

Three members of the New York depart-

GENERAL VIEW OF FIREMEN'S SCHOOL AND ITS EQUIPMENT

missioner does not intend to be forced to look for chauffeur material beyond the personnel now under his orders, and with this idea in view has established a school for

one end of the room there is one of the red "F. D." runabouts with hood removed and motor partially dissected, while all around the place are other evidences of a real "chauffeurs' school."

Captains and lieutenants regularly report to headquarters the names of men who show either special mechanical aptitude or a particular desire to become chauffeurs, and the officials at headquarters each month choose about fifteen of these men and assign them to school duty. While drivers are preferred, if they show the necessary abilities, the school course is not restricted to them, and any member of the department, regardless of his present duties, may make application for a chauffeur's position. The course lasts one month, with daily instruction of three hours in theoretical and practical repairing, reconstructing and assembling motors, magneto lore and the handling of demountable rims, and in driving one of the new engines of the department through city streets. As soon as one squad has finished the course, another starts, so that by next summer the department expects to have about 200 men capable of running the new apparatus. A civilian has been employed by the Fire Department to teach these men, the present incumbent being Frank E. Butler.

THE FIRST ROAD LESSON

ment at present are on an extended tour of the Middle West, where they are examining various makes of fire engines and arranging for deliveries next year.

MAKING PLAIN IGNITION PROBLEMS

DEMOUNTABLE RIM INSTRUCTION

COLBY WITH UNDERSLUNG FRAME

Iowa Manufacturer Adds Popular Priced New Model to Line—Characteristics That Distinguish It.

As the leader for its 1912 line, the Colby Motor Car Co., of Mason City, Iowa, has brought out a 30 horsepower underslung car, known as Model L, while at the same time continuing its 40 horsepower Model H, of more conventional spring suspension. While the price of the Model H remains at \$1,750, the new Colby "30" underslung Model L, with five passenger touring car body, four passenger touring car body, or

THE NEW COLBY UNDERSLUNG 30 HORSEPOWER CHASSIS

two passenger roadster body, lists at \$1,250, although in three passenger coupe form it bears a body of such complete and elaborate coupe detail as to bring the price up to \$2,250. Indications of the generous proportions of the underslung model are manifest in the fact that 36 x 4 tires, on demountable rims, are used, the wheelbase being 116 inches and the road clearance a full 11 inches.

A four cylinder water cooled motor, having 4 1/16 x 4 1/2 bore and stroke, is used for the new car. The cylinders are cast en bloc, with enclosed valves and with inlet manifold cast integral. The motor is lubricated by a cam-driven plunger pump in the crankcase. For the ignition, the Splitdorf dual ignition system, embodying magneto and battery, is employed, the spark plugs being located over the intake valves. The radiator is very large, of the square tube variety, located on an extra cross member of the frame in front of the one that carries the subframe. Circulation is by centrifugal pump on the left side of the motor, the pump shaft being an extension of the magneto shaft. The fuel tank is under the front seat, and feeds to the 1 1/4 inch Stromberg carburettor by gravity. In the clutch a pressed steel cone, with pilot springs, is utilized.

The control levers are on the right side, with the shifting lever inside the body and the emergency brake lever on the outside.

The foot pedals are located on either side of the steering post, with accelerator between and the muffler cut-out at one side.

Special pride is taken by the Colby company in the rear system, the transmission gear being located on the rear axle. Combining the functions of torque and strut rods, the torsion tube extends forward to a yoke around the universal joint. Torque and driving strains are sustained by heavy brackets securely riveted to the frame and forming the rear subframe hangers. In addition to the heavy torque tube, the axle is braced with two radius rods which extend to the pins on which the yoke turns. The transmission is of a very light, compact type, and the cover plates of both rear axle and transmission are readily re-

movable to give free access to the gears. Service and emergency brakes are of the external-internal type, operating on the same brake drums, which are 2 1/4 inches wide and 12 inches in diameter, equipped with non-burning brake lining. The whole rear axle, which is of the semi-floating type, is full ball bearing. In accordance with the underslung construction, semi-elliptic springs are used for both front and rear.

Little or no change has been found necessary in the 40 horsepower Model H, which made its appearance for 1911 last December. The standard closed front touring car is maintained at \$1,750, but with a Colonial limousine body the Model H lists at \$3,500. The company is represented in the commercial vehicle field, as well with one and one-half and five ton trucks, in order that its line of pleasure and commercial cars may be completely rounded out.

When Brakes Require Equalization.

When it becomes necessary to reline one of a pair of brake shoes, great care should be taken to see that the brakes afterward are properly equalized. If they are not equalized, or rather adjusted, undue strain will be thrown on the differential mechanism, and in addition one tire, on which practically all the strain will be put, will wear rapidly.

SLIDING SCALE FOR TRUCK BUYER

Packard Evolves One to Promote Quantity Purchases—Basis of System and How it Works Out.

As in the case of all merchandising involving quantity, buyers of motor trucks have been accustomed to seek special concessions in price where their orders have involved a number of trucks rather than a single vehicle, but it has remained for the Packard Motor Car Co., of Detroit, Mich., to provide a definite sliding scale of quantity discounts from the prices asked for single trucks.

The obvious purpose of the sliding discount system announced by the company is to make the price concession for quantity a definite and open arrangement with retail buyers instead of having it a matter of private dicker and bargain that might be variable according to the shrewdness and bargaining faculty of the buyer. It is also a recognition that the quantity buyer may be regarded as properly entitled to slightly better prices than if he were to buy but one truck.

In stating its plan whereby "all buyers may have the same proportionate benefit," the Packard company indicates that it has fixed its sliding scale of prices on the following basis:

"Orders for single trucks will be filled only at the regular list prices—\$3,400 for the 3-ton chassis and \$2,800 for the 1 1/2-ton chassis. Orders for several trucks to be delivered and paid for at the same time will entitle the purchaser to a percentage reduction in price equivalent to the number of ordered trucks multiplied by the constant .0015. Thus, on an order for ten 3-ton truck chassis, the price will be calculated as follows:

Ten chassis at \$3,400.....	\$34,000
Percentage reduction equals number of chassis (10) multiplied by constant .0015, which is .015, or 1.5 per cent. of total list price (\$34,000)	510

Net price of ten chassis.....\$33,490

Net price of each of ten chassis...\$ 3,349

"When a number of trucks are ordered for delivery in instalments within a specified period, the reduction allowed upon the successive instalments will be cumulative, so that at the completion of the entire order the purchaser will have received upon all trucks a maximum reduction the same as on a unit order for an equal number of trucks"

The system applies uniformly in establishing the prices for all orders of from 2 to 50 trucks, the latter number being the point of maximum reduction. The quantity prices apply to chassis only, the list prices on bodies being net regardless of quantity.

KNIGHT HONORED ON NATIVE HEATH

Inventor Banquetted and on Lecture Platform Tells of His Struggles and His Engine—Answers Some Questions.

When Charles Y. Knight returned to America on a visit last Saturday, 27th inst., for a short stay, it was entirely in keeping with the scheme of things that he should be carried from the steamship dock to his hotel in a car equipped with an engine of his own invention. In company with his partner, his counselor and representatives from the F. B. Stearns Co., the Dayton Motor Car Co., the Columbia Motor Car Co., and the Atlas Engineering Co., American licensees under the Knight patents, he was whisked to his temporary place of abode in a Stearns-Knight car and since then his life has been as strenuous and as full of speechmaking and banqueting as ever was a presidential candidate's. His engine was conceived and first exploited in this, his native land—he was born in Indiana—but it was not until he took it abroad that it found honor, and for the first time he returned here to find his invention recognized and honored by other Americans; he had "come into his own," so to speak.

Officially, the inventor's round of activity commenced on Monday night when he was tendered a dinner at the New York Athletic Club by Frank E. Lonas, attorney for the Knight & Kilbourne Patents Co.; on Tuesday evening, he lectured at the Automobile Club of America, before a body composed chiefly of the Metropolitan section of the Society of Automobile Engineers, and on Wednesday he jumped to Pittsburg and continued his educational-lecture tour, which will be repeated in three other cities. Sandwiched between lectures and dinners have been visits to the manufacturing plants of American licensees, consultations with a view to increasing the productiveness of these licensees and a host of other engagements, all of which must be settled in record time in order to allow Knight to return to England early next month.

The dinner on Monday night was in the nature of a greeting to the returned inventor. It was attended by representatives of all the American licensees under the Knight patents, including Engineer J. G. Sterling, Associate Manager Hadley, H. H. Hower and W. Arthur Lesser of the F. B. Stearns Co., Horace De Lisser, J. W. Wellington, Alfred Reeves, Montgomery Halliwell, F. E. Dayton, R. T. Houk, H. V. Nichols, Rue De Lisser, Carl Tucker, Gridley Adams and Harry Broner, representing the Columbia and Stoddard-Dayton interests; H. J. Halle, F. H. Baker, Louis Switzer and R. B. McMullen, of the Atlas Engineering Co.; A. Massenet, American repre-

sentative of the Panhard-Levassor Co., and E. Lilly. J. E. Ryan, who has had charge of the American publicity for the Knight interests for several years, was toastmaster, and he was flanked by Counselor Lonas and L. B. Kilbourne and Consulting Engineer W. Owen Thomas, of the Knight & Kilbourne Co.

Naturally, Knight's address was the principal event of the evening, though Mr. Lonas said much that served to convey to those present the difficulties which had to be overcome and the extremely rigorous tests which were required by the foreign manufacturers before they finally consented to adopt the Knight sleeve valve motor. Following Lonas's remarks, Toastmaster Ryan introduced Mr. Knight with the usual flow of scintillating wit for which he has acquired an almost national reputation.

Knight's talk occupied more than an hour, and for the most part consisted of a recital of the events which led up to his invention of the sleeve valve engine which bears his name. Virtually he told the story of his life. He told of his first invention, which was a printing press, and of his second, which was a country newspaper. His third invention was a statement of circulation and somewhat whimsically he added that in his estimation it was the most successful of the three. Some years later, having ridden in an automobile which was far from quiet, he decided to turn his attention to the organization of a really silent motor and after years of study and experimenting the Knight sleeve valve engine was produced.

In appearance Knight suggests more of the successful capitalist than the inventor. He is fairly tall—and also fairly rotund—and smooth-faced, and boasts the ruddy complexion of which Britons are proud. He talks convincingly and though there are traces of English inflection apparent at times, as evidenced by his pronunciation of the word patent in true British style with an A as in plate, his manner of speech on the whole is distinctly of Chicago in the clear enunciation of very hard r's.

In the course of a few brief remarks, it was brought out by Horace De Lisser, of the United States Motor Co., that while his company did not object to the action of the Knight-Kilbourne interests in placing the production of Knight engines for the open market in the hands of the Atlas Engineering Co., it did not agree to the wisdom of the plan. The Atlas Engineering Co., of Indianapolis, was the latest, and in all probability will be the last American licensee under the Knight patents. De Lisser explained the reason for the attitude of the United States Motor Co., by saying that it was possible that the Atlas company might allow Knight engines to fall into the hands of car builders who would not sustain its reputation. For this reason he suggested that great restrictions should be placed on the Atlas Engineering Co. regarding its disposal of the motors.

Later, the Atlas representatives gave assurances on this very point.

After even briefer speeches by practically all of the others present, the gathering broke up and each of those present carried away with him two extremely clever souvenirs of the occasion. The first of them was the menu, which was printed in a perfectly working model of the Stearns-Knight engine in cardboard. By a neat arrangement of tiny gear wheels and coloring the whole of the valve mechanism of the engine was shown in its working relationship to the piston. The other was a "motion picture" of the Columbia-Knight engine, the illusion of the engine in operation being obtained by allowing the pages of a small booklet to flip over rapidly under the thumb.

The gathering which greeted the inventor in the lecture room of the Automobile Club of America on Tuesday evening was several times larger than that which was on hand the previous night and it was there that Knight really got down to a technical treatment of his engine. After a lengthy preamble in which he recounted the enormous increases in profits which have been made by those foreign manufacturers who have taken up the manufacture of the Knight engine, he repeated what now is history regarding the severe tests to which the Royal Automobile Club of England submitted the engines. Two of them, one of 22 horsepower, and the other 38 horsepower, were run continuously for 132 hours, pulling one and one-third times their rated powers. Then, after having been run 2,000 miles at 40 miles an hour on Brooklands track in touring cars, carrying a full complement of passengers, they were dismounted and tested on the bench for five hours and showed respectively 39 and 59 horsepower. Though they had been run the equivalent of 10,000 miles, they showed no appreciable wear. Indicative of the small amount of wear which actually takes place, Knight cited one instance where one of his engines had been run 100,000 miles and still showed no signs of wear, and opined that had it been run 1,000,000 miles the wear would not have been greater.

The most interesting part of his description pertained to the lubrication of the engine. Contrary to the general idea, he said, the greatest problem was not to provide efficient lubrication, but to prevent over lubrication. The splash system is relied upon entirely, and the method of oiling the eccentric sleeves is unique. Owing to the partial vacuum caused by the suction of the piston the oil which clings to the bottom of the sleeves is drawn up between them and distributed evenly over them by means of under-cut grooves in their peripheries. The older method of using an auxiliary oiler to force oil on top of the pistons has been discarded.

The discussion which followed the lecture was exceedingly meagre and was confined to half a dozen questions, some of

THE MOTOR WORLD

which already had been answered though Knight good naturedly went all over the ground again. In the course of the lecture he had stated that approximately two horsepower was required to operate the sleeves in a six-cylinder motor and asked the power required to drive the poppet valves in an engine of similar size stated that owing to the fact that he had never had opportunity to test a poppet valve engine of similar size he could not say. The oil best suited to the sleeve valve engine, he stated, in answer to a question, was identical with that used in poppet valve motors; he refused to state the clearances between the sleeves and the cylinder walls and the piston on the ground that it was a "state" secret. He did admit, however, that it varied according to the bore of the cylinders.

After a long pause, during which no more questions were forthcoming, Knight thanked the audience for its close attention, and with evident relief, retired, later to join the gathering at a "Dutch" provided in the grill room by the Automobile Club of America.

Germans Declare a Cruel, Cruel War!

While war between Germany and France, according to reliable information, actually has not been declared by the German Emperor and his ministers, German motorists and cyclists have been called on to throw themselves at the Michelin Tire Co., which, as most people know, is a French enterprise. And all because the Michelin company, in its humorous cartoons and caricatures of people of note, far from tickling the German funnybone, offended it. At least that is what the president of the Deutscher Radfahrer Bund and the president of the Allgemeiner Automobil Club claim the company has done, and they are very sore about it, too. In an official and signed announcement these two leaders demand that every loyal German automobile owner, motorcyclist and bicyclist, henceforth shun the Michelin product as he would the Evil One himself; for the French company has "dared to insult the national feeling of the Germans, to caricature the person of their emperor and to launch unheard-of attacks against Germanism and German industrial progress"—"and this," the manifesto goes on to explain, "despite the fact that millions of good German money have been paid for the tires made by this firm." The call to arms closes with a demand for instant and absolute boycott of the company's products. The "proclamation" is said to have caused Michelin's "Bibendum twins" to shake more vigorously than usual.

T. Geddes Grant, who is described as one of the wealthiest residents of Trinidad, has secured the Velie agency for that tropic island. Grant, who represents a large number of American enterprises, makes Port au Spain his headquarters.

S. A. E. TRIP ASSUMES IMPORTANCE

Visit to Europe Now Assured and Interest Added to Program—Some of Those Who Will Go.

Giving every indication of their enthusiasm over the projected trip to Europe under the auspices of the Society of Automobile Engineers, the members of that organization are responding to a degree that bodes well for the size and success of the undertaking. Already a great many have indicated their positive intention of making the trip, while an even larger number have put themselves on record as intending to go if possible. Although the Olympia automobile show in London is to be the main attraction for the members, the program that is being developed in connection with their visit has been brought to a point that renders it of international interest.

Leaving New York about the first of November, the visitors are to arrive in London on November 7th, and three days will be available for visiting the Olympia show. On November 8th there will be a joint technical meeting with the English automobile engineers, at which meeting an S. A. E. member will present a paper. An entertainment will be given the visitors on November 9th by the Incorporated Institution of Automobile Engineers. November 10th is set aside for a trip to Birmingham, to see the factories of the Austin Motor Co. and the Wolseley Motor Car Co., while on November 11th the Daimler Motor Co.'s plant at Coventry will be visited. On the same day the British Society of Automobile Engineers will give the S. A. E. members a dinner. Sunday, the 12th, will be the day for an automobile run through the Warwickshire district and to Stratford-on-Avon.

After visiting the Humber factory on the 13th, the members will be given an opportunity, on the 14th, to inspect the garages of the biggest London taxicab companies, and on the evening of that day there will be a technical session held by the Institution of Automobile Engineers, with reading of papers and discussions. The next two days, November 15th and 16th, have been set aside for a visit to Newcastle-on-Tyne, the home of the Armstrong Whitworth factory. The succeeding day will afford a program of special racing events at the great Brooklands motordrome, of a kind calculated most to interest the engineers.

The departure for France, on an excursion to the French automobile factories, is scheduled for Saturday, the 18th, and on the 20th the pilgrims will be given the somewhat rare privilege of going through the Panhard et Levassor plant, in Paris, while on the following day they will be shown the Delaunay Belleville factory at

St. Denis. In addition to what is thus provided for, it is probable that visits will be made to the South Kensington Museum in London, the testing laboratories of the Royal Automobile Club of England, and of the Automobile Club of France, the Conservatoire des Arts et Metiers, and the Clement and DeDion plants in France. Factories making commercial vehicles as well as pleasure cars, and those making moderate priced as well as the highest priced cars will be visited. Altogether the trip, including the return journey home, will take about the whole month of November.

The following, many of them to be accompanied by their wives, have signified their intention of making the trip:

Henry Souther, president of the S. A. E.; Howard E. Coffin, past-president of the S. A. E.; D. G. McDiarmid, superintendent and designer, C. P. Kimball & Co., Chicago, Ill.; William E. Metzger, secretary and treasurer, Metzger Motor Car Co., Detroit, Mich.; William Kelley, vice-president and engineer, Metzger Motor Car Co., Detroit, Mich.; J. G. Vincent, chief engineer, Hudson Motor Car Co., Detroit, Mich.; A. R. Miller, Barthel, Daly & Miller, New York City; John S. Clarke, vice-president, Autocar Co., Ardmore, Pa.; B. B. Bachman, engineer, Autocar Co., Ardmore, Pa.; David S. Ludlum, president, Autocar Co., Ardmore, Pa.; G. R. Wadsworth, assistant to president, Peerless Motor Car Co., Cleveland, Ohio; A. J. Myers, engineer, G. & A. Carburetter Co., New York City; G. B. von Rottweiler, manager and chief engineer, Falls Machine Co., Sheboygan Falls, Wis.; H. L. Davisson, engineer, Edison Storage Battery Co., West Orange, N. J.; L. C. Marburg, secretary and treasurer, Marburg Bros., New York City; Coker F. Clarkson, secretary, Society of Automobile Engineers, New York City.

Those who are planning to make the trip if possible are:

S. P. Wetherill, Jr., general manager and treasurer, Wetherill Finished Castings Co., Philadelphia, Pa.; H. F. Cuntz, mechanical engineer and patent attorney, Automobile Board of Trade, New York City; A. P. Sloan, Jr., general manager, Hyatt Roller Bearing Co., Harrison, N. J.; Lon R. Smith, Eisemann Magneto Co., New York City; N. B. Pope, technical editor, Motor World, New York City; W. G. Wall, chief engineer, National Motor Vehicle Co., Indianapolis, Ind.; Bernhard M. Beskow, Commercial Tractor Co.; John G. Wood, general manager, Empire Motor Car Co., Indianapolis, Ind.; A. O. Dunk, vice-president and general manager, Auto Parts Mfg. Co., Detroit, Mich.; C. H. Foster, president and general manager, Gabriel Horn Mfg. Co., Cleveland, O.; Charles Ethan Davis, general manager, Warner Gear Co., Muncie, Ind.; Thomas J. Kehoe, Kinsey Mfg. Co., Toledo, O.; E. W. Hart, manager lock washer department, Hobbs Mfg. Co., Worcester, Mass.

DR. TESLA TALKS OF GAS TURBINES

(Continued from page 23)

that Tesla himself cannot answer, though he explained that he is "under great pressure from all sides" to complete the development of certain kinds of apparatus, steam engines and pumps having received a great deal of attention up to the present, and that he expects to have some of them ready for production "before very long."

Tall, erect, almost angular, with the broad brow of the philosopher and the sharply chiseled features of the habitual student, Dr. Tesla bears few of the earmarks of the traditional genius. He wears his iron-gray hair a little low in the back, to be sure, but not for an inventor, and when he walks there is just a bare suggestion of histrionic attainments utterly at variance with the hurried preoccupation of the conventional type of man whose brains are stored in the archives of the Patent Office.

"We understand that you are doing remarkable things with steam, but how far has your confidence been extended to the gas turbine?" the scientist was asked.

He laughed.

"Why, I am working with them all the time," he answered.

"You mean to say that you already have built and operated internal combustion turbines employing your principle of fluid propulsion?"

"Yes. But I am not satisfied—not yet. You see there are many things to be considered. The turbine, that is one thing; it is complete in itself and there is no question of its applicability. But when you come to the combustion of the gas you have a new difficulty. It am not satisfied with the present methods of gasification. I have tried one of my turbines discharging the gas into a chamber and then spraying water into it. You see in that way you get an intermittent flow through the nozzle, but you also have better thermal action because you get your adiabatic expansion, [meaning that in which theoretically there is no loss of heat]. And then, I have tried with gasoline using a constant jet, in which you get less efficient thermal action but better action for the turbine. But I am not yet satisfied. I think that some day we shall get better processes of combustion that will enable me to work to more advantage with my turbine.

"You see, that is one great trouble," continued Dr. Tesla. "The human mind thinks but to complicate. As soon as one problem is solved, that solution introduces new complications, other problems that perhaps did not exist before. That was one of my great troubles when I was younger, I invented many things that were very fine, but always I was getting into complications. I have had to work very hard to overcome that. But here, you see what I have done. Do you see how very simple it

is? You take, for instance, the ordinary turbine, a bucket turbine. Here you have around the outside of the wheel a row of little jets, and within, on the periphery of a wheel, a row of buckets—many of them and very small, even on a large wheel. But don't you see that in that entire wheel you have only a narrow strip, a ring perhaps three or four inches wide, that is really useful—that is really active?"

"In my invention practically the whole surface is active. In the bucket turbine the action does not even extend all the way around; you must have a series of jets. But in my turbine you have the gas traveling all the way around in free spirals—always seeking the path of least resistance—and expending its full energy."

Here he laid aside the pencil with which he had been illustrating the point, and reverted to the beginning of what he evidently considers his "big idea."

"I have been working at this a long time. Many years ago I invented a pump for pumping mercury. Just a plain disk, like this, and it would work very well. 'All right,' I said, 'that is friction.' But one day I thought it out, and I thought, 'No, that is not friction, it is something else. The particles are not always sliding by the disk, but some of them at least are carried along with it. Therefore it cannot be friction. It must be adhesion.' And that, you see, was the real beginning.

"For if you can imagine a wheel rotating in a medium, whether the fluid is receiving or imparting energy, and moving at nearly the same velocity as the fluid, then you have a minimum of friction, you get little or no 'slip.' Then you are getting something very different from friction; you are making use of adhesion alone. It's all so simple, so very simple.

"This is the greatest of my inventions," Tesla went on with great enthusiasm. "Now take my 'rotating field'—do you know my rotating field—are you familiar at all with electricity? There are millions invested in it already. Well, that is a very useful thing, but the field is limited to dynamos and motors. But here you have a new power for pumps, steam engines, gasoline motors, for automobiles, for airships, for many other uses, and all so simple."

"But is it really true that you have produced 110 horsepower from a wheel only 9¾ inches in diameter and two inches wide, as has been reported?" asked the interviewer incredulously.

"Oh, yes!" was the reply. "And more. We could get more power. We had 125 pounds steam pressure and no vacuum. We ran it that way for hours."

"Was it sustained power?"

"Yes, sustained power. And we could only use part of the drop in pressure; we would have twisted off the shaft, it was so light, if we had been able to use all the energy of the steam. I had to put in a smaller nozzle on that account."

"And they are very light, these steam engines?"

"I can build a steam engine that will develop one horsepower for every one-tenth of a pound of weight," was the instant and amazing response. "I am now building a double turbine, one with two wheels which must revolve in opposite directions. It is for a special purpose, and I cannot talk much about that, but each wheel develops 200 horsepower, that is 400 horsepower, and it weighs 88 pounds."

A no less amazing claim made at another time was that the steam turbine could be made to return in power at the shaft no less than 97 per cent. of the energy of the steam. There seems to be no limit to what the inventor thinks the new system will accomplish, though, of course, a waiting world may be pardoned for withholding a full verdict of confidence until it has had opportunity to witness some of the promised marvels.

As far as demonstration of the basic principle is concerned, however, the success of the idea is unquestionable. A small pump, originally put together for purposes of exhibition before a body of scientists, to whom Dr. Tesla first disclosed his invention, was operated for the benefit of the Motor World man; the inventor himself obligingly switching on and off the current from the little electric motor which drove it, and operating the valve by means of which the discharge could be regulated to increase the flow and decrease the pressure, or vice versa.

The rotor, mounted in a casing of volute form hardly more than six inches in diameter, contained five disks of three inches diameter. From a small tank, which was part of the model, water was drawn into the casing and forced through a pipe with a lift of 18 inches or so to a long strainer in a horizontal pipe, whence, after passing a baffle plate, to break up the flow and prevent splashing, it fell back into the tank over a miniature weir in a beautiful clear sheet. The hand of a pressure gauge indicated four pounds when the valve was closed, but fell to a little under two pounds when the full discharge was permitted.

With the valve closed, the action of the disks was shown to good advantage. Rapidly snapping on and off the switch, the inventor gleefully pointed out how the hand of the gauge jumped up and fell back again so closely in response to the speed of the motor, as judged by the hum of its commutator, that eye and ear failed to detect the difference.

"And so you really believe that a practical form of gas turbine can be developed on this principle and in such shape that it could be profitably adapted to automobile use?" asked the Motor World man.

"I am so sure that I would make a contract today to build gas turbines and equip automobiles with them."

JACKSON ADOPTS TORPEDO LINES

Three Higher Powered Models Are Different Sizes of One Pattern—New Prices—Center Control Roadster.

Radical changes in the line of Jackson automobiles, produced by the Jackson Automobile Co., Jackson, Mich., for 1912, relate chiefly to the prices and bodies of the various models, in comparison with their 1911 predecessors. New prices have been made that place the largest car of the line at \$1,800 instead of \$2,200, without sacrifice or important modification of the power plant and chassis, while the body construc-

TORPEDO LINES OF THE THREE HIGHER POWERED JACKSON MODELS

tion has been improved. Similar new prices and body improvements apply to the smaller models. Altogether there are five general models, of which the lowest priced is being listed at \$1,000, a two passenger roadster.

Each resembling the others, both in body and in chassis construction, the three largest models represent three sizes of the one prototype, all having five passenger torpedo type body with non-detachable front doors, but differing in three sizes of engine, wheelbase and wheels, while maintaining practically identical relative proportions in each case. A description of the largest car, therefore, serves also for the two models next in size, except the differences indicated.

The big car is known as Model 52, and its four cylinder engine, $4\frac{3}{4} \times 4\frac{3}{4}$, is rated at 50 horsepower. In the design of its body and its general appearance the car is a pronounced departure from anything the Jackson company heretofore has brought out. The body is of the true torpedo type, with closed front and with control levers, handles, etc., inside. The wheelbase is 124 inches, and the wheels are shod with 36 x 4 inch tires on demountable rims. A combination of top, windshield and speedometer, in addition to the regular equipment, is supplied for \$135 over the regular \$1,800 price.

The characteristic Jackson motor, evolved in 1908, and having the valves at

an angle of 45 degrees in the opposite sides of the spherical heads of the cylinders, is retained. The valves are actuated by an overhead camshaft driven from the crankshaft by a vertical shaft and bevel gears, avoiding the necessity for long push rods from the engine base. As claimed by the Jackson company, the advantages of the 45 degree valves and spherical cylinder heads are a much freer and quicker admission and ejection of the gases in relation to the combustion chamber, and a more complete scavenging than is possible with ordinary construction. It is pointed out, also, that in entering and leaving the cylinder, the gases are not compelled to travel around corners or change their general direction, an effect that contributes toward

flexibly suspended in the frame so that alignment may be maintained despite any road shock. This construction has obtained in the Jackson chassis for a number of years. Full elliptic springs both front and rear are used in all models, and to provide for their use the proper drop frame provision is made in each case. Selective sliding gear, with three speeds forward, prevails throughout the line, together with a distinctively Jackson clutch, of the plate type.

Ranking next to the biggest car is the Model 42, having the same general construction, but with a motor $4\frac{1}{2} \times 4\frac{1}{2}$ and a wheelbase of 118 inches. It travels on 34 x 4 tires, not demountably fitted. In this model, which sells for \$1,500, the liberal equipment policy has been extended

JACKSON PLATE CLUTCH

more rapid action and a considerable increase in power.

Cooling is by the thermo-syphon system. The valve operating mechanism is worked out in careful detail, including the fitting of rollers to the ends of the rocker arms to minimize wear.

Motor, clutch and transmission are a unit, enclosed in a dustproof case and

to include top with top hood and a windshield, in addition to gas tank, gas lamps, oil lamps, coat rail, tools and the like. Without top and windshield the price is \$1,450.

The third in size of the torpedo models, No. 32, is of the same pattern, but with an engine 4×4 and with a wheelbase of 110 inches, the tires being $32 \times 3\frac{1}{2}$. It lists at \$1,100, with extra charge for top, windshield and speedometer.

A two passenger torpedo roadster, selling at \$1,100, is offered in Model 26, which has center control, a feature heretofore employed by Jackson only in one of its earlier four passenger cars. It has a high side door, the gasoline tank and luggage box being at the rear. The wheelbase is 100 inches, while tires are $32 \times 3\frac{1}{2}$. The motor is 4×4 and has the valves in the side. In Model 27, at the same price, an identical car is presented, but with the 45 degree valves in the cylinder heads, operated by overhead camshaft, as in the bigger Jackson cars.

At \$1,000 the company offers its Model 28, having a plain open two passenger roadster body, with control levers on the right side, and gasoline tank and luggage box at the rear. This, too, has a 4×4 engine with valves in the side, but for those who prefer the 45 degree valves in the head, Model 29, also at \$1,000, is available, resembling Model 28 in all other respects, the equipment also being similar.

JACKSON 45 DEGREE VALVES

EXTRACTING FANGS FROM GASOLENE

German Invention Demonstrated in New York Adds to Safety of Handling Fuel—Simplicity of Device.

Before a gathering of some twenty engineers, chemists and representatives of the press at the laboratories of the Berlin Chemical Co., at 560 West 171st street, New York, Dr. Edward D. Feldman yesterday (Wednesday) gave a practical demonstration of a new safety device for gasoline cans and other receptacles for highly inflammable liquids. The device is styled "Langrehr," after its inventor, and comes from Germany with the strong backing of government adoption on warships, in navy yards, etc.

As is the case with practically all other safety devices against gas explosions it is a variation of the Davy lamp principle, which consists in placing between the flame and the gas supply a screen of metal. This screen, by its cooling action, reduces the temperature of the combustion gases and prevents a communication of the flame to the bulk of gas. In the original Davy lamp this result is obtained by means of a fine mesh wire screen, but in the Langrehr device the cooling effect is obtained by causing the inflammable liquid to pass through a tube of metal, in which the perforation effects are produced by means of a flat strip of metal, smooth on one side and corrugated on the other, which is wound spirally to form a tube. This tube is screwed into the mouth of the gasoline receptacle and is claimed to prevent any and all "back-firing." Dr. Feldman, in his experiments, proved that a can partially filled with gasoline and fully charged with the dangerous explosive mixture of air and gasoline vapor, would not ignite or explode. He poured gasoline from one can into another through an open flame, while air was blown into the cans, forming highly explosive mixtures, and yet, no explosion occurred, although several of the press representatives fidgeted rather nervously in their chairs during the test.

Belgium's Industry and Small Output.

The extent of Belgium's automobile industry, as disclosed by a recent official census, proves it to be almost microscopic as compared to the American industry. According to the figures, there are engaged in the business in the little kingdom, 23 makers of motor cars and motors for vehicles, employing 5,217 workmen. The plants delivered 2,171 chassis in 1909, and 3,020 in 1910, and it is anticipated that this year the number will reach 4,850. Motor car accessories are made in 200 plants, employing 3,500 workmen. The coachbuilders who are

engaged exclusively on motor cars number 50. They delivered 1,212 bodies in 1909, and 2,617 in 1910; for this year the number probably will reach 3,480.

Lathe Tool That Supplies Many Points.

Not only does the Billings & Spencer Co., of Hartford, Conn., make automobile parts and heavy drop forgings, together with tools of a sort that are suited for a place in the motor car equipment, but it also makes a number of shop and machine tools calculated to serve the factory and repair shop. The newest of its productions in this line is the Jacques Diamond Point tool for lathe work. It is a single drop forged piece, embodying a succession of points, as shown in the accompanying illustration. The points are used one after another as the end points become dull. By simply grinding away the dull point, a new point is exposed for use. This new point is sharpened and hardened in the usual way. The economy of the tool lies

in the fact that no blacksmithing is required in repointing. The first tools made were hardened throughout, with a view to avoiding the necessity for retempering each of the 12 points in turn, but it was discovered that a fully hardened tool would break in the center under heavy service. While the hardening of the whole tool is now dispensed with, the tool is furnished with the two end points hardened, and the whole is drop forged of high speed tool steel.

Two Thousand Cars "Lost" in Oklahoma.

As has been the case in many other States, the number of automobiles actually registered and found by county assessors in the State of Oklahoma is far short of the "estimate" of the highway department. While the latter officials claimed the existence of 5,500 Oklahoma-owned cars, the various county assessors were able to locate only 3,504, or about 64 per cent. The count was taken because only 1,000 automobile owners of the State had paid the \$1 tax demanded of them by the highway department, and some one in this department was rather anxious to locate the missing 4,500, and thereby add \$4,500 to the State treasury.

Iowa Professor to Produce Vulcanizers.

B. M. Allen, who formerly was mechanical instructor in the Highland Park (Ia.) College, has resigned that position, set up a plant in Des Moines, and will engage in the manufacture of a portable tire vulcanizer which he has invented. It is of the self-contained type, steam being generated by gasoline fuel.

ENGLISH VIEW OF YANKEE INVASION

American Popular Priced Cars Making Great Headway—Pemberton Says They Are Too Good To Be Scoffed.

Opinions are divided as to the influence of American imports on the British automobile market. Many of the English manufacturers, having undergone a period of apprehension when several American manufacturers' exploitation plans were announced, have recovered their equanimity. Together with a large proportion of the retailers and accessory people they now seem to feel that there is absolutely no danger to their own interests either through direct competition or as a result of a wholesale "dumping" of left-over models to be sold at cut-throat prices. That this spirit of confidence is not universal, however, is evidenced by Max Pemberton, the author, who also is automobile correspondent of the London Field, who does not attempt to deny his conviction that in the \$1,000 American car, British builders have an extremely hard-shelled nut which they will be a long time in cracking.

"No one, I think, can drive very far upon any considerable trunk road and fail to perceive that the American invasion is a reality and that the British manufacturer is already called upon to face it," Pemberton writes. "The little cars with their apparently frail equipment and their names scribbled boldly upon their radiators glide by us at every turn, are seen standing before many a humble house and are to be found in every inn yard."

"A friend of mine," he continues, "discussed the affair recently with the agent of a well known maker and some odd talk ensued. 'Would you,' asked the agent, 'be willing to go about in ten and six penny boots when you usually pay forty shillings?' My friend retorted that he would not care the end of a match what the boots cost if they wore well and were shapely. 'Ah,' rejoined the agent, 'if they wore well! How do you know that these Yankee cars are going to wear at all?' To this the answer was that the particular Yankee car in question cost \$1,000 all ready for the road and that if the whole thing were scrapped at the end of two years depreciation would be no larger an item than it is now with any English car costing, say, \$2,500. Indeed, it would be less, for the man who could get \$1,500 for his car at the end of two years would be a lucky fellow."

"Admitting this, the agent went on to ask if my friend supposed that any rich man, accustomed to drive a stately carriage from such houses as Rolls-Royce, Daimler, Wolseley or Napier, would be seen in one of these American contraptions. The reply was: 'Certainly not.' The cars

are for the multitude and the multitude is buying them. Even the rich man might use them as runabouts at his country home, but he is not concerned in the argument, for the ample reason that there is not enough of him. The cars will stand or fall according as they meet or do not meet the considerable demand for a serviceable vehicle at a price of \$1,000 or thereabouts."

After this colloquy there follows much regarding the necessity for the Briton to combat and defeat the American invasion in automobiles as he has done with other such invasions in other lines. "Because," says Pemberton, "we have seen many of these cars upon the road, we have heard excited owners bear witness to their durability, we have studied the photographs which show them braving roads in America which seem to us unspeakable, we have heard and seen all this, and gradually we have come to put our prejudice aside and to get down to reality. The cars will go, there is no doubt of it. They are not the shams we once believed them to be, they have pleased thousands of British owners, they are for the moment the supreme problem for all whose interests are at home and industrial. Let us regret the fact or rejoice at it, according to our point of view, it is one which dominates the year and will make it memorable when the story of this decade is wholly written."

In conclusion he says with a shudder: "This is a great subject and we are but at the beginning of it. The attitude of the British manufacturer toward it seems to me unduly optimistic and altogether too lofty. There is a crisis before him and he must face it. We shall await his answer to the 'Yankee' cheap car with interest."

"I am no admirer of many of these little productions, and therefore may write of them favorably without a suspicion of prejudice. It seems to me, in a word, that they are about to revolutionize the small car industry and to revolutionize it wholly. That they will compete with the larger and finer products of the British houses I do not for one instant believe, but that they will make it almost impossible to sell a 12 horsepower car in this country for any sum above \$1,500, I hold most stoutly. They are now reaping the reward of the enterprise, as it seems to me, and if the British makers are to fight the Americans successfully they have no time at all to lose. Other industries have been through the ordeal and emerged triumphantly. The bicycle trade won its battle long years ago and vanquished the enemy utterly. It can be done in the motor trade even yet, but some coats must first come off and some good right arms be bared."

The contacts of coil tremblers periodically become pitted and require, to be smoothed down with a fine file. If no file is available, however, they may be effectively dressed by tapping them lightly with a very small hammer.

FIRE TRUCK CREATES NEW RECORD

Propels Itself 350 Miles from Factory to Destination—Leaves Trail of Interest Along the Route.

When early this month a Sampson combination chemical, hose and hook and ladder truck was sent under its own power from Detroit, Mich., to Alliance, Ohio, its manufacturers killed a whole flock of birds with one stone—not only the proverbial two. The trip was the longest ever undertaken by a fire truck, covering as it did no less than 350 miles of good, bad and indifferent roads, and that the machine came

portant cities: Trenton, Mich., Toledo, Clyde, Sandusky, Elyria, Cleveland and Massillon. In the latter city a test was arranged between the Sampson and horse equipment. Chief Aungst, of the Alliance fire department, accompanied the truck the whole distance, and was at the wheel when the destination was reached, and there the whole town was out to welcome it in "conquering hero" style.

Kentucky Makes Big "Raid" on Motorists.

Motorists of Louisville, Ky., who imagined that they could evade the provision of Section 4 of the State automobile law, requiring that the number of their state license be displayed on the side lamps of their cars, in addition to the regular li-

SAMPSON FIRE TRUCK WHICH MADE 350 MILES JOURNEY

through the difficult and arduous test without trouble or break-down is a matter of much gratification to its makers.

Aside from delivering the truck at its destination without having to resort to freight trains, the United States Motor Co. managed to give the vehicle a thorough try-out and at the same time gave such convincing demonstrations of its efficiency that most of the towns en route, where the truck performed, are said to be clamoring for similar apparatus.

The truck, which is shown in the accompanying illustration, carried on its trip its complete regular equipment, including four extension ladders, two scaling ladders, chemical tank and reel of hose, rubber boot and coat racks, and a 10-inch searchlight. It has a four cylinder motor developing 33 horsepower and is capable of making 35 miles per hour. Metal cases protect the driving chains and a differential locking device is used to insure traction for both rear wheels.

In making the trip from Detroit to Alliance the truck passed through several im-

cense tags, had a rude awakening last Saturday, when 800 of them were served with warrants. The crusade was started by the State revenue agent at large, who spent several weeks gathering evidence, aided by deputies sent from the State capital. The penalty for violation of the law is a fine of not less than \$20 nor more than \$50 in each case. The earlier automobile laws of nearly all States contained a similar provision, but it was soon proven ineffectual and of no real service and was soon abandoned.

Brackets That May Extinguish Lights.

If electric lights suddenly extinguish themselves for no apparent reason the lamp brackets themselves should be examined, incongruous as the suggestion seems. The reason for this procedure is that in some wiring systems the return circuit is formed by the chassis of the car, only one wire being led to the lamps. When such is the case, paint of other foreign matter on the lamp brackets will prevent the passage of the current.

The Unit Power Plant; Both Sides of the Subject

One of the most interesting developments which marks the history of automobile design was the appearance in the year 1904 of the first four-cylinder unit power plant supported at three points. To the old Stevens Arms & Tool Co., Chicopee

of the male and female portions of the clutch. Lack of foresight was directly responsible; crank shaft bearings were plain, whereas the shafts in the change gear set were carried in roller or ball bearings. Consequently the wear in the crank shaft

simple expedient of making the engine bearings and those in the change gear set the same, either both plain or both roller or ball, according to the inclination of the designer. But the fact remains that unless these bearings are the same, some form of flexible connection is absolutely necessary, and this should not be lost sight of. In this respect it should be remembered that the conditions obtaining in unit power plants and separate elements are vastly different. When the elements are separate, the shafts may be neither concentric nor parallel, and therefore to make a perfectly flexible connection two separate universal joints at the extremities of a short floating shaft are necessary. With the unit power plant, on the other hand, the ordinary universal joint is worthless, owing to the fact that the shafts in practically all cases are maintained parallel, though they may not be concentric, and as the ordinary type of universal joint will not transmit power unless the shafts are concentric, there remains nothing but to use an Oldham coupling or something very similar.

Notwithstanding objections to the Oldham coupling, which probably are due to the fact that not infrequently it was incorrectly used, that form of joint probably is the best to use, for the reason that it corrects for lack of concentricity and within certain limits also for lack of parallelism.

Falls, Mass., now the Stevens-Duryea Co., belongs the credit for the actual introduction, though the idea even then was not absolutely new. For some time previous, foreign manufacturers had been experimenting in a desultory sort of way along the same general lines, but the Stevens-Duryea was the first four-cylinder car embodying a unit power plant actually placed on the market. Few realized the scope of the apparently simple design at that time; today the full value of the system is appreciated and it is being used by an increasing number of manufacturers both in this country and abroad.

In theory, the unit power plant is simple; it is supposed to insure the positive maintenance of the alignment of the several connecting shafts in the engine, the clutch and the gear set, though whether it does so depends largely on the construction of these elements. Due to constant effort on the part of designers, it does so in 99 cases out of 100, though at first clutch trouble was not rare in spite of its incongruity in view of the fact that as often as not the trouble occurred in unit power plants which were supported at three points.

The trouble which was experienced was exactly the same as had marked the efforts of earlier designers whose cars embodied separate engines, clutches and change gear sets, and was due to lack of concentricity

bearings was greater than it was in the change gear bearings, and when the engine bearings were taken up the inevitable result was that though the shafts still were

maintained parallel they no longer were concentric. The effect may readily be imagined.

The old method of interposing some sort of a flexible connection, preferably an Oldham coupling, between the engine and the change gear set, to correct for the lack of concentricity, was greatly improved by the

Whether or not the shafts run parallel depends largely on the method of supporting the unit. Cases have been known where even with a three point supported unit some little difference in the alignment of the shafts became apparent after a short time. Such cases are extremely rare, however, and this is the least of the troubles

FIG. 1—INTEGRAL HOUSING IN MAXWELL UNIT POWER PLANT

FIG. 2—SHOWING FLYWHEEL IN FRONT—HUPMOBILE CONSTRUCTION

with which engineers have had to cope.

Disregarding other considerations, the ease with which a unit power plant may be so arranged as to be supported at three points is in itself an advantage which cannot be overlooked. Briefly, the advantage of three-point support is that regardless of frame flexure or weaving the proper relationship of the component parts of the unit power plant is maintained. That there must be a certain amount of frame weaving is self-evident, inasmuch as there is no such thing as absolute rigidity, the word rigid signifying "a body which undergoes no change in shape, such as by being crushed or stretched or pulled apart, or penetrated by another body." There is comparative rigidity, and it is this that engineers who mount their power plants on four supports obtain. The power plant, or the engine and gear box separately, as the case may be, act as cross girders in the frame, and the degree of rigidity obtained is sufficient to

dentally, it has been an open question for some time as to whether flywheels are not now made inordinately heavy. The time has passed when flywheels were expected to cover a multitude of sins, for which incorrect designing was responsible, and owing to the present perfection of balancing methods, it appears that flywheels might advantageously be made considerably smaller and lighter. As a matter of fact, flywheels now are much smaller than they were a few years ago, though some of them still are exceedingly cumbersome.

Generally, the housings of unit power plants are composed of two parts, one forming the crankcase and the other enclosing the change gear mechanism, and these two parts are firmly bolted together, making in effect a single unit. In the Maxwell unit, however, which, as may be seen by the accompanying illustration, Fig. 1, has the flywheel at the front, the engine crankcase and the change gear housing are

parts, the crankcase forming one and the gear case the other. The joint where they are bolted together is ground and therefore is oil-tight. Further increasing the simplicity of the power plant, the location of the flywheel in front permits the elimination of a fan. The spokes in the flywheel are cast in the shape of fan blades and the circulation of air which is provided is sufficient for all ordinary purposes, though where the car is to be used in very hot climates, a fan is added as well.

The clutch, which is of the multiple disk type, and the change gears, are contained in the after portion of the unit housing and both operate in the same oil bath. Incidentally, the oiling system on Hupmobiles is unique in that the oil is fed by gravity and in quantities proportionate to the engine speed. The oil is contained in a cast reservoir bolted to the side of the cylinder casting and therefore is maintained at an even temperature and its viscosity remain

FIGS. 3 AND 4--STEVENS-DURYEA AND OHIO UNIT CONSTRUCTION WITH FLYWHEELS IN REAR

preclude the possibility of shafts being thrown out of line.

Regarding the relative merits of three and four point support, numerous controversies have been carried on, though up to the present time neither appears to have a decided advantage over the other. There is one point, however, on which engineers are very nearly in accord, namely, that too great a degree of rigidity may be the cause of crystallization and consequent fracture, and on this count three point support scores, as with it a greater degree of flexibility is possible. Rigidity may tend also to cause excessive vibration, but it likewise has been shown that three point supported power plants, unless carefully designed and mounted, may be even worse in this respect. This trouble, like others, however, has been gradually overcome and present day practice leaves little to be desired with either system of mounting.

There are two methods of mounting the flywheel in unit power plants and each has advantages peculiar to itself. Locating the flywheel in front makes for a little more even distribution of weight and also permits of a smaller housing being used. Inci-

cast integral. The unit is supported at three points, all three of which are flexible connections. Two of them are at the front end of the engine and are rigid arms cast integral with the crankcase. The third is at the extreme end of the housing in which the change gear mechanism is enclosed and is in action a pivot. The lower half of this pivot joint is carried on a dropped cross frame member.

Differing from usual practice, the timing gears are at the rear of the engine and thus come in that part of the housing generally used for the clutch and change gears alone. The clutch is of the multiple disk variety, all the disks being of metal without facing, and runs in an oil bath. The unit power plant also possesses an advantage in that there is no necessity for the pedal control mechanism being attached to the frame, the insulation of the power plant from the rest of the chassis thereby being more complete. As may be seen in the accompanying illustration, the Maxwell pedals are hung entirely from the unit housing.

In the Hupmobile unit power plant, illustrated by Fig. 2, the housing is in two

practically constant regardless of climatic changes. Within the reservoir, two plungers, held on their seats by springs, control the oil supply to the crankcase. The plungers are raised or lowered by a cam mechanism which is directly connected to the throttle lever, the amount of oil delivered being automatically increased when the throttle is opened and reduced when the throttle is closed.

The location of the flywheel at the rear, as exemplified by a large number of manufacturers, allows of enclosing a greater proportion of the moving parts of the engine. Also it permits of the clutch and flywheel being combined, a system of construction which effects a saving of parts and consequently of weight. Obviously, the principal advantage of thus combining the clutch and flywheel is the easy method of mounting the clutch which is possible; with cone clutches, the female portion may be made integral with the flywheel, while multiple disk clutches may be either enclosed in a housing bolted to the flywheel, or in a housing formed in the hub portion of the flywheel itself, which construction is the preferred.

In the Stevens-Duryea unit power plant, illustrated by Fig. 3, however, the clutch, though mounted on the flywheel, which, as shown, is at the rear, is outside of it and is arranged to run dry. The housing is in two parts, the crankcase forming one,

braces a unit power plant which is supported at four points, all four of the supports being cast integral with the upper half of the crankcase. The illustration shows clearly the simplicity of the single pedal control system and its method of attach-

anism is subjected to hard and continual usage, as, for instance, in taxicabs or light commercial vehicles indifferently handled, where the necessity for adjustments is greater than when the vehicle is used less frequently and with more consideration. The same system of construction, with but slight modifications, also is used on a number of other cars, including such well-known products as the Hudson and the Haynes.

The trend toward unit construction is marked, and more so since manufacturers have undertaken and are producing a greater percentage of the component parts which go to make up the finished product than ever before. The principal advantage of unit construction—the positive maintenance of the proper relationship of the different elements of the power plant—has been pointed out, and to this must be added the protection from road dirt and dust which the all-in-one-housing construction permits. When it is properly fitted together the ingress of foreign matter is practically impossible, and consequently, other things being equal, deterioration is less. Also the ease with which the average unit power plant can be kept clean externally is a point in its favor which cannot well be overlooked—generally it is possible to clean a unit power plant thoroughly by the simple expedient of turning the hose on it, and this without the slightest danger of harmful results. The magneto, of course, might be harmed by water, though there are several makes now on the market which are waterproof, and according to present indications, others will make their appear-

FIG. 5—FOUR POINT SUPPORTED CHALMERS UNIT POWER PLANT

to which the other, containing the flywheel and clutch and the change gear set, is bolted; a partition in the rear housing serves to separate the flywheel and clutch from the change gear set, which runs in oil. The method of supporting the Stevens-Duryea power plant at three points is one of its distinctive points. The front of the unit is supported by two arms, which are cast integral with the crankcase and are flexibly connected to the chassis frame. The rear end of the unit is carried on a single pivot bearing, mounted on a dropped cross frame member below the end of the housing in which the change gear set is enclosed.

The Ohio unit power plant, illustrated by Fig. 4, embraces a system of construction which steadily is gaining in popularity among manufacturers of four cylinder cars. The flywheel is at the rear and to it is attached a five-plate multiple disk clutch. Power is transmitted by means of a three speed selectively operated change gear set, in which the driving and lay shafts are arranged vertically. This power plant also is supported at three points, though the arrangement is just the reverse of that which is used in the others. Two of the points of support are at the rear, instead of at the front, and are cast integral with the top of the crankcase in that portion of the housing which encloses the flywheel. These are flexibly connected to the chassis frame. The third point of support is at the front and embraces a bearing carried on a dropped cross frame member.

Chalmers construction, as exemplified by the new "36," illustrated by Fig. 5, em-

ment to the power plant. The housing itself is in two parts, bolted solidly together, the flywheel and multiple disk clutch being in the crankcase portion and the four speed change gear set being in the other.

The arrangement of the Atlas engine.

FIG. 6—ATLAS UNIT SHOWING EXPOSED FLYWHEEL AND CLUTCH

clutch and gear set, as shown by Fig. 6, is unique in that it allows of the advantage of a three point supported unit power plant, while at the same time the clutch mechanism is left open and easy of access. This feature is valuable where the mech-

ance in the near future, so that this danger need not be considered.

The unit power plant has been assailed on the point of inaccessibility. It has been said that parts which are "boxed up" are less easy of access than are those which are

THE MOTOR WORLD

open. The reasoning is perfectly correct; parts are harder to get at. But that scarcely is a detriment today, when trips of a thousand miles or more—continuous running—have demonstrated conclusively that it seldom, if ever, is necessary to get at the clutch or the change gear mechanism except to replenish the lubricant. A few years ago, before automobiles had reached their present high state of efficiency, and it was necessary frequently to make adjustments, minor or otherwise, the contention that the unit housing made parts too inaccessible probably would have been apropos, but not today. The number of unit power plants in use at present is far greater than it was last year, and the probability is that next year the number will be even greater.

When Taxicabs and Touring Cars Differ.

The next time Edward T. Kohanyi, of Cleveland, Ohio, desires to take an automobile ride, he probably first will discover whether or not the car is a taxicab, a five-seated or a seven-seated touring car. His disregard of the difference between these vehicles cost him \$171 and court costs, and that is a lot of money to pay for a little town riding. Kohanyi had made an arrangement with the Prospect Auto Livery Co. to carry him around town at a flat rate of \$3 an hour, and when the company sent him a bill at a higher rate and amounting to \$171 he "kicked," claiming that the city ordinance regulating taxicab rates did not allow such high rentals to be charged. The livery company entered suit and the court decided that insofar as Kohanyi had ridden in big touring cars most of the time, the rate was not excessive and found against him.

Uncle Sam Tries Carrying His Postmen.

Having found the automobile very useful in transporting mail to and from the various substations to the main offices in a number of cities, the United States Post Office Department has extended the system to include the transportation of the letter carriers themselves to and from their outlying routes to the distributing offices, in the city of Washington, D. C. Three Franklin air cooled trucks are to be used in the service, and while the post officials consider the venture in the nature of an experiment, they are nevertheless confident it will work out successfully, as it will eliminate a good deal of the delay incident to delivery of letters by way of "Shank's mare."

When Mirror May Prove Bedazzling.

When driving at night mirrors which are fitted to permit the driver to see overtaking vehicles during the day should be covered, or if adjustable, they should be moved slightly. If they are allowed to remain uncovered in their regular position there is danger that the brilliant lights of overtaking cars may dazzle the driver and blind him temporarily.

MORE BEARINGS FROM FATHERLAND

**Norma Product in Both Ball and Roller Types Appears on American Market—
Their Special Features.**

In entering the field with the Norma ball and roller bearings, the Norma Co. of America, of which W. M. Nones is general manager, and which recently has been

BALL CAGE IN NORMA BEARINGS

formed with headquarters in New York City, has undertaken to introduce to the automobile industry in this country a product which already has become known

CROWNED OUTER ROLLER RACE

abroad and which is not without distinctive features of a radical nature. The bearings have been developed and are manufactured by the Norma Co., of Cannstatt-Stuttgart, Germany, which has disposed of

NORMA ROLLER BEARING

the American patents and rights to the American company.

The ball bearings differ from other types

principally in that the outer race is open on one side so that the parts can be mounted independently of each other and in undivided housings. They may be mounted either with or without allowance for lateral movement. The two races always are rigidly held. The ball cage is of brass and is ingeniously contrived to grip the balls at their axes of rotation. The cage is formed in channel section with the base of the channel lying parallel to the inner race and perforated at the proper points to permit the lower part of the balls to project through and touch the inner ball track. The sides of the channel are crimped over the balls just sufficiently to retain them without impeding their rotation.

Exceptional accuracy is claimed for the manufacture of the bearings as a result of the employment of methods of precision. They are supplied for light, medium and heavy duty and in all the usual diameters.

The Norma roller bearings are designed to interchange with annular ball bearings, particularly where space limitations prevent the safe application of the ball type of mounting. Owing to their greater contact areas the roller bearings are capable of sustaining more than twice the radial loads of ball bearings of the same race dimensions. Like the Norma ball bearings, they are not intended to take end thrusts, such duty being served by combining either type with special forms of ball thrusts. The roller bearings are of the open type with short, cylindrical rollers mounted in a steel cage of rigid construction. The races may be mounted independently, as in the case of the ball bearings, and the parts assembled with the shaft, or they may be mounted as complete units.

A special feature of the design, which is claimed to yield exceptional service qualities, is the crowning of the outer race by a very slight amount. As a result of this provision, the bearing is capable of withstanding inaccuracies of mounting, axial displacement, vibration and even such slight disalignment as may be caused by shaft flexure without binding, skewing or wedging and without increasing frictional resistance. Various sizes are produced in types suitable for either medium or heavy service.

Easy Way to Remove Remote Rivets.

Fortunately it seldom is necessary to remove one of the rivets from the frame of the car in connection with roadside or emergency repair work, but when such a problem is presented it sometimes proves exceedingly difficult owing to the remote location of the fastening. In such cases it is well to remember that it is not necessary to remove the entire head in order to release the parts. Simply file or chip away the rounded head parallel with the shank until a square or octagonal head remains. The rivet then may be readily driven out by means of a punch.

American Cars as Seen by Fair Eyes of Foreign Critics

That the American automobile designer is "master of the world" in the elimination of small noises, is the somewhat astonishing conclusion of Arthur Ludlow Clayden, the English authority, who also expresses the belief that the American engineer has much to learn in engine work. Clayden, while here as the guest of the Society of Automobile Engineers at its mid-summer meeting in Dayton, Ohio, last June, gave an address in which he drew interesting comparisons between practice here and in England. His maturer impressions, prepared for the information of his fellow-countrymen and published in the *Automobile Engineer*, of which he is editor, constitute a thoroughly professional tribute to automobile manufacture on this side of the water and are much fairer than usually comes from English pens.

"So far it has been customary to neglect American practice as being devoid of desirable originality," the British engineer declares, "but if this has been so in the past it will not be in the future, and it is even doubtful whether much has not been lost by us by lack of knowledge of transatlantic doings." To which radical preface he adds: "Many of our manufacturers know to their cost that the exports of cars from English ports to British colonies are not what they ought to be, that, despite even preferential tariffs, American competition has almost closed some British markets to British automobiles, and it has been customary to account for this by saying that American commercial activity is greater than British. A close study of American cars in service in their own country leads to the belief that this is not all; in some respects the average American car would be far better for service in, say, South Africa, than the average British chassis."

"It is doubtful whether the untraveled Englishman can ever really grasp the nature of the roads on which American cars do nine-tenths of their running. . . . It is not too much to say that the 'dirt' roads, which are the only kind found outside urban areas in America, are no smoother and no harder than an ordinary ploughed field. Over such surfaces cars are forced at high speeds with heavy loads, and yet even some of the lighter and cheaper models contrive to hold together for several years."

"To a British observer, sitting beside a rough American road and watching a number of cars passing to and fro, their most noticeable characteristics would be the noisy engines and the extremely silent chassis. The American designer has much

to learn in engine work, but he is master of the world in the elimination of small noises."

"Notwithstanding the constant and violent bumping neither squeaks nor rattles develop to the extent they would in a European car: in fact the few foreign cars met with occasionally in America are usually more noisy than the native product of like age. It is not too easy to account for this quality, especially when it is remembered that almost all American chassis have contracting band brakes on the rear hubs, but absence of squeaks certainly is due largely to the greater use of metal in body construction and the practice of mounting bodies either upon strips of leather or upon rubber studs, so insulating the metal chassis and wooden body frames. Dashboards, too, are usually built very strongly, and add considerable to the rigidity of the middle portion of the frame."

"Also there is no doubt that American leaf spring makers have been either particularly lucky or especially painstaking, for it is but seldom that a poorly sprung car is encountered—that is, for the long undulations of American roads. Springs, as a rule, have a narrow leaf and a large amplitude, with a distinctly low periodicity, while the use of shock absorbers or dashpots is common."

"Rattle is avoided by the elimination of many small parts and the large clearance allowed between such parts as brake-operating rods and levers and other chassis members. It is this, partly, which gives an impression of 'straggleness' to a British eye. Thus for American (or British Colonial) service the compactness and neatness of European design has undeniable drawbacks, because reduction of clearances calls for a greater rigidity if small sounds are to be avoided, and rigidity of frame, and of what might be called frame attachments, can result only in violent straining on roads where it is but seldom that two of the four wheels are on a level."

"Speaking broadly, it might be said that the European chassis is usually rigid from the front end of the engine to the rear of the gear box, a distance of about half the wheel base. In American cars there is a strong tendency to unify the crank case and gear box and to suspend it at three points, of which two almost coincide with the position of the dashboard on the frame. This reduces the rigid length to a matter of a few inches only, and whipping in the frame does no damage as long as it is within the limits of elasticity of the frame members."

"Another and different effect of the rough

roads is found in the steering gears on the cheaper cars, for these are undoubtedly much stouter and more generously proportioned than those on other than the better class of chassis here. Curiously, the ball thrust bearings in the front axle pivots, which are almost universal in Europe, are practically unknown in America, and the same applies to the bearings in the worm box, these also always being of the plain variety. In front axle design the American car possesses scarcely any peculiarities, though perhaps the tubular form finds more supporters there than here. . . .

"The matter of the attachment of the springs to front and rear axles has had perforce more thought than this important detail is wont to receive, inverted U clips of very stout section being employed almost universally, on which it is not altogether unusual to find a castle nut and split pin used. Transmission of the driving effort and resistance of the rear axle torque by the chassis springs is not uncommon, but a torque rod is more often employed, and quite often radius rods are used as well—far more frequently than is the case outside America. Opinion generally is entirely in favor of the torque rod, and when it is omitted cost has always been the reason. . . .

"To a British designer the American rear axle is an object of curious appearance, but this is due principally to the contracting band brakes on the hubs. Remove these and their apparent conglomeration of take-off springs, stops and operating levers and a more usual-looking axle will be found. Pressed steel casings are gaining rapidly in favor, but are usually welded in a vertical instead of a horizontal plane—a matter entirely of choice or convenience—and sometimes the center case is pressed steel riveted to tubular sleeves, and malleable cast iron is also used occasionally, thought not nearly so often as in Europe. The most favored type here, that with conical sleeves, flanged and bolted to a center case, is seen now and then, but not by any means frequently. Likewise it is scarcely usual to find the road wheels mounted outside the sleeves, the more favored method being that of placing a single bearing outside the sleeve and relying upon the driving shafts to secure the wheel in place. Certain axle manufacturers are, however, giving all their attention to the newer pattern, and it will probably gain support for this reason."

"The fact that a very large proportion of all the axles used are manufactured completely by specialists also results in the employment of practically identical axles

by a number of car makers, and there is no doubt that this has militated against changes in design. None the less it must be remembered that the axles of an American car have to withstand extremely violent shocks, and, as a car with a sagging rear axle is as rare a sight in America as elsewhere, it may be presumed that the axles of the parts makers are, at any rate, strong enough.

"Internal roller bearings are very much favored, in fact, they are used for rear axles and road hubs to a much greater extent than ball bearings. Adjustment of the housings of the bearings is always provided for with all the better class of cars, and on many of the cheaper types as well, for it is recognized everywhere that adjustment of both crown wheel and bevel pinion is necessary if silent working axles are to be obtained with the minimum of trouble. . .

. . . The axle arrangement whereby the differential may be removed without disturbance of the road wheels is encountered now and then, but not frequently. Likewise the expanding hub brakes, which are fitted as well as the contracting bands, are seldom so neat as they have become in Europe. Perhaps this can be accounted for by the fact that cleanliness of outline does not appeal very strongly to an American engineer . . . and that American automobile designers have had more important things than appearance to consider. . .

"There seems to be no well-known car in America with a transmission or gear shaft brake, the arrangement of external and internal shoes on the same rear hub drums being practically in universal employment. Seeing that the bad roads of the country provide an overpowering argument against the external hub brake, this radical departure from current practice is at first not easy to understand. Inquiry, however, has elicited the suggestion that it is due to the action of one of America's leading makers. This concern some years ago adopted a design of transmission which made the fitting of a propeller shaft brake practically impossible. It was therefore necessary to find every argument in favor of the double hub brakes, and this an advertising department did to such good purpose that the rest of the American makers were weak enough to copy the design—in some cases against their own better judgment."

The use of metallic packing for facing both bands and shoes of brakes is another point of diversity that elicits comment from the foreign designer. Durability, freedom from rattle and squeaking are among the resulting advantages which are recognized. The absence of front wheel brakes and the scarcity of hand adjustments for brakes also is observed, though it is remarked that as the latter are found now and then their popularity is likely to increase, "for nobody is quicker to adopt a good feature than the American designer—once he is convinced that the new feature is really

good and not an unnecessary extravagance."

Four-speed gear boxes with direct drive on high, as applied to "most of the very large cars," and the prevalence of three-speed gearsets on small and medium sized chassis call forth the comment that three-speed practice is "more easy to excuse in America" because the difficulties of the road prevent the frequent use of high gear ratios. Taken as a whole he thinks the difference between American and European cars in respect to gear noises is not very great. The problem of reducing transmission noises is less difficult in America, it would seem, because of the prevalence of slower engine speeds.

"Really, perhaps the most striking thing in connection with gears is the ability of the American maker to turn out an enormous number of cars in which no one is conspicuously less noisy or more noisy than the rest of its series," he goes on to say. "The writer believes that this is due principally to the use of larger pitches than are common here. . . . The effect of using such large teeth is two-fold, firstly by reducing the number of contacts made and broken per minute it lowers the 'note' of the gear, and, secondly, any inaccuracy either of tooth form (by warping in hardening) or in shaft spacing, is likely to be a very small matter by comparison with the size of the tooth, that is to say, an error in position or form of a thousandth of an inch is only half as important on a wheel with four-pitch teeth as it is on a wheel with eight-pitch teeth."

Partial hardening of gears and methods of truing gears warped in the hardening process appear to be unfamiliar to the foreign manufacturer. The practice of one American builder in testing his axle units in a series of sound-proof chambers, where the effect of adjustments to reduce gear noises immediately can be determined, elicits unfeigned amazement.

But however much respect he may have for American chassis design, it would seem that the American engine holds no charms for the English editor. Indeed, he does not hesitate to say that the average American engine "bears a close resemblance to the typically French designs of 1906-1909." "The high-speed engine and the long-stroke engine are practically unknown," he adds; "bearings are usually inadequate, timing gears are noisy, and most of the attachments and engine fittings are of a decidedly clumsy nature."

"It is difficult to write on this subject of American engine design without commenting on the extraordinary ignorance of American engineers concerning the detail of British or Continental work. This is, of course, probably more than equalled by our own lack of knowledge concerning American doings, but the Americans have avowedly studied and copied European work, whereas there are not many firms in this country who have taken their cue from

America. It appears that the only European cars which have been imported to any extent are the very largest and most expensive and, . . . , the largest and most expensive cars now made on this side of the Atlantic are nearly all of them extremely old fashioned in design, by reason of the fact that the demand for big cars has fallen off so enormously with the improvement of the 15-20 horsepower class. This is, of course, not so in America, for there very large and expensive cars still sell in enormous quantities. . . .

"Engines smaller than 4 inch bore are quite uncommon, and there is a strong tendency for any car of less power than about 40 brake horsepower to degenerate into more or less of a 'freak,' often with two horizontally opposed cylinders, an epicyclic transmission, and so forth. It is not meant to convey the impression that a car of this type is necessarily bad, because there are many answering this last description which give very good service. . . .

"For cylinders the multi-casting is only just coming into vogue, and one hears brought against it all the old arguments which were used here two or three years ago. Two-cylinder casting is most usual, but many cars are still turned out with separate single cylinders. There is reason to believe that American foundry work is not so good as our own; about in the same proportion as our own (taken all round) is not so good as French and Belgian work. This shows itself in the usually greater thickness of cylinder wall, while cylinders are far more often strengthened by thickening up the section than by the introduction of webs or fins. . . . Valve arrangement, too, makes for heavy cylinders, because the T-head system is standard practice, only a very few cars having the valves arranged all on the same side. The pistons also in American engines are immensely heavy; the material is always ordinary cast iron, and there are almost always four separate rings, spaced well apart, with a deep thick skirt flared at the bottom for strength. Close fits are the rule rather than the exception, though stepped tapering in grinding is often resorted to. In fact, studying the running of a comparatively long stroke four-inch engine in one of the manufacturer's experimental rooms, brought home to the writer very forcibly the enormous difference to the British engine in which the adoption of light, short, loose-fitting pistons has resulted."

"Connecting rods are almost always nickel steel stampings, and they, too, are quite needlessly strong and heavy. All this reciprocating weight does, however, result in the use of most generously proportioned crankshafts, but the low maximum speed of revolution which the heavy reciprocating parts compel, has led to the evolution of three and even two bearing designs with the almost total extinction of the five-bearing shaft. . . . For oil grooving

many different designs are in use, just as in this country, and no one of them appears to possess any outstanding advantages over the others. . . . Ball bearings are used in one of two engines, . . . but they are quite audible in running, while they are very large and correspondingly costly. . . .

"Of course, this simplification of the lubrication system assists greatly to cheapen the engines, not only by reducing the number of parts, but by lessening the complication of the crankcase castings. For the latter, aluminum alloy is always used, and the engine is almost invariably carried from the main frame. . . .

"To consider lubrication systems, the ideal, which in the writer's mind is a fully forced system, is as rare in America today as it was in Europe ten years ago, but the old-fashioned plain splash system is giving way to modifications which aim at controlling the amount of oil available by each cylinder. There is a strong tendency to divide the bottom half of the crankcase into separate divisions—one for each cylinder—and to feed these separately by an external supply pump. . . . In other words, in cars which pride themselves upon their lubrication system one finds a more or less faithful copy of a 1907 Mercedes system, while those who are less particular employ an adaptation of one or the other of the 'mechanical' lubricators commonly associated in Europe with the name of 'Dubrulle.' A very few firms are using the trough system with a circulating distributing pump, and no doubt the fact of the Stearns and Columbia companies having taken up the Knight engine will result in still further popularizing this particular method of oiling. . . .

"In cooling, the American designer has a much harder problem to attack than anyone in Europe, for the cooling system must be capable of performing satisfactorily in air temperatures varying from 40 degrees below zero up to more than 100 degrees above. . . . This being so, freezing troubles are very often heard of, and it is the absence of winter trouble that has been the war cry of the Franklin company, who have now for many years pinned their faith to an engine with forced circulation air cooling."

In respect to carburation he observes that the ability to procure fuel "at an average price of 5d. per gallon" has not encouraged manufacturers to elaborate carburettors to any great extent. "Only in quite a few instances are cars supplied with carburettors by their own makers; specializing firms with very large outputs controlling practically the whole of this manufacture. . . . Still, speaking generally, carburettors are of the crudest possible nature, few of them being comparable for a moment with any of the better known devices in England, from the point of view of either power, flexibility or economy."

"In silencer design no great differences

are apparent, except that the public demand and receive a very much smaller degree of excellence. Also an exhaust cut-out is fitted on every chassis, and is in use in 90 per cent. of country running by the majority of drivers. The reason for this is not easy to find, being, in fact, only capable of explanation on the assumption that the driver enjoys the noise created."

One point that the British critic does find in favor of the American engine, however, is that of the uniformity of the product—a characteristic that never ceases to amaze the European manufacturer of no matter what sort of machinery. The great care exercised in the balancing of fly wheels is one reason which he holds as partially accountable for the phenomenon. . . .

After remarking the general use of the leather-faced cone type of clutch, with the secondary importance of the multiple disk type, which correspond with practice abroad, he comments favorably on the so-called dry-plate type of clutch, which a number of American designers have now come to look on with favor. The cork insert plate clutch also impressed him as having good qualities. His frankest appreciation, however, is reserved for the typically American aluminum body, his observations concerning which are well worth repeating.

"It has already been remarked," he says, "that the American chassis is usually designed to be more or less flexible, and that the principal components are not so attached to the frame as to increase its natural rigidity. This being so, it is easy to see that special difficulties will be met with in making bodies, because, if the frame is to be allowed to whip, the body must bend as well. Now, with the ordinary European body, in which the strength is all supplied by wood, and the metal panels are mere loose insertions, continual stressing by frame flexion results in the more or less complete disintegration of the whole structure. The wood frames work loose at all their joints, the panels become loose in the wood, the doors jam or gape, and the whole body rattles and groans. To get over this, American engineers have given very serious attention to the problem and have produced bodies made, in some cases entirely of metal, and in other cases principally of metal, with the simplest possible strengthening. By far the most interesting bodies, however, are those employed exclusively by the Pierce-Arrow Company and by a few other concerns as well. These are made entirely of cast aluminum, and in an open body there will be about half a dozen castings. . . . Having of themselves no very great strength, this allows a sufficient movement in the door spaces to permit the frame to give without straining the body, and, for transverse vibration, there is a certain amount of elasticity in the aluminum itself sufficient to compensate for the flexion. As a result, cracks do not appear even after long use. . . .

"Another type of body, and this perhaps is the most extensively used, derives its strength from a wooden frame, but the whole of the exterior surface, including the beading, is hammered sheet aluminum. . . . Although such a body is not so strong as the cast aluminum structure, it possesses a more or less flexible surface entirely free from joints. Thus there is nowhere a chance for cracks to appear, and no wood-work to paint."

"Covered bodies are not very common, the landaulet being quite rare, and the limousine or coupe seems to be regarded as only suitable for use by elderly people or for purely town work. As the roads are bad enough to put serious difficulties in the way of the ordinary open-body builder, it is easy to see that the task for the constructor of the limousine is very hard indeed, and this perhaps accounts for the comparative scarcity of the closed body. Another point which must exercise some influence as well, is the popularity of horse drawn vehicles of the buggy type, in which there is no more shelter and protection for the occupants than that provided by a folding cape cart hood. . . .

"In curious contrast to the bodywork the wooden wheel is supreme in America, although there are indications that steel will replace it before very long. The wire wheel is more rare than it was in England in 1903, and the few sets which have been imported are regarded more as mechanical triumphs than practical improvements. Thus one designer told the writer that, although he had been experimenting with a set of British-made wire wheels for some time, he was afraid to use them when in very rough country, because they did not 'look strong.' In other quarters, however, it is realized that the strength of the steel wheel must result in its becoming universal sooner or later, and lateral rigidity is of such enormous importance on rough roads that the case for the steel wheel is twenty times as strong in America as in Europe. . . .

Whatever the shortcomings of present engine design, he thinks that development will be rapid in the future; several proposed new valve systems having attracted his attention while here. "Of course," he adds in respect to the trend of moment, "the adoption of long strokes will act again just as it has here, by producing lubrication, vibration and noise troubles; so it is likely to be quite three years before the average American engine is as good as is the average European engine now."

"In transmission work Europe is, of course, ahead in respect to worm drives, and the better success of many of the American firms in the endeavor to procure quiet running bevel gears will retard the adoption of the worm. Also the question of clearance between the axle and either the road or the floor boards counts for so much more in America that the difficulty of applying the worm is greater."

HERE IS GENUINE PATHFINDING

Seattle Motorist Undertakes Stupendous Task of Blazing Route to British Columbia—Purposes in View.

The word "pathfinder," which some sixty or eighty years ago really meant what it said—namely, the "finding" of a path

sible, and openly expressed their opinion that the pathfinders would never reach their goal. Nothing daunted, however, the party left Seattle on August 28th, to the tune of merry music and accompanied by a procession of a score of automobiles, headed by the mayor. At last reports, Sands still was deep in the wilderness. One of the purposes of the trip is to find a feasible route for the highway which is to be

by British Columbia; another purpose is to secure the glory and a handsome trophy offered by a Hazelton firm for the first motorist to complete the journey by the overland route.

Connecticut Carries Reciprocity Further.

Following the passage of amendments to the present motor vehicle laws in Connecticut, one of which was designed to prevent an owner or driver of a motor vehicle from being held up on a mere technical violation of the highway laws and permitting him to be released on his own cognizance, Secretary of State Rogers corresponded with the departments of Rhode Island, Massachusetts, Vermont, New York and Pennsylvania, asking that similar treatment of Connecticut owners be assured by the authorities of these States. Only Massachusetts, however, has been able to give this assurance, establishing a complete reciprocity agreement between these two States.

The Massachusetts Highway Commission has announced that if a Massachusetts operator should be arrested for any violation of the motor vehicle laws of Connecticut, and gives his own personal recognition to appear in court and does not appear as agreed, the commission, upon receiving proof of the facts, would consider such action a sufficient cause for revocation of the license or for the suspension of it for a period of at least sixty days.

As a matter of fact the commission has already taken this action in certain cases

SANDS AND HIS FLANDERS BLAZING WAY THROUGH VIRGIN FOREST

through trackless desert or forest—has been badly overworked since the automobile made its appearance, and now is so often applied to pleasure jaunts on well-made roads preparatory to "reliability runs" and endurance contests, where the terms "laying out a route" and "finding a path" are confused and wrongly used, that "pathfinding" has lost its meaning. The exploit of P. E. Sands in a Flanders "20" in the heart of the Canadian wilderness, however, comes nearer to real pathfinding than anything hitherto accomplished in this line. The accompanying photographs give some slight idea of the difficulties encountered and the obstacles to be overcome.

Sands is manager of the E-M-F Northwest Co., in Seattle, Wash., and his intention is to reach Hazelton in British Columbia, by the overland route, a mere matter of 1,000 miles of mountains and seemingly impenetrable forests. The car carries a complete outfit for temporary road making, for hewing a way through the forest, for blasting rocks, and even building bridges over mountain torrents. It weighs empty 1,675 pounds, but carries a load of almost a ton in weight.

When the plan first was discussed, the officials of British Columbia advised the E-M-F manager that the trip was impos-

FORDING A STREAM IN THE UNTRAVELED MOUNTAIN WASTES

constructed by the provincial government from the coast to Hazelton, and for which the funds already have been appropriated

where Massachusetts operators have not appeared when summoned by the courts of other States.

THAT'S WONDERFUL WHEN YOU CONSIDER that in these events, while entered only in her own class, her merit scores at the end make those of cars in the higher priced classes look cheap indeed.

TAKE THE TWIN CITY RUN—Minneapolis to Helena, Montana, over prairie trails and mountain passes, in which such cars as Packard, Stoddard-Dayton, Abbott-Detroit, Simplex, Maxwell, Cole, Krif, Hupmobile and other cars failed to finish with perfect scores, and two out of three Flanders "20's" did.

IS PRICE ANY INDICATION of the road ability, the staying qualities, the reliability and the capacity for standing hard knocks?—surely not in view of these splendid victories of this "20" horse-power \$800 car.

NO, IT CERTAINLY IS NOT—we have never claimed that the E-M-F "30" was a better car than the three speed Flanders "20." The thirty is a little larger—ten inches longer wheel base, will go faster—say 55 miles per hour as against the 47 that any Flanders Touring car will go; but it won't—and no car made will—climb a hill better; it won't—and no car made will—stand rougher usage or perform so well month in month out with so little care or attention or expense.

FLANDERS "20" IS MADE OF SAME high grade steels—the best the science of metallurgy knows how to produce—by the same careful methods and in the largest plant in the world devoted to the making of one model. We make every part—"from pig iron and the raw steel bar to the finished car." And we guarantee every car for a year, giving the buyer a bond signed by General Manager Walter E. Flanders himself.

FLANDERS "20" IS YOUR CAR—it is the ideal car for the man who does not feel he can afford, or who does not care to pay more than \$1,000 into an automobile—whether it be the one car he and his family shall use for all purposes, or an auxiliary car for the rich man who wishes to save his big, expensive, more cumbersome touring car or limousine.

DELIVERIES—YES, THAT'S THE ONLY TROUBLE—we can't seem to catch up with the demand—can't promise you immediate delivery. August was the biggest month in our history. September will surpass it by 500 cars—shipping 125 Flanders "20" cars per day now and increasing our factory facilities just as fast as we can. Bought the original Ford plant last month and putting on 1,000 more men. This will increase our output 20 per cent. Trying our best to catch up—but people have come to appreciate this car and the demand still leads the supply.

ONLY WAY IS TO SEE YOUR LOCAL DEALER at once. Get your order in, pay a deposit, so the order will be sent to the factory and given its regular serial number—then you won't have to wait long. Every day's delay in placing the order makes two more days' delay in getting the car, for Flanders "20" is carrying everything before her, and the "tin cars" are losing ground fast. Flanders "20" has the call—but if you hurry you'll be "lucky."

NOW THIS IS ONLY ONE of several great feats the new three speed Flanders "20" has performed during these past few weeks. We set out to show that in this three speed, fore-door model we have a car that has not a superior in the world—and not an equal outside of our own E-M-F "30." The staying qualities, speed and hill climbing ability of which is so well known that it no longer needs demonstrating.

JUST LISTEN TO THIS: Flanders "20" has won every event she has entered—has more reliability runs, more hill climbs to her credit than any other car this season. Not a day passes but she adds one or two more victories to her credit—one or two more trophies to her collection.

Flanders "20" Wins

1. **IOWA'S LITTLE GLIDDEN:** Flanders "20" made three perfect road scores out of a possible three. Going some!
2. **TWIN CITIES TO HELENA, MONTANA:** 1,390 miles over prairie trails and mountain passes—mud—hub deep in places. \$4,000 cars succumbed to the difficulties—Flanders "20" won 1st and 2nd—all the prizes there were.
3. **DEAD HORSE HILL:** At Worcester, Mass. This is America's Greatest Annual Hill Climbing Contest. Flanders "20" won first, clipping 47 seconds off previous record and making her nearest competitor look like an also-ran.
4. **ST. LOUIS TO KANSAS CITY Reliability Run:** Flanders "20" won 1st with score of 998 out of possible 1,000. Other cars penalized 150 to 999 points—and out.
5. **BUFFALO ENDURANCE RUN:** A test devised to eliminate all if possible. Proved to be four days of mud plugging—that's nuts for Flanders "20." Won first—of course.
6. **NEWPORT HILL CLIMB:** This was not a sanctioned meet but is the biggest event of the year in Indiana—worst hill in the state. An owner entered his own car—and he not only won in his class, but made a clean sweep of seven straight events in larger car classes. A 90 horse power Knox beat her time 2 seconds—hooray!
7. **DES MOINES, IOWA—Speed Event:** Two special racing cars came to town—fine frameup for a record. Dealer took stock car off the showroom floor—and cleaned them up—1st easily.
8. **SEATTLE TO HAZELTON, B. C.:** This was not a contest—for the very good reason that no other car has ever dared attempt the trip for gold medal offered two years ago. Flanders "20" went after it—through the wilderness. Brought it back, of course. This will long stand as a record of endurance for motor cars of any power or price.
9. **PATHFINDER FOR GLIDDEN TOUR—**first official car over the "Dixie Trail"—New York to Jacksonville, 1,490 miles in 10 days—average 149 miles a day. Chairman Butler of the A. A. A. says the cleanest job ever done in laying out a Glidden Route—a wonderful car.

and other data must be gotten out. We can't allow more than sixteen days of that for the pathfinding."

"WHY, WHAT DID YOU EXPECT, MR. BUTLER?" asked Driver Soules, who feared he had misunderstood his instructions—and Soules never does that.

"WHY I EXPECTED an E-M-F '30"—the old war horse that has laid out so many routes. I surely did not expect a smaller car and I am surprised that W. E. Flanders, Manager of the Studebaker automobile business would risk his and their reputation with the 2,600 dealers of the Studebaker Corporation in such an important event on so light a car. What will a 20 horse-power car do on the slippery clay roads of North Carolina and the sand trails of Florida? Why—!"

"WHAT WILL SHE DO?" asked Soules—now thoroughly on his mettle—"I'll tell you what she'll do, Mr. Butler: She'll make the \$5,000 cars that have laid out former Glidden Tours look like thirty cents—plugged."

"WHAT WILL SHE DO?"—you say you can only allow sixteen days; that's an average of eighty-five miles per day. We—this little three speed car and me—will take your official party over that route on the tour schedule—that's ten days—and we will give them as comfortable a ride as they ever had—and we won't be late for supper once."

"WHY, THE E-M-F '30' TOOK 38 DAYS to cover the 2,600 miles from Detroit to Denver and return when pathfinding for the 1909 Glidden," said the chairman. "And that was a great performance." "That's true, Mr. Butler, but we make wonderfully good cars nowadays. That's just what we are going to prove to you."

"YOU'RE ALL RIGHT, SOULES," exclaimed the Chairman enthusiastically now. "You have the right spirit and it is very evident you believe in your Flanders '20.' Go to it—and if you do the trick, hanged if I won't buy one—I begin to like the looks of her. She certainly is a trim looking little rig."

DRIVER SOULES WAS PLEASED—but he took issue with the chairman on one point. She isn't so "little." Mr. Chairman—she has 102 inch wheel base; will carry five just as easily as four, and we'll show you there's the biggest 20 horse-power under that bonnet you ever saw in a car.

WELL, TO MAKE A LONG STORY SHORT, she did it and she did it magnificently. Each succeeding day when Pathfinder Westgard wired the head office the surprise of Chairman Butler and his associates became greater.

STUDEBAKER CORPORATION
E-M-F Factories, Detroit, Mich.

995,450. Storm Apron for Vehicles. Oliver P. Fritchle, Denver, Colo., assignor to Fritchle Automobile & Battery Co., Denver, Colo., a Corporation of Colorado. Filed Jan. 18, 1909. Serial No. 472,852.

1. The combination with a vehicle of a storm apron comprising two portions flexibly connected along an upwardly curved line, the lower portion of said apron being fastened at its lower edge to the inside of the vehicle, and co-operating detachable means for securing to the hood or top of the vehicle, the upper part of the lower portion of said apron and the free edges of the upper portion.

995,468. Nut Lock. William F. Kenney, Providence, R. I. Filed Nov. 22, 1909. Serial No. 529,474.

1. In a nut lock, the combination of a bolt having upon its exterior both right and left hand screw threads, with a holding nut and a locking nut fitting the said screw threads of the bolt, respectively, one of the nuts being provided with an externally screw-threaded tenon, and the other with an internal screw thread, and also with an internal bearing shoulder adapted for engagement with the said tenon, the said engaging parts of the nuts being screwed up to contact with each other when the nut lock is in use, whereby backlash in the action of the nut lock will be prevented.

995,471. Roller-Bearing with Looped Cage. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Company, Harrison, N. J., a Corporation of New Jersey. Filed June 18, 1910. Serial No. 567,548.

1. In a roller bearing, the combination, with inclined bearing seats and a series of inclined tapering rolls converging toward a common center, of a sheet metal cage comprising a series of integrally connected loops with sides inclined toward a common center and extended the entire length of the rolls.

995,482. Automatic Reversing Switch for Gas Engines. James M. Rhett, Beaufort, S. C. Filed Oct. 15, 1910. Serial No. 587,276.

1. In a reversing switch for gas engines the combination of a sparking circuit; magnetic means for breaking said circuit; means for controlling the action of said magnetic means; and means for locking said magnetic means and automatically releasing the same after a predetermined interval, substantially as described.

995,484. Valve. Lee H. Rogers, Parsons, Kan. Filed Feb. 21, 1911. Serial No. 609,975.

1. A valve of the character described comprising a case consisting of a body portion and an interior tubular extension formed on the wall of the body portion, a seat member removably arranged in the valve case, the seat thereof being disposed in spaced relation to the open end of said tubular extension, and a spring seated valve member movable in the tubular extension, said valve member having a tubular portion

to receive the end of the seat member, substantially as and for the purpose specified.

995,489. Ignition System for Internal Combustion Engines. Claude L. Silva, San Diego, Cal., assignor of twenty-five and one-half one-hundredths to Percy J. Benbough and forty-nine one-hundredths to H. Coon, John A. Gillons, Clair A. Nelson, N. H. Hargrave, W. V. O'Farrell, D. A. Garra, Lyman P. Owen, A. O. Walker, N. D. Kuhlman, F. M. Madison, V. E. Hawkins, I. T. Brockett, and P. J. Benbough, San Diego, Cal. Filed Feb. 23, 1910. Serial No. 545,268.

1. In an ignition system, a current source, two condensers in series having their neutral point grounded and their free terminals connected to the current source, an induction coil having its primary and secondary wiring connected to a pole of the current source, an ignition device in the second circuit, and a timer in the primary circuit.

995,490. Ignition System for Internal Combustion Engines. Claude L. Silva, San Diego, Cal., assignor of twenty-five and one-half one-hundredths to Percy J. Benbough and forty-nine one-hundredths to H. Coon, John A. Gillons, Clair A. Nelson, N. H. Hargrave, W. V. O'Farrell, D. A. Garra, Lyman P. Owen, A. O. Walker, N. D. Kuhlman, F. M. Madison, V. E. Hawkins, I. T. Brockett, and P. J. Benbough, San Diego, Cal. Filed Feb. 23, 1910. Serial No. 545,269.

1. In an electric ignition system, twin condensers connected in series, a charging circuit to which the free terminals of the condensers are connected, ignition coils having their primaries connected, respectively, to opposite sides of the charging circuit, and each of said primaries being also connected to the neutral point of the condensers, and a timer in the circuits of the primaries, said timer being located between the primaries and their connections with the aforesaid charging circuit, for alternately closing the primary circuits.

995,502. Automobile Wheel with Pneumatic and Spring Hub. Charles E. Wade, Masonville, and Charles J. Lagerwall, New York, N. Y. Filed Oct. 19, 1910. Serial No. 587,905.

1. In a device of the class described, an inner hub; an auxiliary rim; a movable member seated in the hub for sliding movement in one direction; a plate applied to the rim and provided with inwardly projecting lugs; guides secured to the lugs and adapted to receive the movable member for sliding movement in another direction; yieldable means for limiting the sliding movement of the movable member; there being communicating oil ways in the guides and in the movable member accessible from the exterior of the device, and discharging between the movable member and the hub.

995,521. Gasolene Separator. Joseph Buhr, Norwood, Ohio. Filed Mar. 11, 1911. Serial No. 613,880.

1. In a gasolene separator, a receptacle for the liquid to be treated, and a plurality of vertical partitions dividing the receptacle into compartments, with free passageways at the bottom of the partitions, and a supply pipe opening into the upper end of one of said compartments, with openings into

the upper end of the adjoining compartments, and a discharge opening from the receptacle below the level of the openings in the partition, and another discharge opening from the receptacle substantially on a line with said partition openings.

995,530. Internal Combustion Engine. Claude M. Garland, Urbana, Ill. Filed July 5, 1910. Serial No. 570,346.

In an internal combustion engine of the character described, a substantially horizontally arranged explosion cylinder provided with inlet and exhaust means, valves to control said means, a lever having pivotal connection intermediate its ends with said explosion cylinder, and disposed to operate one of said valves, means to operate said lever synchronously with the speed of the engine, a bracket rigidly connected with said cylinder, a pump connected with said bracket, connecting means between said pump and lever, a tank having communication with said pump, a three-way valve structure, a conduit connecting said valve structure and pump, a by-pass conduit connecting said valve structure and tank, a conduit connected with said valve structure and having its discharge end extending through the explosion cylinder for supplying a cooling medium within said cylinder at a point near the forward end of the same, a centrifugal governor to actuate said three-way valve structure, an outer casing surrounding the explosion cylinder for forming a water space therebetween, a conduit for establishing communication between said water space and tank, a conduit for supplying material within the outer casing, and a check valve connected with the third named conduit.

995,543. Sparking Plug. Emil Kuhn, Stafa, Switzerland. Original application filed May 21, 1910. Serial No. 562,686. Divided and this application filed Nov. 22, 1910. Serial No. 593,659.

1. In a sparking plug the combination of a steel body provided with external and internal screw threads, an insulator connected with said steel body said insulator having a central bore, an electrode movably arranged in said insulator, a head on said electrode provided with threads adjacent the internal threads of the steel body, a cap screwed on said insulator, a spring abutting against said cap and said electrode, and a wire terminal connected electrically with said electrode.

995,547. Starting Device for Explosive Engines. Arthur Mason, Pike, N. Y., assignor of one-half to John A. Levis and one-eighth to Howard W. Shannon, Rochester, N. Y. Filed Apr. 27, 1910. Serial No. 558,038.

1. In a starting mechanism for explosive engines, the combination with a clutch member adapted to turn with the engine shaft, of a crank arm adapted to extend radially of the shaft and mounted to swing loosely on the latter, a handle portion on the crank arm having a normal position substantially parallel with the shaft and movable angularly with relation thereto and a second clutch member rotatable with the crank arm about the axis of the shaft, and co-operating normally with the first, the handle portion and one of the clutch members being operatively connected so that the latter moves out of co-operation with the other clutch member when the handle portion is turned angularly with respect to the shaft.

995,608. Wheel Hub and Axle Bearing. Herbert Kintz, Sharpsburg, and John P. McConnell, Pittsburg, Pa. Filed Feb. 16, 1910. Serial No. 544,248.

1. In a vehicle hub, an axle, bearing blocks rotatable on the axle, a drum concentric with the axle and having shoulders on its inner circumferential surface and having U-shaped apertures formed between said shoulders, plates slidable on said shoulders and each having a hole therethrough, radially disposed pins fixed to said bearing blocks and entering said apertures through said holes, said pins being of less radial extent than the internal radii of said inner surface, to allow limited play of the bearing blocks relative to the drum, and springs

around said pins interposed between said plates and said bearing blocks for absorbing shock substantially as specified.

995,573. Resilient Tire. George W. Rowell, Portales, N. Mex. Filed Dec. 5, 1910. Serial No. 595,753.

1. A resilient tire for vehicle wheels comprising an inner casing, a series of radially projecting inner spring holding plates secured to said casing, a series of guide plates arranged in said casing between said inner spring holding plates, a series of coiled springs arranged between said holding plates and engaged with said guide plates, a series of outer holding plates adapted to be engaged with the outer ends of said

springs whereby the latter are connected and held in position in said casing, an outer casing adapted to be engaged with the outer ends of said springs, and means to hold said casing in operative engagement with the springs.

995,552. Transmission Gearing. Alden E. Osborn, New York, N. Y. Filed June 4, 1908. Serial No. 436,552.

1. In a transmission gearing the combination of a gear system, a movable mount having connection with an element thereof, means for restraining at will the motion of the mount, and controllable means for positively driving the mount independently of the action of the gear system but at a differing speed therefrom.

WANTED—Young Men

To manage branch stores which we will open in the near future. Those thoroughly acquainted with automobile supply business. In answering state age, whether married or single, experience, give names of houses worked for and length of time with each firm. Give references. Address by letter only.

CHAS. E. MILLER, 97 Reade St., New York City

FIAT

"THE MASTER CAR"

35 H. P., \$4,500, Open Bodies; \$5,500, Limousine Bodies

(Completely Equipped)

The Fiat Agency Policy Is One of Permanency

POUGHKEEPSIE

F.I.A.T.

NEW YORK

Runmobile

Prices include complete equipment of fore-doors, top, windshield, gas lamps, generator, three oil lamps, horn and seat. All models have 4-cylinder, 20 h. p. motor, sliding gears and Bosch magneto.

Runabout	\$750	Touring Car	\$900
Torpedo	\$850	Coupe	\$1,100

Fore-doors on Runabout and Touring Car.

HUPP MOTOR CAR COMPANY
1254 Jefferson Avenue Detroit, Michigan

WINTON SIX

The Six that Converted the Industry

The Winton Company was the first company in the world to make Sixes exclusively. For years it was the only company that dared declare the six superior to all other types. Today many makes are advertising sixes, because the Winton Six convinced them that the Six is the one superior car. The car that converted the industry is the safe car for you to buy. 48 H. P., self-cracking motor, \$3000. Send for catalog.

The Winton Motor Car. Co.

426 Berea Road, Cleveland, O.

SHAWMUT TIRES

SOLD EVERYWHERE

SHAWMUT TIRE CO., Boston, Mass.

B & L CASTOR

The B & L Castor Front Axle

WILL BE MANUFACTURED BY

Weston-Mott Co.

FLINT, MICHIGAN

who are one of the oldest, largest and best known axle manufacturers in the world.

The Weston-Mott Company's engineers made careful, exhaustive tests of the B & L Castor Front Axle and substantiated all of our claims before they would consider making them.

This gives you the assurance that you get the best of mechanical construction, backed by the experience that thirty years of axle making is bound to produce.

This means to the manufacturer that he can have the B & L Castor Front Axle made by the same firm who makes his rear axles, and whom he knows to be one of the most reliable in the business today.

MOTOR THE WORLD

Vol. XXIX.

New York, U. S. A., Thursday, October 5, 1911.

No. 2

TO LITIGATE SHAFT DRIVE PATENTS

Baker Brings Two of Them to Bear and Files Suits for Infringement—Concerns Only Electric Vehicles.

Quite unexpectedly the shaft drive, as applied to electric vehicles, has become a matter of litigation, which, it is intimated, may prove to be of a widespread nature. The Baker Motor Vehicle Co., of Cleveland, O., is the aggressor in the matter, and while it does not claim that the shaft drive is a matter of basic patent, or that its construction has been infringed by all manufacturers of all electric vehicles, it asserts that there are a number of such infringements, and it has inaugurated proceedings by instituting suit against two of its alleged infringers, the Rauch & Lang Carriage Co. and the Broc Electric Vehicle Co., both located in Cleveland.

The suits which were filed in the United States Circuit Court in that city, allege infringement of patent No. 960,897, covering "running gear construction," and No. 987,358, covering an "electric motor vehicle," both of which were issued during 1910 to Emil Gruenfeldt and by him assigned to the Baker company. Gruenfeldt, who several years ago came to this country from the German Daimler works, is the Baker company's engineer.

Lewis Takes Over Its Own Sales.

The Lewis Spring and Axle Co., of Jackson, Mich., has not only terminated its selling arrangement with the American Distributing Co., but has taken over the office and display rooms at 1003 Woodward avenue, in Detroit, which previously were occupied by the distributing company. The Lewis people have also transferred their mechanical expert, J. D. Linderman, to the Detroit office, where he will be stationed at all times. Incidentally, the company has found it necessary to add 60,000 square feet floor space to its factory in Jackson,

which makes a total of 360,000 square feet devoted entirely to the production of automobile springs, axles, transmissions, etc.

Newerf to Make Tires in California.

W. D. Newerf, who for many years has been engaged in the sale of tires on the Pacific coast, and who at present maintains a large establishment in Los Angeles, is credited with having practically completed arrangements for the erection and operation of a full fledged tire factory on the Coast, the exact location being one of the few things that remain to be settled. It is stated that he already has contracted for the necessary machinery and for the services of an experienced superintendent.

Two Motor Truck Projects in Marion.

The Harwood-Barley Mfg. Co., of Marion, Ind., has added motor trucks to its other productions; for the purpose it has acquired a disused brass bed factory in West Marion. George R. Sheldon, representing several residents of Marion, also is concerned with a motor truck project. He has made an offer for the plant of the Indiana Auto Parts Co., which has been in the hands of a receiver for about a year, and if the offer is accepted a company will be formed to build trucks therein.

Immels Take Up the Electric Truck.

John Immel & Sons, of Columbus, O., who are among the oldest manufacturers of horse-drawn vehicles in that State, are about to engage in the manufacture of electric trucks, and will also establish a department for the repair and repainting of automobiles of all sorts. To serve those purposes they are having plans drawn for the erection of a 62x85 feet addition to their present plant on Fulton street.

Splitdorf Locates Branch in London.

Charles F. Splitdorf, the well-known New York ignition specialist, has established a London branch at 41 Great Portland street W. C. It is his purpose to push the sale of everything from the Splitdorf magneto to the Splitdorf spark plug.

SHOW QUESTION SETTLING ITSELF

N. A. A. M. Practically Assumes Control and One Show Era Is in Plain Sight—Makes Its First Allotments.

With the abandonment of the so-called independent show, which was to have been held in Grand Central Palace, New York, in January next, and with the future of its promoter, the Automobile Manufacturers' Association of America, in doubt, and with the end of Madison Square Garden also in sight, matters rapidly are shaping themselves toward that desideratum, one show, open to all. In fact, they already have so well shaped themselves that this week the National Association of Automobile Manufacturers made known that in 1913 there will be but one show in New York.

With the demolition of Madison Square Garden, which will begin in February next, Grand Central Palace will be the only show building remaining, and as S. A. Miles, general manager of the N. A. A. M., is president also of the exhibition company, which practically controls the Palace, that the New York shows of the future will be held under the auspices of the N. A. A. M. is plain to be seen. Indeed, it is well known that even in the Automobile Board of Trade the opinion has been so strong that the promotion of shows should be turned over to the National Association of Automobile Manufacturers, which includes practically all of the Board of Trade members, that the Board of Trade may be expected shortly to take action formally expressing this opinion.

Manufacturers of cars already have been allotted space in the last Board of Trade show which will be held in Madison Square Garden in January next, and yesterday space was similarly apportioned for the N. A. A. M. show in Grand Central Palace, and also for the Chicago show. For the Palace show 32 allotments for exhibits of passenger cars and 22 for commercial

vehicles were made. For space in Part I—pleasure cars—in the Chicago show, there were 102 applicants, of which 68 are members of the N. A. A. M. and 34 are outsiders. For space in Part II—commercial vehicles—there were 24 applications from N. A. A. M. members and 28 from outsiders, a total of 52. While there will be such that any considerable number of late comers will swamp the management.

The apportionment of space for accessory exhibits has not yet been made for any of the shows, and will not be made until the Motor and Accessory Manufacturers have taken care of their members.

Buffalo League May Build Tire Factory.

According to reports printed in Buffalo, N. Y., the International Automobile League Tire and Repair Co., which was incorporated last year by the proprietors of the International Automobile League, has purchased a tract of land, having a frontage of 750 feet at Northland avenue and Chelsea Place, Buffalo, on which, it is alleged, it will erect a \$600,000 tire factory. Whether the league graciously will permit its "members" to purchase stock has not yet developed. The league, which, despite its title, is a one-man corporation, has on several occasions obtained undesirable publicity and many times has been charged with peculiar practices. Only a few months since it was brought into court by one of its "members," who alleged that an old tire had been palmed off on him as a new one.

Moreland Completes His Truck Company.

Watt L. Moreland, the Los Angeles designer, who has evolved a truck incorporating a number of special features, has completed the organization of the company which will manufacture it. It is styled the Moreland Motor Truck Co., and has elected these officers: R. H. Raphael, president; C. J. Kubach, vice-president; Sheldon Morris, secretary and treasurer; Watt J. Moreland, general manager. Ground has been broken for the erection of a factory in Los Angeles, at Main and Wilhardt streets. It will have a capacity for 300 trucks per year. Not the least interesting of Moreland's inventions which will be applied to his vehicle is a gasifier attached to a standard carburetter, which permits the use of fuel distillates other than gasoline.

Elkhart Finally is Adjudged Bankrupt.

The Elkhart Motor Car Co., of Elkhart, Ind., against which a petition in bankruptcy was filed in June last, has, after a lapse of several months, been adjudged a bankrupt; a meeting of its creditors has been called for the 7th inst., when a trustee will be selected. At the time the petition was filed, the Elkhart company, alleging that it was solvent, asked for a jury trial, but later withdrew its application. Shortly before the petition was filed against it, the Elkhart company disposed of its plant to

the Elmer Auto Corporation, which now has a six-cylinder car, styled the Lohr, almost ready for the market.

Changes Among Prominent Tradesmen.

Bert S. Bingham, who for two years has been Pacific Coast manager for the Regal Motor Car Co., of Detroit, has been transferred to New York, where he will have charge of the company's Eastern district. He already has assumed the duties.

Homer C. Lathrop, who has been identified with the organization since its inception, has been elected secretary-treasurer of the Henderson Motor Sales Co., of Indianapolis, distributors of Cole cars. He succeeds his father, Dr. H. L. Lathrop, who resigned to devote himself wholly to his banking interests.

H. A. Goddard, who for several years was in charge of the automobile department of the Chicago Evening American, has been appointed general sales manager of the Gramm Motor Truck Co., of Lima, O. He got busy at once, sailing on Thursday last to Europe to study foreign conditions, with a view of enlarging the market for Gramm trucks.

E. Louis Kuhns, for many years manager of the Studebaker Corporation's Chicago establishment, has been advanced to the management of the big company's New York depot. Lafayette Markle, assistant sales manager of the Studebaker Detroit factory, succeeds to the vacancy created by Kuhns' promotion. H. E. Westerdale remains assistant manager of the Chicago branch.

Berton B. Bales has resigned the presidency of the American Automobile Mfg. Co., of Louisville, Ky., and New Albany, Ind., and will be succeeded by George H. Wilson, of the former city. The company, which transported a Jonz car and some Jonz machinery from Beatrice, Neb., about a year ago, has not been very active in the industry despite the publication of the most elaborate and highly-pitched catalog that ever offered automobile shares to the public.

George Collister Claimed by Death.

George Collister, of the firm Collister & Sayle, Cleveland, O., and one of the best-known dealers in the East, died at his home in that city Tuesday last, 3rd inst. Bright's disease complicated by heart trouble caused his death. Collister was one of the many bicycle pioneers who early gravitated into the automobile business. At all times he was an active man, who usually was present wherever there was "something doing," and because of the fact few retailers were more widely known in either the bicycle or automobile trades.

Coffin Chosen to Speak in London.

Howard E. Coffin, chief engineer of the Hudson Motor Car Co., and former president of the Society of Automobile Engi-

neers, has been selected as the American representative who will deliver an address at the joint technical meeting with the English Institution of Automobile Engineers, which will be a feature of the S. A. E.'s visit to Europe next month. "Chassis Design" will be the subject which Coffin will handle, that being a point in which some European authorities consider Americans lead the world. The joint technical session at which Coffin will deliver his address will occur in London November 8th.

Ricketts Seeks to Form Third Company.

J. W. Ricketts, who, when located in South Bend, Ind., successively organized the Ricketts Automobile Co. and the Diamond Automobile Co., both of which went bankrupt, is endeavoring to form what will be known as the States Motor Car Co., in Michigan City, Ind. It proposes to acquire some of the machinery which at present reposes in the idle plant in South Bend and to use it to produce a \$450 runabout.

Bankruptcy Action Follows Van Receiver.

Bankruptcy proceedings have been instituted in the United States Circuit Court against the Van Motor Car Co., of Grand Haven, Mich., which in July last got into financial difficulty which led to the appointment of a receiver by the State court. The company built a low-priced runabout, and although it made no great headway it is alleged to have amassed liabilities of \$85,000. Its assets are placed at \$45,000.

Coates-Goshen Claimed to Be Bankrupt.

The Coates-Goshen Co., of Goshen, N. Y., the principals of which once built a car of that name, which latterly has done chiefly a retail or small jobbing business in supplies, has been petitioned into bankruptcy by the Michelin Tire Co. and two other creditors. It is alleged that the company on September 2nd admitted in writing its inability to meet its obligations. Its assets are estimated at \$9,000.

Lippard-Stewart Leases Buffalo Plant.

The Lippard-Stewart Motor Car Co., of Buffalo, which recently was formed to manufacture trucks, has leased the plant in Buffalo formerly occupied by the Thomas Taxicab Co. It took possession on the 1st inst., and it now installing the necessary machinery. Additional capital which has been invested in the company during recent weeks has permitted it to enlarge its plans considerably.

Hupp Opens a Branch in New York.

The Hupp Corporation, of Detroit, has opened a New York branch at 1989 Broadway, in the building previously occupied by the bankrupt Carhartt Automobile Sales Co., where both the R. C. H. gasoline car and the Hupp-Yeats electric will be shown. The branch is in charge of R. J. Lacair, who previously was New York manager for the Metzger Motor Car Co.

WANTS TRADE TO SELL INSURANCE

Philadelphia Dealers Give New Project a Boost—Insurance Policies That Would Be Handled Like Accessories.

Taking the ground that the big insurance companies at present writing automobile insurance policies are badly messing things up and are raising their rates to unreasonable altitudes in order to cover up their mistake and make a big profit, a group of Philadelphia insurance experts have interested a number of Philadelphia dealers and have brought about the organization of a new automobile insurance enterprise, the stock of which is to be owned by automobile manufacturers and dealers, who will direct its management.

In order to cover the legal situation, two corporations are being created, one for the purpose of writing fire insurance and the other for casualty and liability, but the two companies will be as one, from a practical standpoint. Two charters are necessary because the law does not permit a liability company to write fire insurance, and vice versa.

The names selected are the Manufacturers and Dealers Motor Fire Insurance Co. and the Manufacturers and Dealers Motor Casualty Co., and, according to the promoters of the project, the companies are not only to write automobile insurance all over the United States, but are to exert powerful beneficial effects on motoring in general, not only in relation to the trade but to the public. In fact, some of the intended features of the concern's operation are almost altruistic in their nature. An organization committee already has been created with the following members:

George W. Hipple, president of the Philadelphia Automobile Trade Association, chairman; Ernest H. Greenwood, insurance expert, secretary; A. E. Maltby, manager of the Winton Motor Carriage Co.'s Philadelphia branch; E. B. Jackson, of the Packard company; W. P. Berrien, of the Stoddard-Dayton, and W. G. Foss, treasurer of the Foss-Hughes Motor Car Co., which handles the Pierce-Arrow in Philadelphia.

With this as a beginning, the organizers, of whom Ernest H. Greenwood is one of the most active, hope to interest motor car manufacturers and dealers throughout the country in taking stock in the combined companies, which will have a total capitalization of \$1,000,000. The manufacturers as a class already have been approached on the subject, and at the last meeting of the Automobile Board of Trade in New York City the Philadelphia men were given an audience and submitted their proposal, which, however, the Board of Trade referred to its conference committee. The plans for the project con-

plate a reduced cost of automobile insurance to the automobile owner; control of automobile insurance by the automobile trade; profits, which hitherto have gone to non-specializing insurance companies, to be diverted to the automobile trade; control of insured cars by manufacturer and dealer, and the elimination of the driver who makes "criminal" use of the public highway.

It is proposed that agents and dealers in automobiles shall act as agents for the companies, offering the insurance at the time of making a sale of a car. Beyond this there is to be no field force and no agents, nor will insurance be accepted through insurance brokers. There are to be supervisors, however, in each of the larger cities. The district manager in each of the larger centers will organize his local force from the dealers. It is planned that the active management or operation of the enterprises shall be in the hands of skilled and experienced insurance men employed for the purpose, but that the board of directors and executive committee will be made up of automobile men.

Advantage is claimed over the companies now writing automobile insurance by reason of the fact that with the latter "there is no attempt at standardization, no classification of risks, simply a blind tendency to raise rates, which are already too high." As against this, "these allied companies propose to make the moral risk the key to their entire plan." This means a strict classification of risks, depending upon the "moral standing" of the applicant for a policy, so far as concerns business honesty, operation of his car, and a regard for legal regulations. When an insured car is damaged, it is to be returned to the manufacturer himself or one of his authorized agencies, so that it may be properly repaired or rebuilt, thus "protecting his name," instead of being sent to some irresponsible shop for patching up.

Representing that "an insurance company is the only corporate organization which is in a position to demand an enforcement of the regulations governing the speed of motor cars on the public highways," the projectors propose to place a metal tag on each of its insured cars, so that violations of the contract of insurance by an owner will easily be spotted. The companies' recommendations as to road and motor vehicle legislation are also expected to have great weight with municipal and State governing bodies. Dividends to policy holders are to be paid out of surplus profits, after "reasonable dividends" to stockholders.

Col. George Pope Takes Vacation Abroad.

Col. George Pope, treasurer of the Pope Mfg. Co., and chairman of the Board of Trade show committee, sailed yesterday to Europe for a vacation. He will be absent about five weeks.

NOT EASY TO OPEN SOUTH AMERICA

Camacho Tried It and Returned Ten Years Sooner Than He Expected—Expenses and Conditions Met With.

Rich and attractive as the possible profits may be, after one is well established, the introducing of American-built automobiles in the two big cities of South America, Rio de Janeiro and Buenos Ayres, is no child's play, if one is to judge by the experience of Al Camacho, who, after considerable experience in selling motor cars on New York City's automobile row, recently went to South America in high hopes, but who is back in New York again, a sadder and wiser man. Almost needless to say, Camacho returned much sooner than he expected—some ten years sooner, to be exact. He also returned without the fortune he had expected to make in those ten years.

By special arrangement with the American Locomotive Co., Camacho sailed for Buenos Ayres last spring with several Alco cars, these being representative high-grade American products such as in his mind's eye he thought the wealthy South American motorists would take to. The cars were not even moved off the boat when he got down there.

"First crack out of the box," Camacho explained to a Motor World man, "it would have cost me \$500 for a foreign merchant's license to unload my cars. Then it would have cost me \$150 for a street tax receipt, to run them, and I would have been compelled to employ a local chauffeur, at about \$8 a day. So I reconnoitred. My father having been the Venezuelan Minister to the United States and my granduncle having been the George Washington of Venezuela, I speak Spanish perfectly and was well received. But I found the pace too swift for me to do business, at least a motor car business.

"Living economically it cost me \$22 a day at the hotel, and a man needs \$50 a day in American gold to get along, as in order to do business with the class who buy cars he must dress like a nabob, live like a lord, never walk and always be loaded with money. There are only two classes of people in Rio and Buenos Ayres, the very rich and the very poor. In Buenos Ayres they sell American \$5 shoes for \$25 a pair, have a \$5,000,000 theater and four miles of mosaic sidewalk laid by workmen imported from Paris for the job. French, Italian and German cars practically own the market. To introduce an American car successfully requires two or three years' hard work and an investment of a fortune in champagne and social extravagance. It was too big a proposition for my resources, so I sailed back with my cars."

POPE RENDERS ANNUAL REPORT

Development of New Car and Truck Eats Heavily Into Earnings—But Surplus is Increased, Nevertheless.

One of the most illuminating illustrations of the expense that attaches to the development and production of a new model, even by a long established manufacturer, and to changes involved in engineering practices, is contained in the annual statement of the Pope Manufacturing Co. for its fiscal year ending July 31, 1911, which was made public early this week.

Although the company's sales for the fiscal year amounted to \$4,081,486.82, an increase of \$71,286.88 over the sales of the preceding twelve months, the net earnings, \$214,119.22, represent a decrease of \$531,272.11. Despite the fact, \$76,227 was added to the surplus, which now amounts to \$936,430.85, the sum of \$377,337 having been added to the surplus account at the close of the fiscal year 1910.

The total account for the two years compares as follows:

	1911	1910
Income from operations*	\$169,310	\$664,496
Other income	107,928	127,989
Total income	\$277,238	\$792,485
Misc. losses and expenses	63,119	47,094
Net income	\$214,119	\$745,391
Preferred dividends	137,892	1275,784
Common dividends	92,279
Surplus	76,227	377,337
Previous surplus	860,203	482,866
Total surplus	\$936,430	\$860,203

* After deducting manufacturing and producing costs, depreciation, replacements, renewals, administration, office and selling expenses.

† Includes dividends on preferred stock for years ended July 31, 1909, and July 31, 1910.

In presenting the report, Albert L. Pope, president of the company, explains the reasons for the decrease in net earnings and sums up the situation as follows:

"Depreciation on buildings, machinery, tools and equipment, amounting for the fiscal year to \$136,226.19, and accrued taxes, insurance and other expense items have been charged monthly to operations. Ample reserves have been set up to provide for possible loss in Accounts Receivable. Accounts Payable, as shown in the statement, are for current invoices which had not matured for payment on July 31st.

"The inventory has been taken at actual cost, any material—raw, manufactured or in process—not available for current needs, having been charged off. Buildings, machinery and equipment have been maintained in good condition, all current repairs having been charged to operations and not added to inventory values. All

bills for purchase of materials and equipment during the fiscal year have been discounted.

"It was considered by the management absolutely necessary for the retention of its business to construct a new model of its automobile, inasmuch as no substantial change had been made in models for three years. A larger car developing greater power was therefore designed to meet a growing demand from buyers and also an increasing competition. The result was a complete change in the product involving great expense and considerable delay. In order to make up for this delay and retain customers it was necessary to work the factories over-time and in some departments twenty-four hours each day. This very materially added to the cost of production for the past year, but it is not expected that such expense will be at all necessary the coming year. . . .

"During the year the company has designed and perfected a three-ton motor truck, but as none of these except the

model was perfected until the last month of the fiscal year, it has not as yet added materially to the company's sales. Thus far, however, it has given the best of satisfaction.

"There has also been designed and produced a motorcycle, which, as in the case of the motor truck, was not put on the market until late in the fiscal year. It is meeting with the approval of the public and promises a material addition to the business for the coming year. . . .

"With the changes in the material of automobiles from ordinary to "high speed" steel, it became necessary to purchase and construct additional machinery. During the year the company has expended for this purpose \$87,746.35, and I believe that the company is now thoroughly well equipped for the manufacture of its product so that no considerable additions of machinery will be necessary in the near future."

The certified balance sheet, as of July 31, 1911, is as follows:

Assets.			
Real Estate, Buildings, Plant, Equipment, Machinery, Tools, Patents, Licenses and Good Will, in operation July 31, 1910...	\$5,524,131.38		
In Process of Construction and Installation July 31, 1910.....	54,114.28	\$5,578,245.66	
Deduct—Net Adjustments	\$7,740.60		
Unoperated Machinery, Tools and Equipment Sold or Scrapped.....	26,358.52	34,099.12	
		\$5,544,146.54	
Add—Expenditures on Additions and Improvements, Complete and in Operation In Process of Construction and Installation	\$237,146.73		
	36,276.16	273,422.89	\$5,817,569.43
Deferred Charges and Prepaid Expenses, including Prepaid Insurance and Advance Work on Models for future production			156,867.75
Contract to be liquidated by Deferred Instalments.....			183,640.66
Inventories of Materials, Supplies, Work in Progress and Finished Product		\$1,190,841.43	
Accounts and Notes Receivable (Less Reserves for Bad and Doubtful Accounts).....		338,329.64	
Cash and Cash Items in Bank and Office, including Fund for Payment of Unclaimed Dividends.....		92,061.22	1,621,232.29

			\$7,779,310.13

Edward A. Ross is building a garage and salesroom at 20 Water street, Auburn, N. Y. He handles Overland cars.

Charles E. Miller, the New York supply man, has opened still another branch, this time in Albany, N. Y. It is located at 137 Central avenue.

Hood Brothers Garage is the style of a new establishment which just has opened at South Greensburg, Pa. Repairing will be made a specialty.

F. L. Burdick and A. H. Elmore have formed the Franklin Motor Car Co. at Houston, Tex. As the style of the company indicates, Franklin cars will be handled.

The H. H. Dillon Co. has "opened up" in Lincoln, Neb., with headquarters at 331 South Eleventh street. Besides carrying a full line of supplies the company will handle the Hudson car.

The Abbeville Motor Car Co. has been formed at Charleston, S. C., with \$25,000 capital, and W. P. Greene as president. The company will sell Reo cars and do a general garage business.

The United States Motor Co. has opened a factory branch in Boston, Mass., to handle the distribution of Stoddard-Dayton cars. The branch will be known as the Stoddard-Dayton Sales Co.

The Hancock Motor Co., which was organized some months ago and which conducted a salesroom and garage at Calumet, Mich., has gone out of business. Lack of orders and slow collections caused the dissolution.

Frank Gotch, who has quite an international reputation as a wrestler, has gone into the automobile business, and opened salesrooms and a garage in Humboldt, Ia., in partnership with P. F. Saul. He will handle Mitchell cars.

The Peerless Motor Car Co. has brought suit for \$9,000 damages against F. H. MacFarlane and the Park City Motor Car Co., of Bridgeport, Conn. The suit hinges upon several notes of the Park City company, which were indorsed by MacFarlane.

The garage operated by George Hock on West C street, St. Louis, Mo., was closed last week under a distress warrant for alleged non-payment of rent. The constable levied on the seven automobiles in the garage and took them into custody.

The Haynes Automobile Co. has opened a factory branch in the building occupied by the Automobile College on North Capitol avenue, Indianapolis, Ind. The branch will be styled Haynes Motor Car Co. and

will be under the management of R. P. Dillon.

Harry G. Hawkins has bought the interests of his partner, R. M. Skidmore, in the Washington Motor Vehicle Co., Spokane, Wash. He has the only exclusive electric garage in the city, and acts as distributor for Baker and Hupp-Yeats electrics.

S. H. Brown, of Los Angeles, Cal., and H. L. Olive have formed a partnership under the style Harry L. Olive & Co., and opened salesrooms on First avenue, near Adams street, Spokane, Wash. The concern will sell the Overland and Kissel productions.

Charles Adams has opened a salesroom and garage on Adams avenue, Scranton, Pa., where he will do business under the style the Eureka Motor Car Co. He will handle Hudson, Metz, McFarlan and Herreshoff cars, and will carry a complete line of accessories.

The American-Marion Sales Co. and Charles E. Reiss & Co. have leased the building at the southeast corner of Broadway and 65th street, New York City. They will shortly remove to the new salesrooms from their present quarters on Broadway, near 57th street.

The Mitchell, Lewis & Staver Co., which conducted a general implement business in Spokane, Wash., has relinquished its agency for Mitchell cars, which hereafter will be handled by the factory branch recently established by the Mitchell Motor Car Co. in Seattle.

L. H. Moos, to whom the Carhartt Motor Sales Co., of New York, made an assignment two weeks ago, has been appointed receiver by court. It is now stated that the assets amount to but \$10,000 and that there is a dispute as to the ownership of several cars and some of the office furniture and fixtures.

Kenneth W. Brewer, formerly principal of the Washington school at Fond du Lac, Wis., has organized a company under the style the Brewer-Baker Motor Co., and opened salesrooms and a garage at 426 North Capitol avenue, Southport, Ind. He will act as distributor of Baker electrics for the states of Indiana and Kentucky.

John P. Snyder, of Minneapolis, Minn., has formed the J. P. Snyder Co., with temporary headquarters at 107 South Tenth street. A new garage and salesroom for his use is in course of construction on the same street, between Fourth and Fifth avenues, and will be ready for occupancy on

December 1. It is 82x157 feet, two stories high. It will house Fiat cars exclusively.

Alexander H. Robertson has been appointed receiver for the James G. B. Davy Co., dealers in automobile supplies, at 20 St. Paul street, Baltimore, Md. The bill of complaint alleges that the company owed Robertson \$205.85, and that it was unable to meet its obligations, while in its answer to the complaint the company admitted that it was embarrassed by the want of ready cash.

Under the style the White Motor Car Co. of Missouri, a new company has been formed at St. Louis, Mo., for the distribution of White cars. Oliver Shiras is president-treasurer and Walter C. White, of the White Co., of Cleveland, O., is vice-president. The company shortly will locate at 3422 Lindell avenue, but meanwhile temporary quarters have been established at 1820 Locust street.

Under the style Motor Mart the Bennett Auto Supply Co. will open one of the largest automobile sales buildings in the country in Sioux City, Ia. The structure is 150x150 feet, with a floor area of 67,500 square feet, and is built of steel and concrete, strong enough to carry four additional stories, if necessary. The building, including the plot, will cost when complete \$120,000. R. A. Bennett is the president.

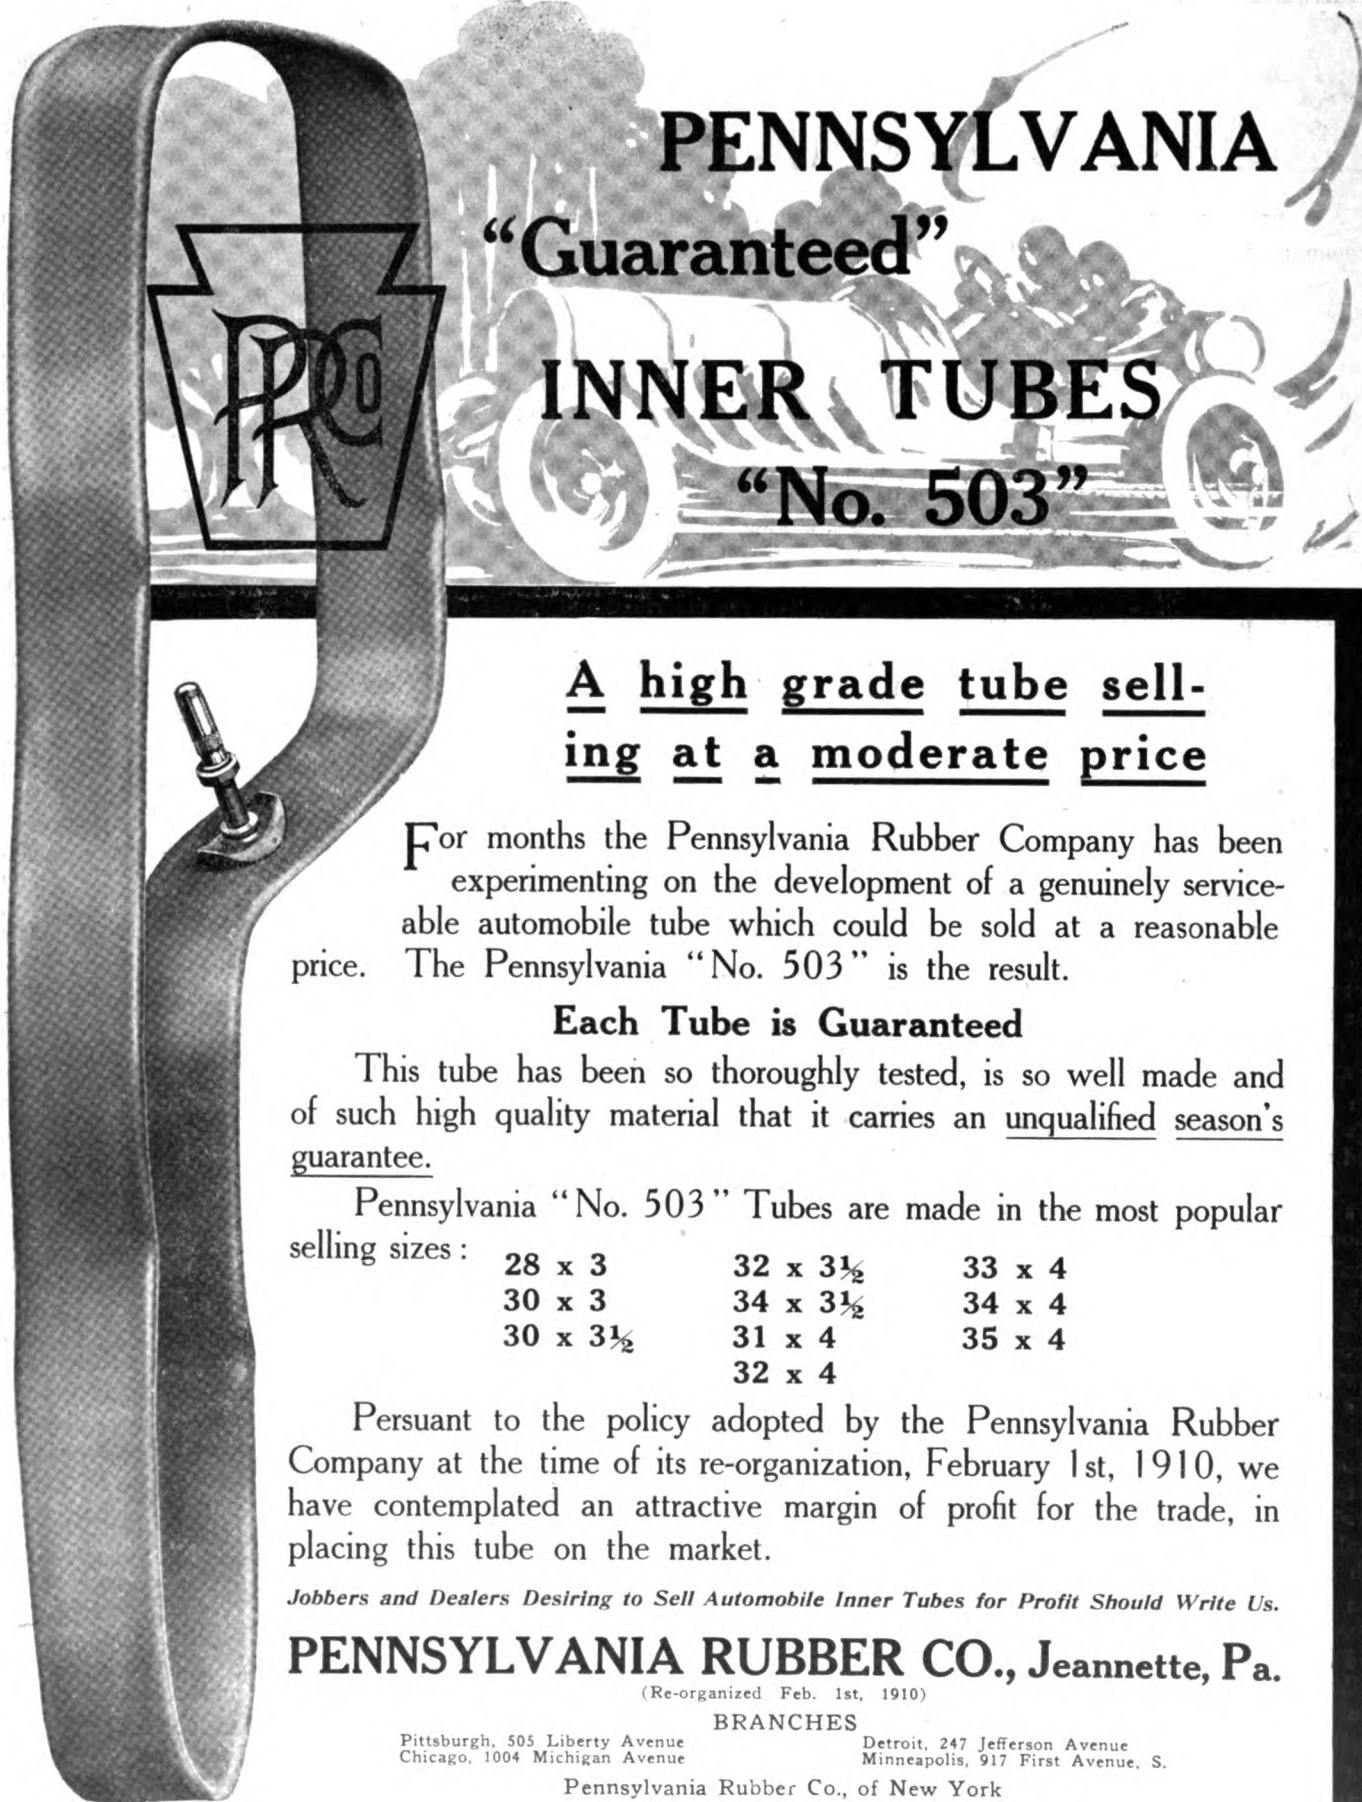

On account of new fire regulations in Spokane, Wash., the George W. Merrill Auto Co., which handles National and Thomas cars, had to remove its salesrooms and garage to 1317 Second avenue, until permanent new quarters can be secured. The old building at 910 Second avenue did not conform with regulations and the company was compelled to remove all gasoline from tanks on the cars before the latter could be put into the garage.

The disappearance last week of D. L. Clark, manager of the Atlantic City store of the Penn Auto Supply Co., of Philadelphia, Pa., brought to light several discrepancies in his accounts and the embezzlement of money from the company. A warrant charging Clark with embezzlement has been issued, and it is stated that, although he was bonded, the supply company stands to lose money, as the shortages exceed the amount of the bond.

Recent Losses by Fire.

Queenstown, Ont.—Humphries's Garage and one car damaged. Loss, \$3,000.

Sacramento, Cal.—Ritchie & Heriot, automobile supplies store on Eleventh street, damaged by fire. Loss, \$2,000.

PENNSYLVANIA

"Guaranteed"

INNER TUBES

"No. 503"

A high grade tube selling at a moderate price

For months the Pennsylvania Rubber Company has been experimenting on the development of a genuinely serviceable automobile tube which could be sold at a reasonable price. The Pennsylvania "No. 503" is the result.

Each Tube is Guaranteed

This tube has been so thoroughly tested, is so well made and of such high quality material that it carries an unqualified season's guarantee.

Pennsylvania "No. 503" Tubes are made in the most popular selling sizes:

28 x 3	32 x 3½	33 x 4
30 x 3	34 x 3½	34 x 4
30 x 3½	31 x 4	35 x 4
	32 x 4	

Persuant to the policy adopted by the Pennsylvania Rubber Company at the time of its re-organization, February 1st, 1910, we have contemplated an attractive margin of profit for the trade, in placing this tube on the market.

Jobbers and Dealers Desiring to Sell Automobile Inner Tubes for Profit Should Write Us.

PENNSYLVANIA RUBBER CO., Jeannette, Pa.

(Re-organized Feb. 1st, 1910)

The Vitalizing "Southern Spirit."

There must be something in that "Southern spirit" of which the Southerners themselves are so proud. The manner in which they took hold of the Glidden contest after it twice had fallen flat for lack of interest elsewhere and when it seemed about ready for permanent burial, is not short of inspiring.

The life the Southern people have breathed into it—the manner in which they are making the forthcoming contest the greatest Glidden tour ever held—is truly remarkable. Coupled with the fashion in which they have also "saved" from oblivion both the Grand Prize race and that greatest of all American automobile classics, the Vanderbilt Cup race, the sport of automobiling owes no small debt to the "Southern spirit," and none should begrudge or withhold recognition of the fact. It's a fine spirit—the spirit of real sportsmanship; it would be well were there more

of it in the sport. It is not born or begotten of, or dependent on, trade. There's a lot of civic pride in it, but it gives forth only faint and indirect sounds of the dollar. The spirit of the sportsman is carried further in the gift of the Anderson (S. C.) trophy for competition between private owners.

However faded we of the East may have become—however wearied of dollar-dimmed automobile contests—we can afford to be glad that south of us there is a spirit charged with real enthusiasm and capable of bringing the dead to life. The "Southern spirit," as displayed on these occasions, points the way to genuine amateurism—to real sportsmanship, which has been the saddest lack of automobile competition in this country.

Measuring the Worth of a Car.

Paraphrasing the old mechanical dictum that a chain is no stronger than its weakest link, the observation is advanced that a car is not better than its driver. The merit of the observation is such that few can escape it, but the degree of its truth is worth consideration by reason of the mass of supporting data. To take an extreme example, it can be shown that an inexperienced or blundering driver can reduce a \$5,000 car to \$34 worth of junk by running it into a stone wall at high speed or sending it over the side of a bridge. In milder form, a poor driver can and does reduce the value of a car by the lesser errors in operation and in maintenance, particularly in the shifting of gears, sudden and hard application of the brakes, and in permitting the driving mechanism to accumulate dirt and rust.

Only recently a manufacturer of cars that enjoy the highest reputation and sell at topmost prices cited an example where a customer's car developed a ruined transmission as the result of being driven by a chauffeur with more muscle than brains, who yanked the change-gear lever with such Sandow strength that he broke a steel ball in the transmission bearings. The hard steel pieces of the ball did the rest, and the car was not again fit for service until it had a complete new transmission and a new chauffeur. In other cases the value and efficiency of a car is impaired by improper control of the oiling, and neglect of adjustments affecting the carburetter, the ignition, the clutch or even the fan belt tension. The tires afford the incompetent

driver an excellent chance to have trouble and blow-outs, where a good driver would have taken the necessary precautionary steps and would have had no trouble at all. Failure to have enough water in the radiator has accounted for many a car's being out of service until a new engine could be installed.

Conversely it has been made apparent from the earliest days of the automobile business that a skilled operator can perform wonders with the most decrepit sort of motor vehicle, provided it can run at all. A car may not be as good as its driver, in which case the limitation exists with the car and not with the operator. A good driver gives the car its maximum value.

In commercial vehicle work it has been found that to get the value that lies in the vehicles themselves it is necessary to have competent drivers rather than men who are merely cheap. Whether the responsibility for the operating and the keeping of the mechanism in condition be a combined or a divided duty, it must be placed with competent employees if the value of the vehicles, either intrinsically or operatively, is to be preserved. The same processes of cost keeping and ascertainment of relative values are used in relation to commercial vehicles, when applied to pleasure cars emphasize the same truth, which, to repeat, is that a car is no better than the man who is in charge of it.

Propelling a steam fire engine by means of a gasoline engine may be an improvement over hauling it by horses, but it nevertheless represents a ridiculous compromise and power duplication. While at present the New York Fire Department, which is in the transition stage from horses to motors, may take pride in a steam fire engine with a gasoline motor system of propulsion, such a cumbersome contrivance will be laughed at a few years hence. If gasoline be sufficiently reliable to be depended upon to take the apparatus to the fire, it ought to be depended upon to supply the pumping power at the fire itself. No ordinary reasoning can justify the use of a powerful gasoline motor to pull an inert steam engine outfit that in turn works while the motor that pulled it lies idle. A self-propelling fire engine should be either all steam or all gasoline in respect to the power employed, and not a lumber-some hybrid.

Detroit, Mich.—Motor Tire and Repair Co., under Michigan laws, with \$1,000; to deal in and repair automobile tires.

Boston, Mass.—Mark Motor Supply Co., under Massachusetts laws, with \$25,000 capital; to manufacture automobile supplies. Corporators—R. M. Johnson, Cambridge; M. V. O'Neill, Roxbury.

Lima, Ohio—Blevins Motor Sales Co., under Ohio laws, with \$5,000 capital; to deal in automobiles. Corporators—H. W. Blevins, T. E. Coles, George P. Lutz, V. E. Rudy, C. P. Lauchman.

Dayton, Ohio—Brackburn-Ailen Co., under Ohio laws, with \$30,000 capital; to manufacture an ignition apparatus. Corporators—W. J. Blackburn, E. E. Allen, M. A. Blackburn.

Youngstown, Ohio—Cutting Motor Sales Co., under Ohio laws, with \$5,000 capital; to deal in automobiles and accessories. Corporators—J. B. Dilchon, A. E. Baldwin, J. N. Davis, J. W. Carver, W. L. Dales.

Buffalo, N. Y.—Krotzer Co., under New York laws, with \$10,000 capital; to manufacture motors and engines. Corporators—Louis E. R. French, Israel G. Holender, Christopher M. Baldy, Charles H. Taylor.

Peoria, Ill.—Cadillac Automobile Co. of Peoria, under Illinois laws, with \$5,000 capital; to deal in automobiles. Corporators—Rollin Travis, 26 shares; Henry Nummann, 14 shares; H. H. Moody, 10 shares.

Chicago, Ill.—Logan Square Motor Car Co., under Illinois laws, with \$2,500 capital; to deal in automobiles, accessories and supplies. Corporators—Francis E. Thornton, Fred Gloor, James M. Sprinkle.

Chicago, Ill.—Hoskins Automobile Service, under Illinois laws, with \$40,000 capital; to operate and deal in automobiles and motor vehicles. Corporators—William E. Fuller, Frank J. Hogan, A. A. Pantelis.

Dallas, Texas—Overland Automobile Co., under Texas laws, with \$25,000 capital; to deal in automobiles and supplies. Corporators—W. W. Taxis, D. T. Finley, F. M. Bannell.

Peoria, Ill.—Reliable Tire Repair Co., under Illinois laws, with 2,400 capital; to deal in and repair automobiles. Corporators—John V. Leslie, George Haas, Bert A. Fritz.

Chicago, Ill.—S. & K. Tires Co., under Illinois laws, with \$4,000 capital; to manufacture tires and materials for same. Corporators—David F. Rothenthal, Edwin D. Wright, Leo F. Kosetchek.

Augusta, Me.—New England Sales & Equipment Co., under Maine laws, with \$10,000 capital; to deal in motor vehicles

and accessories. President and treasurer, E. M. Leavitt.

Louisburg, N. C.—Jackson Tri-State Motor Car Co., under North Carolina laws, with \$25,000 capital; to deal in automobiles. Corporators—R. Y. McAlden, H. D. Woolcott, Agnes Lacy.

Muncie, Ind.—Clenol Manufacturing Co., under Indiana laws, with \$10,000 capital; to manufacture polishes. Corporators—F. O. Peckinpugh, O. W. Cromer, George Lewis.

Cleveland, Ohio—The James Cormier Co., under Ohio laws, with \$2,000 capital; to deal in automobiles and accessories. Corporators—James Cormier, J. F. Nelson, R. M. Calfee, J. G. Fogg, C. M. Stelling.

Marietta, Ohio—Pioneer Motor Car Co., under Ohio laws, with \$18,000 capital; to deal in automobiles and other motor vehicles. Corporators—F. B. Bosworth, A. J. Watson, A. A. Crawford, T. McCune, H. B. Coen.

Camden, N. J.—The Auto Chemical Fire Engine Co., under New Jersey laws, with \$1,000,000 capital; to manufacture automobiles and chemical engines. Corporators—F. R. Hansel, I. C. Cow, J. A. MacPeak, all of Camden.

Minneapolis, Minn.—Oldsmobile Co. of Minnesota, under Minnesota laws, with \$10,000 capital; to manufacture and deal in automobiles and accessories. Corporators—Louis D. Manwaring, Annie Connors, F. V. Comfort.

Alexandria, Va.—The B. F. Board Motor Truck Co., under Virginia laws, with \$100,000 capital; to build commercial motor vehicles. Corporators—B. F. Board, T. C. Smith, W. E. Bain, George S. Hinkins, E. K. Callahan.

Memphis, Tenn.—Ozburn Automobile Supply Co., under Tennessee laws, with \$15,000 capital; to deal in automobiles and motor vehicles. Corporators—N. F. Ozburn, W. J. Shay, W. P. Armstrong, W. A. Webster, Joseph F. Covern.

Jersey City, N. J.—Metropolitan Motor Speedway Association, under New Jersey laws, with \$1,500,000 capital; to conduct automobile races and other motor contests. Corporators—I. N. Quimby, F. H. Dobbins, E. S. Johnson, all of Jersey City.

Los Angeles, Cal.—Derby Automobile Race Co., under California laws, with \$100,000 capital; to maintain a race track and promote automobile racing. Corporators—J. E. McReynolds, E. R. Horrie, O. V. Traggard, A. F. Scherfenberg, C. I. Reynolds.

Richmond Va.—Motor Truck Co., under Virginia laws, with \$25,000 capital; to operate motor trucks and conduct a commercial transfer business. Corporators—H. A. Gillis, Charles Laurens, T. M. Garrity, all of Washington, D. C.; E. P. Cox, of Richmond.

October 7. Philadelphia, Pa.—Quaker City Motor Club's 200 miles race at Fairmount Park.

October 9-13, Denver, Colo.—Denver Motor Club's reliability tour.

October 12-22, Berlin, Germany—International automobile show in Exhibition Hall, Zoological Garden.

October 13-14, Atlanta, Ga.—Racemeet under management H. C. George.

October 14, Santa Monica, Cal.—Santa Monica road races under auspices of Santa Monica Motor Car Dealers' Association.

October 14-25, New York City to Jacksonville, Fla.—American Automobile Association's eighth annual national reliability tour for the Glidden trophy.

October 16-18, Harrisburg, Pa.—Reliability contest under auspices Motor Club of Harrisburg.

October 27-November 3, Chicago, Ill.—1,000 mile reliability contest under auspices Chicago Motor Club.

November 1, Waco, Texas—Racemeet under auspices Waco Automobile Club.

November 2-4, Philadelphia, Pa.—Reliability contest under auspices Quaker City Motor Club.

Nov. 3-11, London, England—Society of Motor Manufacturers' and Traders' annual show in Olympia Hall.

November 4-6, Los Angeles, Cal.—The Phoenix road races under auspices Maricopa Automobile Club.

November 9, Phoenix, Ariz.—Track races under auspices Maricopa Automobile Club.

November 9-12, San Antonio, Texas—Racemeet under auspices San Antonio Automobile Club.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

November 29, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

November 30, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

January 6-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual show in Grand Central Palace.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

KOOPMAN AWAY OFF AT THE GUTT"

Flies the Old Track and Escapes With Slight Injuries—De Palma and "Dead-heads" Features of the Meet.

At the final racemeet of the Metropolitan district, held on the old Guttenberg track, which is in the New Jersey township of that name, it was fitting that Ralph De Palma should be the star, for he had done things there before, including the setting of a track record or two, and he therefore had a reputation to sustain. But the next time he goes to Guttenberg he will have to work a good deal harder than he did on

DE PALMA (MERCER) LEADING KOOPMAN (NATIONAL) IN FIVE MILE FREE-FOR-ALL

Saturday last, 30th ult., for he lowered two of his own records—one at one mile and the other at five miles—with the Simplex he reserves for such doings, and also won a five mile event with his recently acquired Mercer.

It was a fairly big crowd that witnessed the racing, though only a very small part of it paid for the privilege. By far the biggest part of the crowd was composed of "fence birds," and they remained perched on the fence surrounding the mile oval till Henry Koopman, driving a National in a five miles free-for-all, lost control of the car on the first turn and it skidded around and rolled over two or three times, throwing out both driver and mechanic. Simultaneously the hundreds of spectators on the fence dropped down into the enclosure, and in an instant the wrecked National was the center of a bigger crowd than ever was in the grandstand. De Palma, who was leading with his Mercer at the time, was flagged and the race was stopped, Gray (Schacht), the only other competitor, being far behind. Neither Koopman nor his mechanic was seriously hurt. Koopman's spill was the only excitement of the raw and rather dull afternoon.

After the officials had shooed the crowd off the track into the paddock, the judges

stand and the 50-cent seats in the grandstand, De Palma went out with his Simplex and drove five laps in 4:51½, which is no less than 29¾ seconds faster than the best previous record of 5:20¾, also held by himself. His first trial against his own record of 59¾ seconds for one lap of the track netted him 58½ seconds. With his Mercer he had a particularly easy time in winning a five miles race for cars of less than 301 inches displacement. Jack Towers (E-M-F) was second and J. M. Gray (Schacht) was third. De Palma's time was 5:45¾. William Regan at the wheel of a Paige-Detroit walked away from Charles Tate and Emery Smith, both in Regals, in the curtain raiser, a five miles brush for cars with less than 231 inches displacement. They finished in

that order. Regan's time was 6:29¾. Ira Vail, Regan and Smith, all in Regals, started in a five miles race for private owners, but Vail was the only one to finish. His time was 6:40¾. The summary:

Five miles, class E. under 231 inches displacement—Won by William Regan (Paige-Detroit); second, Charles Tate (Regal); third, Emery Smith (Regal). Time, 6:29¾.

Five miles, class C, under 301 inches displacement—Won by Ralph De Palma (Mercer); second, Jack Towers (E-M-F); third, J. M. Gray (Schacht). Time, 5:45¾.

Rain Causes Postponement at Omaha.

Three days of continuous rain disarranged the plans of the Omaha Motor Club in connection with the Ak-Sar-Ben celebration in the Nebraska city, 1st to 7th inst. A four days' racemeet was announced to begin Saturday, 30th ulto. and continue until Tuesday, 3rd inst. The storms of Friday, Saturday and Sunday, however, put the speedway in such bad condition that it was not deemed safe for automobile racing, and they were postponed until the 4th to 8th inst. inclusive. There will not be five days of racing, however, as the Ak-Sar-Ben parade takes place on Thursday, 5th inst., and the program for that day will be carried out on Sunday, 8th inst.

NINETEEN FOR FAIRMOUNT PARK

Line-up for Philadelphia's Big Race Promises a Quality Contest—Zengle Again to Defend His Laurels.

With 19 entries in hand, and the promise of one or two others, though the entry list officially was closed on Monday, the Fairmount Park race, which will be run on Saturday next, 7th inst., in Philadelphia, will not be as big an affair as it was last year, when 32 cars were sent away. It does not lack quality, however, and that it will be faster, is the opinion of several of the drivers who have been practicing on the course. Mulford, who so nearly carried away the laurels last year with his Lozier, says that Zengle's average of 58 miles an hour will be bettered by at least four miles an hour, and the others are equally optimistic; nearly all of them are well-known figures, though some have changed their mounts, and others are more or less new.

Zengle, last year's winner in the big car class, will be there, of course, though not with his old familiar Chadwick. This year he will drive a National around the eight miles circuit in Philadelphia's "people's playground," and will have as his team mate "Don" Herr. Mulford will drive a Lozier, and a second Lozier will be handled by Harry Grant. Grant's car is the same one that Van Goerder drove at Indianapolis on Decoration Day, and though it is privately owned and entered, Grant will be one of the Lozier team. The Bergdoll brothers will be on hand, three strong. Charles and Grover will drive Bergdoll cars, and this is the first time that either drivers or cars have appeared in a long-distance road race. Edwin R. Bergdoll will have the same Benz he drove last year. The self styled Lee "Oldfield" is listed as the driver of one of the Fiats entered, though whether he will drive it is an open question. It is probable that his place will be taken by Willie Haupt. The other Fiat will be driven by J. Fred. Betz 3rd.

Practically all of the other combinations are familiar, the complete list being as follows:

Division 3C, 231-300 inches displacement.	
Driver.	Car.
Charles Bergdoll.	Bergdoll
Grover Bergdoll.	Bergdoll
Joe Jagersberger.	Case
Charles Basle.	Cole
Hughie Hughes.	Mercer
Harvey Ringler.	Mercer
H. S. Matthews.	Ohio
George Parker.	Ohio
Division 4C, 301-450 inches displacement.	
Donald Herr.	National
Harry Koopman.	National
Gil. Anderson.	Stutz
Division 5C, 451-600 inches displacement.	
Harry Grant.	Lozier

Ralph MulfordLozier
 Willie WallaceMercedes
 Spencer WishartMercedes
 Leonard ZengleNational
 Division 6C, 601-750 inches displacement.
 Edwin R. Bergdoll.....Benz
 J. Fred. Betz 3rd.....Fiat
 Lee "Oldfield" or Willie Haupt.....Fiat

Among these drivers, however, there is at least one who will not start—Harvey Ringler and his Mercer. They figured in a spill in practice on Wednesday, which cost Ringler a broken arm and his mechanic a fractured leg.

For the fourth time in as many years the municipal authorities of the city of Philadelphia will co-operate with the Quaker City Motor Club in the management of the event. The course will be the same as it has been in years gone by—200 miles, the most of it in Fairmount Park and a small part of it on city streets. The race is a class C, non-stock event and will be divided into four classes, according to piston displacement, as follows: 231-300, 301-450, 451-600 and 601-750 cubic inches piston displacement. To the driver making the best time for the 200 miles, regardless of the class he is competing in, there will be given a grand prize of \$2,500. The winners of the four classes will be given \$1,000 each, so that it is possible for one man to win at least \$3,500, to say nothing of the various "dots" which have been added by accessory manufacturers and which should bring the amount of the grand prize well above that figure. The entry fee for a single car is \$500.

Coroner's Verdict on Syracuse Tragedy.

Everybody and nobody is guilty of causing the disaster at Syracuse on September 16 last, in which 12 persons were killed and several injured when Lee "Oldfield's" Knox crashed through the fence. In his verdict, rendered on Monday last, Coroner George R. Kinne distributes the blame. Everybody connected with the racemeet, including the New York State Fair Commission, and the crowd around the fences is blamed in a superficial way, but, says the Coroner: "I do not find that the driver (Oldfield), his manager or any of the people mentioned were guilty of that careless and reckless disregard of the lives of others which the courts hold to be that degree of culpable negligence which would justify a charge of manslaughter."

New Club for Marysville, Kan.

Motorists of Marysville, Kan., have formed the Marysville Automobile Club and elected the following officers: President, Charles F. Travelute; vice-president, Joseph Ellenbecker; secretary-treasurer, L. H. Whan; good roads committee, E. O. Webber, Harry M. Thompson, Dr. W. R. Breeding, C. F. Travelute, L. H. Whan; executive committee, Charles J. D. Koester, William Kraemer, Charles K. Kern, L. H. Whan, C. F. Travelute.

FINE JUDGEMENTS FROM GERMANY

Motorist Mulcted for Impairing "Nerves" of Horse—Another Escapes Because Beer Affected Cyclist's Hearing.

While it long has been a well-recognized and well-established fact that the minds of judges and those of ordinary mortals rarely "run in the same channels," as great minds are said to do, it appears as if the learned judges of the German Empire manage to go further and to read things into the letter of the law that the average man could not discover, were he to labor over the task for the greater part of his life. Particularly since the great rise of the automobile industry and the wonderful increase of automobile touring have judicial decisions become "past understanding." Nearly every month brings forth another crop of freak sentences, so that it is almost impossible to keep track of them.

Undoubtedly the prize for the most freakish decision should go to the Oberlandesgericht Stuttgart, which recently decided that an automobile owner is responsible for the "nerves" of a horse! It seems that a certain high-spirited trotter was "scared to death" by a passing automobile and became so nervous that it could not trot satisfactorily thereafter. A suit for "damages" having been instituted the court promptly sentenced the motorist to pay the amount asked, invoking in support of its opinion the old Roman law, according to which a man is responsible for damages sustained by another person, although such damages may consist in mere "nervousness" which would tend to prevent the victim from following his vocation." The court applied the same principle to the horse, and the motorist had to pay, because the court in question is the highest court in Wuerttemberg and its findings in civil actions are not subject to revision by the Reichsgericht.

Another decision, however, while freakish enough, was in favor of the motorist. In this case a bicyclist had taken a few drinks and was in a state of mind that may properly be described as "slightly intoxicated," when he decided to take a ride on his wheel. An automobile knocked him down and injured him severely. In his suit for damages the cyclist admitted having taken a couple of drinks, and alcohol experts testified that the quantity of alcohol admittedly imbibed by him was sufficient to impede seriously his power of hearing, at least temporarily. The motorist was able to prove that he had sounded his horn and was promptly acquitted. But the best part of the trial came when the court severely reprimanded the cyclist for daring to ride on the public street and endangering traffic by his carelessness in reducing the powers of his auditory nerve.

Another judicial decision, rendered by the Reichsgericht and establishing a valid precedent for all similar suits within the confines of the German Empire, is more in line with decisions rendered in this country. It declares it the duty of every person visiting an automobile race to be careful in the choice of his position. If such a spectator chooses to stand at a place known to be dangerous, the court held that he cannot recover damages if he should be injured. In the eyes of the law he is an accessory before the fact.

More Half-Mile Stunts in South Jersey.

Harvey Ringler did not quite drive rings around the local pilots against whom he drove on Saturday, 30th ult., at Bridgeton, N. J. The so-called South Jersey Motor Club promoted the meet and it was held on the half-mile dirt track on which the Bridgeton Driving Association exercises its horses. At the wheel of a Mercer, Ringler accounted for three of the seven events, but W. D. Morton in a Kline and J. W. Minker also twice shared the limelight. Joseph Di Napoli, who was put off the Point Breeze track recently because he wanted to race with an aged tire and who subsequently did go out without changing it and wrecked his car, started in a match race with a Knox, but Sam Bloxom, with a Jackson, easily beat him. The summary:

Five miles, free-for-all handicap—Won by John W. Minker, Kline (40 seconds); second, Thomas Luinney, Hudson (20:10 seconds). Time, 7:30.

Five miles, free-for-all handicap—Won by John W. Minker, Kline (6:15 seconds); second, Joseph Di Napoli, Knox (scratch). Time, 6:37:19.

Five miles match, Harvey Ringler (Mercer) vs. W. D. Morton (Kline)—Won by Ringler. Time, 6:34:60.

Five miles match, Sam Bloxom (Jackson) vs. Joseph Di Napoli (Knox)—Won by Bloxom. Time, 7:18:20.

Five miles match, Harvey Ringler (Mercer) vs. W. D. Morton (Kline)—Won by Ringler. Time, 6:35:10.

One mile time trials, flying start—Won by W. D. Morton (Kline), time, 1:15; second, Joseph Di Napoli (Knox), time, 1:19; third, J. W. Minker (Kline), time, 1:20.

Five miles, free-for-all handicap—Won by Harvey Ringler, Mercer (scratch); second, A. U. (Vincent) Padula, Abbott-Detroit (20 seconds). Time, 6:50:60.

Iowa Adopts Black and White Tags.

Iowa has decided to use black and white license plates for the year 1912. The plates have been greatly improved, following many criticisms from owners of cars. The square, sharp corners have been discontinued, the new plates being furnished with smooth, round corners. The letters will be in white enamel, raised on black background. They will cost the State 44 cents each set of two, or 8 cents less than the present plates.

SOUTH GIVES GLIDDEN BIG BOOST

Assures Its Being "Greatest Ever" in Point of Numbers—83 Entries and More Coming—The Itinerary.

In point of size, at least, the 1911 Glidden tour, which is scheduled to be started in New York City on Saturday morning, 14th inst., will be the greatest that ever started in the American Automobile Association's historic event, or for that matter in any other reliability tour, no less than 83 entries have been made, and though the list was closed on the 1st inst., it is not unlikely that several more will be added. Seventy-seven of the entries in hand are those of contestants, and six, embracing two press cars, a Reo truck for baggage and three diminutive Kelsey Motorettes, are non-contestants.

That chief interest in the tour centers in the South is evidenced by the fact that very close to 80 per cent. of the entrants hail from Southern States. Another substantial evidence of the interest occasioned in the South is shown in the donation by Chamber of Commerce and the citizens of Anderson, S. C., of a handsome silver trophy to be awarded the individual owner whose car covers the 1,454 miles journey with the least number of points penalty against it. The cup measures some 39 inches by 15 inches and is second only to the Glidden trophy itself in point of intrinsic worth.

As previously stated in the Motor World the tour will be a grade IV team contest, which is to say that penalties will be imposed only for lateness at control, and the Glidden trophy will be awarded to the team of three cars making the best aggregate score. Those entrants who team up and compete for the Glidden trophy will also compete for the Anderson cup. To date only six teams have been nominated, though the nomination of others is pending, and it is likely that at least a dozen will be formed. The six which have been formed are as follows: Tarrytown, N. Y., team, United States Motor Co., three Maxwells; Detroit team, Studebaker Corporation, three Flanders cars; Waltham, Mass., team, Metz Co., three Metz runabouts; Nashville, Tenn., team, Marathon Motor Works, three Marathon cars; Atlanta team No. 1, Mayor C. S. Winn (Flanders), F-M-F Atlanta Co. (Flanders) and Decatur Board of Trade (Flanders); Atlanta Journal team, Major J. S. Cohen (White gasoline), Jas. R. Gray (Thomas) and Inman Gray (American). The complete entry list is as follows:

R. M. Owen Co., New York.....Reo truck

Elaborate arrangements have been made for the entertainment of the Gliddenites all along the line of the tour and the easy stages and good roads insure the contest savoring more of the sociability run than ever did Glidden tour before. The itinerary is as follows:

Oct.	Start.	Night	Daily	Noon Stop.
14	New York.....	Stop.	Mileage.	Trenton
15	Philadelphia.....	Philadelphia	95.1	Lancaster
16	Gettysburg.....	Gettysburg	120.1	Winchester
17	Staunton.....	Staunton	182.3	Nat'l Bridge
18	Roanoke.....	Roanoke	90.8	Martinsville
19	Winston-Salem.....	Winston-Salem	124.3	Salisbury
20	Charlotte.....	Charlotte	135.6	Anderson
21	Anderson.....	Spartansburg	160.6	Commerce
22	Atlanta.....	Atlanta	144.2	
23	Atlanta.....	(Sunday stop-over)...		
24	Atlanta.....	(Monday stop-over)...		Macon
25	Cordelle.....	Cordelle	167.5	Valdosta
25	Live Oak.....	Live Oak	149.1	None
		Jacksonville	85.0	

Total Mileage.....1,454.6

Lazansky Moves for Uniform Laws.

To smooth over the difficulties and end the conflict of the warring States of the Union, more particularly the Eastern States, in regard to their automobile laws, is the heroic task Edward Lazansky, Secretary of State of New York, has set himself. As a first step toward this goal the secretary has invited the officials having charge of automobile matters in the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, Maryland, Virginia, Ohio and Illinois, requesting their presence at a conference to be held in his office in the State capitol in Albany on October 8.

Secretary Lazansky has no intention of forcing the New York laws upon other States, nor does he claim that the provisions of the Empire State are the best that could be made, but he does think that the present chaotic state in the automobile laws of neighboring States has become untenable and that uniform regulations are absolutely necessary.

Where Even Baby Carriages Are Tagged.

While it is fairly well known that every adult German is supposed to carry with him day and night his so-called "identification papers," women and babies hitherto have been free from the galling requirement. Not so at present, however, for at least one of the cities of the Fatherland recently passed a law requiring all baby carriages to be properly registered and tagged with a license plate. The law is expected to help grieving parents and distracted policemen to locate or identify the baby after the nurse has taken a walk with her "soldier boy."

FIRST TICKETED TOUR STARTS WEST

Five Garford Carloads of Passengers Make Up Tourists' Agency's Ocean to Ocean Journey—Their Route.

When some three months ago the Raymond & Whitcomb Co., as related in the Motor World, announced its intention of sending ten Garford touring cars filled with passengers on a transcontinental trip from New York City to Los Angeles, Cal., many people viewed it as a mere publicity scheme on the part of that well-known tourists' agency. That the company meant what it said, however, was made evident last Mon-

START OF FIRST TOURIST AGENCY OCEAN TO OCEAN TRIP

day, October 2d, when a party of 16 people took their seats in five Garford cars and started on the long 4,200 mile run, according to the announced schedule. A. L. Garford, president of the company which made the cars, was at the wheel of the first car and piloted the "fleet" part of the way to Poughkeepsie, N. Y. With him were Mr. and Mrs. A. L. Westgard, Mr. Westgard being the official pilot of the party.

While this is not the first transcontinental touring party of more than two cars, the present enterprise is the first one in which anyone could step up and pay \$845 for a reserved seat in a touring car for such a journey; the price includes all hotel and incidental expenses. The plan of sending the touring cars across the continent suggested itself to the Raymond & Whitcomb Co. after the various New England tours conducted by the same agency disclosed a public liking for automobile touring of the kind. The company, as stated in the Motor World at that time, planned to inaugurate a similar service in California during the winter months, and, instead of shipping the cars by freight, it offered to take passengers across the continent in

the automobiles on a regular schedule, at a comparatively low rate of transportation.

The accompanying illustration shows the fleet of cars ready for the long trip of 4,200 miles from New York City to Los Angeles, Cal., which latter city the tourists are scheduled to reach on November 22. The route will go from New York to Chicago via the conventional paths, then across the State of Illinois to Davenport, Ia. Thence it leads to Omaha along the famous river-to-river road. Kansas City is the next big city on the route and forms the beginning of the famous Santa Fe trail, which is followed through Colorado, New Mexico to Santa Fe.

At this point the route will leave the railroad, which it has been following thus

far, and strike into the sparsely settled territory of Arizona, touching Phoenix, the capital. From Phoenix the trail will lead to the Salton Sea and the Jacinto Mountains to Riverside and Los Angeles.

The names of the persons who have engaged accommodations and actually started, besides A. L. Westgard and his wife, are: Mr. and Mrs. George F. Foote, Mr. and Mrs. John Legg, Howard Legg, W. J. Studwell, Richard L. Fox, W. F. Harris, H. D. Ashton, Leonard Ormerod, Edward Grabow, J. T. Springer, Horace Horne, M. Ryan, George H. Reye and P. B. Bier-shenk.

A carload of New Englanders will join the party at Albany, and other passengers will be picked up on the route.

Motorists of Norfolk, Neb., have organized the Madison County Automobile Association. Each district of Madison county has been requested to nominate a representative on the board of directors. The officers, all of whom reside in Norfolk, are: President, H. A. Pasewalk; vice-president, George B. Christoph; secretary-treasurer, C. B. Salter.

PAYS A FINE FOR SAVING A LIFE

Germany Stirred by Case of Motoring Physician Hurrying to Scene of Accident—Peculiarities of the Law.

While in America physicians have been arrested for exceeding the speed limit when driving to patients on a "hurry call," such cases have been rare in Germany, because the automobile law allows a higher speed to physicians responding to bona-fide sick calls. The law there, however, does not say anything about their being permitted to use promenades or cycle paths in emergency cases. Furthermore, paragraph 54 of the criminal code of the German Empire permits a man to disregard local ordinances or traffic regulations only in case his own life or that of a member of his family is in jeopardy. The peculiar wording of this paragraph was responsible for the arrest and fine of a physician, who by temporary disregard of a town ordinance succeeded in saving a human life.

The case, which has aroused widespread interest and called forth vigorous protests from the general public as well as from the medical profession, occurred on August 10th last, in a small city in the province of Brandenburg, within a day's walk of the capital of the Empire. A doctor was called by telephone to a bathing pavilion, where a swimmer had become unconscious. Half way between the doctor's residence and the bathing pavilion the road was in a very bad condition and accordingly he drove on a near by cycle path. He saved the swimmer's life but the argus-eyed police promptly fined him 25 marks for trespassing on the cycle path.

When the doctor appealed to the higher court against the police decision, the learned judge presiding declared that while the German law permits an individual to ignore ordinances, if such disregard would result in the saving of a life—or a strict observance of the regulation would be followed by death or injury to the individual or members of his family—as it did not make mention of stranger's lives, any man breaking a police regulation in order to save a stranger's life would have to take his chances with the police, insofar as fines were concerned.

In connection with the ruling of this judge, the German press calls attention to a truly "classical" example of red tape and bureaucracy which occurred last year in Silesia. There a miner, passing along the highway which runs parallel and close to the railroad tracks, noticed a stranger lying across the rails, and, at the risk of his own life, rushed upon the raised roadbed and snatched the would-be suicide from in front of an onrushing train. The next day he was fined 10 marks for "trespassing on the property of the railroad."

CITY PARADES FIRE APPARATUS

**First Public Display Pointing Way to
Motorization of Entire Department—
Motors and Horses Compared.**

New York witnessed its first parade of automobile fire apparatus on Monday last, 2nd inst. While the turnout was interesting to many New Yorkers, as affording the first close examination of the modern fire apparatus, it was not so impressive as will be a similar parade twelve months hence. The parade was incident to the opening of the annual Budget Exhibit of the City of New York, to which it was designed to at-

tract public attention; as admission is free it follows that it does not lack spectators.

the Fire Department. The touring cars and the runabouts all are finished in "fire alarm red."

At present there are 29 pieces of automobile apparatus in the New York Fire Department. One year hence there will be more than 100, orders for which already have been placed, as it is the intention to wholly "motorize" the big city fire department. What the future holds is indicated not only by these figures, but by the fact that not only is all of the present horse-drawn apparatus to be displaced by motor propelled vehicles, but that 42 new companies are to be organized and similarly equipped.

The parade called on the Mayor at the City Hall, and for two hours the vehicles

The Waterous engine shown in the Budget exhibit is probably the largest of its kind in existence. It has a power plant of six cylinders $7\frac{1}{4} \times 8$ and develops about 126 horsepower. Its pumping plant also is driven by the gasoline motor and includes four pumps $4\frac{3}{4} \times 8$ inches.

Wants \$10,000 for Injury to Eyes.

Although Fayette Fink, of Omaha, Neb., does not exactly know what happened to him just before he took an aviation trip to the ceiling of his garage, coming down with considerable vehemence upon the wooden floor, he followed the general trend of the times and blamed his new automobile for his experience—which, of course, means that he sued the company which sold

NEW YORK'S MOTOR PROPELLED FIRE APPARATUS PARKED IN FRONT OF THE CITY HALL

tract public attention; as admission is free it follows that it does not lack spectators.

The Budget Exhibit, housed in a big building on Broadway in the business district, is designed to give the taxpayers and rent payers an idea of how their money is spent, and also presents object lessons designed to show why the budget grows larger and larger each year and why the city fathers, therefore, require more money.

It is a wonderfully interesting display, which this year includes everything from samples of stationery and penwipers used in the various city departments to fire horses and police dogs and the big six-cylinder 126 horsepower Waterous gasoline pumping engine. This gigantic engine has not yet been added to the New York Fire Department, as it is yet only on trial. It did not take part in the parade, which was made up of a Webb automobile fire engine, a Webb high pressure hose wagon, a Knox wagon of the same sort, a water tower drawn by a Couple-Gear tractor, two Lozier touring cars, which are used by the fire commissioner and the fire chief, and eight Ford runabouts, which are employed by the deputy chiefs and battalion chiefs of

were parked in City Hall Park, forming an unusual scene for the thousands who are so quickly attracted to the many scenes which occur on that busy spot in New York.

The pathetic side of the parade was supplied by two of the oldest fire horses in service, both of which were garlanded with flowers, suggesting what is the fact, that the funeral of the horse, so far as the fire department is concerned, is not far removed. The cause which is hastening this funeral is emphasized by a placard displayed near a big Webb high pressure wagon, which, with the Waterous engine, is included in the Budget Exhibit. The placard makes plain the record of Engine Company No. 58, which is the busiest in New York City, and shows the comparative cost of horse equipment and automobile equipment during the period from March 20th to September 30th, inclusive. The comparison comprises the following figures:

Maintenance of engine and hose wagon with five horses.....	\$471.90
Maintenance of automobile engine and hose wagon	73.35
Saving in 6 months and 10 days....	\$398.55

him the car for damages. In his complaint Fink alleges that the Peerless Auto Co., of the Nebraska city, represented in the person of one Guy Smith, sold him an automobile said to be a brand new one, but that on his subsequent examination the machine proved to have been run before. He also states that on this occasion he came into contact with gasoline when he didn't expect it, and hit the ceiling with a crash. He claims his eyesight has been impaired \$10,000 worth and he wants the automobile company to make good the alleged damage.

To Build Track in Sioux Falls.

Motorists of Sioux Falls have formed the Sioux Falls Automobile Racing Association for the purpose of promoting race-meets in that prosperous South Dakota city. A mile track will be built exclusively for automobiles. Incorporation papers have already been filed and the following officers elected: President, H. F. Brownell; vice-president, H. C. Fenn; secretary-treasurer, A. J. Keith; directors, D. L. McKinney, J. L. White, C. R. Newby and George W. Abbott.

FORD PRICES REVISED DOWNWARDS

Lops \$90 Off List of Both Runabout and Touring Car—Also Adds Delivery Wagon to 1912 Line.

Making new and lower prices on its established styles, the Ford Motor Co., of Detroit, Mich., for 1912 is adding a delivery car as a regular member of its line and at the same time is announcing an increase of production to 75,000 cars for the season. The Ford company makes but one chassis, known as the Model T and having a four cylinder, 20 horsepower engine. On this chassis the various differ-

porated in the flywheel, transverse springs, vanadium steel construction and a unique pedal-operated planetary gear transmission system with shaft drive. In its original form the Model T chassis was developed in time for the season of 1909, since which year it has been improved in detail from time to time, as in the replacing of plain bearings with roller bearings and similar improvements where they were possible.

In explaining why it will make 75,000 cars for 1912, the company incidentally offers statistics showing the amazing proportions of its business. It is claimed that there are over 100,000 Model T cars in use, and that the present Ford selling organization comprises three large reserve work-houses or service stations, 30 branches and

CRITICIZES BODY POSITIONING

Its Extension Over Rear Axle Prime Cause of Discomfort and Deterioration, Says Engineer—Remedy Advocated.

Suggesting an almost complete rearrangement of the position of automobile bodies with regard to the axles, a British engineer has advanced the opinion that present day practice which carries the extension of the body over the rear axle is largely responsible for increased deterioration of the car as a whole. Stiff spring suspension is made necessary, he says in substance, and he proceeds to prove, to his own satisfaction, at least, that the employment of sufficiently flexible springs necessitates that the passengers' seats be in front of the rear axle.

"Road shocks on the wheels and axles are unavoidable," he says. "The problem is to make the connection between the frame and the axle such that these road shocks are so softened as to be negligible by the time they reach the frame. The whole point is that these violent stresses must not reach the frame; no subsidiary device interposed between the frame and the passengers can be considered as meeting the real difficulty. It is necessary, therefore, to have a spring of such suppleness connecting the axle and the frame as will give to the road shocks without having the power violently to raise the weight of the frame and the body."

"As the supple tree gives to the blast while the stiff tree is torn up by the roots," he explains, "so the supple spring gives to the road while the stiff spring transmits a shock to the whole of the car."

"In practice," he continues, "the employment of a supple spring brings the designer against the problem of how to allow for greatly increased movement of the wheels and axle, for the wheels and axle will have greater movement in the same way as the top of the supple tree moves vastly further than the top of the stiff tree. It is quite impossible to allow for this movement if the frame and the body project over the rear axle." "It is not necessary to elaborate this point," he says further, "for a moment's examination of any car on which the frame and body project over the rear axle will show that if the wheels and axle were allowed to move with considerably greater freedom than these parts would bump against the frame and body."

"Now to sufficiently raise the frame and body is impracticable for several important reasons which it might be tedious to discuss in detail, and the designer is driven to find some other method. And thus we come back again to the position of the back seat in front of the rear axle. The only practical method is to make the frame end in front of the rear axle and to let

FORD \$700 PANEL TOP LIGHT DELIVERY CAR

entiations of body are made that result in the touring car, the roadster, the runabout, the coupe and the delivery car. The price of the Ford touring car for 1912 is to be \$690, as against \$780 for 1911, and the price of the two-passenger runabout and of the three-passenger roadster having a rumble seat is to be \$590, as against \$680. The new delivery car, which has a carrying capacity of 750 pounds, is to sell for \$700, complete with panel delivery body, windshield and accessories. As during 1911, the prices on the pleasure cars include very complete accessory equipment, including top, windshield, speedometer, five lamps, generator, horn and tools.

In respect to mechanical features the Model T continues with only minor changes, the essential features being in every respect the same as during 1911. These include as characteristic elements a block motor with all four cylinder heads removable as one piece, a magneto incor-

porated in the flywheel, transverse springs, vanadium steel construction and a unique pedal-operated planetary gear transmission system with shaft drive. In its original form the Model T chassis was developed in time for the season of 1909, since which year it has been improved in detail from time to time, as in the replacing of plain bearings with roller bearings and similar improvements where they were possible.

Will Manufacture Hupmobiles in Canada

The Hupp Motor Car Co., of Detroit, which during the past year has operated an assembling plant in Windsor, Ont., which is opposite Detroit, is making ready to erect a real manufacturing plant in the Canadian city. An option on a site on Mac-Dougal street has been secured, but the Hupp people cannot obtain possession until the transaction is ratified by popular vote. When this is done it is the intention to turn out about 3,000 Hupmobiles annually for the Canadian market.

the body project so little that it is still well clear of the wheels and axle. We then have, so far as this part of the car is concerned, ideal conditions—the wheels and axle free with plenty of room to bump about as the work on the rough road necessitates, and thus able to be connected to the frame by springs so supple that no harsh, violent movements can be transmitted to the frame, the machinery and the coachwork. In this way we secure not only the maximum possible comfort for the passengers, but also the minimum of stress for the frame, with consequent ability to travel fast and safely over a rough road surface.

"Obviously the coachwork can suffer only from such stresses as are transmitted to it by the distortion of the frame. So the more we can lessen these distortions the better for the coachwork, and the most direct method of doing this is to absorb the road shocks in the springs."

"Now that the mechanical side of motor cars has reached such perfection," he says in conclusion, "interest is chiefly centered in the arrangement of the car as a whole, or, I might say, in any such rearrangement of its standard component parts as will make it a more perfect road vehicle, more comfortable, more convenient and more suited for the rapid travel we desire over the rough roads we so often have to traverse. . . . I believe the comparative stiffness of springing, necessitated when the body is back over the rear axle, is the most serious and annoying defect of the motor car today."

Dealers Sue Sheriff for Damaged Car.

The Sheppard Motor Co., of New York City, has sued James J. Kelly, Sheriff of Hudson county, New Jersey, for alleged damages to an automobile seized by him in attachment proceedings brought by Mrs. Cecilia Buck, president of the Communipaw Motor Vehicle Co. In the bill of complaint it is claimed that someone who had access to the automobile while it was in the Sheriff's custody damaged the car by driving it 740 miles, wearing down the tires, breaking lamps and steps and badly damaging the top. No one connected with the Sheriff's office admits having used it, but the Sheppard company holds the Sheriff responsible for the safe-keeping of the machine, which was valued at \$1,400. The attachment was removed recently and it was then that the car was discovered in a condition suggesting an unusually strenuous "joy ride."

Lighting Company Removes to Holyoke.

The Auto Lighting Co., previously located at 154 Dwight street, Springfield, Mass., has been induced to remove to the adjoining city of Holyoke. Through the influence of the Holyoke Board of Trade the company, which is capitalized at \$30,000, secured a portion of an old warp mill on Main street.

ISOTTA HERE WITH FRONT BRAKES

Latest Models of Italian Car Disclose Trends of Foreign Practice—What They Are and Their Purposes.

Embodying many of Europe's latest kinks in automobile construction, such as front wheel brakes, leather disk universal joints, chain covers and the like, several 1912 Isotta Fraschini models have been received by J. M. Quinby & Co., of Newark, N. J., who, in addition to being body builders of real note, are also the American distributors of the Isotta line, popularly known as the "I-F." All of the chassis received from the factory in Milan, Italy,

ISOTTA FRONT WHEEL BRAKE

are unusual in that they are equipped with front wheel brakes, which are operated by an emergency hand lever. These brakes take the place of the more usual transmission brakes, and it is claimed for them that they reduce skidding to a minimum and that they equalize that portion of the tire wear directly resulting from braking, while their efficiency, by reason of having the braking effect on four wheels instead of two, is claimed to be almost doubled.

Long-stroke motor design is continued, with detail refinements in the motor looking to silence and increased flexibility. All of the moving parts have been enclosed by aluminum covers, to assist silence, lubrication and protection from dust. Chain covers are a feature of the chain driven models, the covers being rigidly attached to the radius rods, with no loose or rattling joints. The shaft driven models have the patented Isotta leather disk universal joint, which at any angle preserves identical speed between the driving and the driven side, so that no second universal is necessary for equalization. It is claimed for the leather disk coupling that in addition to requiring no lubrication or adjustment, it serves the function of being a sound deadener in respect to vibrations from the rear axle gears, further aiding in the silence of running. The Quinby company is offering

four size of chassis, viz., 15-20 horsepower, 25-30 horsepower, 35-45 horsepower and 100-120 horsepower.

Where Chauffeur's Sins Find Him Out.

Although the German automobile regulations or laws do not specifically say that a man who has been found guilty of assault shall not be given a chauffeur's license, the German police authorities have, at various times, taken the stand that such a person is not fit to be trusted with the handling of a motor car. It remained for one of the higher courts of Prussia, equivalent to the Circuit Court of Appeals in one of the States of the Union, to decide once for all whether or not the police authorities had any right to refuse a chauffeur's license for the reason given. And the court placed itself squarely in favor of it.

In the case in question a chauffeur who had been arrested and punished no less than sixteen times—including six times for assault, five times for using foul and insulting language, twice for resisting an officer, and once each for threatening with a dangerous weapon, damage of private property and interfering with public conveyances—applied for a driver's license, but was refused when the police started to look up his character. The chauffeur applied to the courts but lost in every instance, the case going to the court of appeals so as to make a test case valid all over the kingdom of Prussia. In his decision the presiding justice said: "The law does not specify the offenses for which one must have been punished in order to be ineligible to drive a motor car, but it does say that no man 'unfit to drive' should be given a license. The offenses for which the applicant has been punished show him to be of highly choleric disposition, of leaning towards quarreling and fighting and the use of foul language. Taking into consideration that driving an automobile in crowded traffic requires a steady, quiet temper, and that it tends to accentuate whatever tendencies a man may have to quarrel or fight, we find that the appellant cannot be considered a man to be trusted with the running of a motor car."

A. C. A. Special Rate Leads to Trouble.

The discount of 20 per cent. from current rates granted to members of the Automobile Club of America and subscribers to its Bureau of Tours, has gotten the London, Liverpool and Globe Insurance Co., and the brokers who made the arrangement, into trouble with the State authorities. The insurance company and the brokers, R. C. Rathborn & Son, have been cited to appear before the State Insurance Department and explain their action in the matter, which it is charged is a violation of the insurance law, which prohibits discrimination in rates. In its defense, the insurance company states that the arrangement complained of was discontinued some time ago.

FOR PREVENTION OF EXPLOSION

How the Langrehr Tube Serves That Useful Purpose—Easily Applicable to Tanks and Other Receptacles.

That many of the fires due to the handling of gasoline are easily preventable was the sum and substance of a lecture delivered by Bernhard Zwillinger, Ch. E., which preceded the demonstration of the

through the interstices, feeding the flames until the supply is exhausted. A momentary covering of the opening of the tank or can will extinguish the flame immediately, and it is asserted by the inventor that no flare-back ever has resulted. The rather startling demonstrations following the lecture fully bore out the claim that ignition of the liquid was impossible.

The most spectacular of these tests consisted of putting a small quantity of gasoline into a can, introducing a current of

GASOLINE CANS FITTED WITH THE LANGREHR DEVICE

new Langrehr safety device at the laboratories of the Berlin Chemical Co., at 560 West 171st street, New York City, a resume of which appeared in last week's Motor World. Mr. Zwillinger's remarks showed plainly that the object of the Langrehr device is not so much the prevention of the ignition of gasoline as the prevention of explosions. If a tank or can, partly filled with gasoline is fitted with one of the Langrehr tubes, as shown in the accompanying illustrations, the gasoline fumes issuing from the opening may be ignited as easily as if no safety device were present, and the contents of the can or tank will continue to burn until every vestige of the combustible liquid is exhausted. What the device is claimed to prevent is the communication of the flame on the outside of the tank to the air-mixed vapor inside.

The device is so constructed as to cool the gases of combustion in their passage through the interstices of the tube, so that the fire which may rage on the inside of the tube is not able to penetrate the relatively small holes which give access to the gasoline surrounding the tube, even though the latter be mixed with air in the most dangerous proportions. The heat generated by the burning vapor on the inside of the tube is sufficient to gasify the liquid surrounding it and to force it

air and then lighting the fumes that issued. Despite the fact that the flame was about two feet long no flare-back resulted.

LANGREHR SAFETY TUBE

WHY SOLID TIRES REQUIRE COOLING

Hoopengartner Points Out Its Importance—Shows Wherein Other Attentions Are Profitable.

If that average man experienced only with pneumatic tires who fancies that because solid rubber tires are not subject to punctures and blow-out they require no thought or attention—if he had been present at the last meeting of the New York Motor Truck Club he would have learned more than the proverbial thing or two. E. O. Hoopengartner, New York manager for the Swinehart Tire and Rubber Co., delivered an address on that occasion, in which he pointed out that oil, cuts and overloads all have their baneful effect on solid tires, exactly as they exert it on pneumatics, and sought to show that lack of care results in the same short life and increase of maintenance.

Solid tires being designed for heavy loads, Hoopengartner emphasized the great friction and therefor great heat to which they are subject and dwelt at some length on the necessity for cooling such tires as much as possible, in which connection he urged the use of not only larger tires but larger wheels. Among other things, he said:

"In so far as 90 per cent. of delivery wagons and motor trucks are operated on solid tires," he said, "the item demands greater and more careful consideration. There has been considerable agitation in the last year or two in regard to the use of pneumatic tires on commercial cars, and some builders advocate these tires on trucks under two-ton capacity. This idea has been followed out more abroad than in this country, and, owing to the better road conditions, has met with some success, but these tires can only be recommended for light cars, where the nature of the work demands quick deliveries, or where the load itself is of such a nature that it cannot stand the vibration which must be expected from solid tires.

"Truck manufacturers, users and tire makers themselves are all interested in securing the most economical service on solid tires. A great opportunity for the truck builders to effect a more economical tire cost is for them to equip their product with ample tires. We have known a great many cases where the tire expense and trouble were more than cut in half by the application of adequate sized tires.

"While the matter of having the car properly equipped in the first place is of supreme importance, yet the proper care of the tires, once applied, is a close second. A great deal of energy and effort have been expended in the direction of the up-keep and care of pneumatic tires, but it has been taken for granted, that, once a solid tire

has been applied, it required no effort or intelligence, and, as a result, the truck has proceeded to be sometimes expensive.

"There is a great deal of friction necessarily induced in propelling a heavy truck with a load. Therefore, heat being one of the greatest factors in the deterioration of a tire, the temperature of a tire should be kept as low as possible. One of the most practical means for overcoming this in commercial trucks is to use wheels of a large diameter.

"I believe that a 42 x 5-inch dual tire will give longer service, and consequently more satisfactory results, than a 36 x 6-inch dual. I have recently had occasion to observe a 3-ton truck equipped with 48 x 6-inch single tires. These tires, after having been in service for about 3,500 miles, show practically no wear, and we think that there is no question but what the engineering difficulties which are presented in a high wheeled car will be more than compensated for by increased service of the tires.

"Take, for instance, a wheel of 34-inch diameter, and one of 48-inch. The ratio of the circumference is as two to three. In other words, a tire on a 34-inch wheel would come in contact with the ground three times where a tire on a 48-inch wheel would touch the ground only twice. This gives a tire 50 per cent. longer time to cool, and this, taken into consideration along with the greatly lessened shock received by the tire on a large wheel, going over rough pavements, makes a big difference in the wear of the tire.

"Another very important point to be taken into consideration, and which favors the dual tire, is the much larger cooling surface presented on, for instance, two four-inch tires, rather than one eight-inch. The heat being one of the worst enemies of rubber, it can be readily understood that this is a large factor, small bodies cooling more readily than large ones."

Regarding the proper care of tires, he states the already well known fact that speeding is poor economy. Surveillance of the driver, he suggests, is the only sure method of stopping this form of abuse. "Another unnecessary strain," he says, "is to permit the car to stand over night or for any length of time with its load; it would be more economical to remove the load or jack up the car."

That "service" is of vital import to the tire industry as is the sale and maintenance of the trucks themselves, was the keynote of the discussion which followed. While practically every manufacturer of tires is prepared to render quick service in emergency cases, it was shown that several already have rapid emergency wagons which can be despatched at short notice to render aid. Carrying the matter of service even further, it was brought out that one of the tire companies had requested a truck manufacturer to furnish a set of wheels which could be kept tired in readiness for instant use.

CONTINENTAL'S NEWEST ENGINE

Well Known Manufacturers Produce One of Long Stroke Type, Newly Designed Throughout—Its Specifications.

Inasmuch as the power equipment of no inconsiderable number of motor cars emanates from the factory of the Continental Motor Mfg. Co., of Muskegon, Mich., in the form of Continental motors, proportionate interest attaches to the fact that the company has brought out a new motor, styled the Model C. It is of the long

CONTINENTAL "C" MOTOR—MAGNETO SIDE

stroke type, of compact design, and is newly designed throughout, after long experimental work. It is made in two sizes, viz., 3¼-inch bore x 5¼-inch stroke, and 4⅞-inch bore x 5¼-inch stroke. Both sizes can be furnished with either thermosiphon or pump water circulating system.

The crankcases are of nickel aluminum alloy, and are split in the center to give easy access to all the adjustable main bear-

VALVE SIDE OF CONTINENTAL "C" MOTOR

ings. These bearings are carried in the upper half of the crankcase. They are made of nickel babbitt, are generous in size, and, being split, are adjustable. For the adjustment of the bearings, liners or shims are used, which are .001 to .004 inch thick and made from sheet steel. The liners are removed as required and the bearings taken up for wear. Three bearings support the crankshaft, which is made of .45 carbon steel, drop forged and heat treated.

Lubrication is by a positive force feed constant level oiling system, having two plunger pumps. These pumps are oper-

ated by two camshaft eccentrics, one pump feeding into the large oil reservoir and maintaining the level, while the other forces oil directly to the helically cut timing gears at the front of the crankcase. Dippers are provided on the lower half of the connecting rod bearings, splashing oil to the oil grooves and bearings.

Special attention has been paid to the enclosed valve mechanism, the valve guides being cast separately and machined both inside and out. The valves practically operate in oil and are designed to be exceptionally quiet. The camshafts are drop forged from a single piece of low carbon steel, the cams being integrated with the shafts.

The Model C motor is supplied in complete unit power plant. The bell housing, which is cast integral with the crankcase, wholly encloses the flywheel and clutch. Power plants are furnished with multiple disk clutch and three-speed selective transmission. All the working parts are completely encased, making the motors proof against dirt and dust and contributing to their noiseless operation.

Truck Club Discusses Demonstration Fees.

Because of an intended long stay in Europe, Alfred T. Otto tendered his resignation as vice-president of the New York Motor Truck Club at the last meeting of that organization, held on the 27th ult., and it was accepted. Practically the only business that was transacted at the meeting had to do with the proposed establishment of uniform fees for truck demonstrations. The subject had been discussed at several previous meetings and still is in the hands of a committee which is endeavoring to frame a uniform system. The matter was brought up at the last meeting by a representative of Mack Bros. Motor Co., who stated that it was the universal policy of his company to charge \$15 a day for the demonstration of a light truck and \$20 a day for a three or five ton truck. In order to ascertain the views of the various companies as to a proper charge for the work, the secretary was authorized to communicate with all manufacturers, requesting them to suggest a suitable fee which can be standardized and adopted by most manufacturers.

Dealer Loses in Second Hand Car Suit.

Mary Lausecker, of Hoboken, N. J., has obtained a judgment of \$500 against DeWitt Romaine, a dealer at 225 Mercer street, Jersey City, for alleged breach of agreement. It appears that Mrs. Lausecker turned over her car to Romaine to be sold by him, on condition that she receive \$500, out of the selling price. Romaine, on the witness stand, admitted that he accepted the car, but claimed he was to allow Mrs. Lausecker the sum of \$500 on a new car to be bought of him. Judge Erwin, before whom the case was argued, decided for the plaintiff.

Positioning the Gasolene Tank; the Factors Involved

It is probable that there are few who realize that such an apparently simple problem as the locating of a gasolene tank on a chassis is not quite as simple as it looks. At first blush it seems that it scarcely can be called a problem and yet there is abundant evidence that to even this comparatively simple detail of construction there has been paid a much greater

amount of attention than appears on the surface. Obviously it is absolutely essential that the gasolene be delivered to the carburettor. Also it must be delivered positively at all engine speeds regardless of whether the car is moving smoothly over good roads or whether it is bouncing and jouncing over "roads" which bear resemblance to ploughed fields. Therein lies a material part of the problem; that the gasolene shall feed properly on any grade up which the car can be driven constitutes the remainder of the problem.

FIG. 1—CONVENTIONAL ARRANGEMENT WITH TANK UNDER FRONT SEATS—THE OHIO

amount of attention than appears on the surface.

Obviously it is absolutely essential that the gasolene be delivered to the carburettor. Also it must be delivered positively at all engine speeds regardless of whether the car is moving smoothly over good roads or whether it is bouncing and jouncing over "roads" which bear resemblance to ploughed fields. Therein lies a material part of the problem; that the gasolene shall feed properly on any grade up which the car can be driven constitutes the remainder of the problem.

From the first, the location of the tank beneath the front seats in touring cars or behind them on runabouts has been the most popular; a conservative estimate would be that on at least 75 per cent. of the cars on the road, it is so placed. In the majority of them, gravity alone is relied on to insure the feeding of the fuel, but while this system undoubtedly is the simplest—merely a tank and a length of piping to connect it with the carburettor—it necessitates very careful designing to obviate the possibility of the cessation of gasolene flow when the car is tilted on grades.

For this reason, the carburettor must be placed as low as possible consistent with accessibility. There are very few carburettors that do not require slight adjustment from time to time, though this fact has been overlooked by several manufac-

turers, who have placed them so low that they cannot be reached except from below, and in at least one instance this requires that the underpan be removed. On the score of accessibility, the under-the-seat location of the gasolene tank is not as good as some other locations, as it requires that both occupants of the front seat move when it becomes necessary to fill

the tank. Also this location prevents the space under the front seats being used for anything else, such as the storage of tools, spare parts or other incidentals.

If the tank is not located under the seats, or as in the case of runabouts, behind them, but is hung under the body at the rear, other complications arise, and it is largely to this fact that the gravity feed

system owes its popularity. When the tank is hung at the back it is then either lower than the carburettor, or so nearly level with it that on even slight grades the fuel will not feed by gravity and some form of pressure is necessary. Only light pressure is necessary (about two pounds) and generally this is obtained and maintained con-

stant by means of an automatic valve which admits a small part of the exhaust gases to the tank. A small hand pump is provided to obtain the initial pressure to fill the carburettor, after which the pressure is maintained automatically.

Often the pressure feed system is used out of necessity and not out of choice. The present tendency toward low-hung cars with an ever increasing touring radius necessitates a larger tank and one that is hung lower, and as there remains only the alternative of placing it under the body at the back, pressure feed must be used. On the other hand, the pressure feed system is used in as many cases because the manufacturer believes that it is in every way superior to the gravity feed, though whether it is or not is an open question.

The pressure feed system requires an additional pipe line, a pump, and usually, a gauge on the dash to indicate the amount of pressure, all of which are missing from the gravity system. Also a slightly heavier tank is required, and as each of these items means extra cost, it is apparent that the gravity system is by far the cheaper of the two. In fact, it is claimed by a large number of manufacturers that it is not only cheaper to install but because of its simplicity it also is cheaper to maintain and is longer lived.

Certain it is there is less to get out of order. It weighs less because of the lighter tank which may be used, and the absence of piping and other fixtures, and a feature which should not be overlooked is

FIG. 2—THOMAS PRESSURE FEED SYSTEM WITH TANKS UNDER BODY

that because there is no pressure on the gasolene, leakage must be slower in case of damage to the tank; this minimizes the risk of danger from fire. When the tank is placed high enough for the fuel to feed by gravity, the center of gravity of the car is raised, of course, but this is not a serious matter and almost may be disre-

garded.

garded. The danger of the pipe line becoming clogged is remote, provided the gasoline is carefully strained and any foreign substance large enough to obstruct the fairly large pipes which now are used would be readily discernible in the gasoline before it was put into the tank.

Though it has been stated that when na-

FIG. 3—HUDSON TANK WITHIN A TANK

ture and man can obtain the same results, man invariably introduces unnecessary complications, the fact remains that under certain conditions the pressure feed system possesses advantages which the gravity feed system does not, in spite of the state of perfection to which the latter has been brought in the last few years. The

FIG. 4—ARRANGEMENT OF KNOX TANK

principal of these is that the "head" on the gasoline is constant regardless of road conditions. With the gravity feed system it may vary, but with the pressure feed system it cannot. Therefore, when a car equipped with a pressure feed system is climbing a hill, with the tank very nearly empty, the "head"—or pressure—on the gasoline remains the same as when the

tank is full, whereas with the gravity system the "head" would be least, when, in order to supply the increased demand, it should be greatest.

The pressure feed system allows of greater latitude in the location of the tank, but at the same time, as already stated, it requires extra piping, valves, etc., which may be the cause of trouble. They seldom are, however, despite the necessity for airtight joints. The vent which is necessary in the tank in gravity fed systems is not required when pressure feed is used and this is an advantage, inasmuch as evaporation is reduced, slopping is done away with and the likelihood of dirt getting into the tank is greatly lessened.

Generally when the tank in gravity fed systems is located under the front seats, it is rectangular in shape, as shown on the Ohio chassis illustrated in Fig. 1. Cylindrical tanks have been used but have given

FIG. 5—ACCESSIBILITY OF WINTON TANK

way to the rectangular form principally for the reason that a cylindrical tank in the same space must necessarily be of smaller capacity. Though it has been pointed out that in this position the tank cannot be reached in case it is damaged except by removing the body, the very fact that it is under the seats and therefore fully protected reduces the likelihood of injury from external sources to the minimum.

The internal source of injury is found in the force of the gasoline splashing against the sides and top and straining the joints. The amount of this force may be estimated from the old saying to the effect that "a pint is a pound the world around." Of course the actual weight of gasoline varies according to its specific gravity, and while in any case it is less than a pound to the pint, it is very little less, and assuming that the average tank holds about 20 gallons, it readily may be appreciated that the force is considerable. To render this force less destructive, some manufacturers fit their tanks with splash plates, though the majority of them make the tanks themselves heavy enough to withstand the strain.

The tank within a tank arrangement, whereby an auxiliary supply of gasoline is carried for use in case of an emergency, is gaining in favor and is now used more than ever. With this arrangement, a three-way valve generally serves to allow the gasoline to be drawn from either of the tanks at the will of the operator, or to be shut them both off when the car is left unattended. Obviously, the logical place

FIG. 6—POSITION OF THE LOZIER TANK

for such a valve is outside, where it can be reached immediately, though in some makes of cars it has been placed under the foot boards in a very inaccessible place.

In runabouts, the gasoline generally is fed by gravity from a tank located behind the seats, this position making use of otherwise wasted space and permitting tools and spare parts to be stored under the seats. Incidentally the placing of the tank be-

FIG. 7—MATHESON TANK UNDER CHASSIS

hind the seats imparts to the car a "racy" appearance. Just how "racy" the car may be made to look depends to a great extent on the shape of the tank, and manufacturers have not been slow to realize this feature. Merely by changing the shape of the tank the appearance of a car often can be altered from a speedy looking "flyabout" to a sedate gentleman's roadster.

One of the latest practices embraces the use of an auxiliary oil tank within the gasoline tank, such an arrangement being shown in Fig. 3, which is illustrative of Hudson construction. As may be seen in the picture, the double purpose of the tank may be only suspected by reason of the two filler caps. The capacity of the gasoline tank is 30 gallons, while the internal oil tank holds 10 gallons. The Knox tank, which is illustrated in Fig. 4, is oval in shape and slightly flattened, leaving ample leg room for the occupant of the third seat in the rear. The capacity of the tank is 16 gallons.

The combination of gravity and pressure feed is by no means uncommon, and a number of manufacturers now make use of this system. The arrangement of the piping and pump is practically the same as when the pressure system alone is used, the pressure being merely auxiliary. Ordinarily a vent is required in the tank when the gasoline is fed by gravity alone, and its disadvantages are overcome when the two systems are combined. Naturally the combination allows of the advantages of both systems, while at the same time if the apparatus by means of which the pressure is obtained should be crippled, it would only be necessary to loosen the filler cap, when the gasoline would flow by gravity, provided the line was not obstructed.

Illustrated in Fig. 2, the location of the Thomas gasoline and oil tanks is unique. Both gasoline and oil are fed by pressure, the tanks being located under the body and on opposite sides of the chassis frame, to which they are attached. They are therefore in a fully protected position. Extending from each of them a pipe leads up to a filler cap in the floor boards of the tonneau, and both tanks may be filled without the necessity of disturbing the occupants of the car. Incidentally the proximity of the oil tank to the exhaust pipe insures its maintenance at an even temperature and its viscosity remains practically the same regardless of weather conditions.

The Winton method of carrying the gasoline tank at the rear of the chassis, which, with but slight modifications, also is used by a large number of other manufacturers, is illustrated in Fig. 5, and shows graphically the accessibility which this location gives and the ease with which the tank may be filled without disturbing the passengers. Generally when tanks are so placed they are protected from accidental injury by means of wooden slats held in place with bands that encircle the tank. The Winton tank is protected by a cross rod between the rear springs.

The Lozier tank, illustrated in Fig. 6, also carried at the rear and below the chassis, is located a little further forward than is the general custom and comes entirely in front of the cross member of the rear three-quarter platform spring suspension by which it is protected. Owing to its

location it is necessary that it be shaped as shown in order to allow for the movement of the differential housing and axle and at the same time provide sufficient capacity. Needless to say, the gasoline is fed by pressure, this being obtained by means of a valve which permits a part of the exhaust gases to enter the tank. A somewhat similar arrangement of the tank is shown on the Matheson chassis, which is illustrated in Fig. 7. This tank also is cut away to make room for the differential, though unlike the other it projects further.

Between gravity and pressure feed there really is very little to choose; both have been brought to a high state of perfection and it is seldom that either gives trouble. There is this in favor of the first-named, however: there is practically nothing to get out of order, and the only thing that could happen to it would be a stoppage or a break in the piping. Similarly, in the location of the tank—under the front seats or behind them or below the body at the rear—there is little advantage. When the tank is placed nearer to the center of the chassis it makes for a more even distribution of weight, but the weight is relatively so small that it makes very little difference. With the tank at the rear, a greater weight is placed on the rear tires, but while this might be expected to cause the tires to wear more rapidly, the reverse has been found to obtain. Which is to say that the added weight tends to hold down the wheels and the tires in better contact with the road, the result being that slippage of the wheels is reduced and the wear therefore is likewise reduced.

St. Louis Show in Summer Garden.

St. Louis has the distinction of holding the first trade show of 1912 automobiles in 1911. It is under the direction of the St. Louis Automobile Manufacturers and Dealers Association, and is a feature of Veiled Prophet week, which began Monday last and will continue until Saturday, 7th inst. It comprises 55 pleasure cars displayed in Forest Park Highlands, one of the largest summer gardens in the Missouri city, and is styled an open air show, although it is housed in a pavilion, which, however, has been transformed into an "autumn forest." The ceiling and walls are covered with foliage, taken from the woods, and southern mosses, and the posts disguised with birch and oak bark, with grape vines twined around them. The signs designating the various exhibits also are of rustic design, and the electric lamps which illuminate the building are concealed behind foliage. The firms exhibiting and the cars shown are as follows:

Buick Motor Co.—Buick; Bagnal Automobile Co.—Cadillac; Missouri Automobile Co.—Amplex and Marmon; Moon Motor Car Co.—Moon; United Motors St. Louis Co.—Maxwell and Columbia; Halsey Automobile Co.—Packard; Chicopee Motor Car Co.—Stevens Duryea and Cutting;

Overland Automobile Co.—Overland; Park Automobile Co.—Chalmers, Thomas and Baker Electric; Kardell Motor Car Co.—Reo; Kissel Kar Co.—Kissell; Layne-Lynce Motor Car Co.—Marion and Owen; Olds Motor Works—Oldsmobile; Woods Motor Vehicle Co.—Woods Electric; Cook Motor Vehicle Co.—Firestone-Columbus, Krit and Columbus Electric; Southern Auto & Machinery Co.—Ohio; Preismeyer-Stevens Co.—Waverley Electric; Lindsay Motor Car Co.—Premier and Inter-State; Weber Implement Co.—Lozier and Mitchell; Brown Automobile Co.—Peerless; General Motor Car Co.—Locomobile, National, Hupmobile and Cole; Smith Automobile & Battery Co.—Ohio Electric; Superior Motor Sales Co.—Stoddard-Knight; South Side Automobile Co.—Stanley, Apperson and Corbin; Oakland Automobile Co.—Oakland; Studebaker Automobile Co.—E. M.-F., Flanders and Garford; Union Electric Light & Power Co.—Rauch-Lang Electric; Johnson Automobile Co.—Moline; Stearns Automobile Co.—Stearns; Simplex Motor Sales Co.—Simplex; Heinrich Automobile Co.—Michigan; Winton Automobile Co.—Winton; Binkman Automobile Co.—Nyberg; Mound City Buggy Co.—Halladay; Dorris Motor Co.—Dofris; Igou Motor Car Co.—Bergdoll; Western Automobile Co.—Pierce-Arrow; Phillips Automobile Co.—Hudson; Ford Motor Co.—Ford.

Hot Engines and Overheated Ones.

It may not generally be known that the term "overheated," when applied to an engine, means one of two things—that either the cooling water has commenced to boil or the paint on the engine has commenced to burn. In either of these two cases the motor really is overheated. But when the motor is merely hot—too hot perhaps for the hand to be rested on it—and neither of these signs is apparent no apprehension need be felt. It should be remembered that heat is power and up to a certain degree is desirable. A motor which runs almost cold is not operating at its greatest efficiency and measures should be taken to see that it runs hotter. The best way of doing this is to bend the fan blades slightly, though great care should be taken to see that they are not bent too much, in which case the motor probably will overheat in the true sense of the word.

Blumenstein Promotes Show in Canada.

Louis Blumenstein, who promoted several shows in smaller cities in the United States last season, has crossed the border, and in connection with the Ottawa Valley Motor Car Association, has planned a show in Ottawa. It will be held in Howick Hall, April 6th to 13th.

Providence, R. I., has appropriated \$11,000 for the purchase of two motor-driven combination fire wagons. Two similar vehicles are already in use in the city.

TIRES EXTRACTED FROM TURPENTINE

They Are Far Removed, But Scientists Assert Artificial Rubber at Last is Possible—Turpentine the Basis.

After years of unceasing endeavor and a series of false alarms, artificial or synthetic rubber that is not merely "like rubber," but that actually is rubber or caoutchouc, is now being produced in the chemical laboratory, according to Prof. Ira Remsen, president of Johns Hopkins University, and while at present it is worth almost its weight in diamonds, he declares that "it safely may be predicted that before many years have passed, rubber will be artificially prepared in quantity sufficient to supply the great and increasing demand for it." It is to turpentine that the chemists now look as the basis of supply for the artificial rubber of the future, the rubber being evolved as the result of a series of processes involving four general stages, but it probably will be years before tires extracted from turpentine will replace those that grow on trees, so to speak.

In order to make artificial or "synthetic" rubber, Remsen explains in the Scientific American, it first was necessary to determine the chemical nature of caoutchouc, and this was something of which very little was known until recently. In telling of how its chemical identification was brought about and how rubber is now being made from isoprene, he says in part as follows:

"In general terms it may be stated that chemists do not like to work with gummy substances, but prefer things that crystallize, or that boil without decomposition, or that form definite crystallizable products. Now caoutchouc does not crystallize, it does not boil without decomposition, and until a few years ago it was not known to be capable of yielding definite crystallizable products. Great impetus was given to its study by the discovery of Harries that it forms a well-defined product when treated with ozone, and that the ozonide thus obtained decomposes when boiled with water and yields levulinic aldehyde, a substance that can easily be identified.

"It also has been shown that caoutchouc forms a so-called nitrosite when treated with nitrous acid, and this nitrosite can also easily be identified. These facts make it possible for the chemist to tell whether he has caoutchouc in hand or not and the scientific study of the substance has been materially advanced in consequence. Before the discovery of these facts a product had been obtained artificially that was described as 'like rubber,' but the question whether it was identical with caoutchouc or not could not be definitely answered. Now it is possible to determine with certainty whether a substance is or is not caoutchouc.

"To identify caoutchouc after you get it is one thing, to determine what it is is quite another. The first step towards the solution of this problem was taken a number of years ago when Greville Williams showed that when rubber is heated to decomposition a very volatile substance is formed which he called 'isoprene.' This boils at 36 deg. C. and is a hydrocarbon of the formula C_5H_8 . Later Harries found that this same hydrocarbon is formed by the action of moderate heat upon oil of turpentine and other terpenes. This isoprene has come to be the chief factor in the artificial preparation of rubber, for it is this substance which when exposed to certain conditions is converted at least partly into caoutchouc. . . .

"In the summer of 1909 Harries received from an English firm a specimen of a substance which it was claimed had been made artificially by a process patented by Dr. Heinemann in England. Harries found that the substance was in fact caoutchouc, but he did not believe that it had been made artificially. Heinemann's method consisted in passing acetylene, ethylene and methyl chloride together through a tube heated to redness. Harries could not make this work and others who tried it also failed.

"Up to this time the experiences of Harries had been anything but encouraging. In November, 1909, he received from the Elberfeld Color Factory some specimens of artificial rubber which had been made from isoprene by a secret process devised by Dr. Fritz Hofmann. This led Harries to take up his own experiments on the subject again, and toward the end of January, 1910, he was in a position to apply for a patent. The method devised by him consists in heating isoprene with strong acetic acid in a closed tube. The product thus obtained is unquestionably caoutchouc.

"From the scientific point of view the problem of the artificial preparation of caoutchouc is thus solved, but it is a far cry from this to commercial success. Given isoprene in sufficient quantity and at a sufficiently low price and the commercial problem will be solved. At present artificial rubber is almost as precious as the diamond, but, on the whole, the problem is in a more hopeful state than the indigo problem was for years after the start was made. The manufacturers and those who are carrying on chemical investigations for them are, plainly of the opinion that the work is worth while. That great firm, the Baden Aniline and Soda Factory (generally called the 'Badische') has taken out a number of patents in this field, and this is most significant. It is this firm that worked out the indigo problem and is now supplying the world with artificial indigo, having expended in the preliminary work millions of dollars! It is this firm that is placing the manufacture of artificial nitrates upon a firm scientific basis—probably the most important problem before the world, as it

involves ultimately the food supply. It may safely be predicted that before many years have passed rubber will be artificially prepared in quantity sufficient to supply the great and increasing demand for it. Meantime there is no danger of a famine, as plantations are springing up to supplement the supply of wild rubber.

"As has been pointed out, the first thing to be done is to get enough cheap isoprene. The only way to do this that appears to be in the least promising is to make it from oil of turpentine. In this connection it is of interest to note that Staudinger and Kleven have succeeded in increasing the yield of isoprene obtained from the terpene, dipentene, by heating to a high temperature the vapor of the terpene under diminished pressure. When the pressure is sufficiently low the yield is about 60 per cent. This is a very important observation for the purpose in view. Dipentene itself does not, to be sure, occur in nature in very large quantity, but the chief constituent of American oil of turpentine is pinene, a substance of the same composition as dipentene, and pinene is converted into dipentene by heating it to 250 to 270 deg. C. The way out may therefore be through turpentine. To recapitulate, turpentine contains pinene. Pinene is converted into dipentene by moderate heat. Dipentene when heated to a high temperature under diminished pressure yields isoprene. Isoprene can be converted into caoutchouc by heating it with concentrated acetic acid and by other methods that need not be described here.

"There are other hydrocarbons similar to isoprene that undergo changes similar to that by which isoprene is converted into caoutchouc, and there is therefore a prospect of the ultimate preparation of a number of products similar to rubber, but differing from it in some respects."

When Sprags Are Not Dependable.

That a sprag or drop brake, used to prevent a car running away backward in case the brakes fail on a hill, is useless on soft roads, is obvious, and also that it is not always dependable on roads that appear hard, recently was instanced when on a steep hill the operation of changing to low gear was fumbled and the car immediately commenced to run backward down the hill, despite the fact that the sprag had been dropped before the climb was attempted. Luckily the car was brought to a stop by means of the emergency brake. Subsequent investigation revealed the fact that, like many others, the road consisted of a hard upper crust over a very much softer foundation. When the sprag "bit" it simply drove through the hard crust and "kinked" in the middle without serving to stop the car. The moral is obvious: As it is not always possible to judge of the character of a road, too much dependence should not be placed on a sprag at any time.

RAMBLER REVEALS ELEVEN MODELS

They Include a \$1,650 Leader and a Double Limousine, All Named Instead of Numbered—Detail Mechanical Changes.

With no less than 11 different styles of car in its line, of which the 38 horsepower "Cross Country" Rambler at \$1,650 is the flag bearer, the Thomas B. Jeffery Co., of Kenosha, Wis., is disclosing for 1912 not only a great increase in the number of its styles, but a power and dimensional increase in the cars themselves over the nearest corresponding styles that preceded them. Names instead of numbers now designate the various Rambler models, which are divided into two general classes as to power, there being five models of 38 horsepower and six of 50 horsepower, with four cylinders in each case.

RAMBLER "KNICKERBOCKER," DOUBLE LIMOUSINE MODEL

In general design the chassis construction, in both the 38 and the 50 horsepower types, retains the features characteristic of the 1911 Ramblers, including the internal expanding clutch adopted in 1911. The engine is much the same, except that the positive feed lubricator, which previously was mounted on the left side of the chassis beside the flywheel, now is on the left side of the engine, between and in line with the water pump and the Bosch magneto, all three taking their drive from the one through-line of shaft. The mixture lead from the carburettor to the inlet manifold no longer loops over the top of the engine. Cylinders are cast separately, as before, and the 38 horsepower dimensions are $4\frac{1}{2} \times 4\frac{1}{2}$, while those of the 50 horsepower are $5 \times 5\frac{1}{2}$ inches. Improvements have been made in the linkage from the selective change gear lever to the transmission case, so that the pull on the shifter-arm rods is more direct, without side strain. The radiator is of new design and finish, being higher and mounted by a

graceful filler cap. Strong gusset plate construction is used at the rear of the frame. All models have semi-floating rear axle with roller bearings, the drive axle

RAMBLER 38 H. P. "CROSS COUNTRY" MODEL AT \$1,650

shafts and gears being forged integral. Brakes are internal and external on rear wheel drums.

the big cars they are 40 inches in diameter. There is a cowl over the dash, double curved front fenders, new hubs, and rich, darkened finish for the polished wood

parts. Every model is finished in nickel, and the prevailing body color is English purple lake, a rare shade of deep maroon.

The unique Rambler spare wheel system is still applicable to all models, but the spare wheel itself no longer has a place on the running board as part of the regular equipment. The spare or demountable wheel which may be used to replace any one of the four regular wheels, is now offered as an extra accessory, for which the charge without tire is \$30. Furthermore, a place for it has been found at the back of the car, instead of on the right hand running board. Should a tire become punctured or a wheel broken, it is easy to take off the wheel and replace it with the demountable wheel. "Ever-Ready" automatic engine self starters are fitted to any of the models at \$175 extra.

Considering the various models individually, the "Cross Country" model, which enjoys not only first place in the 38 horsepower group but in the entire line, by reason of its being designed to meet the largest popular general requirements as to price and capacity, is a five passenger tour-

Wheelbase dimensions have been lengthened so that in the 38 horsepower and two of the 50 horsepower cars it is now 120

"MORaine" MODEL RAMBLER—50 H. P., 7 PASSENGER

inches, and in the remaining four 50 horsepower models it is 128 inches. Large wheels are used, those for the smaller cars being 36 inches, while for all but two of

ing car possessing the same quality in material and workmanship that characterized the higher priced Rambler of the past few years. It is the first four cylinder

Rambler to be offered at so low a price as \$1,650. The front axle is set well forward, giving 120 inches wheelbase, and the body is of the torpedo type. The wheels are 36 inches in diameter. The frame is dropped to make it low, and the spring suspension is arranged for the same result, semi-elliptics being used in the front and three-quarter elliptics in the rear. Plenty of room has been provided in the body, with 27 inches from the front seat to the dash and 30 inches from seat to seat in the tonneau. There are no outside door latches. The enclosed front is ventilated. A new feature is the drop forged I-beam axle with adjustable roller bearings. The internal expanding clutch, as in all the models, has double adjustment, one for easy starting and one for full engagement. The equipment includes gas headlights with gas tank, oil side and tail lamps, tonneau hinged robe rail, adjustable foot rest and complete tool outfit.

The Rambler "Suburban" is a four passenger car with the same chassis as the

LEFT SIDE OF RAMBLER ENGINE.

"Cross Country," but affording a more compact body for those who prefer this style. It also lists at \$1,650. A third body variation of the same chassis is the "Roadster" for two passengers, which sells at \$1,600. It is equipped with round visible gasoline tank and a touring trunk, both placed on the platform back of the enclosed two passenger body. With the trunk are two suit cases for city use or country touring. By minor modifications the 38 horsepower chassis is also adapted for the "Gotham" and the "Sedan" models, both of which are closed cars. The "Gotham" is a five passenger limousine with cap sides, selling for \$2,750. All of the windows are made to drop, except those over the front seat arms and the rear window. Two folding cab seats are attached to the front end of the enclosed portion. Bedford cord is used for the interior trimming, and pillar lamps are mounted between the driver's seat and the rear compartment. The latter has a toilet case, speaking tube, and electric dome light, together with silk curtains on all the windows. The "Sedan" model, which is priced at \$2,500, has a big coupe or limousine body that includes driver's seat and all, with door on the left side, at the front. All the windows, ex-

cept that at the rear, can be dropped in the frame, the window plate glass being set in mahogany sash. The interior trim and fittings resemble those in the "Gotham."

In the 50 horsepower division the six

THE 1912 RAMBLER FRONT EFFECT

models, respectively, are the "Country Club," "Moraine," "Valkyrie," "Metropolitan," "Greyhound" and "Knickerbocker." The "Moraine" is a seven passenger touring car with 40-inch wheels and 128-inch wheelbase, selling at \$2,500, and representing in many respects a continuation of the 1911 seven passenger 45 horsepower car, though with many improvements. The Bosch dual ignition system is used, with 6-80 accumulator. The front axle is tubular, with internal reinforcement. Springs are of the semi-elliptic pattern in front and seven-eighths elliptic in the rear. In general outline the five passenger "Country Club" model and the four passenger "Valkyrie," both selling at \$2,250, are the same as the seven passenger car, having the same power equipment and appearance, but reduced in body size, wheelbase and

WHERE THE SPARE WHEEL GOES

wheels. The wheelbase is made 120 inches and the wheels 36 inches. Two models of the 50 horsepower in torpedo body are supplied in the "Metropolitan" and the

"Greyhound," the former seating seven passengers and the latter six. Both models sell for \$2,850, and have 40-inch wheels with 128-inch wheelbase. In these models the front axle is I-beam instead of tubular, and the rear springs are three-quarter elliptic. While the "Metropolitan" seven passenger car has the regular English purple lake finish, with Brewster green as an option, the six passenger "Greyhound" is true to its name and has Rambler grey finish, striped with white. It is hung low, and while narrower than the "Metropolitan," has plenty of leg room.

As the most elaborate and expensive car in the line, the seven passenger, 50 horsepower "Knickerbocker" is built accordingly. It is of the double or Berlin limousine type. The front compartment, surrounding the driver's seat, is leather trimmed, while the rear compartment is upholstered

RAMBLER EXPANDING CLUTCH

in Bedford cord. The finish is deep maroon, Brewster green or blue, with trimmings to match. Big, 5-inch tires are used on the 37-inch wheels. Side pillar lamps are mounted on the sides of the body between the driver's and the rear compartment. In the front compartment there are electric lamps in each quarter. Among the luxuries and refinements are arm rests at the side of each seat, megaphone speaking tube with buzzer, flower vase and bracket, umbrella holder, silk hat rack, whisk broom holder, toilet case and clock.

Number Plates and Leaky Radiators.

Though the practice of attaching the bracket which holds the front license plate to the radiator cap is quite general and in the majority of cases is harmless, it may become the cause of a leaky radiator. The plates are not as light as they appear to be and the continual vibration occasioned by traveling over rough roads has been known to cause the cap to part from the radiator proper. A much better manner of attaching the front plate is to wire it to the cross rod which generally is fitted to maintain the headlights in position. Barring this there is nothing in the law which forbids the plate being wired to the axle.

Knight's Own Defense of the Sleeve-Valve Engine

In the course of the several lectures which he has delivered before various engineering bodies before his return to his home in Coventry, England, on the 4th inst., Charles Y. Knight, inventor of the sleeve valve motor which bears his name, has cleared up a number of points in reference to his motor and its working which to many minds have been more or less vague. Uncommon interest attaches to Knight's lectures, inasmuch as never before has he appeared in public to explain or defend his invention; his American press agent has been quite active during the past few years, but he has dealt chiefly with glittering generalities, and it remained for Knight himself to go below the surface.

Prefacing his remarks with the truism to the effect that "any mechanism which does not possess merits sufficiently pronounced to warrant its features being described in a non-technical manner can possess few tangible advantages," and with the help of a working model of a Stearns-Knight engine, Knight successfully lays several ghosts which have existed in some minds regarding the practicability and reliability of his motor.

After a lengthy introductory, in which he tells of the avidity with which foreign manufacturers have grasped the sleeve valve motor, he says that though its popularity has been proven and is increasing, it never will entirely supplant the poppet valve type.

"I do not hold that the poppet valve engine is going to the eternal bow-wows," he says, "or that the sleeve valve engine is going to chase every other type of explosion motor off the earth. I am simply expressing the belief that the time is ripe for the introduction of new blood into the internal combustion field; that a new type has made its appearance which has commanded a sufficient following to compel the attention of the industry; that almost without exception manufacturers of automobiles are either themselves experimenting with some new type or are upon the lookout for something different from the poppet valve, with features of merit which will meet with the approval of the public and its appetite for the new article." At all times he refers to his invention as a "sleeve valve motor," and states that because of the failure of early slide valve engines, he at first vigorously opposed the use of the latter term as applied to his conception.

"Since the advent of the sleeve valve motor in Europe," he continues, "no fewer than 250 patents have been issued by England, France, Germany and Austria, covering suggestions for the improvement of the

sleeve valve engine. I characterize these as suggestions because I have not included in this list a single instance wherein the design did not contemplate the employment of each and every one of my original elements combined, and constructed substantially the same as my original sleeve valve design. In addition to these there has cropped out also innumerable suggestions for flat slide valves, rotary posted valves, flat disk valves, round ring valves, rotary sleeve valves and various piston valves. The inventors of these motors seem, in few cases, to have gone further than registering their ideas for priority purposes with the patent office.

"The outstanding feature of the motor, as a matter of course, is the substitution of sleeve valves for poppet valves. This innovation in the explosion motor is wholly original, to the extent of my knowledge and belief, with myself. It is not so much the novelty of the valves and their elimination of noise which have contributed to the success of the motor, because admittedly other motors with other valves have been produced which were fairly quiet. Unfortunately for the other constructions, as far as I am advised, the form of the valves is such that, instead of contributing to further efficiency of the motor, they are to the contrary, employed in spite of their disadvantages, because of their merits.

"The failure of former devices has been almost wholly due, as suggested by Prof. Hutton, of Columbia University, in his work 'The Gas Engine,' published in 1902, to the impossibility or impracticability of lubricating the highly heated sliding surfaces which were employed in those types of sliding valves. Now a failure to lubricate may result from a number of causes no one of which, if taken alone, might render the operation impractical. The disposition, functioning and design of the sleeve valve motor differs from all former types of the slide valves in the fact that it encircles the piston and forms the outer walls of the combustion chamber. Not only are the sliding surfaces subjected to the intense heat of the exposure and the blow torch action of the exhaust, but the extreme pressure as well. Failure of lubrication might be brought about by either of these causes, but is almost certain to result from a combination of both. The old type slide valve was forced by the intense explosion hard down upon its seat and was necessarily moved under the same intense heat and pressure.

"The most difficult surface in the world to lubricate is a sliding surface subjected to intense heat combined with high pres-

sure. Two flat surfaces, if working together, resist to an enormous extent the squeezing of the oil from between them when conditions are such that the viscosity of the oil may be preserved to a reasonable extent, but increase this pressure, heat the surfaces to a point where the oil thins up like water and it soon finds its way to the outer edges as a result of the reciprocating movements essential to the functioning of the valves. . . .

"In the concentric sleeve valve these conditions are almost entirely eliminated. The fact of the sleeve valve wholly encircling the piston and forming the side walls of the explosion chamber prevents these valve seats being subjected to high pressures, as the explosions against the walls of the valve are entirely balanced, just the same as you are perfectly safe in embracing, without fear of harm, the breech of a twelve-inch gun when the explosive pressure of tons to the square inch is generated inside—a pressure which, if exerted in a particular manner, would be sufficient to blow several regiments to kingdom come. So is the seat of the sleeve valve immune from injury from pressure at the time of the explosion of the internal charge. The cylindrical walls, as a result of their form, are not in the least affected as to position by the explosion and, as in the case of the implement of war alluded to, the effects of the explosion are directed to useful work instead of being expended by producing worse than useless friction through the pressing together of two surfaces which lack the form to balance themselves against pressure. . . .

"Now, the first criticism that was directed against this construction in the early days, after the critic had slightly recovered from his spasm of fear that the sleeves would seize either between themselves or with the cylinder, was that the ports in the sleeve valves would burn. It might suffice to state that they do not, but the cause of their immunity from damage from heat is easily explainable. The ports in the inner sleeve are sealed through the lapping of their openings with a wide ring, styled the junk ring. This ring is similar in construction to the ordinary piston ring only much wider in order to seal the ports. Underneath the junk ring there is placed a second or spring ring for the purpose of insuring perfect contact with the interior of the sleeve. Both rings, needless to say, are split like a piston ring. Above them are two or three ordinary piston rings to bar the escape of any gases which might pass the break in the junk ring.

"These rings are all set in the inwardly

projecting water-cooled head in which is located the spark-plug. The water reaches within a portion of an inch of the bottom of the inside of the head. The cylinder surrounding the sleeves and head is also water-jacketed, so that the sleeve valve reciprocates between water-cooled walls and the sleeve junk ring and ports are cooled upon both sides.

"At the time of the explosion the ports in the inner sleeve are central with the wide junk ring. Hence at the time of the development of the greatest heat until, in fact, the temperature in the explosion chamber is reduced to at least half of the maximum, the ports through which the exhaust gases pass are not exposed to heat at all. Therefore their lips and surfaces are not only immune from the fierce heat of the violent part of the explosion, but the entire section of the sleeve carrying them is pushed up after every explosion and rubbed against the water-cooled surfaces which serve to prevent the accumulation of heat at this vital point. None of the valve mechanism is ever brought in contact with the heat, as is the case with poppet valves, whose heads are always subjected to the highest temperature generated in the explosion chamber, which reaches almost the melting point of steel."

Turning to the question of lubrication, Knight says that the critic's conclusions to the effect that the sleeves must seize because in his estimation it is impossible to introduce oil between the sleeves and the cylinder walls, are quite natural unless his attention is called to the facts.

"He takes it for granted," Knight continues, "that compression is held between the two sleeves; that they work like the ordinary slide valve, and he knows how difficult it is to prevent the leakage of gases at pressures ranging from 200 to 400 pounds per square inch, particularly when the oil film becomes worked out from between their surfaces. It surprises him to learn that the clearance between the sleeves and cylinder are not of great importance. He has overlooked the fact previously stated that the real valve is in the construction contained in the head and is never exposed to the pressure or the heat of the explosion, and is kept upon its seat not by the pressure of the explosion, but by the spring of the rings similar to the ordinary piston ring. In short, if rings are a success on the piston they are equally practicable in this position on the head.

"The valving of a four-cycle motor is much different from the functioning of any other mechanism of the pump order. Coincident with the pressure and explosion stroke, the cylinder must be sealed in a manner which admits of no defect. The contact between the valve and its seat must be perfect. This function is performed by the wide range engaging the interior of the inner sleeve.

"During the period of the exhaust and scavenging and aspiration strokes, a differ-

ent condition prevails. The pressure in the cylinder has dropped to at least 40 pounds to the square inch before the lower lip of the exhaust port in the inner sleeve slides over the bottom of the wide ring upon its downward or exhaust stroke. The intake and exhaust ports are so arranged in this inner sleeve that the latter leads the former by about one-sixteenth of an inch. This gives the exhaust gases an opportunity to escape sufficiently to reduce the pressure in the explosion chamber almost to atmospheric before the lower lip of the intake port is exposed to their heat. This means that the danger of these gases blowing out between the lips of the inner and outer sleeve on the intake side is prevented, the liberal clearance between the two sleeves required for lubrication not furnishing sufficient aperture to cause a leak of exhaust into the intake ports.

"Upon the aspiration stroke, there is never in excess of a few pounds vacuum developed in the cylinder as a result of the suction with closed throttling. Therefore the necessity for a very close fit between the upper lip of the outer sleeve and the lower lip of the water-cooled cylinder which serves to seal the exhaust port during this aspiration stroke is not essential.

"If necessary clearances as great as between the piston and cylinder can be employed between the two sleeves and between the outer sleeve and the water-cooled cylinder wall. But the critic will say, even with such a clearance, the wall surfaces are long and it is a question as to whether the lubricant will find its way to the extreme points. Here again," he says, "is a criticism born of a lack of comprehension of the many features of the motor," and he proceeds to explain:

"There is always more or less of a vacuum at the intake ports as a result of the necessity of placing a suction upon the spray nozzle of the carburetter. These ports extend about one-third of the way around the cylinder and sleeves. The lower ends of the sleeves are constantly immersed in the spray of oil which exists in the base. The oil which naturally clings to the lower ends of the sleeves when they reciprocate in this base is slowly but surely drawn upwards by this suction of the pistons which draw in the gas, as the clearances between the two sleeves and the other sleeve and the cylinder, whatever they are, open into the intake pipe through the intake ports just the same as the top of a water pump suction pipe opens into the valve and suction chamber for the purpose of conducting the desired liquid to the required point.

"That this suction does draw the oil from the base between the sleeves and cylinders is most easily demonstrated by placing a motor upon the block, driving it from power through a belt and placing an obstruction over the intake port, creating a vacuum around the sleeves. Inside of a minute or two remove this obstruction or

cover and a small pool of oil will be observed to have accumulated therein. But if there is no vacuum around these intake ports they will remain free from oil no matter what length of time the motor may be turned over with a belt. This oil, drawn from the base between these surfaces, must necessarily distribute itself between the faces of the sleeves, as a result of capillary attraction. In fact, instead of being difficult to lubricate, these sleeves are first to attract any oil that may be flying about, and in cases where bearings have burned out and the piston seizes the sleeve surfaces were found to have been bountifully lubricated.

"Taking the subject the other way about, why should these sleeves seize between their surfaces? Our critic may answer that when the motor is in operation this oil may be squeezed out from between the surfaces through the lateral pressure of the piston at its greatest angle. But suppose we analyze these pressures and see how serious they are. Taking as an example the $4\frac{7}{8} \times 5\frac{1}{8}$ size, the pressures distributed over these sleeve surfaces amount, for a fraction of the sleeve, to about 20 pounds to the inch. At the same time the piston is working under about 50 or 60 pounds to the inch, in proportion to the length of its skirt.

"Now how do these pressures compare with those employed upon rotative bearings? While these pressures are extreme, it is a fact that the load upon the upper metal surfaces of the connecting rod big ends often approaches close to 1,000 pounds to the square inch of effective surface. And further, the heat under which these big ends work in the base is probably at times greater than that which exists between the sleeves, as they are pressed alternately from one side to the other of the water-cooled cylinder, and an opportunity given for the heat to be conducted to the water jacket."

Regarding the question of efficient cooling, Knight says that this is most effectively answered by the fact that there are over 8,000 motors in use and that in no case has one given trouble. "But here again I have no desire to dodge the issue," he adds. "The critic will raise the point that between the piston and water-cooled cylinder wall of this motor are four intervening films of oil as against one in the poppet valve type, and that oil, even in these very films, is a most inefficient conductor of heat. Here again are peculiar conditions of which he has not taken account exist. Were it a fact that these sleeves remain stationary, while under heat, I would concede the correctness of the theory. What do you do with a quantity of liquid in a vessel when you desire to drive the heat from it? Naturally you stir it in order that gradually each particle should be brought either into contact with the open air or against the sides of the walls which are so exposed. A vessel of hot fat left undisturbed

will congeal at the edges of the vessel and remain liquid at the center.

"So with the oil films between the sleeves. If they are left undisturbed they will retain their heat to a greater or less extent. But if the particles are rolled and tumbled about by being rubbed between the sleeves surfaces there is no chance for any heat remaining away from contact with metal slides. Each reciprocation changes the position of these heat particles and serves to remove them from local heat spots which otherwise might cause a section of the surface to become too hot for proper lubrication. The average person may readily understand that the transfer of heat from one surface to another is tremendously facilitated through rubbing them together."

Discussing the question of wear on the sleeves he maintains that owing to the fact that they are perfectly lubricated and the pressure on them is only about one-third of that to which the piston is subjected, it cannot be other than minimum wear. "The sleeves travel from one inch to one and one-eighth of an inch, while the piston is traveling once up and once down its stroke," he explains. "Therefore if the stroke of the piston is five inches the piston is traveling about ten inches to the sleeves' one. Logically it would appear that the wear between the sleeves should be one-tenth of that between the faster traveling piston and inner sleeve. But the piston is equipped with strong expanding rings and reciprocates against a surface which is exposed to the highest temperature of the burning gases. Its lubrication can never be so good as between the sleeves and cylinders.

"Actually there is no appreciable wear between the surface of the sleeves where they engage each other and the water-jacket cylinders. I am satisfied that under normal conditions one of these sleeves and the water-cooled cylinders would not deteriorate a particle through a road use of a million of miles. We have several instances where they have served to value a motor which has covered more than 100,000 miles with no evidence of wear after they had smoothed their surfaces driving the first few hundred miles.

"The interior of the inner sleeve where the rings and the piston work, of course, will show wear just the same as the cylinder of the poppet valve motor in which the piston works. But instead of finding it necessary to replace an entire outer cylinder, as in case with the poppet valve type, the replacement of the inner sleeve only is required."

The power required to drive the sleeves, he says, is surprisingly small, and he continues: "In a six-cylinder, 77-horsepower Daimler motor this loss of energy was measured through the introduction of a differential mechanism between the eccentric shaft end and the chain sprocket which drove it. Power recording apparatus was

attached and it was found that when the motor was developing 75 horsepower at 1,200 revolutions a minute upon the brake two horsepower was absorbed in driving the 12 five-inch sleeves. But for the necessity of driving these sleeves the motor would have developed 77 instead of 75 horsepower, not a very serious loss of power."

Comparing this absorption of power with that required to operate poppet valves, Knight says: "The springs necessary to seat the poppet valves of a motor developing the power given off from a $4\frac{7}{8} \times 5\frac{1}{2}$ sleeve valve type require at least 100 pounds tension. Not only this, but on the exhaust side the cam shaft is compelled to lift against an explosion pressure which amounts to at least 150 pounds upon the valve head at the end of the firing stroke, when the pressure of the explosion is somewhere about 50 pounds to the inch when the exhaust valve should open. Thus we will see that fully 250 pounds pressure is required to lift the exhaust and 150 to raise the intake valves at every second revolution.

"The weight of the inner sleeve of the $4\frac{7}{8} \times 5\frac{1}{2}$ size Knight engine is nine pounds; of the outer sleeve eight pounds. At the greatest power, counting a coefficient of one as the ratio of friction to pressure, 90 pounds are required to slide these sleeve valves against each other and the pressure of the piston. The inertia of the inner sleeve, when the motor is turning 1,200 revolutions per minute, is something like 60 pounds, while that of the outer sleeve is less than 50. Taking the inner sleeve as the one subject to the greatest stresses because of its greater weight, there is 96 pounds of weight to raise; 90 pounds of friction to overcome at one point only; 60 pounds of inertia to counteract at the outer and inner ends of the stroke, a total of 160 pounds against 250, in case of the poppet valve.

"Being positively connected, the silence of the sleeve valve is not affected by increase of load or speed, and is as quiet at 50 as at 15 miles an hour. But the pressure of the exhaust upon the poppet valve rises with the increase of power, and as the speed becomes high the valve springs fail to cause the valve tappets to hug the profile of the cams and a valve clatter of increasing intensity is the result."

In connection with the functioning of the sleeves, Knight explains that the piston and sleeves start downward simultaneously and move together until the piston has reached the bottom of its stroke and the pressure in the cylinder has been practically reduced to atmospheric. "Now it will be realized," he points out, "that instead of the sleeve requiring power from the eccentric shaft to drive it downward, the friction of the piston against its walls would have done so had no other means been provided, but, of course, it would not have stopped at the right point. We have

the maximum side pressure of the piston during this explosion stroke.

"While the piston returns the sleeve continues downward and the two elements are driven by their mechanism in opposite directions. But upon this stroke there is no lateral pressure upon the sleeve because the piston is only dispelling the exhaust gases. Hence there is no resistance to the travel of the sleeve. When the piston reaches the top of the sleeve has reached the bottom of its stroke, and again they start moving in opposite directions. But as this is the suction stroke again here is no friction of consequence, the piston having no pressure upon it. The piston, having drawn in the gases, starts upon its return stroke and the sleeve continues upward. Here there is the lateral pressure of the piston which meets the resistance of the compressed gases and the sleeves are again under pressure. But here again the pressure instead of being of disadvantage is an advantage, as it aids them in their upward movement.

"Now remains another objection to meet with regard to the substitution of sleeve valves for poppet valves," he continues. "It is urged that if the poppet valves stick no damage is done, but if the sleeve valves are injured as a result of neglect, or lack of lubrication, the matter is serious.

"But to what extent is this serious?" he questions, and answers himself: "Several years ago, before I had the experience I later acquired with these motors, I listened to this argument and provided a scheme for answering and insuring absolutely the safety of these sleeves against damage from seizure. The device was as simple as the alphabet itself. It merely consisted of a weak point in the outer sleeve connecting rod so inserted as to give way well before the power required to pull the sleeve should reach a point where the lug might be broken off. The way these lugs are designed to-day requires over 6,000 pounds pressure to fracture them, and each and every one of our licensees informed me that they saw no necessity in practice for the adoption of this precaution; it was never attached to a single motor."

Light on Rats and Rubber Question.

Notwithstanding ostensibly correct information to the contrary, it has been fairly well established that rats and mice have no taste for rubber articles. The question is one which has been much mooted, particularly among those who store spare tires in more or less rat infected public or private garages. Additional evidence in the experience of a vermin exterminator, who also is a motorist of many years' standing, should go far toward deciding the issue. "During 20 years' experience," he says, "I have never known an instance of a rubber tire being damaged by rodents, though car upholstery, hoods, etc., are not nearly so free from the attentions of such vermin."

EVIDENCE OF EVERITT EXPANSION

Enlargement of Factory Being Prosecuted Even by Electric Light—Capacity to Be Forty Cars Daily.

That the Metzger Motor Car Co., of Detroit, has expanded and is expanded is evidenced by the increasing number of Everitt cars which are in use on the roads. Naturally they are widely scattered, and perhaps the best concrete evidence of the expansion is the accompanying illustration of the Metzger factory as it will appear when the additions now in course of erection are completed, and they are being

been the custom of the Motorists' Union and the Automobile Association—as well as that of nearly every representative automobile association in other countries—to give warning of so-called speed-traps, established by the police with the express purpose of catching drivers who exceed the legal speed limit by even the narrowest margin. These warnings never have been considered illegal, and the publishers of them never have been hauled before a justice for the "heinous crime" committed thereby. If, however, a private chauffeur undertakes to warn other automobile drivers of the existence of a speed trap, it is called "interference with officers of the law in the performance of their duty."

The case which called forth this judicial

CAUSES OF LUBRICATION FAILURE

Scientist Undertakes to Name Them Categorically and Contrasts Oiling Systems—Outlines the Ideal Arrangement.

Lubrication, particularly as applied to automobile practice, is a subject which is insufficiently understood by the average motorist, despite the frequency with which it has been publicly discussed. Ignorance of the way in which the lubrication of the car should be carried out is a far more frequent cause of difficulty than faulty design. "To the ordinary motorist owning a high-class or well-designed car, the design of the

ENLARGED METZGER FACTORY AS IT WILL APPEAR WHEN ADDITIONS NOW UNDER WAY ARE COMPLETED

rushed to completion by men who are working night and day, hundreds of big arc lights furnishing the illumination after sunset. When all is done the plant will have a daily capacity of 40 cars.

The larger of the two additions is four stories high, 550 feet long and 68 feet wide. It is planned to use this structure for the various operations of assembling, finishing, etc., using the original factory building for the heavier manufacturing operations, where the complete equipment of heavy machinery, with machine tools and jigs and fixtures of all kinds is already in place and now in operation. A second recent addition to the Metzger plant, which already is in operation, is the new heat-treating plant, a huge brick structure, covering a floor space of 6,000 square feet.

Illegal to Prevent Speed Violation.

There appears to be justice of two kinds in Great Britain, as far as automobiles are concerned, at least. For some time it has

decision occurred last month, and it has caused a veritable storm of protest to be launched at the head of the "offending" magistrate. The evidence presented brought out that two policemen were working a speed trap over a measured course, and that a chauffeur who observed them stopped his car outside the measured limits and warned all approaching motorists of the existence of the trap. The police officers ordered the chauffeur on his way, but he persisted in his work, notifying about thirty motorists. Finally the officers became angry and arrested him for interfering with their duty. The magistrate before whom he was brought fined him \$40, with the alternative of going to prison for two months.

In America, where such warnings frequently are given, it is usually considered not so much an obstruction to the carrying out of justice as a warning to motorists that assists in preventing the violation of the law.

bearings must be taken for granted, but the nature and method of application of the lubricant is often under his control," remarks R. W. A. Brewer, the well-known British scientist, in a helpful consideration of the subject. "The failure of any lubricating system with the consequent result of seized or fired bearings," he goes on to explain, "is generally due to one of the following causes:

"Insufficient supply of the lubricant, due, in a forced system, either to the choking up of an oilway or the failure of the oil stream to reach those bearings which are furthest remote from the pump. This failure may be due to a too free means of efflux for the oil from those bearings which are situated nearest to the pump and generally at points of maximum pressure on the oil line.

"Loss of nature in the oil itself, or a reduction of its viscosity caused either by excessive heating or by inherent defects in the oil itself; this can only be guarded

against by care in the choice of the oil, but the viscosity of the lubricant when cold is not by any means an indication of this same property when the oil is heated up to its working temperature.

"Unsuitably placed admission devices for the oil supply, as, for instance, the oil holes entering the bearings at points of high pressure or oil grooves cut in such positions that they do not tend to distribute the oil properly over the loaded surface of the bearing itself. There is a considerable diversity of opinion as to the best position and shape of oil grooves upon a bearing, and as the oil generally enters the bearing at some point near its center these grooves should be so arranged that the oil is distributed across a region of low pressure. Preferably several such grooves should be so cut that the oil is distributed over an appreciable portion of the circumference as well, so that as the point of minimum pressure moves around the bearing under the variation of working conditions an adequate oil supply may be insured at the point of minimum pressure.

"Transverse grooves of this kind should be connected by a circumferential groove which should be staggered to such an extent that local wear is not set up on the shaft journal. When forced lubrication is employed the oil grooves are necessarily much more simple than when a purely splash system is relied upon, and, in addition, the load, which can be carried by a bearing served with forced lubrication, can be much higher than in the other system per unit of area.

"Overloading.—The load which a bearing will carry depends upon several factors, the principal of which are the time of duration of pressure upon it, the facilities for cooling, the method of oil supply, the materials in contact, and the nature of the lubricant.

"When a bearing is continuously loaded, as in a crankshaft bearing, the intensity of the load must be less than when intermittent loading only is borne, because the time question is an important consideration. It is obvious that if a film of oil be interposed between two metallic surfaces and a pressure comes upon those surfaces, the oil will be squeezed out, if the intensity of pressure be great enough. Naturally a certain amount of time elapses before the whole of the oil is extruded, and if the time interval be short enough, a load which would be fatal when continuously applied could be easily carried when its duration is only intermittent and for very short periods. For this reason such bearings as are fitted at the ends of connecting rods will carry safely a far higher load per unit area than the continuously loaded crankshaft bearings.

"In the former case the oil has not time to squeeze out entirely from between the surfaces in contact during the time of application of the load. . . . Oils which are very viscous when cold, rapidly lose their

viscosity when heated to 212 degrees Fahr., which is, however, a higher temperature than should be prevalent in the base chamber of an engine. Many engines work at temperatures in the neighborhood of 180 to 200 degrees Fahr. . . .

"We see, therefore, that the oiling arrangements of a motor car should be such, and the pipes and passages of sufficient diameter, as to allow a viscous oil to pass when the engine and the oil are cold. If a forced feed lubrication system be used we also see that when the engine is heated up an enormously greater quantity of oil will travel through the same sized pipes, and at the same time a hot oil will much more easily squeeze out from between two surfaces in contact than would the same oil at a lower temperature.

"Too much care cannot be taken to exclude foreign matter from an oiling system, and a sufficient sump should always be placed, so that any grit or worn particles of material can fall into this sump in such a manner that they will not become dislodged by the jolting of a car, and again enter the oil circulation. This applies also to the gear box and differential casing, and, bearing this in mind, it is generally advisable to use a lubricant of such viscosity that solid matter will not be held in suspension in the lubricant itself, but will promptly fall to the bottom of the sump.

"In some cars, owing to defective design of the bearings themselves, the user of such a car is unable to employ a lubricant which will comply with these conditions, as when a thin oil is introduced into the gear box or the axle, it gives trouble by creeping through the bearings and dropping on to the road or the brake drums. . . .

"When the gear box bearings are properly designed oil is by far the best lubricant for both shafts and teeth, as it is thrown up in a continual stream and always goes where it is required. On the other hand, with the grease lubricated box, the gear teeth cut a passage through the grease and thereafter fare very badly with regard to an adequate supply of further lubricant. Grease also has a nasty habit of retaining any particles of grit or chipped metal in suspension, which is continually churned round and does further damage to the working parts.

"Impurities in the oil are sometimes a source of trouble to the motorist. These may consist of water, acids, or small pieces of fluff, which are sometimes passed to the oil from the refineries. Fluff is seldom found in canned oils, but where oil is handled in barrels or drums it is sometimes met with and can only be accounted for through carelessness with the packages. Sometimes a drum may be left with the stopper out, and a piece of waste inserted; this is a very dangerous practice, as the waste is apt to enter the drum to be eventually encountered in the oil strainer of the engine.

"Oil in the correct place is what is aimed at in an efficient system of lubrication, but this ideal is sometimes attended with the evil results of distributing the oil in other places as well. Allusion has already been made to oil throwing into the cylinders, and creeping on to the brake drums, and the latter fault in particular, in addition to causing loss of lubricant resulting in a dirty car, is also a matter of considerable danger to the occupants of the car itself.

"Greasy brakes can never be relied upon, and although a certain amount of oil is often desirable on the brake drums of many cars, a continuous excess of lubricant makes the brakes erratic and useless at critical moments.

"Many motorists are unaware of the considerable loss of power which occurs in some types of unlubricated brake drums when the brake shoes hang upon the drums through insufficient disengagement. Those who wish to get the best results from their cars should pay some attention to the lubrication of the joints of the brake shoes and their actuating mechanism, as this detail is often overlooked, and in many cases insufficient provision is made for the introduction of the necessary lubricant. . . .

"It is much cheaper to buy oil than to pay heavy repair bills, and one does not suffer the inconvenience of continually having the car laid up when careful attention is paid to all the details which require lubrication, both by hand and by pump.

"Many makers pride themselves upon the small consumption of lubricating oil that their engines require, but it cannot be supposed that a certain quantity of oil, continuously used over and over again for lubricating parts which run at high temperatures, can maintain its lubricating properties for a great length of time. In gas engine practice one does not usually care to employ an oil which has been used for cylinder lubrication a second time for the same purpose, although it may do quite well for shaft bearings."

Motorists' Legal Adviser for Pocket Use.

"Road Rules and the Law of Automobiles" is the title of a neat and handy little booklet compiled by Neal Down Becker, a member of the New York Bar, and published by Erle W. Whitfield, of New York. In nine concise chapters it covers the general requirements of New York, New Jersey, Connecticut and Massachusetts, as to licenses and equipment permitted or demanded; the important points in the automobile laws of these States; the procedure at arrests and the matter of obtaining bail, etc., and the systems of automobile insurance. In appendix form it affords a resume of the existing automobile laws of all the States, particularly as to the license requirements and the "non-residents" provisions. A section also is devoted to the speed and equipment regulations in the several States of the Union and the Dominion of Canada.

Rambler

Cross Country

\$1650

Rambler dealers have for years been clamoring for a car of Rambler quality to sell at a popular price. They have long maintained the superior fitness of the Rambler organization to produce such a car.

The company, after purposely delaying taking this step until the factory organization had been perfected, now announces the Rambler Cross Country, a 38 horsepower, five-passenger touring car at \$1,650.

In building this model Rambler, quality in material and workmanship has been maintained throughout. The richness of appearance which sets the Rambler apart from lower-priced cars characterizes this as all other models.

The Rambler Cross Country will have an unprecedented sale, if advance orders may be taken as an indication. Come to the factory and see these new models which are now on exhibition, but wire or write immediately for territorial reservations.

995,583. Tire Saver. Le Ray Willour, Ashland, Ohio, assignor to The Ashland Manufacturing Company, Ashland, Ohio, a Corporation of Ohio. Filed July 11, 1910. Serial No. 571,335.

1. In a lifting jack, a standard, a lift-casing having slidable engagement therewith, a bracket connected with said standard approximately midway of its ends, a lever pivoted to said bracket, said lift-casing being provided with teeth, a pawl pivotally connected with said lever to engage said teeth, said lift-casing being provided with apertured knuckles, and a second bracket carrying pins for insertion within said apertured knuckles.

995,606. Expanding Brake. Edward F. Kelley, Bridgeport, Conn., assignor to The Royal Equipment Company, Bridgeport, Conn., a Corporation of Connecticut. Filed June 20, 1910. Serial No. 567,773.

1. A brake of the character described comprising a band adapted to engage the inner periphery of a drum, and provided with a stay piece by which it is retained in place, a lever having one end pivotally connected with one end of said band, an operating link pivoted to the other end of said lever, a hub connected with the other end of said band, a rod pivoted at one end to said lever, the other end extending transversely through said hub, means for adjustably connecting said rod and said hub, and means for actuating said link.

995,613. Cranking Device for Automobiles. Winfield A. Long, Baltimore, Md. Filed Oct. 12, 1910. Serial No. 586,780.

1. In a cranking device for automobiles, an engine shaft, a spring-actuated bevel pinion mounted slidably upon said shaft, a

shipping lever to actuate the bevel pinion, a counter shaft, clutch-actuated bevel pinions to actuate the engine shaft pinion constantly in one direction when the counter shaft is oscillated, means for oscillating the counter shaft, and means for engaging the shipping lever to retain the latter when the pinion upon the engine shaft is projected against the tension of its actuating spring.

995,618. Tipping Truck. Konrad Malcher, Gleiwitz, Germany. Filed June 8, 1910. Serial No. 565,836.

1. A tip truck comprising an underframe having a pair of wheels at each end, a beam pivotally supported longitudinally immediately of the said pairs of wheels, a truck body movably supported on said frame and a vertical pivotal connection between the said body and the said beam, means for rotating said truck on said pivot consisting of a crown of downwardly extending teeth mounted on the bottom of said body and a driving pinion in engagement therewith mounted on said underframe and means for tipping said body endwise immediately of the wheel pairs substantially as described.

995,620. Cushion Tire. George H. Mattheson, Toledo, Ohio, assignor of one-half to John M. Hayes, Toledo, Ohio. Filed Jan. 24, 1910. Serial No. 539,835.

1. In a cushion tire, the combination of a wheel rim, a casing mounted thereon, annular rings disposed within the casing and conforming in cross section to the desired contour of the casing sides, and means rigidly spacing said rings apart intermediate their edges and holding them in contact with the opposed casing walls, said means having pivotal bearings on said rings to permit portions of the rings to which radial pressure is applied to laterally oscillate thereon.

995,623. Carburetter. Harry A. Miller, Los Angeles, Cal. Filed Nov. 16, 1909. Serial No. 528,400.

1. In a carburetter, a nozzle, a valve for controlling the flow of fuel through the nozzle, an air passage around the nozzle, an automatically variable air inlet, control-

ling means for said air passage comprising a plurality of pivoted segmental wings, and means operated by said inlet controlling means to produce a variable ratio of relative movement between the valve, and said air inlet controlling means.

995,653. Speedometer. Charles L. Bastian, Chicago, Ill. Filed Sept. 27, 1909. Serial No. 519,863.

In a speedometer, an electric generator, means for driving the same from and at proportional speed to the driving element whose speed is to be indicated, a dial having a scale graduated in miles, a pointer movable over the dial and provided with an armature, an electric circuit including the generator and an electro-magnet, and means for yieldingly opposing the pull of the magnet on the armature, substantially as described.

995,688. Vehicle Shaft Forming Apparatus. George A. Lambert, Anderson, Ind. Filed Nov. 5, 1909. Serial No. 526,413. Renewed Nov. 14, 1910. Serial No. 592,328.

1. A vehicle shaft forming apparatus including a base frame with surfaces upon which a pair of shafts are adapted to be placed and curved to conform with the desired curvature of the forward portion of the shafts, means connected with one end of said frame against which the heels of the shafts abut, independently movable plates against which the other ends of the two shafts abut, a pair of upsetting levers pivoted to said plates and adapted to be folded over upon the shafts for forcing them in the desired shape, the surfaces of said levers adjacent the shafts being shaped to conform with the surfaces on the base frame on which the shafts rest, means for clamping said upsetting and forming levers down upon the shafts and a connection between said straps and upsetting levers, whereby as the levers are folded over upon the shafts they will draw the straps and give said plates the upsetting movement.

995,731. Magnetic Speedometer. John K. Stewart, Chicago, Ill. Filed June 17, 1910. Serial No. 567,420.

1. In a speedometer, in combination with a case, a magnet carrier having its shaft

LONG
SERIES

IN high efficiency—first cost—dependability—and in practical value—the Hyatt Roller Bearing is superior.

Hyatt Roller Bearing Co., Detroit, Michigan

AUTOMOBILE AGENTS!

There are still a few territories in which we have no representatives. We have the best Agency Proposition in the world. 62% of our 1912 output already sold.

Michigan "40" \$1,500

The only automobile of standard specifications selling at as low as \$1,500. Price made low, not through cheapened materials, but through remarkable saving in selling expense. Special features: 40 horsepower—116-inch Wheel Base—34 x 4-inch Tires—Demountable Rims—Nickel Trimmings—Three Bearing Crankshaft—Enclosed Valves—Absolute-Silent Motor.

SHAWMUT TIRES

SOLD EVERYWHERE

SHAWMUT TIRE CO., Boston, Mass.

journalled for rotation of the carrier within the case, said shaft being axially chambered at one end; a hanger rigid with the case having a depending limb extending rigidly into the axial cavity of the shaft without contact therewith; a non-magnetic disk having a spindle stepped in said depending limb and having a second bearing rigid with the case; and a spring reacting between the disk and the case for biasing the disk toward a predetermined position in its range of oscillation.

995,732. Core for Molding Tires. Frederick S. Stiles and John Yekimer, Akron, Ohio, assignors, by direct and mesne assignments, to The Faultless Machine & Manufacturing Company. Filed Apr. 9, 1910. Serial No. 554,396.

1. A tire molding core comprising a plurality of separable segment members adapted to abut against one another, end for end, and each having an inwardly extending member provided with a lateral flange an open clamping ring engaging said flanges and coacting therewith to draw the segments together and means to detachably secure the ends of the said open clamping ring to the said inwardly extending member of one of said segments.

995,738. Vehicle Tire. Johannes Thomsen, Chicago, Ill. Filed May 23, 1910. Serial No. 562,871.

1. The combination of a casing, a sectional ring in the inner portion of said casing, lugs on said ring arranged in pairs transversely to the plane of the wheel, springs engaging with said lugs, a shoe having its outer surface conforming with the outer portion of the inner surface of said casing and having lugs engaging with said springs, a stirrup over said shoe, and flexible connections between said stirrup and said ring for holding said springs under tension and limiting the outward movement of said shoe.

995,771. Luggage Carrier. James R. Coyle, Huntsville, Ala., assignor of one-half to Elmore J. Mitchell, Huntsville, Ala. Filed July 7, 1910. Serial No. 570,877.

1. A luggage carrier including a pair of supports adapted for attachment to a vehicle and having horizontal arms provided with longitudinal guide grooves, lazy-tongs mounted against the inner faces of the supports and having lateral projections engaging in the guide grooves when closed, and transverse bars carried across the inner ends of the lazy-tongs to close the ends of the carrier.

995,807. Valve Mechanism for Gas Engines. Robert M. Roof, Muncie, Ind., assignor to The Peoples Trust Company, trustee, Muncie, Ind. Filed Apr. 19, 1909. Serial No. 490,866.

1. In a valve mechanism of the kind described, the combination of a valve chest having an exhaust chamber and an inlet chamber separated by a partition, a port from the said exhaust chamber, a sleeve adapted to pass through the said chambers and the said partition and having openings in the portion thereof that is surrounded by the intake chamber the inner end of said sleeve being flared to form a valve for said port, a removable flange on the bottom of said sleeve, a spring between the said flange and the wall of the valve chest, a valve at the inner end of said sleeve having on its stem a head to move slidably in the interior of said sleeve, a guide member carried on the inside of the sleeve and in

which the valve stem may move slidably, a spring between the said head and the valve head.

995,828. Clutch Mechanism. Henry A. Waterman, Milwaukee, Wis., assignor to International Harvester Company, a Corporation of New Jersey. Filed Apr. 21, 1910. Serial No. 556,710.

1. A clutch mechanism including, in combination, a rotatable shaft, an annular clutch ring loosely mounted upon said shaft and adapted to be received by said annular ring in a manner to frictionally engage therewith, means for causing the frictional engagement of the two clutch members, including a longitudinal groove in said shaft, and a wedge engaging with a side of said groove and with said split ring in a manner to move longitudinally to cause expansion of the latter when said shaft is turned in one direction.

995,857. Internal Combustion Engine. Hugh Francis Fullagar, Newcastle-upon-Tyne, England. Filed Nov. 4, 1909. Serial No. 526,226.

1. An internal combustion engine comprising two cylinders arranged side by side, two oppositely movable pistons in each cylinder, and coupling rods connecting each piston in one cylinder to the oppositely situated piston in the other cylinder.

995,878. Indicator for Spark Plugs. Addison R. Lamberson, Albany, N. Y. Filed Dec. 1, 1910. Serial No. 595,023.

1. The combination of a metallic tubular member, a head closing one end of said tubular member and made of insulating material, a metallic member mounted within said head and provided with a portion to be applied to a conductor, a spring mounted within said head and in electrical communication with said metallic tubular member, a lamp disposed with said tubular member and engaging said spring, and a contact washer connected with said tubular member and engaging a part of said lamp.

THE MOTOR WORLD

Vol. XXIX.

New York, U. S. A., Thursday, October 12, 1911.

No. 3

DURANT'S PLANS BEGIN TO UNFOLD

**Chevrolet Car but One Link in Chain—
Plants Acquired for Motors and
Low-Priced Model.**

Although he remains a director of the General Motors Co., which he organized to dominate the automobile industry of the world and which he himself dominated until the banking interests stepped in a year ago, W. C. Durant is actively prosecuting plans for rebuilding an automobile business of his own.

Acting through W. H. Little, one of his old lieutenants, he, as already is well known, has organized the Chevrolet Motor Car Co. in Detroit, and this was supposed to represent the sum total of his activity. But it transpires that the high speed, high priced car which the Chevrolet company will produce is but one link in the chain which Durant is forging. For he also has the production of a popular priced car in view, and by those who are in a position to be informed is credited with having already placed himself in position to produce it. For that purpose he is reported to have acquired not only a car-building plant, but an engine-making factory as well, the former being the Flint Wagon Works, which has been producing the Whiting car, while the engines will be made by the Mason Motor Co., which recently was organized in Flint, Mich., and which Durant, through others, is said to control. Durant himself is saying nothing, but that his boundless activity and industriousness will not much longer permit him to remain in the background seems at least fairly certain.

From time to time reports have been current that his connection with the General Motors Co. had terminated, but, though it is well known that he long since ceased to be a power in its affairs, it can be authoritatively stated that he still remains a director of the big corporation which

caused him to over-reach himself. The board of directors held a meeting only last week and although his fellows on the board are well aware of his activities in other directions and on his own account, Durant still retains his official identification with the company.

Detroiters Form Steam Truck Company.

Composed of Detroit men and incorporated under the laws of West Virginia, the Harger Steam Truck Co., of New York, has been organized with capital stock of \$1,000,000. While the title of the company suggests that it will engage in the manufacture of steam trucks, none of the men interested will give any information concerning the project, stating that plans are not yet sufficiently ripe for publication. The Detroiters who incorporated the company are as follows: Walter S. Wheeler, of the firm of McIntyre & Wheeler, lawyers; James L. Weir, of the Electric Depot Co.; John S. Harger, George F. Conis and Gilbert E. Ofeldt.

Ross to Make Truck Transmissions.

Several of the men previously identified with the Ross Gear and Tool Co., of Lafayette, Ind., have organized the Ross Machine Co., in that city, and secured a plant on South Fourth street, where motor truck transmissions will be produced. William Ross is president of the new company; Linn C. Ross, secretary and treasurer, and Robert Conn, general manager. The company, which has been capitalized at \$15,000, will begin manufacturing operations early next month.

Will Be the Briggs-Detroit Company.

Claude S. Briggs, who recently resigned as sales manager of the Brush Runabout Co. of Detroit to further the organization of a company of his own, has not yet completed his plans, although it is now known that the company will be styled the Briggs-Detroit Co., and that the car which it will manufacture will sell for less than \$800. The car, as previously announced, will be styled the Detroit.

STANDARDIZING THE TRUCK WHEEL

**S. A. E. Makes Further Progress in That
Direction—Tire Fastenings and Official
Stamp Recommended.**

As tangible evidence of progress in the standardization work of the Society of Automobile Engineers commercial vehicle manufacturers will be asked to stamp all wheels purchased and inspected according to the new S. A. E. standards with a permanent mark visible during the life of the wheel. Much useful work already has been accomplished by the society in carrying out its standardization program, but this is the first instance in which it has attained to the dignity of a hall-mark. In view of the importance of distinguishing between standard and non-standard wheels action to this end was taken at a joint conference between the wheel dimensions and fastenings committee of the society and representatives of the leading solid tire manufacturers, held at the New York headquarters of the society last Thursday, 5th inst.

Continuing its work of perfecting wheel standards for commercial vehicles the society has progressed from the determination of a permanent metal band surrounding the felloe to a consideration of the fastening of tires of the flange type, and also has tackled the difficult and intricate problem of standardizing and grading woods for artillery wheels. The result of last week's conference was that the committee was requested to recommend to the society the adoption of definite specifications for bolts for the tire flanges.

The recommendations were for a standard of half inch through bolt for all sizes of solid tire and for a 28½-inch diameter bolt hole circle for 36-inch tires, increasing or decreasing by even two-inch differences for larger or smaller tire sizes. Up to and including 36-inch tires, it was recommended that 8, 12 or 24 bolts, equally spaced, should

be used, according to requirement, while for tire sizes between 36 and 42 inches 10, 15 or 30 bolts should be used. For tires of 42 to 48 inches diameter 12, 18 or 36 bolts should be used, in the opinion of the meeting, and for sizes between 48 and 54 inches, 14, 21 or 42 bolts.

In consideration of the extremely important question of woods for wheel construction two papers were presented to the meeting, one by Arthur Ryan, of Crane & MacMahon, Inc., of New York City, and the other by W. P. Kennedy, chairman of the committee, the latter dealing more particularly with the seasoning of timber for wheels. The problem of grading material for wheels has not been advanced sufficiently for standard recommendations to be adopted as yet, however.

Metal wheel dimensions insofar as they relate to the application of side flange tires will be taken up by the society on recommendation of the conference, while the moot point of necessary tolerance in the circumference of the permanent metal band on S. A. E. standard wheels was again discussed, with the result that the committee has for the time being reserved its opinion on reconsideration.

Changes Among Prominent Tradesmen.

H. R. Croninger, who most recently was identified with the Alco interests, has joined the staff of the Speedwell Motor Car Co., of Dayton, O. He will have charge of its truck department.

William Fewell, manager of the Oldsmobile branch in St. Louis, has been transferred to the management of the Boston branch. He succeeds G. W. Houk, who, it is understood, will go abroad in the interests of the General Motors Co., of which the Olds company is a part.

Joseph E. Warren has joined the Metzger Motor Car Co.'s sales department in the capacity of chief of district managers. Previously he was connected with the Chalmers Motor Co., in which W. C. Hood, the Metzger company's present sales manager, occupied a similar office.

Fred P. Nehrbas, formerly general superintendent of the E. R. Thomas Motor Co., has been made factory manager of the American Locomotive Co.'s Alco plant at Providence, R. I. Nehrbas's identification with the industry dates from 1899, which indicates that his experience is ripe and extensive.

Hawkeye Building Truck Plant in Iowa.

G. C. Schneider, W. Morgan and D. Stofflet, of Cedar Rapids, Iowa, have formed the Hawkeye Carriage and Auto Co., in that city, where they are erecting a one-story factory, which will be devoted to the manufacture of a motor truck embodying several new features originated by Schneider. It is expected that the plant will be completed and in operation before the end of the year.

THE MOTOR WORLD

BOARD OF TRADE ALLOTS DUTIES

Make-Up of Its Nine Standing Committees Announced—Titles Suggest a Broadening of the Field of Endeavor.

Routine work was the rule at the quarterly meeting of the general membership of the Automobile Board of Trade, which was held in its New York offices on Thursday last, 5th inst. The only exception to the rule was the announcement of the make-up of the nine committees which will shape the work of the organization until the next annual meeting. Those who compose the committees, several of which are new, are as follows:

Patents—C. C. Hanch (Marmon), W. H. VanDervoort (Glide), L. H. Kittredge (Peerless), A. Macauley (Packard).

Trade—H. O. Smith (Premier), E. R. Benson (Cadillac), W. E. Metzger (Metzger), C. W. Churchill (Winton), W. T. White (White).

Statistical—Benjamin Briscoe (U. S. Motor), E. P. Chalfant (Thomas), J. S. Clarke (Autocar).

Show—George Pope (Pope), Alfred Reeves (U. S. Motor), M. L. Downs (Autocar).

Legislation and law—G. H. Stilwell (Franklin), Albert L. Pope (Pope), W. B. Hoyt.

Intercourse and arbitration—G. E. Daniels (Oakland), W. C. Shepherd (Matheson), J. W. Gilson (Mitchell).

Good roads—R. D. Chapin (Hudson), S. D. Waldon (Packard), J. N. Willys (Overland).

Publicity—Alfred Reeves (U. S. Motor), E. R. Estep (Packard), H. W. Ford.

Mechanical co-operation—A. L. Riker (Locomotive), D. Ferguson (Pierce-Arrow), F. B. Stearns (Stearns), H. E. Coffin (Hudson), C. W. Nash.

Olds Explains Reo's Passed Dividend.

Although the Reo Motor Truck Co., of Lansing, Mich., which was organized about a year ago by the same interests, declared a 10 per cent. dividend at its annual meeting held last week, the Reo Motor Car Co. itself for the first time passed its annual dividend. The fact that in other years the Reo company has cut several plump melons, made the passing of the dividend on this occasion the cause of considerable trade comment. R. E. Olds, president of the company, explained, however, that although there was a cash balance of \$1,280,000 on hand, instead of distributing this surplus to the stockholders, as heretofore, it is the intention to use the money for working capital and thereby save the 6 per cent. usually paid for bank loans. He reported that orders had been booked for 10,270 cars and that although they would have to be sold on closer margin than here-

tofore, he believed that it would be possible to declare a 50 per cent. deferred dividend next April.

Barnes Acquires the Parish Account.

Claire L. Barnes & Co., of Chicago, Detroit, Cleveland and New York, who attained trade prominence in a remarkably short space of time, have acquired the account of the Parish Mfg. Co., Reading, Pa., makers of heat treated frames and other steel specialties which are in wide demand. In addition to selling Parish frames and specialties Barnes & Co. are direct factory representatives handling the entire production of Billings & Spencer, drop forgings and tools, Van Wagner die castings, Fort Pitt small steel castings and Simmons wire spring constructions, which, with their four branches and intimate trade acquaintance, places them in splendid position to render efficient service anywhere.

Credit Association Admits Thirteen More.

At the last meeting of the Automobile Trade Credit Association, 13 new members were admitted to membership, as follows: Armiger Chemical Co., Chicago, Ill.; Bliven & Carrington, Inc., New York City; Calmon Asbestos & Rubber Works, New York City; Federal Rubber Manufacturing Co., Cudahy, Wis.; O. Fenstermacher, Minneapolis, Minn.; Gulf Refining Co., Pittsburg, Pa.; Interstate Auto & Sup. Co., Sioux City, Ia.; Lowe Motor Supplies Co., New York City; Lutz-Lockwood Mfg. Co., Roselle, N. J.; Marvel Carburetter Co., Indianapolis, Ind.; W. P. Miller's Sons, Long Island City, N. Y.; G. Piel Co., Long Island City, N. Y.; Union Auto Specialties Co., Pittsburg, Pa.

Pennsylvania Strikes Financial Shoals.

The Pennsylvania Auto-Motor Co., of Bryn Mawr, Pa., maker of the Pennsylvania car, has been petitioned into bankruptcy. Although producing a car of quality, the company had been practically at a standstill for more than a year, not even the new blood, in the persons of W. H. Hurlburt and Thomas F. Moore, being able to move it forward.

Fire Damages Holtzer-Cabot Factory.

Fire of mysterious origin started at midnight, October 6-7, in the factory of the Holtzer-Cabot Electric Co., Brookline, Mass., and destroyed the entire main building, causing nearly \$250,000 damage. Among other things, the Holtzer-Cabot company makes a dynamo lighting and ignition system for automobiles.

Turton Heads Newark Truck Project.

The Commercial Motor Truck Construction Co. has been organized in Newark with W. Eugene Turton, president, Dr. William Dimond, vice-president, and Jacob Ludwig, secretary-treasurer. They purpose making three models of a four-cylinder, four-cycle, gear driven truck.

BIG INCREASES IN SOUTH AND EAST

**Export Shrinkages in Canada and Europe
More Than Offset by Gains Elsewhere
—Big Jump in Oceania.**

The spreading out of the export trade in American automobiles continues unabated, the statistics for the month of August, 1911, clearly showing the shifting of the market towards Asia, Oceania and South America. The gains during this month are large, amounting to fully 50 per cent., despite the fact that Canada, Mexico and all the European countries, with the exception of France, reduced their purchases, as compared with the same month of the preceding year. During August, 1911, 1,150 cars, valued at \$1,248,926, were sent abroad, as against 656 cars, valued at \$897,322, in the same month of 1910. Parts to the value of \$136,437 worth in August of last year.

•The most significant showing is that made by British Oceania, which increased its purchases from \$68,212 to \$295,548, a clear gain of 335 per cent. Asia also took a much larger quantity than in the same period of last year, its quota increasing from \$46,806 to \$138,867, or practically 200 per cent.

The figures for the eight months ending August 31, 1911, serve to accentuate this shifting of the market. While shipments to Canada still show a small increase over those during the same period of 1910, those for the United Kingdom shrunk by \$420,000, or about 19 per cent., the figures being \$1,867,323 for the 1911 period, and \$2,286,984 for that of 1910. This loss, to which must be added the losses in France (\$240,000), Germany (\$186,000), Italy (\$172,000), and Mexico (\$155,000), however, is more than balanced by the extraordinary gains made in South America (\$440,000), Oceania (\$900,000), Asia (\$270,000) and Other Countries (\$70,000). The total quantity exported during this period was 10,085 cars, valued at \$10,443,490, and \$2,207,981 worth of parts, as compared with 5,970 cars, valued at \$8,266,808, and \$1,408,495 worth of parts in the eight months of 1910. The report in detail:

	August		Eight months ending August		
	1910	1911	1909	1910	1911
Automobiles and parts of—					
Automobiles	\$897,322	\$1,248,926	\$5,107,953	\$8,266,808	\$10,443,490
Parts of (except tires)	136,437	306,274	526,492	1,408,495	2,207,981
Exported to—					
United Kingdom	205,007	213,328	1,612,726	2,286,984	1,867,323
France	15,699	45,024	739,764	613,737	371,824
Germany	49,334	7,049	151,711	284,772	98,332
Italy	7,510	5,597	214,345	347,629	175,511
Other Europe	69,075	49,581	267,086	593,450	541,803
Canada	398,825	314,437	1,746,453	3,889,539	4,239,702
Mexico	70,492	18,669	294,286	431,594	276,733
West Indies and Bermuda	23,293	20,179	203,646	270,638	230,611
South America	60,443	122,080	125,978	286,651	726,309
British Oceania	68,212	295,548	137,766	262,495	1,153,744
Asia and other Oceania	46,806	138,867	70,107	280,961	566,996
Other countries	19,063	18,567	70,577	126,853	194,612
Total	\$1,033,759	\$1,555,200	\$5,634,445	\$9,675,303	\$12,651,471

Two New Men Enter Kokomo Tires.

Fred I. Willis, of the Hersey-Willis Co., of Indianapolis, and G. H. Hamilton, former sales manager for the G. & J. Tire Co. and more recently New York representative of the Continental Rubber Works, of Erie, Pa., have acquired an interest in the Kokomo Rubber Co., of Kokomo, Ind., and hereafter will play an active part in its affairs. Willis will divide his time between the Kokomo company and the Hersey-Willis Co., while Hamilton next week will go to Kokomo and assume charge of the sales department. D. C. Spraker, who built up the Kokomo concern from a modest beginning, will retain the presidency, and D. "Lon" Spraker will remain his first lieutenant. The company has a proud reputation in the matter of bicycle, motorcycle and carriage tires and now is preparing to take up automobile tires in real earnest. It has made a number of them during the past several years, but never really entered the market with them.

Confusion of the Woodards, O. J. and H. J.

Ever since Harvey J. Woodard resigned the management of the Diamond Rubber Co. of New York and became general manager of the Century Tire Co., of New York, his brother, O. J., who retained his connection with the Diamond company, has been put to it to make clear that it was H. J. and not O. J. who made the change. As he has not yet been able wholly to overtake the reports that confuse him with his brother, O. J. Woodard wants it generally known that he remains manager of the truck tire and wire departments of the Diamond Rubber Co.'s factory in Akron, and has nothing to do with the Century Tire Co.

August Strong Month for Tire Exports.

During the month of August, 1911, there were exported to foreign countries \$251,262 worth of American automobile tires, as compared with \$151,468 worth during the same month of 1910. During the eight months ending August 31, 1911, \$1,715,322 worth were sent abroad, but no comparison with last year's amount is available, as the Government did not list tires separately previous to July, 1910.

MAKERS WHO SECURED SHOW SPACE

**M. A. M. and N. A. A. M. Line Up Their
Members for New York and Chicago
Exhibitions—Their Preferences.**

The Motor and Accessory Manufacturers on the 5th inst. completed the allotment of space to its members for the Madison Square Garden Show, in New York, and the Chicago Show. In each case the M. A. M. contracted for the greater portion of the desirable accessory space, subsequently dividing it among its own members. The members to whom space was allotted are as follows:

Both Weeks at Garden.

Ajax-Grieb Rubber Co., American Ball-Bearing Co., American Circular Loom Co., Apple Electric Co., The Badger Brass Manufacturing Co., The Baldwin Chain & Mfg. Co., Bosch Magneto Co., S. F. Bowser & Co., Briscoe Manufacturing Co., Brown-Lipe Gear Co., Byrne, Kingston & Co., Champion Ignition Co., The Chandler Co., Chicago Telephone Supply Co., Coes Wrench Co., Columbia Lubricants Co. of New York, Columbia Nut & Bolt Co., The Connecticut Telephone & Electric Co., Consolidated Rubber Tire Co., Continental Caoutchouc Co., Covert Motor Vehicle Co., The Wm. Cramp & Sons Ship & Engine Building Co., Crucible Steel Co. of America, The Dean Electric Co., Diamond Chain & Manufacturing Co., The Diamond Rubber Co., Jos. Dixon Crucible Co., Dorian Remountable Rim Co., Driggs-Seabury Ordnance Co.

Edison Storage Battery Co., The Edmunds & Jones Manufacturing Co., Eise-mann Magneto Co., The Electric Storage Battery Co., Empire Tire Co., Firestone Tire & Rubber Co., The Fisk Rubber Co., G & J Tire Co., Gemmer Manufacturing Co., The B. F. Goodrich Co., The Goodyear Tire & Rubber Co., Gray & Davis, The R. E. Hardy Co., A. W. Harris Oil Co., Hartford Rubber Works Co., Hartford Suspension Co., Havoline Oil Co., Herz & Co., The Hess-Bright Manufacturing Co., The Hoffecker Co., Hyatt Roller Bearing Co., Janney-Steinmetz & Co., Isaac G. Johnson & Co., Phineas Jones & Co., Jones Speedometer Co., Atwater Kent Manufacturing Works, Kokomo Electric Co., Leather Tire Goods Co., Lebanon Steel Casting Co., J. Ellwood Lee Co., Light Manufacturing & Foundry Co., Link-Belt Co., Lovell-McConnell Manufacturing Co.

McCord Manufacturing Co., The McCue Co., C. A. Metzger, Michelin Tire Co., Morgan & Wright, A. R. Mosler & Co., The Motz Clincher Tire & Rubber Co., Muncie Gear Works, National Carbon Co., National Tube Co., The New Departure Manufacturing Co., N. Y. & N. J. Lubricant Co., The Noera Manufacturing Co., Oliver Manufacturing Co., Pennsylvania Rubber Co.,

Pittsfield Spark Coil Co., Remy Electric Co., The Republic Rubber Co., The Royal Equipment Co., A. O. Smith Co., The Sparks-Withington Co., Spicer Manufacturing Co., C. F. Splittorf, Standard Roller Bearing Co., The Standard Welding Co., Stewart & Clark Manufacturing Co., Stromberg Motor Devices Co., Swinehart Tire & Rubber Co.

The Timken-Detroit Axle Co., The Timken-Roller Bearing Co., The Turner Brass Works, U. S. Light & Heating Co., Vacuum Oil Co., Vanadium Metals Co., The Veeder Manufacturing Co., Warner Gear Co., Warner Manufacturing Co., Weed Chain Tire Grip Co., Weston-Mott Co., Wheeler & Schebler, Whitney Manufacturing Co., J. H. Williams Co., O. W. Young, Federal Rubber Manufacturing Co., Detroit Electric Appliance Co., Carnegie Steel Co., Automobile Supply Manufacturing Co., The Simms Magneto Co., International Acheson Graphite Co., The Buda Co., Stutz Auto Parts Co., Bower Roller Bearing Co., United Rim Co., Jacobson-Brandow Co., General Electric Co.

For First Week Only.

Allen Auto Specialty Co., Auburn Auto Pump Co., The A-Z Co., Briggs & Stratton Co., Continental Rubber Works Co., Adam Cook's Sons, C. Cowles & Co., Dover Stamping & Manufacturing Co., Gabriel Horn Manufacturing Co., The Gilbert Manufacturing Co., Globe Machine & Stamping Co., Gray-Hawley Manufacturing Co., George A. Haws, Hayes Manufacturing Co., Heinze Electric Co., Hodgman Rubber Co., Kellogg Manufacturing Co., National Coil Co., The Pantasote Co., Rose Manufacturing Co., J. H. Sager Co., The Seamless Rubber Co., C. A. Shaller Co., The Sprague Umbrella Co., The Springfield Metal Body Co., The Stein Double Cushion Tire Co., Valentine & Co., Vesta Accumulator Co., Warner Instrument Co., Western Tool & Forge Co., White & Bagley Co., The Willard Storage Battery Co., The Manufacturers Foundry Co., Doehler Die-Casting Co., The Hess Spring & Axle Co., The G. Piel Co., The Esterline Co., Universal Wind Shield Co., The Batavia Rubber Co., Double Fabric Tire Co., Voorhees Rubber Manufacturing Co., Wolverine Lubricants Co.

For Second Week Only.

Ross Gear & Tool Co.

For Both Weeks at Chicago.

Ajax-Grieb Rubber Co., American Ball Bearing Co., American Circular Loom Co., Apple Electric Co., Auto Parts Manufacturing Co., The Badger Brass Manufacturing Co., The Baldwin Chain & Mfg. Co., Bosch Magneto Co., S. F. Bowser & Co., Bliscoe Manufacturing Co., Brown-Lipe Gear Co., Byrne, Kingston Co., Champion Ignition Co., The Conn. Telephone & Elec. Co., Consolidated Rubber Tire Co., Continental Caoutchouc Co., Continental Motor

Manufacturing Co., Covert Motor Vehicle Co., The Wm. Cramp & Sons Ship & Engine Building Co., The Dean Electric Co., Diamond Chain & Mfg. Co., The Diamond Rubber Co., Driggs-Seabury Ordnance Corp., Edison Storage Battery Co., The Edmunds & Jones Mfg. Co., Eisemann Magneto Co., The Electric Storage Battery Co., Empire Tire Co., Firestone Tire & Rubber Co., The Fisk Rubber Co.

G & J Tire Co., Gemmer Manufacturing Co., The B. F. Goodrich Co., The Goodrich Tire & Rubber Co., Gray & Davis, C. T. Ham Manufacturing Co., The R. E. Hardy Co., A. W. Harris Oil Co., The Hartford Rubber Works Co., Hartford Suspension Co., Havoline Oil Co., Herz & Co., The Imperial Brass Manufacturing Co., Isaac G. Johnson & Co., Jones Speedometer Co., Atwater Kent Manufacturing Works, Kinsey Manufacturing Co., Kokomo Electric Co., Leather Tire Goods Co., J. Ellwood Lee Co., W. H. Leland & Co., Link-Belt Co., Lovell-McConnell Manufacturing Co., McCord Manufacturing Co., Michelin Tire Co., Morgan & Wright, A. R. Mosler & Co., The Motz Clincher Tire & Rubber Co., Muncie Gear Works, National Carbon Co., National Coil Co., National Tube Co., N. Y. & N. J. Lubricant Co., Oliver Manufacturing Co.

Pennsylvania Rubber Co., Pittsfield Spark Coil Co., Remy Electric Co., The Republic Rubber Co., Ross Gear & Tool Co., The Royal Equipment Co., The Sparks-Withington Co., Spicer Manufacturing Co., C. F. Splittorf, Standard Roller Bearing Co., The Standard Welding Co., Stewart & Clark Mfg. Co., Stromberg Motor Devices Co., Swinehart Tire & Rubber Co., The Timken-Detroit Axle Co., The Timken Roller Bearing Co., The Turner Brass Works, The U. S. Light & Heating Co., The Veeder Manufacturing Co., Vesta Accumulator Co., Warner Gear Co., Warner Mfg. Co., Weed Chain Tire Grip Co., Western Motor Co., Weston-Mott Co., Wheeler & Schebler, Whitney Manufacturing Co., J. H. Williams Co., Federal Rubber Mfg. Co., Detroit Electric Appliance Co., Waukesha Motor Co., The Esterline Co., The Simms Magneto Co., Falls Machine Co., International Acheson Graphite Co., The Buda Co., Stutz Auto Parts Co., The United Rim Co., Jacobson-Brandow Co., General Electric Co.

For First Week Only.

Allen Auto Specialty Co., Auburn Auto Pump Co., Avery Portable Lighting Co., Booth Demountable Rim Co., Briggs & Stratton Co., Columbia Lubricants Co. of New York, Continental Rubber Works Co., Adam Cook's Sons, C. Cowles & Co., Jos. Dixon Crucible Co., Dorian Remountable Rim Co., Dover Stamping & Mfg. Co., The Globe Machine & Stamping Co., Gray-Hawley Mfg. Co., George A. Haws, Hayes Manufacturing Co., Heinze Electric Co., The Hoeffcker Co., Kellogg Manufacturing Co., The McCue Co., The Pantasote Co., J. H. Sager Co., C. A. Shaler Co.,

A. O. Smith Co., The Sprague Umbrella Co., The Stein Double Cushion Tire Co., Valentine & Co., Warner Instrument Co., Western Tool & Forge Co., The Willard Storage Battery Co., Doehler Die Casting Co., The Hess Spring & Axle Co., The G. Piel Co., Universal Wind Shield Co., Universal Tire Protector Co., Automobile Supply Manufacturing Co., The Batavia Rubber Co., Double Fabric Tire Co., Voorhees Rubber Mfg. Co., Wolverine Lubricants Co., The Start-Lite Co., Gabriel Horn Manufacturing Co.

Car Makers Who Have Booked Space.

Allotments of space in the Grand Central Palace Show in New York and in the Chicago Show were made by the National Association of Automobile Manufacturers on the 4th inst., at its offices in New York. The applicants for space were divided into three classes, of which the preferred class were the members of the N. A. A. M.; the second, members of the Automobile Board of Trade who are not members of the N. A. A. M., and the third, those not members of either organization. The majority of the accessory space allotments are made by the Motor and Accessory Manufacturers from the space assigned wholesale to that organization. The N. A. A. M. gave space to the Grand Central Palace, January 10th to 17th, as follows:

The Thomas P. Jeffery Co., The Gramm Motor Truck Co., Baker Motor Vehicle Co., Babcock Electric Carriage Co., Kelly Motor Truck Co., The Columbus Buggy Co., The Waverley Co., Cole Motor Car Co., Hupp Motor Car Co., Hupp Corporation, Regal Motor Car Co., Clarke-Carter Automobile Co., The Ohio Electric Car Co., Abbott Motor Co., Imperial Automobile Co., The Walter Auto-Truck Mfg. Co., The De Tamble Motors Co., Krit Motor Car Co., Auburn Automobile Co., The Schacht Motor Car Co., Crow Motor Car Co., F. I. A. T. Cars.

Great Western Auto Co., McFarlan Motor Car Co., Lion Motor Car Co., Haberer & Co., The Dayton Auto Truck Co., Middleby Auto Co., Ames Motor Car Co., Lauth-Juergens Motor Car Co., Colby Motor Co., Walker Vehicle Co., Newark Automobile Mfg. Co., Warren Motor Car Co., National Motor Truck Co., Sullivan Motor Car Co., Eclipse Truck Co., W. A. Paterson Co., Elkhart Carriage & Harness Mfg. Co., Universal Motor Truck Co., Lippard-Stewart Motor Car Co., Cortland Motor Wagon Co., The Sanford-Herbert Co., Ideal Motor Car Co., Rassel Motor Car Co., Kline Motor Car Corporation, Velie Motor Vehicle Co., Paige-Detroit Motor Car Co., Packers Motor Truck Co., Atterbury Motor Car Co., Durant-Dort Carriage Co., Marion Motor Sales Co.

For the Chicago Show the automobile manufacturers to receive space for the first week, January 27th to February 3rd, are as follows:

(Continued on page 191)

R. Martin has opened a garage in Eddyville, Ia.

E. Garber has opened salesrooms at Washington, Ill., where he will display Cole cars.

C. L. Trenery has sold his garage and salesroom in Lemars, Ia., to Albert Wenders.

Robert & Lott, who conducted a garage at Salem, S. D., have dissolved partnership.

Reek & Bennet is the style of a new firm which has opened a garage in Battle Creek, Mich.

Daniel Pierce is building a cement garage at Harleyville, N. Y. It will be two stories high.

Harry N. Wilson has purchased the interest of Thomas Meiklejohn in the Crescent Motor Co., at Fond-du-lac, Wis.

F. A. Skipton has built a new garage on Fourth street, Council Bluffs, Ia. It will accommodate 30 cars, is made of brick and cost \$2,000.

Theodore Sture and his son, Albert, have purchased property in Manning, Ia., on which to erect a garage. It will be of brick and cement blocks.

The Paxton-Crumley Automobile Co. has opened salesrooms at 660 North Broad street, Philadelphia, Pa. It will handle Warren-Detroit cars.

Alexander List has broken ground for a two-story garage to be erected at 51st street and 12th avenue, New York City. It will cost, when complete, \$9,000.

George W. Browne has opened, at a cost of \$15,000, a salesroom and garage at 458 Milwaukee street, Milwaukee, Wis. He handles Overland and Marmon cars.

Allie Houdeshell, who conducted an implement business at Irene, Ill., has sold the latter and opened a garage and repair shop on State street, Belvidere, Ill.

John A. Magee has opened a salesroom at Government Place and West Third street, Williamsport, Pa. He will handle Stoddard-Dayton, E-M-F and Flanders cars.

The Iowa Motor Co. has opened salesrooms and a garage on Stevens street, Iowa Falls, Ia. Clare McDowell and Claude Nickerson are the men behind the enterprise.

At a cost of \$5,000 W. H. Brophy, of Bisbee, Tex., is building a modern garage in El Paso, in the same State. It is located at the corner of Stanton and Missouri streets.

Alexander Allan has broken ground for

a new garage at Highland and Germantown avenues, Philadelphia, Pa. It will be 47x105 feet, two stories high, of brick and stone.

R. E. Betts, who is in partnership with A. J. Mandel, operating a garage and repair shop in Sioux City, Ia., has disposed of his interest; Mandel will continue the business alone.

L. L. Savage has leased the building now under construction at the corner of Fifth street and Lawrence avenue, Springfield, Ill. When completed it will give a garage and salesroom 105x60 feet.

A. W. Tyner, N. P. Bush and R. C. Bush have purchased the Day County Auto and Supply Co.'s business at Webster, S. D. They will continue the business under the style Tyner Garage Co.

Norman R. Gallatin and Steward R. Myers have purchased from A. B. Oden the Penn Park Garage at Park and Mason avenues, York, Pa. They will do business under the style Central Garage.

Earle C. Anthony is building a four-story garage of reinforced concrete in Los Angeles, Cal. It is located at the southwest corner of Tenth and Hope street and will cost when complete over \$100,000.

W. C. Knight has sold his interest in the City Garage, Temple, Tex., to R. B. Hemphill, of Coleman, Tex. The latter will continue the business in partnership with A. S. Foyt, retaining the style City Garage.

Charles Frey, who formerly conducted a livery business at 117 West Fourth street, Davenport, Ia., has remodeled the building into an automobile salesroom and garage. He will carry several lines of popular-priced cars.

Painting automobiles is to be the specialty of a new company which just has "opened up" in Burlington, Ia. It will do business under the style the Burlington Carriage and Automobile Painting Co., with B. Vorwerk as manager.

Incorporated under the laws of West Virginia, with \$25,000 capital, the Premier Motor Co. has been organized for the purpose of operating a garage and general automobile business in Pittsburg, Pa. It has located at 112 Shady avenue.

Tom Botterill, who handles Hudson, Pierce-Arrow and Columbus electric cars at Denver, Colo., is building what is said to be one of the largest repair shops in the West. The structure will be two stories high and will afford 8,500 square feet of floor space.

H. W. Fox, who for several years past

has been manager of the Maxwell Garage in Sandusky, O., has opened a garage on his own account at the corner of Hancock and Market streets. He will operate as the Fox Automobile Garage, and will devote himself to repair work exclusively.

Simultaneously with moving into more commodious quarters at 1512-14 Broadway, Denver, Colo., the Western Marion Motor Co., dealer in Marion cars, has taken the agency for the Abbott-Detroit line. The company also has opened a spacious garage, 60x40 feet, in connection with its showrooms.

The Simplex Automobile Co., which was incorporated last week in St. Louis, Mo., with \$20,000 capital, has leased the building at 3214 Locust street, which now is in course of construction. Temporary quarters have been established at 3907 Olive street. J. D. Wooster Lambert is president and general manager of the company.

The Merchants' Auto Co. is the style of a new concern which has opened a garage at 322 North Delaware street, Indianapolis, Ind., with the intention of taking care of the motor equipment of some of the department stores. The new company has as its stockholders a number of the most prominent business men of Indianapolis, including E. Darrow, president; W. E. Burk, vice-president; Harvey B. Stout, secretary, and Charles S. Shotwell, treasurer.

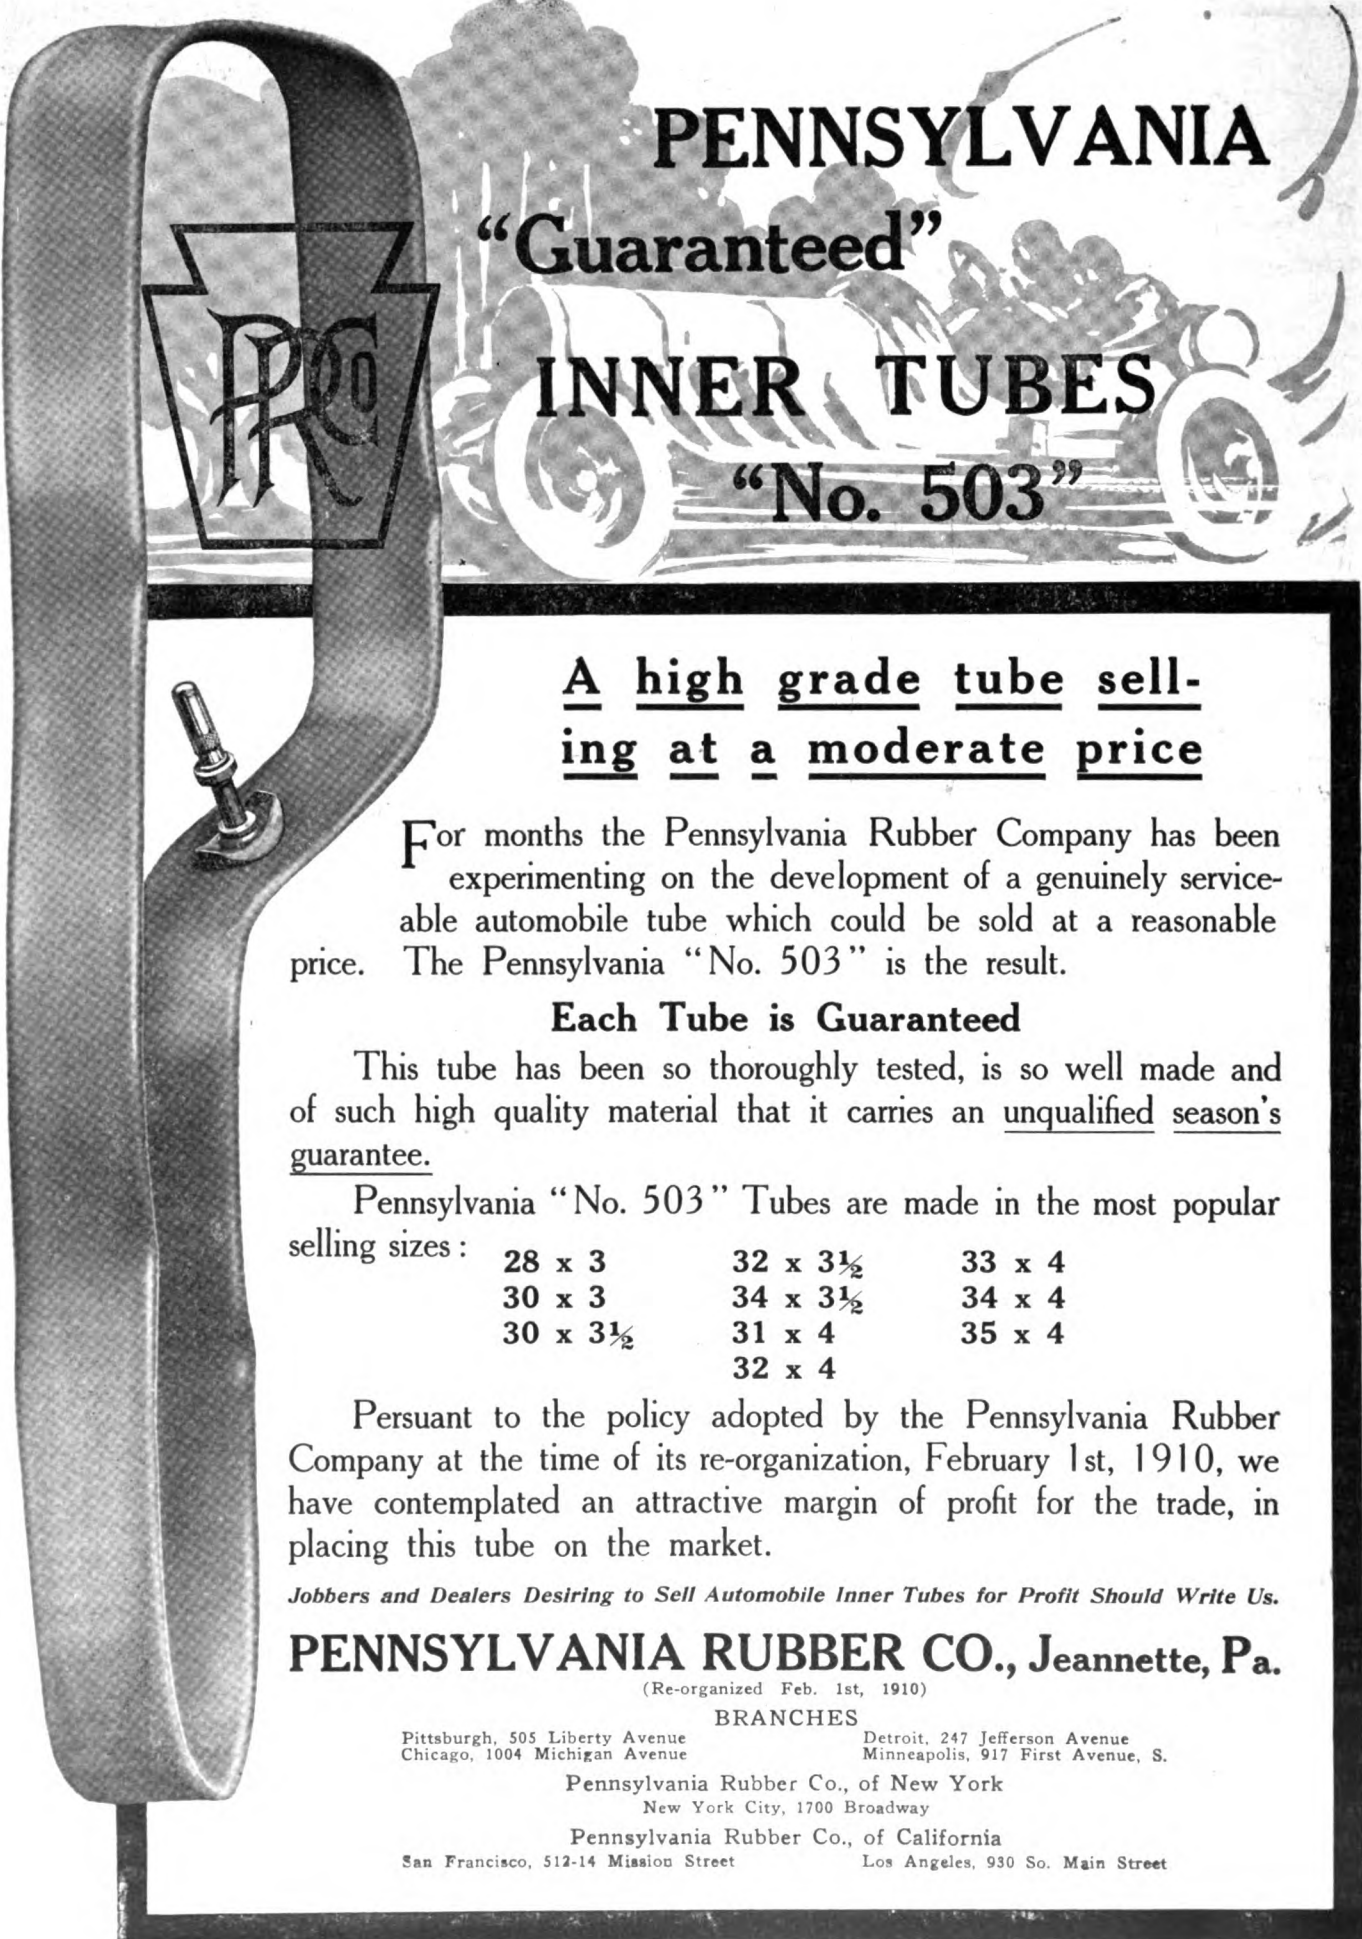

A number of important changes in the automobile business of Springfield, Mass., took place on October 1. E. A. Nelson, agent for Buick cars, retired from business and the Buick line henceforth will be handled by the Woodward-Reopell Co. The Northcross-Cameron Co. has discontinued its sale of Hudson cars, while the firm of Riggs & Bloom has been dissolved. A. E. Bloom, one of the partners of this company, has purchased a controlling interest in the Hampden Auto Co., and taken the agency for Hudson cars. E. R. Clark has withdrawn from the E. R. Clark Automobile Co. and formed the Western Massachusetts Cadillac Co. He will handle Cadillacs, while the Clark company will continue to sell Pierce-Arrow cars.

Recent Losses by Fire.

New York City, N. Y.—John O'Neill's garage at 514 West 37th street. Loss, \$500.

Malden, Mass.—Hancock & Ready carriage and automobile factory destroyed. Loss, \$25,000.

Memphis, Tenn.—J. E. Starke's garage at 665 Willett street and one car destroyed. Loss, \$9,000.

PENNSYLVANIA

"Guaranteed"

INNER TUBES

"No. 503"

A high grade tube selling at a moderate price

For months the Pennsylvania Rubber Company has been experimenting on the development of a genuinely serviceable automobile tube which could be sold at a reasonable price. The Pennsylvania "No. 503" is the result.

Each Tube is Guaranteed

This tube has been so thoroughly tested, is so well made and of such high quality material that it carries an unqualified season's guarantee.

Pennsylvania "No. 503" Tubes are made in the most popular selling sizes :

28 x 3	32 x 3½	33 x 4
30 x 3	34 x 3½	34 x 4
30 x 3½	31 x 4	35 x 4
	32 x 4	

Persuant to the policy adopted by the Pennsylvania Rubber Company at the time of its re-organization, February 1st, 1910, we have contemplated an attractive margin of profit for the trade, in placing this tube on the market.

Jobbers and Dealers Desiring to Sell Automobile Inner Tubes for Profit Should Write Us.

PENNSYLVANIA RUBBER CO., Jeannette, Pa.

NEW YORK, OCTOBER 12, 1911.

Factory Costs and Selling Costs.

Six years ago the automobile manufacturer who called to him his chief designer and said: "Go build me a car to sell for \$1,000 in 5,000 lots—and, mind you, a real automobile, too!" would have been carted off to a padded cell. Even at that comparatively late date most makers were still very much involved in embarrassing details of a purely mechanical nature. Nobody could be trusted to design a whole car on price and capacity specifications alone, the master builder had to plunge into the thing up to his elbows and himself help solve some of the many obtruding puzzles. The consequence was that the industry for the most part retained much of its old flavor of experimentalism.

Since that period vast strides have been made, however, and due passage of time has marked the growing ability of one manufacturer after another to reduce his product to any definitely assumed stand-

ards, and by the same token to increase his production rate without sacrifice of quality, but rather to the contrary. The change has transformed the maker himself from a mechanic to a business man, it has enabled him to assume broader views of trade requirements and trade conditions, and above all it has permitted him to study his market and built to its needs, rather than to strive to recoup his experimental costs by disposing of the labor of his own hands at the best price he could command. That transformation is one of the signal changes that has come over the industry during the period of its commercial upbuilding; it accounts for many things, and among them for modern methods of marketing the finished product.

With the passing of the era of "kid glove" salesmanship, naturally very many alterations in selling systems were introduced, but with them was developed in many cases a tendency to continue the heavy burden of costly sales buildings, with their elaborate salon salesroom effects. The modern automobile builder who also is a shrewd business man, however, is continually turning over in his mind the idea that selling costs have not yet been reduced to as low a relative level per machine as have building costs. There are many products which it costs much more to sell than it does to build, it is very true, but in this particular instance the notion clings that sales costs remain higher than they should. Hence the beginning of a new movement in the industry, which in all likelihood will be more clearly manifest in years to come and particularly in the great cities, where "overheads" are almost prohibitive.

The broad distinction of the new movement lies in the separation of garage, service and sales departments to whatever extent may be necessary, with the staple idea of conserving rental costs or their equivalent. In New York, Boston and other cities great service and assembling plants already have been built in accessible suburban districts, thus rendering possible legitimate economies in areas where land is worth more than its weight in gold. With proper administration the plan bodes no hindrance to the carrying on of business, but rather promises to facilitate it through permitting the more liberal use of floor space.

The tangible result, which at the present time is not so noticeable as it will be a couple of years hence, is that portions of

the big structures along the conventional "automobile row" will be turned to other uses than they now subserve. To the outsider the result may look like wholesale retrenchment, even an impoverished condition; actually it is an index of the best business acumen.

The enforced abandonment of the conference of State officials called by the Secretary of New York State is distinctly regrettable. The object, that of promoting uniform legislation and reaching a better basis for reciprocal relations, was a worthy one, and having a hall mark of authority such a conference must have carried some weight. But when the private map-selling corporation styling itself the Touring Club of America commenced tacking its name onto the project and endeavored to use it for advertising purposes, the failure of the conference was foreordained. New York's Secretary of State probably is not aware that shortly before his time the map sellers who employ such a high-sounding disguise induced a number of State officials to attend a similar conference, which served its intended purpose—that of advertising the so-called Touring Club of America and nothing more, unless to lay open the officials to the charge of frivolously wasting taxpayers' money. Once bitten, perhaps the State officials are now more than twice shy.

Of all the motor vehicles that ever pressed an asphalted street none are so remarkable as the touring cars and runabouts employed for municipal service, whether in large city or small. It is their cost of maintenance that makes them remarkable. Periodically, this item of expense affords conspicuous reading for the public, and it is certain that if motor cars were judged by such figures few of them would be sold; comparatively few people could afford them. Such publicity makes unpleasant reading from the view point of the automobile industry, and were it not so much the habit of the American taxpayer to subconsciously believe that "public office is private graft" real harm might be done; in that form of graft the municipally owned motor car has taken high rank. But at that and taking the whole range of graft and joy-riding into consideration, the wonder is that the cost of maintenance of these cars should prove so astoundingly excessive.

Saginaw, Mich.—McNailey Vulcanizing Co., under Michigan laws, with \$1,000 capital.

Davenport, Iowa—Davenport Auto Co., under Iowa laws, with \$10,000 capital; to deal in automobiles. Corporators—August Lebermann, Charles A. Frey.

Lafayette, Ind.—Ross Machine Co., under Indiana laws, with \$15,000 capital; to manufacture automobile parts. Corporators—William, David E., Linn C. and Edward A. Ross.

El Paso, Texas—Rio Grande Automobile Co., under Texas laws, with \$5,000 capital; to deal in automobiles and accessories. Corporators—Max Moye, W. F. Carter, Jr., John M. Wyatt.

Chicago, Ill.—Pathfinder Motor Car Co., under Illinois laws, with \$10,000 capital; to deal in automobiles and motor vehicles. Corporators—R. G. Vawter, Charles H. Latt, Edmond W. Pottle.

Charleston, S. C.—The Robinson Automobile Co., under South Carolina laws, with \$10,000 capital; to deal in automobiles and other motor vehicles. Corporators—J. T. Robinson, B. F. Robinson.

Utica, N. Y.—Thompson-Creedon Co., under New York laws, with \$5,000 capital; to deal in motor vehicles. Corporators—William Thompson, Iliou, N. Y.; Dennis P. Creedon, Ella Creedon, of Utica.

Paducah, Ky.—Kentucky Auto & Machine Co., under Kentucky laws, with \$5,000 capital; to deal in automobile supplies, sell, store and repair automobiles. Corporators—F. M. Fisher, R. G. Fisher, W. F. Paxton.

New York City, N. Y.—The Beasley Co., under Delaware laws, with \$150,000 capital; to manufacture and deal in automobiles. Corporators—R. F. Pratt, Jersey City, N. J.; A. E. Beasley, T. Moynan, of New York City.

St. Louis, Mo.—Cochrane Motor Sales Co., under Missouri laws, with \$5,000 capital; to deal in automobiles and supplies. Corporators—O. E. Cochrane, 48 shares; L. M. Dunn, N. F. Kelleher, one share each.

Buffalo, N. Y.—Buffalo Reliable Garage Co., under New York laws, with \$2,000 capital; to maintain a garage and deal in automobiles. Corporators—John T. Timmerman, Irving L. Carpenter, Charles H. Cutting.

Memphis, Tenn.—The Memphis Motor Co., under Tennessee laws, with \$12,500 capital; to deal in motor vehicles and accessories. Corporators—J. T. Fisher, D. M. Armstrong, A. Goodman, Walter Berry, T. K. Creson.

Grand Rapids, Mich.—Lewis Specialty Co., under Michigan laws, with \$5,000 capital; to deal in automobiles, motorboat parts and accessories. Corporators—James M. Hynes, Richard Shoemaker, R. H. Shoemaker, C. E. Lewis.

Newark, O.—Blair Manufacturing Co., under Ohio laws, with \$300,000 capital; to manufacture and deal in automobiles and supplies. Corporators—Frank M. Blair, John R. McCune, Willis A. Robbins Edwin C. Wright, Harry H. Baird.

Camden, N. J.—New Jersey Automobile and Supply Co., under New Jersey laws, with \$125,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—H. Morgan Hatch, J. R. Mick, Wilfred B. Wolcott.

Memphis, Tenn.—Chickasaw Motor Car Co., under Tennessee laws, with \$25,000 capital; to deal in motors and motor vehicles and supplies. Corporators—Carroll P. Cooper, Simpson T. Spears, J. W. Leftwich, N. Hill Martin, R. B. Martin.

Providence, R. I.—Providence Motor Car Co., under Rhode Island laws, with \$25,000 capital; to deal in automobiles and maintain a garage. Corporators—William A. McSoley, Alice Stanton, of Warren, R. I.; John A. McDonald, of Providence.

St. Louis, Mo.—Simplex Automobile Co., under Missouri laws, with \$20,000 capital; to deal in automobiles, motor vehicles and supplies. Corporators—J. D. Wooster Lambert, Edward A. Faust, C. Drummond Jones, Knox Taussig, Thomas S. McPeeters.

Philadelphia, Pa.—The Philadelphia Fritchle Co., under Delaware laws, with \$125,000 capital; to deal in automobiles and vehicles propelled by motor power. Corporators—Edward G. Johns, Don Wood, both of New York; Willis G. Hillman, Jersey City, N. J.

Pittsburg, Pa.—Premier Motor Co., under West Virginia laws, with \$25,000 capital; to manufacture automobiles and maintain a garage. Corporators—W. R. Clifton, A. C. Osburn, of Beaver, Pa.; H. A. Wilder, B. J. Ross, C. S. Forkum, P. M. Moore, L. H. Pyle, all of Woodlawn, Pa.; C. H. Martin, of Pittsburg.

Old Orchard, Me.—The Old Orchard Automobile Association, under Maine laws, to promote automobile racing. No capital. Corporators—Fred C. Goodwin, Walter J. Gilpatric, Percy N. H. Lombard, Charles H. Campbell, William J. Mewer, William M. Davis, Azro D. Morse, William L. White, Charles E. Goodwin.

Increases of Capital.

Birmingham, Ala.—Dreenen Motor Car Co., from \$5,000 to \$50,000.

Pendleton, Ind.—Forse Manufacturing Co., from \$10,000 to \$25,000.

Ft. Wayne, Ind.—Ft. Wayne Auto Motor Co., from \$50,000 to \$100,000.

October 9-13, Denver, Colo.—Denver Motor Club's reliability tour.

October 11-18, San Francisco, Cal.—Reliability contest.

October 12-22, Berlin, Germany—International automobile show in Exhibition Hall, Zoological Garden.

October 13-14, Atlanta, Ga.—Racemeet under management H. C. George.

October 14, Santa Monica, Cal.—Santa Monica road races under auspices of Santa Monica Motor Car Dealers' Association.

October 14-25, New York City to Jacksonville, Fla.—American Automobile Association's eighth annual national reliability tour for the Glidden trophy.

October 16-18, Harrisburg, Pa.—Reliability contest under auspices Motor Club of Harrisburg.

October 27-November 3, Chicago, Ill.—1,000 mile reliability contest under auspices Chicago Motor Club.

October 28, Newark, N. J.—Newark Motor Club's reliability contest.

November 1, Waco, Texas—Racemeet under auspices Waco Automobile Club.

November 2-4, Philadelphia, Pa.—Reliability contest under auspices Quaker City Motor Club.

Nov. 3-11, London, England—Society of Motor Manufacturers' and Traders' annual show in Olympia Hall.

November 4-6, Los Angeles, Cal.—The Phoenix road races under auspices Maricopa Automobile Club.

November 9, Phoenix, Ariz.—Track races under auspices Maricopa Automobile Club.

November 9-12, San Antonio, Texas—Racemeet under auspices San Antonio Automobile Club.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

November 29, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

November 30, Los Angeles, Cal.—Race-meet at Los Angeles Motordrome.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

January 6-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual show in Grand Central Palace.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

"FALL OPENING" MADE MEMORABLE

**Chicago Dealers Do Themselves Proud—
Week of Illumination and Pageantry—
Mrs. O'Leary's Cow Remembered.**

Chicago's automobile row now is fairly rocking in the glory of its second fall opening week, which, for purposes of publicity, is termed a local show. A show it is in matter of fact, but such only in the sense

dence that Monday was the 40th anniversary of the historic Chicago fire. "Fire Prevention Day," arranged in commemoration of that event, was celebrated by a parade of fire-fighting machinery, ancient and modern, in which a goodly number of automobiles of various patterns took part; while the chief figures of interest were the characters of the renowned Mrs. O'Leary and her cow, which later took part in the symbolic burning of a replica of the O'Leary barn, where the great conflagra-

tion was the sponsor for the Fire Prevention program and parade of Monday. Hundreds of motorists constantly parade the decorated section of the city viewing the "sights" from their cars, while the conception of an "endless demonstration" is carried out by affording motor transportation from end to end of the "show" for such as are without cars of their own. To the busy normal traffic of the thoroughfare also is added a liberal sprinkling of demonstrating cars constantly being circulated by the

NIGHT SCENE ON MICHIGAN AVENUE, CHICAGO'S "AUTOMOBILE ROW," SHOWING ILLUMINATION FOR "OPENING WEEK"

that it is a great pageant, the greatest, in all probability, that that district ever has seen. Some 65 automobile agents and branch houses and 100 accessory, parts and sundries dealers, not to mention hotel keepers and merchants without the pale, are taking advantage of the period to display the advantages of their products. Street and building decorations add a festive air to the "row," while by all the arts and lures of free shows, souvenirs and the milder promised diversion of real interest in the wares displayed, the Chicago Automobile Trade Association and the individuals comprising it are striving to take advantage of the great advertising opportunity.

By no means the least important feature of the opening, which "opened" last Saturday, 7th inst., and will continue to the end of the present week, was the coinci-

tion is supposed to have originated. At seven o'clock Saturday evening N. H. Van Sicklen, president of the Trade association, was permitted the distinction of pressing a little button which set aglow the thousands of electric lights that festoon the two miles of Michigan avenue from Twelfth to Twentieth streets.

In addition to the decorations, which include ornamental pillars at street intersections connected by strings of lights, the committee of arrangements has provided the dignity of a daily program which consists principally in giving different designations to the succeeding days. Thus Saturday was Opening Day; Monday, Chicago Day; Tuesday, Wednesday and Thursday, respectively, Owners', Club and Dealers' Days; while Friday will be consecrated to the "Ladies" and Saturday to the Chicago Association of Commerce, which stood

dealers for the benefit of genuine and hypothetical "prospects."

Among the features of the individual store displays are the Studebaker motion picture exhibit of factory processes, stereopticon views of one of the Ford cars climbing Ben Nevis in Scotland—some 200 Ford agents being on hand for this and the opportunity of looking over the new models, by the way—a vehicle built by the elder Cunningham in 1939 and indirect ancestor of the present Cunningham line, an historic belt-driven Benz car, as well as other relics of the past New models of the Rambler, Locomobile, Packard, Speedwell, Overland and other well-known products are on view, while among entirely new cars seen for the first time are included the Flanders electric, Rayfield, Coey-Mitchell—the latter a brand new Chicago product—and King. Sectioned chas-

sis, demonstrating models of components, and partially finished bodies are much in evidence, while repair shops, garages and service stations are included in the open-house program.

French Exports Still Going Upward.

Exports of French automobiles still continue their marvelous growth, no less than \$23,915,600 worth of complete cars and chassis being sent out of France during the first eight months of the current year. Compared with the \$23,569,000 worth exported in the same period of 1910, this shows an increase of about \$350,000, largely due to the enormous gains in Algeria (\$600,000), Other Countries (\$580,000), Brazil (\$800,000), and Turkey (\$210,000), which more than made up for the losses sustained in the markets of the United States, the United Kingdom, Italy, Russia and Switzerland. In this respect the French export statistics form an interesting comparison with those of the United States, wherein the tendency towards Asia, South America and Oceania is visible.

French imports simultaneously took a slight upward trend, about \$700,000 worth of automobiles in excess of the 1910 quota being imported, the figures for the respective eight months of 1910 and 1911 amounting to \$1,208,000 and \$1,929,000.

Imports Actually Increased in August.

Although the total imports of automobiles into the United States for the eight months of the fiscal year ending August, 1911, discloses a further shrinkage, the month of August itself held more real sunshine for the import trade than has any other month for several years. France, especially, which showed such heavy losses during the past year, managed to hold her own, sending 31 cars, valued at \$74,513, as compared with 36 cars, valued at \$73,090, in the same month of the preceding year. The only country registering a loss is Italy, which sent 22 cars, valued at \$29,115, as against 30 cars, valued at \$55,890, in August, 1910. The figures for the eight months ending August, 1911, show a practical standstill, the small loss being due to the early months of the present year. 608 cars, valued at \$1,312,969, were imported during this period, as against 723 cars, valued at \$1,443,871 in 1910. Parts to the value of \$13,881 reached this country in August, 1911, showing a gain of 47 per cent. over the same month of 1910.

Kansas City Dealers Elect Leaders.

The Motor Car Trades Association of Kansas City, Mo., has elected the following officers for the ensuing twelve months: President, J. Frank Witwer; secretary, R. C. Greenlease; treasurer, Julius G. Kinsten; directors, J. Frank Martin, E. P. Moriarty, Neslon Haynes, Harry Bruening; show committee, Teddy Dey, J. Frank Martin, Nelson Haynes, R. C. Greenlease, Julius Kinsten.

TWO DAYS TRUCK TEST IN FRISCO

Twenty-one Vehicles Participated and But One Failed to Finish—Minor Troubles Caused Penalizations.

The first reliability contest for commercial vehicles which natives of Northern California have witnessed was finished in San Francisco on the 5th inst. The San Francisco Examiner sponsored the affair and it was not an exceedingly strenuous one despite the fact that part of the program embraced a climb to the summit of Twin Peaks, which is one of the city's many steep hills. The drivers of 21 trucks of various sizes and makes participated in the run, which was started on the 4th inst., and stopped the same night, to be continued the following morning and finished on the afternoon of the 5th inst.

The trucks which were started and their drivers were as follows:

White	W. Slimmon
White	R. M. Beagle
White	Wm. Wagner
White	P. M. Melchert
White	W. K. Beagle
Federal	P. Nichols
Franklin	H. J. Boxell
Brush	E. Fitzgerald
Buick	C. A. McGee
Lewis	F. H. Ely
Reliance	G. W. Knight
Gramm	R. W. Dunn
Speedwell	J. Gordon
Pierce-Arrow	C. E. Adams
Pope-Hartford	J. Fleming
Grabowsky	C. Schultz
Kelly	B. Grant
Autocar	W. Hammerson
Reo	D. W. McVan
Indian	W. G. Collins
Packard	H. Phillips

The first day's journey consisted of a run down the peninsula to San Jose and return, a distance of a little under 100 miles, and though the roads traversed were in fairly good condition, it was unofficially reported that but 11 of the trucks survived with perfect scores. One of them, the Reliance, was withdrawn because it became overheated and the driver lost so much time that he decided to quit.

The clean score trucks were as follows, though the referee has not yet completed his labors and it is possible that a number of changes may be made: Four of the five Whites, Buick, Reo, Speedwell, Packard, Autocar, Gramm and Brush. Subsequently the Pierce-Arrow truck also was given a clean bill of health, the referee deeming the insertion of a wooden plug in the muffler not sufficient cause for penalization. The others that got into trouble and the reasons therefor were: Pope-Hartford, lost gasoline pipe connection; Lewis, broke radiator spring; Federal, broke steering arm; Franklin, lost toggle joint; Grabowsky, leaky gasoline tank; Reliance, carburettor trouble and brake bands caught fire; Indian, lost mudguard

screw; White, ran out of water and overheated.

On the morning of the second day, the trucks were preceded by a guard of mounted police and run 21 miles through the city streets to show them off, after which they were garaged over the noon hour. The ascent of Twin Peaks in the afternoon presented no particular difficulty to any of the trucks. There was no time limit imposed for the climb and they one and all reached the top without mishap. Arrived at the summit, a rigid technical examination was made and the trucks then were started back to the official checking station.

Repairer Held Responsible for Road Test.

The general belief that a man is responsible for goods which he may undertake to repair, while they are in his possession, once more received judicial cognizance in Newark, N. J., last week, when the F. C. L. Auto Co. was sentenced to pay \$628 damages to Albert G. Brooker, whose automobile was wrecked by an employe of the garage. The complaint charged that the Martin company had sent one of its mechanics to give the Brooker automobile a road test, in order to determine whether certain repairs made in its garage were satisfactory, and that on this testing trip the mechanic wrecked the car and himself was seriously injured. When Brooker sued the company for the full value of the car the defendant claimed that it was not responsible for accidents during a road test, and tried to show that "trade custom" did not entail such responsibility. The jury thought differently and not only awarded the plaintiff the damages asked, but also gave him the wreck of the car.

Gary to Wrest Greatness From Detroit!

Gary, Ind., which only a few weeks ago heard that "one of the largest automobile manufacturing companies in Detroit" was anxious to locate "in its midst," has heard that an "old-established automobile company" in Cleveland, O., is possessed of anxiety of the same sort. Unless a suitable site and buildings can be obtained, the identity of the Cleveland concern, as was the case with the Detroit movement, will remain a secret. If one cares to share the enthusiasm of the Gary Weekly Post, he can see Detroit's fame rapidly diminishing, for the Post has heard that "motor car experts have declared that Gary is the logical point for the manufacture and distribution of automobiles in the United States, and that it is designed to wrest the honors from Detroit in a very few years."

Stage Promoter Building His Own Road.

Harry L. Powell, of Mattoon, Ill., is constructing a concrete road between Tuscola and Mattoon and will establish an automobile interurban service between the two towns. The road is 16 feet wide and the automobiles will provide both passenger and freight service.

MOST GIGANTIC OF FIRE ENGINES

Huge Self-Propelling Pumping Apparatus To Be Employed in New York—Its Proportions and Its Scope.

Having found that it is possible to obtain gasoline fire engines in which the same motor that propels the outfit through the streets is employed to pump the water when the fire is reached, the City of New York shortly will place in service the huge Waterous motor driven pumping engine, which now forms a part of the Budget Exhibit and which, while not as yet accepted and paid for by the city, has

gallons, while engines of the first class pump 900 gallons.

If looks alone were the test, the engine, shown in the accompanying illustration, would pass on its very appearance, as it is a gigantic vehicle about 18 feet long over all, and having a wheelbase of 146 inches, with a tread of over 60 inches. The top of the bonnet is six feet from the ground, and the bonnet itself is between six and seven feet long, with six big cylinders almost filling the inside space, so that one can well understand why it should cost \$10,000. The wheels are 42 inches in diameter, with solid rubber tires five inches wide.

Thrilling as the sight may be to see a trio of fire horses plunging and tugging in

cams, which are all mounted on one long shaft over the cylinder heads, are moved out of position and out of action by a lateral movement of the camshaft itself. The air tank for the self-starting system is fed by a small four cylinder air compressor geared to the engine crankshaft. Air pressure for the fuel system is obtained from the same air tank, though greatly reduced through a governor. Ignition is by a dual system, with magneto and storage battery. Fuel is supplied by one carburetter, a Stromberg.

Power from the engine is conveyed to the three speed selective transmission through a four-point internal expanding clutch, and from the differential jackshaft to the rear wheels by side chain drive. The outfit having reached the fire, the pump, which in the rear portion, is driven by a direct, locked shaft drive from the engine, the change gear and rear wheel drive being entirely out of action. The pump, which is single acting and has four cylinders, $4\frac{1}{4} \times 8$, is arranged as a V over the powershaft extending lengthwise of the vehicle, with two cylinders on a side. It has shown in the tests a capacity of 744 gallons per minute at 128.3 pounds pressure, and 279.6 gallons at 230 pounds pressure, enough pressure to throw water 225 feet above the ground. In traveling, the cooling of the engine is dependent on the large radiator at the front and the circulating pump, but in pumping at a fire the engine is cooled by tapping the flow of cold water from the big water pump. The fuel tank holds 40 gallons of gasoline, sufficient for three hours steady pumping without refilling.

NEW YORK'S GIGANTIC 126 HORSEPOWER FIRE ENGINE

passed the necessary tests. The big engine, which is of the type that in the future is to represent the "heavy artillery" of the department's equipment when the latter becomes more wholly "motorized," has passed all the acceptance tests, and the department has anticipated its actual purchase to the extent of printing a picture of the new engine at the top of a card of warning "Don't's," issued to the public as an aid to fire prevention.

While New York's fire department already has about 30 motor vehicles in service, including runabouts and touring cars for the chiefs, hose wagons, a water tower, a gasoline propelled steamer, high pressure hose wagons and some delivery trucks, it has obtained a special appropriation of over \$700,000 which shortly will be available for the purchase of more motor fire apparatus, and this purchase is to include a representation of the new, all-gasoline fire engines.

The Waterous engine has a rated pumping capacity of 700 gallons per minute, equaling a steam fire engine of the second class, the latter also being rated at 700

their efforts to haul a glittering and smoke-belching steamer to a fire at high speed, the animals are only able to do about 16 miles an hour in the first block, after which their speed rapidly declines to a maximum of 12 miles an hour. In contrast to this, the new engine, despite the fact that it weighs 13,600 pounds, is able to do 40 miles an hour in a pinch, though the department has fixed 30 miles an hour as the maximum at which it shall be operated, probably out of consideration for the street pavements, which would soon be ruined by seven tons going at 40 miles an hour.

By reason of the special nature of its service, the power plant has been made self-starting. The cylinders, which have a bore and stroke of $7\frac{1}{4} \times 8$, are fitted with special cam-operated inlet valves for compressed air from a high pressure tank, so that when the air line is opened to start the engine, the air automatically is admitted to those of the six cylinders in which the piston is in the working stroke position. After the engine has been thus "turned over" as long as is necessary to get it running on its own power, the air inlet

Dust Not Due to Tire Suction.

According to a prominent automobile engineer, the idea that dust is raised by pneumatic tires as the result of suction is all wrong. It is a palpable fallacy, he asseverates, and explains that the rubber of the tire is stretched as it rolls and that on rising from the ground it reverts rapidly to its unstretched condition, giving a slight backward flick to the dusty binder which has become imbedded in the tread during its brief moment of forcible contact with the road. "This flick," he continues, "is additional to the kick given by the driven wheels when more power is transmitted through them than the adhesion between the tire and the road warrants. The flick will certainly pick out and throw away fine, blinding dust, raising it an inch or two above the road. This is the explanation of that which has been called the suction of the tire. The fall of pressure caused by the car in its wake owing to its bad "lines" is a very slight one, but covers a large volume of air, and it is this quasi-vacuous space which is refilled by eddying currents flowing in to restore the equilibrium of atmospheric pressure which picks up and raises to a great height the dust which has been loosened by the flick and kick of the tire."

GETS GASOLENE FROM NATURAL GAS

Condensation Process Gives Rise to New Source of Valuable Fuel—Simple Equipment That is Employed.

Within a year there has sprung up in Western Pennsylvania, Ohio and West Virginia, an industry which in the not far distant future is likely to reach such proportions as to have a well defined bearing on the automobile industry. It embraces the production by condensation of gasolene from natural gas. That gasolene and other equally valuable volatile liquids exist in practically all natural gas and that they can be extracted in such quantity and with such facility as to make their production of commercial value has been known for some time. It is only recently, however, that the industry has become of sufficient importance to attract attention.

Today there are dozens of small compressor plants distributed over the great oil and gas fields which are being operated profitably. As with other pioneer works many of the real problems still remain to be solved but in an illuminative article in the *Industrial World*, Frank P. Peterson, an engineer, who has been actively engaged in the industry, tells something of the progress which has been made and its commercial possibilities.

"It is a little difficult to trace to its very inception the starting of the industrial movement to recover by condensation the gasolene or hydro-carbon condensate carried suspended in the heavy casing head of oil well gases in which it is most commonly and plentifully found," he says. "But little publicity was given to the early ventures along the lines that led to success, each experimenter holding to the belief that strong latent possibilities for wealth lay in his ability to keep quiet and either sell at profit the experience gained in the successful development of his ideas, or limit the production of a very valuable by-product to his own properties.

"All this was well enough and perfectly consistent with the keen perception of the man wide awake to the possibilities of such a promising industry, if—and that 'if' was a most annoying affair—a means only could be devised for a right application of the process in the avoidance of disastrous mistakes in what to undertake and what to let alone. It developed that certain gases on the dividing line between those that could be strongly suspected of being productive and non-productive were quite productive. This naturally led back to the conclusion that all gases might be productive.

"When the chemist was called into the question, he frankly confessed that no precedent had been worked out that could throw any light on the subject so far as the laboratory was involved. The experi-

menter was left pretty much to his own resources, to the alternative of blindly guessing at the matter or expensive investigation of the desirability of every gas which it was proposed to work.

"Early development along similar general lines was carried out in southern New York and in Pennsylvania at three or four different points and at Sisterville, W. Va. In each of these localities the pioneers seeking to develop the industry were peculiarly favored with those physical field environments that contribute most effectively to easy and assured success in an undertaking. The age of the wells, the general favorable formation of the producing strata, the character of the oil and gas product and in all but one or two instances the prior application of gas pumping or vacuum treatment of the wells to increase oil production constituted a generally very favorable situation to take hold of for easy solution. It is particularly worthy of mention that in the Sisterville district in West Virginia, the accumulation of "drip" formation of a good grade of gasolene was so persistent as to demand attention of operators and to indicate so plainly further possibilities as to make the assumption unmistakable of greater possibilities for only slight application of any means which would further favor the natural tendency of the heavy gases to condense.

"In confirmation of these conclusions there is at present one well on a lot almost in the heart of Sisterville which is being operated for its gasolene product in a most desirable and profitable manner. A gas pump sustaining $27\frac{1}{2}$ points, or inches mercury vacuum, devotes its entire attention to the one well. The same engine that drives the gas pump also drives a small single stage compressor which compresses the gas to 75 pounds per square inch. With a very simple set of water cooled condensing coils and separating traps, the entire gas product from this well is condensable into gasolene of about 90 degrees Beaume. The output is approximately one drum of 50 gallons daily.

Recent information is to the effect that in one of the favored localities of Pennsylvania some wells are producing in excess of $1\frac{1}{4}$ barrels of condensate daily, by the application of gas pump treatment alone, in which only a very few pounds condensing pressures are employed.

"These rare exceptions, however, are only indicative of the plainly laid leads of nature for the guidance of the experimenter to the results which are so plainly possible. They do not, to any considerable degree, indicate the possibilities of production on the large scale or to the extent which will eventually prevail. These leads, however, offered the suggestions which led to the conception of the ultimate possibilities and the breadth of the industry.

"Through their development, they suggested not only that the heavy gases treated contained a considerable series of hydro-

carbons, which were held in a state of mechanical suspension, and were reducible to liquid approximating commercial gasolene, but that they carried a still further heavy series that were reducible also to liquid, which, if not recognizable as commercial gasolene, is plainly recognizable as a similar light condensate, having a commercial value comparable to the most desirable light refinery products which it has heretofore been possible to produce. . . .

"Many discussions have arisen over the carrying capacity in gallons per 1,000 feet of gasolene in gas. Many of the natural gas condensates approximate in volume, weight, or specific gravity, those same characteristics for liquid butane. Butane is either liquid or gas as temperature and pressure conditions may depend.

"As a gas it weighs almost exactly twice as much as the same volume of air. As a liquid, it weighs almost exactly (a little over) five pounds per gallon. Air weighs at sea level pressure and zero Fahrenheit temperature, 86 pounds per 1,000 cubic feet. Isn't it as easy as a row of pins to see that 1,000 feet of butane would produce about 34 gallons of 'gasolene'?"

"Then when the specific gravity of a gas runs up in the neighborhood of one and a half as referred to air we may easily suspect that more than $3\frac{1}{2}$ gallons of condensate can be recovered from it. However, it is not common practice on the part of the analyst to estimate the maximum apparent value of samples.

"The simplest form of equipment yet of a compressor, cooling or condensing employed in the process combines the use coils, separating traps and final means of resistance, such as a spring relief valve used to maintain the head pressure against which the compressor and the condensing system is made to work. Quite a few variations in the form of condensing appliances have been tried, but the above description covers the basic functions of operation involved and on which the success of any operation must primarily depend.

"More extended temperature reduction than is possible with the mean surrounding temperatures of air or water may be obtained by allowing the discharge gas at the end of the condensing process to rapidly expand to a lower pressure and greater volume, in contact with radiating surfaces containing the compressed gas. This method has been pretty generally adopted by those who have been most active in the advancement of the industry.

"While the total volume of the natural condensate available for use is going to be small, comparatively," he says in conclusion, "the fact that it brings back into available place at least its own volume of unavailable refinery product must not be overlooked. As a result the motor consumer may hope to breathe freely for one or two more seasons before his purse must eventually feel the final call to meet the inevitable shortage."

Bergdoll Sets New Marks for Fairmount Park

Philadelphian Bears Out the Promise He Displayed in Last Year's Race and Triumphs in Superb Style—"Lost" Mechanics Lead to Protests and Transfer Second Honors from Wishart to Mulford—Immense Crowd Views Well Managed Contest.

THE SCENE WHEN BERGDOLL FLASHED ACROSS THE LINE A VICTOR

Erwin R. Bergdoll is a Philadelphian but he certainly knows how to "get a gait on." On Monday, 9th inst., he struck a gait that was faster than the natives of that Pennsylvania city ever had seen. A little better than 61 miles an hour he made in the fourth annual running of the Fairmount Park race, and he won the big car class by a comfortable margin. He covered the 202½ miles—25 laps of the 8.1 miles Park course—with the same Benz he drove last year, in 198 minutes and 41⅓ seconds.

As a matter of fact he had no contestants in his class after the third round. Lee "Oldfield's" Fiat was withdrawn before the race because in practice the expressed displeasure of the crowds hurt his feelings, it is said, and J. Fred. Betz, in the other Fiat, retired soon after the second lap with a broken connecting rod. The drivers in the other classes, however, gave Bergdoll all the race he was looking for. But he liked it. He not only broke the record for the journey, which stood at 3:29:07.88 and was made last year by Len Zengle with a Chadwick, but he also twice lowered the record for a lap, and just to show that it was not a fluke he later equaled his own record lap time. Before Bergdoll started on Monday, Ray Harroun held the lap record of 7:38 with a Marmon, and he made it last year. But Bergdoll broke this easily in his very first round; his time was 7:34. It was in the second lap that he broke his newly established record. Seven minutes and 28 seconds is the record now and it figures out at 65.09 miles an hour.

Spencer Wishart, who is reputed to be

wealthy, and who is called an amateur because he drives automobiles for the fun of the thing, made the next best time with his Mercedes, though later he was disqualified because his mechanic was not fast enough and he left him behind for part of a lap. His time was 3:20:11.42, which is just a little over a minute and 41 seconds

ERWIN BERGDOLL'S \$3,500 SMILE

faster than Ralph Mulford drove his Lozier, and as he, Mulford, was the next man to finish, he was pronounced the winner and given the \$1,000 prize offered to the one who beat all the rest in the class, which was for cars of from 451 to 600 inches.

The race this year was four races within itself, instead of five, as was the case last year. The race for cars in the "baby" class—161-230 inches—was dropped. One thousand dollars was the prize in each of

the four divisions, with \$2,500 added for the one who made the fastest time regardless of class. The winners in the respective divisions and their times were as follows:

Division 6C—601-750 inches.	
Erwin Bergdoll, Benz.....	3:18:41.35
Division 5C—451-600 inches.	
Ralph Mulford, Lozier.....	3:21:52.78
Division 4C—301-450 inches.	
Louis Disbrow, National.....	3:28:22.32
Division 3C—231-300 inches.	
Hughie Hughes, Mercer.....	3:29:45.30

The race itself is decidedly different from any other. In the first place it is the only one in the East in which municipal authorities take an active hand. Nominally the Quaker City Motor Club is the promoter, but the City of Philadelphia keeps a watchful eye over proceedings, for the biggest portion of the "gate" receipts goes to Philadelphia charities. In the second place, it is run in a public park. The biggest part of the 8.1 miles course is in Fairmount Park, and it is notoriously the most tortuous over which races are held.

That it was lightning fast on Monday was evidenced by the fact that the average speed was increased from 58 miles an hour to 61. Opinions differed regarding the condition of the course on Saturday, which was the day the race originally was scheduled to occur, and because of this a new record of another kind was established. For the first time since the Fairmount Park race was inaugurated four years ago, a postponement was declared. Rain on Friday night had soaked the roads, and after

a hurried trip over the course the officials decided not to take a chance and the crowds were sent home disgruntled, to return on Monday—provided it was clear. After it had been decided to postpone the race, several of the drivers, including De Palma, Disbrow, Hughes, Wishart and Basle, went over the course in a touring car, and expressed great dissatisfaction over the decision. In their opinion the race could have been held safely if it had merely been postponed for an hour or so, and they expressed their disapproval in no uncertain terms.

It was to no avail, however, and there was nothing for the crowds to do but to go home and think up new excuses to get another day off so that they could use their "rain checks." And there was a really tremendous crowd there, too. One New Yorker who was present remarked that there were more automobiles to the square inch in Philadelphia on Saturday than he

had ever seen before, and he ought to know for there are more than a few in New York. Even though the race was not

scheduled to start until noon, the course was lined by daylight, and still they came. Special trolleys and special trains dumped

urter.

load after load of sightseers beside the course and returned for more. Long before the postponement was announced

there was a very substantial fringe of spectators leaning on the ropes that guarded the course, and the best part of it was that

they practically all came back on Monday.

"Must be a lot of persons out of work in Phillie," casually remarked one of the spectators as he gazed at the solid phalanx along the ropes. But they were pretty cheerful people, for the grounds looked as if a big picnic was in progress. Everywhere lunch baskets were in evidence and the number of Thermos bottles that were emptied was a caution. For the most part the bottles contained hot stuff—that is to say "hot" because at one time it had been in proximity to a fire—and it must have touched the right spot, for though the sun was shining brightly the air was chilly and winter overcoats were the rule rather than the exception.

At the main grandstand—there were several others along the course—there was considerable activity from early morning till after the last car had been flagged. Preparations had to be made and an army of mechanics, officials, judges, timers

WHERE WISHART (MERCEDES) OVERTOOK GRANT (LOZIER)

and police made them. The police, by the way, was not a crowd of 'rookies' sworn in for the occasion and garbed in civilians' clothes and long clubs. It was the police of the City of Philadelphia, reinforced by the Pennsylvania State "rangers," and the way they performed their duties in keeping the crowds in check was a marvel. No one dared to doubt the majesty of the law—particularly when it was being enforced by a body of men whose average height was in the neighborhood of six feet—and no-

Gordon Bergdoll's Bergdoll, were scratched at the last minute, the Fiat because it just broke "Oldfield's" heart to have the crowds jeer him, and the Bergdoll because it could not be gotten ready in time. In Wagner's most approved style, Gantert slapped Zengle on the back promptly at high noon and he rushed away and disappeared around the first bend and the race was on. The rest of them were started at 20 second intervals, the order of start being as follows:

BERGDOLL ALONE IN HIS GLORY BUT GOING GREAT GUNS

body was naughty; they all "stayed put" and of course nobody was hurt. The Fairmount Park race has established quite a record in this respect, too. Never has any one been hurt badly enough to prevent him carrying on his regular duties afterwards. There have been a few bad spills, it is true, and there was one on Monday, but those concerned always have escaped with minor cuts and bruises. But in no case was the trouble the result of inefficiency on the part of the police.

As was the case last year, G. Hilton Gantert officiated at the start, though there was a fine young mix-up for a few days previous and nobody knew who was going to send the cars away. Fred. Wagner, who has started every other race of importance ever since any one can remember, was on hand with his paraphernalia, but Gantert was determined to show that he could wave a flag as well as Wagner ever did, so "Wag" let him have his way. At first he was intent on insisting on his "rights" as the A. A. A. official starter—whatever they may be—but according to his own statement, he "found so much personal opposition to himself" that he decided that discretion was the better part of valor and thereby lost one of the fat fees to which the A. A. A. has given him a monopoly. So Gantert waved the flags and struck just as many outre attitudes as Wagner and waved his arms in the same way.

This year there were only 16 starters as against 32 last year. Of the 18 that were entered, two, Lee "Oldfield's" Fiat and

The smoke of the last car to leave scarcely had floated away on the still air before the inevitable "Car coming" was voiced by the grandstandees, and Zengle tore down the stretch, his time for the lap being 7 minutes and 41 seconds. He was closely followed by Mulford and "Charlie" Basle, both of them giving promise of great things to come. And then another car flashed into view. According to the order of start it should have been Don Herr and his blue National, but it was not. It was Bergdoll, driving his Benz like a demon. He had started eighth, but in the single lap had passed three cars—a certain indication of what he intended to do, provided his car held together and stayed on the track. In point of time he was first, of course, having made the lap in faster time than any of the others, but that signified little to those in the grandstand, who wanted to see him first in position as well.

And very soon he was first in position, as well as in time. He caught and passed Mulford in the fifth lap—but not until Mulford had caught him and led the race for a couple of laps—and from then on to the 16th lap he gradually increased his lead until there was about two minutes between them. Then he had to stop for tires and gas and oil, and the balance of two minutes swung over to Mulford, who was driving his Lozier for all there was in it and taking desperate chances on the turns. Drive as he would, however, he could not maintain his lead, and he had to be content to see Bergdoll slowly but surely

creeping up on him. Bergdoll caught up in the 19th lap, because Mulford, too, had had to change a tire, and then he gradually slipped away from the blond New Yorker and was not headed to the finish, crossing the finish line fully 1 minute and 30.07 seconds ahead of Wishart, and 3 minute 11.43 seconds in front of Mulford.

But in the meantime things had been happening to the others. J. Fred Betz 3d, on whom Philadelphians had pinned a big

share of their faith, went out in the second lap because a connecting rod in his Fiat snapped. He was going well when it happened and gave promise of being "in the money" at the finish. Spencer Wishart, Mulford and Harry Grant had been having a great little battle between themselves. Wishart led the trio up to the ninth lap, when Mulford passed him by a narrow margin and led up to the 19th lap, when Wishart regained his lead and held it till the end. From the third lap to the 14th Willie Wallace (Mercedes) and Grant both led Zengle, but he had been coming fast and at the beginning of the 15th lap he caught them and assumed third place in the class division until the 20th lap, when he had to make a brief stop, and Grant took

Wishart in turn protested that Mulford had driven part of a lap without a mechanic, because in rounding a turn Mulford's man was catapulted out of his seat onto a pile of brush. But it was proven that Mulford went back after his mechanic and therefore had a man beside him during the whole of the race, and accordingly can scarcely be subject to official punishment.

Wishart stated his intention of appealing to the contest board of the A. A. A. against the decision of the referee, which was upheld by the contest committee of the Quaker City Motor Club, claiming that the disqualification was based on a trifling technicality; that he did not know for several seconds that his mechanic was not on the car, and that, when he finally missed him,

is nothing in the rules forbidding looking back, at times when the driver is alone in the car.

To Louis Disbrow, who drove the National which Koopman was supposed to have driven and who won in the 301-450 class, belongs the credit of having made the most consistent score. The greatest time between his fastest lap, which was the 12th, and his slowest, which was the 17th, was 1 minute and 44 seconds. He simply walked away from Anderson in the Stutz and Herr in the other National, until at the end he had opened up a gap of a little over 12 minutes between himself and the other two. The greatest race of this division was between Herr and Anderson. Herr led by the comfortable margin of nearly

PHILADELPHIA'S "ANTI-TRUST" STARTER GIVING THE CHECKFRED FLAG TO WISHART

up his place, Wallace having dropped away back till he was some 30 minutes behind the others.

Grant's lead, however, was brief, for in the next lap Zengle caught up with him and passed him. It was during this part of the race that "Spence" Wishart, as he affectionately is styled, gave the most spectacular exhibition of dare-devil driving that the Quaker City natives ever have seen. From the 18th lap, when he regained his lead from Mulford, he drove like a wild man. Dangerous curves held no terrors for him; he slewed around them at speeds estimated at 50 to 55 miles an hour, and once he went around a little faster. And that was the cause of his downfall. He ripped off a tire and had to stop and put on a new one. That was all right and it only took a fraction of a minute and Wishart was back in his seat, but the mechanic, oh, where was he? He was still tightening the rim, but Wishart decided to "open up," and open up he did, with the result that the mechanic was left to contemplate thin air. Wishart stopped at the pits and got another, but it sufficed him nothing, for Mulford protested that he had driven a part of a lap without a "helper," and the protest was upheld.

the rules prohibited him from looking back. Inquiry at the office of the A. A. A. on Wednesday resulted in the statement of one of the officials, that no appeal as yet had been received and that in his opinion there was no ground for appeal, as there

five minutes up to the very last lap, when he was forced to stop for tires and for gasoline and oil, and when he was able to get going again his lead was gone. In fact he was a little behind Anderson, who crossed the finish line just 10.82 seconds ahead of him.

"SHAKE I" SAYS MULFORD TO ZENGLE

To use a colloquialism, Hughie Hughes, with his Mercer, "had a cinch" in the light car class. He took the lead at the start and never was headed. As was to be expected, Ralph De Palma, who was his teammate and who took the place of Harvey Ringler, who had been injured several days before, was his most dangerous competitor. He ran second right up to the 22d lap, when engine trouble forced him out. In spite of previous troubles, not the least of which had to do with his tires, he came dangerously near to leading Hughes on several occasions. For instance, in the 10th lap he was only 0.07 seconds behind, and from then till the 12th lap he gradually gained till there was only the one-hundredth part of a second between the two Mercers. Thereafter, however, he dropped back and Hughes maintained the lead unchallenged.

George Matthews (Ohio), who finished second in point of elapsed time, was near-

ly 32 minutes behind Hughes when the race was called, but still was running well. Parker in the other Ohio also was well behind his team mate, and though his car was pounding along at a great rate he had only covered 20 laps when Hughes was given the checkered flag and the race was called. Joe Jagersberger in his snub-nosed Case ran well while he did run, and held third place up to the 15th lap, when he ran into a telegraph pole and had to retire. His mechanic was sent flying out when he struck the pole, but Jagersberger stayed in his seat until the car was stopped. Then he jumped out and, after frantically "winding her up," scrambled in alongside of his mechanic, who was unhurt and who hopped aboard and started off again down the course, leaving a trail of smoke that would have done credit to an ocean liner. But he only got as far as the repair pits, when he discovered that the car was too badly wrenched to be driven with safety, and it was withdrawn.

Charles Basle, who made his debut at the wheel of a Cole "30-40," was unlucky at the start. He got away well and ran consistently until the sixth lap, when his carburettor went back on him and he had to quit. It had been giving trouble for some time and in consequence he was unable to make the showing that was expected of him.

From the trade point of view the race was largely a Bosch-Michelin triumph. Of the 16 cars that started, just half of them were sparked by Bosch magnetos, while 93 per cent. of them were equipped with Bosch plugs. Of the various class winners 75 per cent. were equipped with Bosch magnetos and every one of them used Bosch plugs. Disbrow's National was equipped with a Splitdorf magneto. All of the winners were shod with Michelin tires, as were the winners of second and third places in the 451-600 inch class.

When the Fairmount Park race first was run in 1908, "Smiling" George Robertson led the field home at the wheel of a Locomobile, and his time, which was 4:02:30, was considered pretty fast driving. But the following year he came right back and with a Simplex he won again and lowered his time to 3:38:48½.

The way that Len Zengle drove his Chadwick around the course 25 times in 3:29:07 in winning the contest of last year, also is history, and this year for the fourth time the record for the race has been lowered. Bergdoll's average time per mile throughout the whole of the long grind was 58.8 seconds and his fastest average mile, made in 55.3 seconds, was negotiated in the second lap, when he established the new record of 7 minutes 28 seconds for one lap. Bergdoll started in last year's race and when three minutes in the lead was forced to quit by the breakage of the oil pipe of his Benz. Three other Benzes also started, but all suffered mishaps and none finished. This year there was a different story.

RAIN RUINS OMAHA'S RACE PLANS

Continued Downpour Completely Upsets the Program and Greatly Shortens It—Pearce Wins Twice.

When promoting automobile races in the future the Omaha Motor Club, of Omaha, Neb., first will have to get into the good graces of J. Pluvius, the fellow who controls the heavenly sprinkling can. After postponing the four-day races announced for the 30th ult. to 3d inst. until the 4th to 8th inst. because the speedway was deemed unsafe after three days of continuous rain, they were only able to use the course one day. During the other days J. Pluvius either tilted his can or his work of the preceding day had left the course in such dangerous condition that the officials would not permit it to be used. Three races only were run and these were close contests, which in a manner repaid some of the disappointment. William Pearce, driving a Colby in the 25-mile, free-for-all, captured the Speedway Cup and at the same time made the course in 24 minutes and 52¾ seconds. He also won the 10 miles for cars under 301 inches displacement, and the 10 miles for cars under 231 inches displacement went to Ed Rickenbacher, Firestone-Columbus.

The summary:

Ten miles, class C, under 301 inches displacement—Won by William Pearce (Colby); second, Ed Rickenbacher (Firestone-Columbus); third, William Bruner (Chalmers). Time, 10:09.

Ten miles, class C, under 231 inches displacement—Won by Ed Rickenbacher (Firestone-Columbus); second, Walter Smith (Abbott-Detroit); third, William Bruner (Chalmers). Time, 11:47½.

Twenty-five miles, free-for-all—Won by William Pearce (Colby); second, Ed Rickenbacher (Firestone-Columbus). Time, 24:52¾.

Reckless Driver to Jail for Life.

Alexander Tracey, of Port Huron, Mich., has the unenviable distinction of being the first chauffeur to feel the full severity of the Canadian law in regard to criminal negligence in operating a motor car. He was found guilty and sentenced to life imprisonment. Tracey, on September 4, was driving an automobile through Toronto streets at such a furious rate that he ran into a crowd of people, injuring several, who had to be taken to hospitals. When placed on the stand in his own behalf he claimed that his brake did not work, but witnesses testified that he was intoxicated, or at least that he acted like a drunken man. The Government argued that although no person had actually been killed, this was due solely to Divine Providence, and that insofar as the chauffeur's actions were concerned he

had wantonly menaced human life and deserved the severest punishment. It is expected, however, that he will be pardoned after having served a reasonable term of imprisonment.

Organize New Clubs in Three States.

The Taunton (Mass.) Automobile Association has been organized with these officers: President, Dr. Arthur R. Crandall; vice-president, Frederick Ludlam; secretary-treasurer, Richard Westcoat; directors, the officers, Arthur C. Staples, Frank O. Dean, Dr. Ralph D. Dean, Pardon B. Sanford; representative to the American Automobile Association, Dr. Arthur R. Crandall; representative to the Massachusetts State Automobile Association, William R. Reed. The club will affiliate with the A. A. A.

Twenty motorists of Houghton county, Mich., have formed the Copper Country Automobile Club, with headquarters at Houghton, Mich. The officers are: President, R. Skiff Shelden, Houghton; vice-president, Fred S. Eaton, Calumet; secretary-treasurer, W. D. Calverly, Houghton; directors, the officers, Johnson Vivian, Calumet; John L. Harris, Hancock; H. S. Goodnell, Painesdale; A. F. Heidekamp, Lake Linden.

At its annual meeting last week, the Automobile Club of St. Louis, Mo., elected the following officers to direct its affairs for the ensuing year: President, Roy F. Britton; secretary, James Hagerman, Jr.; treasurer, Edward M. Flesh; directors, Roy F. Britton, Edward M. Flesh, J. Howard Holmes, Alden H. Little, Sam D. Capen, James Hagerman, Jr.; Joseph R. Barroll, Samuel Plant, George J. Tansey.

Motorists of Yazoo county, Miss., have organized the Yazoo County Automobile Association. The officers are: President, R. H. Douthat, Yazoo City; vice-presidents, Dr. S. D. Luce, Benton; Dr. E. G. Parke, Benton; A. S. Gardiner, Yazoo City; Dr. Boyle Seward, Eden; Dr. C. B. Holmes, Silver City; secretary-treasurer, John S. Hord, Yazoo City.

Sportsmanship Gives Prize to Gardham.

In the Buffalo reliability run, September 7-10 last, the prize in the class for touring cars \$1,200-\$1,600 has been awarded to J. W. Gardham, who drove an Everitt. When the technical examinations took place a dispute arose between examiners concerning the three cars finishing in the class and the award was withheld for several days. It was then announced that the prize went to E. G. Gager, who drove a Maxwell, who had the lowest road penalties charged. Gager, however, in a sportsmanlike manner declined the prize, stating that unintentionally he had violated one of the A. A. A. rules and would not take advantage of it. After consideration the Contest Board then awarded the prize to Gardham.

Impediments to General Use of Power Wagons

"It seems to be a habit of the practical mind to try to stretch its own specialty to the solution of every problem it encounters, whether obviously fitted for it or not," declared Hayden Eames, one of the pioneers in electrical vehicle construction and operation, in discussing "Impediments to the General Introduction of Power Wagons" before the Electrical Vehicle Association of America at its second annual convention in New York City, on Tuesday, October 10. "For many years this tendency, directly or indirectly, delayed the work of introduction of power wagons more perhaps than any other. Those most interested in the introduction of the power wagon during those years were engineers," he went on to say in the course of his address.

The "peculiar mental bias" cited in the opening phrase served to focus attention on a search for "engineering solutions" of whatever problems it was possible to define. Attention was correspondingly diverted from any attempt to remove the "true impediments" to power wagon introduction which, during that period were "almost exclusively administrative, and 'psychological' and to a less degree financial."

"While the introduction of the power wagon has made some progress during the period named," Col. Eames continued, "it is still conservative to say that 'the surface has not been scratched.' Power wagon failures are still being reported by people who are trying to use the new machine in the old way; who unconsciously are limiting the capacity of the power wagon by the practices of draught-animal days. . . .

A recent alleged failure of power wagons reported to me was almost as hopeless of cure as though the owner had insisted on putting oat-bins into his machine shop; in fact, the cause of failure was somewhat analagous. It is this that we have to contend with. . . . Unfortunately, it is not only going to be necessary to directly educate owners and prospective users of power wagons, but their employees, even to the drivers, who have in most cases got to modify their points of view and methods before the introduction of power wagons can be expected to be general.

"Like much other labor-saving machinery, especially in the transportation field, the power wagon speeds the men up all along the line. The operators, although much fewer for a given product, have to work harder and faster, but almost invariably obtain their compensation from shorter hours, perhaps not in proportion,

but still to an agreeable extent. The increased speed is the first thing the driver feels. It takes him some little time to find his own advantage.

"A good illustration lies in a story which was told me by an Adams Express agent in Buffalo some eight or nine years ago. At that point and at that time the Adams Express Company had the first really successful installation of electric vehicles. Owing to a poor selection of the size of the vehicles in relation to the routes covered and the service to be done, the station was not as economical as it could have been made, but it was at that time an exceedingly well operated station, and in all probability was at that time, in spite of the above mentioned handicap, delivering express packages more cheaply than it was being done anywhere else in the United States by any means whatever. When the wagons were first introduced, the drivers immediately felt the exactions of the greater speed; they felt themselves 'speeded up,' and they were loud in their denunciations of the whole scheme. They rejoiced in every accident that occurred and took delight in the misfit electrical conditions under which, at first, the vehicles were charged. At the time I speak of, the whole station had changed. The drivers had discovered that instead of being dragged back from the last package on distant routes at a very slow rate by a tired horse, the electric express wagon now 'running light' brought them back at even a faster rate than that at which it had been running during the day. As one of them said to me: 'I can deliver all my packages now, and get home a half hour sooner than I used to.' At that time the express agent offered to buy a new team with brass trimmed harness for any one of the electric wagon operators that would drive it, but it was rejected with scorn.

"All this education takes time, and hardly anybody is addressing himself to try to bring it about.

"Perhaps the commonest of all bad practices is that of applying the power wagon to a delivery route previously operated by a horse wagon of the same size, and limiting it thereto. The difference in the actual cost of operation between a given size of horse wagon and a given size of power wagon is seldom in favor of the latter, and this is true, also, of the first cost of the complete unit. The principal economical virtue of the power wagon lies in its character of labor-saving machine. Under almost all conditions the price of drivers is the largest single item of expense. Taking the station hands into consideration, the

payroll is always the largest single item of expense.

"The problem of the successful user of the power wagon then lies in the question of 'How much goods can I deliver per man per day?' or, 'How much work can I do with a man per day?'

"It does not seem to take an Isaac Newton to realize that if the work of a man operating the new machine is arbitrarily limited to only what he can do with the old, nothing is gained. In all regular delivery systems the problem is not only to lay out the routes to fit the new machines, but to select the machine sizes so that the largest possible machine that can be fully loaded will completely empty itself over a selected route in a man's day's work. This extremely simple mathematical thought seems to be almost incomprehensible to the majority of power wagon users. In some express companies, and others, whose principal business is city transportation, certain routes have become a positive institution, and, although usually originally of an entirely arbitrary selection, are assumed to be as immutable as the value of Pi. . . .

"We are, however, occasionally treated to a refreshing case of independence and directness in the substitution of power wagons for horse service.

"In the fall of 1901, the Adams Express agent in Pittsburg put in service at East Liberty a light electric express wagon, and in doing so gave instructions to the agent at that point, against the latter's protest, that he should 'lay off all four of his horse wagons, and do his work with the electric,' that he (the Pittsburg agent) would decide later whether he would allow him any of the horse wagons back or not.

"This was certainly 'taking the bull by the horns'; but, as the East Liberty agent's 'job' was at stake, the result justified the risk, and only one wagon of the four was put back into service, and that only as an 'extra.' Of course, the intention of this 'barn-yard' approach could easily have been defeated had the size and speed of the wagon been unsuitable to the particular service to be performed.

"A good example of what it means to 'speed up,' not only the operators, but the daily routine and methods, is afforded by the ordinary practices of our great express companies when horses were a rule with them.

"I have before me a careful plotting of ten established routes of different express companies in New York City made in the spring of 1902. You will probably be surprised to discover that from the time the

horses left the barn in the morning until they got back at night, the teams were standing still 40.4 per cent. of the time, the maximum idleness on any one route being 64.25 per cent., the minimum 27.25 per cent. At least 50 per cent. of this is due to the fact that the gait of the man matched the gait of the horse. The draft animal belongs to a slow age, and the man who drove him as a rule adapted himself to it.

"If any one is in doubt as to the reality of this effect, let him observe the Egyptian plowman with his water buffalo. The ordinary plowman is slow enough, but the Egyptian's movements suggest the chameleon. The ordinary draft animal operator grades up from this on the way to the operators of machines. But the accessory facilities have also been accommodated to the draft animal, and are, correspondingly, impeding its successor. The methods of loading and unloading and of handling packages, the shipping room arrangements and routine, and even the unnecessary time (assumed to be necessary), even with the existing facilities, are all adapted to the gait set by the horse, and all tend to deprive the machine owner of his advantage; and, remember, these speeds are not set to what the horse can do or necessarily actually does, but what he may do. Long practice has sub-consciously led to their adjustment to the uncertainties of the horse in spite of the goad of competition. . . . Those who have been through the experience cannot fail to recall the immediate effect of the use of the power wagon toward remedying this condition. The difficulty is to get the first one purchased and properly used. . . .

"The reality of the impediment which present handling facilities interposes to the introduction of power wagons can be illustrated by a case I once came across of a high grade dry goods company in one of our largest cities, whose installation of electric vehicles could not be made to pay. Examination developed the fact that no effort was made to crate or handle the packages in the waiting room with any reference whatever to the respective routes upon which they were to be delivered, and that the routes were laid out with equal disregard to the shortest possibly empty haul; following their practice with draft animals, the wagons were driven to the opening points of the routes, and, extraordinary as it may seem, the packages were all taken out of the wagons and spread along the beds of grass between the curb and sidewalk. Some of the wagons carried one boy, and some two boys—each with a large canvas bag. Each boy pawed over the pile of packages and selected and put in his bag the packages belonging to the block that he was to cover, and those that were left the driver took back into the wagon and drove to the point at which the boys were respectively expected to 'finish their bags.' Rather than this, the firm

should have abolished its entire wagon system and employed boys with bags to carry the packages to the destinations on public trolley cars. . . .

"Many of these requirements could be made to improve the horse service if the horse himself had the endurance to stand it—a point that is frequently overlooked. As has often been said, there is no wattmeter on the horse, and, in consequence, he is generally worked more or less beyond his normal capacity, the loads and routes being more or less subconsciously selected to that end. To save this loading time, therefore, means to cut down the horse's rest, without which he cannot do the work assigned him, but the power wagon needs no rest in the same sense, and it is a large enough investment to make it desirable to conserve this time.

"In considering this general question of reducing delays and loading times, it is often overlooked that the day's mileage is a rough measure of the work performed by a unit in a given service. An hour's delay on a five-ton truck, averaging say two and a half miles an hour, may be a large percentage of a day's work in that unit, but measured in dollars it represents only a third of the loss represented by a similar period of idleness in a five-ton power wagon whose average running speed is seven and a half miles per hour.

"It is very hard to persuade the average user that the idle periods in the day's work in any way affect a comparison of the draft animal and power wagon. The reactionary effect of external conditions goes deeper, and is far more nearly universal than the mere lack of facilities in individual establishments. For example:

"The dimensions of many of the downtown alleys in Chicago put a definite limit on the truck dimensions that can be used therein, and nearly all trucks working in that part of the city load or unload in the alleys. The peculiar arrangement of the railroad freight yards in Chicago curtails the efficiency of all methods of highway transportation to such a degree as to greatly dwarf the question of their relative advantages. Those who have investigated this particular case closely state that it is no exception to the rules, that the conditions can be perfectly well met by a rearrangement of these yards with direct reference to the use of automobiles with a probable improvement of 150 or 200 per cent. in their loading and unloading capacity. It is reported that the railroads themselves are alive to the situation, and are approaching the solution in a more or less dilatory manner with an entire ignorance of the expert knowledge that is available on this subject in the automobile field.

"There are many analogous cases throughout the country; many of them can probably be partially met by special portable loading apparatus of one kind or another applied to the trucks themselves. Next to the increase of factor of safety

in operating cost to be obtained by improvement in tire maintenance on the heavier trucks, there is perhaps no single field in which the designing engineer, strictly so-called, could play as large a part in developing this business as right in this field of portable loading apparatus and the design of trucks with reference to special service. This is one of the few departments of automobile knowledge in which there is anything yet to be learned from draft animal practice, or, rather from the practices that existed during the draft animal period. . . .

"There are, of course, many minor considerations which tend to retard power wagon introduction, and some of them are of a very isolated character. For example: One user of electric livery wagons in New York still uses many horses, and he probably will as long as there is a sale for high grade coach horses, because he raises them and uses his wagons to break them in. This particular firm needs no instructions from anybody. They are as well informed on the economy of delivery, and as well organized, and as unprejudiced, as any wagon user we have come in contact with.

"Then there is always the reactionary or interested delivery manager. I have in mind a case where electric trucks came to grief very largely, but not entirely, because the man in charge of them received a personal compensation for every horse wagon he was obliged to employ in excess of the electric installation. As a result of this situation an electric truck averaging about seven and a half miles an hour round trip by cyclometer, found itself unable to deliver any more goods per day than a horse vehicle of the same capacity averaging two and a half miles per hour round trip by cyclometer. Whenever, as in this case, it looks as though the laws of nature were suspended to the detriment of the power wagon, it is a pretty certain indication that something of this kind is to be looked for. But apart from these minor, but almost universal, considerations, which occur in endless variety, the principal obstacles will be found to be practically limited to those discussed more at length in the above paper."

When Connecting Brake to a Pedal.

The practice of connecting the brakes to a pedal or to the emergency brake lever by means of wire cables is by no means uncommon, but while it is claimed that the system permits positive equalization of the brakes, this is so only when both cables run over equally easy working pulleys. If one pulley sticks, or if one end of the rod to which the cables are attached does not work freely in its slot, a greater strain will be imparted to one brake shoe than to the other. Care should be taken to see that all parts of the brake mechanism work freely and do not lack lubrication, especially in those cases where the cables are placed in tubes.

OVERLAND'S VARIED OFFERINGS

Wide Latitude Afforded Purchasers by New Line—New Bodies and Many Notable Refinements of Details.

Motorists and those coveting the distinction which membership in that class entails who contemplate making selection from the new Overland line are likely at first to encounter no small bewilderment. The advantages of buying that particular make of automobile may not be difficult to understand, but the actual choice of one of nearly a dozen models, all of which look as like as so many peas and are as nearly

the maximum of \$2,000 down to \$850, and in powers of 25 to 45 horse, according to the purpose of the machine. Furthermore, the new line is even more nearly uniform in general design than the present one, such differences as heretofore have existed having been eliminated in one way or another.

Four chassis models are now produced, which are distinguished by the numerals 61, 60, 59 and 58. Three of them correspond to former models, though modified in numerous details, while the fourth, model 59, has the cylinder bore of the old models 50 and 51, but otherwise is new. With one exception all models now are equipped with three-speed selective change gear mechanisms, but in deference to its

comb radiator, which is of more efficient construction, an improved clutch brake, in which the clutch cone on its withdrawal comes in contact with a revolving disk instead of a fixed one, as formerly, and which therefore wears uniformly, a bar connecting and stiffening the lamp brackets, such as was used on the old models 52, 53 and 54, are features common to the three larger chassis of the new line. The clutch brake particularly is a noteworthy improvement, inasmuch as the former device tended to wear a groove in the face of the disk through continual rubbing during the gear-changing operation.

The engine of the new large car has been increased in power from 40 to 45 horse, through the increase of the cylinder bore

OVERLAND INSIDE DRIVEN COUPE AT \$2,000 AND THE \$1,500 45 HORSEPOWER TOURING CAR

SUMMARY OF THE OVERLAND NEW MODELS, SHOWING THEIR ESSENTIAL DIFFERENCES

Model No.	Type.	Pas. Cap.	H. P.	Cylinder Dim's'n's.	Oiling System.	Magneto.	Clutch.	Change Gear.	Brake Sizes.	Rear Springs.	Wheel Base.	Tire Sizes.	Price.

alike—saving only in size and power—as skilled industry can make them, seems difficult at the outset. Closer investigation, however, reveals the fact that the development of the Willys-Overland Co., of Toledo, O., builder of the Overland line, has reached a point where that great and growing concern is able to offer practically equivalent products graded through easy steps to fit the requirement of the individual just to a Tee.

Through a careful process of refinement and selection it has been found possible to improve the new line and also to reduce it to its lowest terms, so to speak, by eliminating needless multiplications. Thus the product which will seek the market in 1912 will number but ten distinct models, as against 13 in the line immediately preceding it. At the same time the same general variety is preserved, including cars of two, three, four and five passenger capacity, in roadster, torpedo, standard touring and coupe forms, at prices which range from

recognized advantages the pedal-operated planetary system which has been an Overland characteristic in former years is retained on the smallest model, which is a two-passenger roadster.

The large chassis, which is of 45 horsepower and equipped with a 4 $\frac{3}{8}$ x4 $\frac{1}{2}$ -inch four-cylinder motor, is developed as a five-passenger touring, four-passenger torpedo, two-passenger torpedo roadster and four-passenger, inside-driven coupe. In the open patterns it sells for \$1,500, which is \$100 less than was asked for the previous corresponding models 52, 53 and 54. The coupe, which is an entirely new creation and fashioned after the popular design of the Sedan body, lists at \$2,000.

As compared with the previous corresponding models the new features which are embodied in the 61 chassis may be summarized briefly as follows:

Stronger wheels, having very wide hub flanges, with 12 bolts in front and 18 bolts in the rear members, a new-style honey-

comb radiator, which is of more efficient construction, an improved clutch brake, in which the clutch cone on its withdrawal comes in contact with a revolving disk instead of a fixed one, as formerly, and which therefore wears uniformly, a bar connecting and stiffening the lamp brackets, such as was used on the old models 52, 53 and 54, are features common to the three larger chassis of the new line. The clutch brake particularly is a noteworthy improvement, inasmuch as the former device tended to wear a groove in the face of the disk through continual rubbing during the gear-changing operation.

In connection with the new rear axle equipment, which is of the full-floating pattern and, like the front axle, Timken roller bearing mounted, though still embodying the change gear mechanism in a single unit, larger brakes have been adopted. The drums now are 14 inches in diameter, instead of 12 inches, and the brakes have 2 $\frac{1}{2}$ -inch faces, instead of only 1 $\frac{1}{4}$ inches, as before. The brakes are of the external-

THE TWO NEW OVERLAND TORPEDO ROADSTER MODELS—45 HORSEPOWER AND 25 HORSEPOWER

internal patterns and applied in the usual manner, namely by foot pedal for the service set and lever for emergency control.

which are tool storage compartments and a cradle for mounting the gas tank, which is a regular equipment. These two models

Increased horsepower in the case of the 60 chassis has been obtained by enlarging the cylinder bore from 4 inches to $4\frac{1}{2}$

COMBINATION CROSS FRAME MEMBER

They are equalized by a new system and have a simple form of local adjustment.

An improved muffler cut-out, grease cups on the spring shackles, instead of oilers; front and rear aprons and nickel plated trimmings are other improvements that apply to all four of the 45-horsepower

BRAKE ADJUSTMENTS ON MODEL 61

models, while in addition the touring and torpedo types have steel running boards with boxes below the tread surface, in

45 HORSEPOWER OVERLAND CHASSIS

also have rear fender irons that are integral with the body and tire irons attached to the rear seat and rear frame.

COMBINED TOOL AND GAS TANK BOX

inches, the stroke remaining $4\frac{1}{2}$ inches. Enclosed valve stems are an innovation, while another innovation is an oil pump mounted in the engine base and serving the constant-level splash system in the crank case, which replaces the former external

VALVE SIDE OF "61" MOTOR

force-feed lubricator in the T and F models. Center mounting of the control set is another innovation, common also to models

THE \$900 30 HORSEPOWER OVERLAND TOURING CAR AND THE 35 HORSEPOWER CAR AT \$1,200

59-T, R and C, while the change gear mechanism has been improved in certain details. Timken front axle bearings, grease cups on the spring shackles, rear fenders fastened to irons integral with the body, are other improvements. This chassis model is produced in five-passenger touring and four-passenger torpedo forms only and sells for \$1,200.

Model 59, which sells for \$900 whether equipped as a five-passenger touring car or a two-passenger torpedo roadster, has a 4x4½-inch motor, which in general is of the same design as the two larger engines, the improved clutch brake, center gear control and several other of the refinements which have been introduced in the larger models. It is rated at 30 horsepower, has 32x3½-inch tires, front and rear, and the same style of equipment as the other models. To meet the special requirement of motorists who require an enclosed car of smaller proportions and lower cost than the 61-C coupe, it also is produced in the form of a three-passenger inside-driven car built along lines closely similar to those of the more powerful machine and remarkably complete for the price asked, which is \$1,250.

The smallest member of the line, the 25 horsepower model 58-R torpedo roadster, which sells for \$850, is much the same as the corresponding offering of last year, though improved in such minor details as the addition of a tool box on the rear deck and removable running boards. In respect to body design, it has the new standard lines and by no means "looks" the part of the little car, which its price would seem to imply. In fact it is in many respects the most striking member of the line, price and power considered.

In the matter of equipment the same sort of standards obtain that prevail in the general construction of the entire line. Tops, windshields and other fittings are listed as extras, but the regular equipment of each member of the line is ample for all ordinary running conditions. It includes three oil and two gas lamps, together with the generator—or, in the case of the 61 models already mentioned, gas tanks, as well as the horn and full set of tools. Magnetos are standard equipment for the entire line, the installation being supplemented by batteries to form a dual system in each case. On models 61 Bosch equipment is employed, Remy magnetos being applied to the two models 60 and Splittorf to the 59 and 58 models, respectively.

Tapping That Loosens Carbon Deposit.

It is well occasionally to tap the exhaust pipe lightly while the engine is running in order to loosen incrustations of carbon deposit which form and partially obstruct the pipe. For this purpose a very light hammer should be used as there is grave danger of cracking the pipe unless great care is taken.

Price Lowered on Hi-Up Dry Cell.

Solely by reason of their price, the Hi-Up dry batteries made by the Manhattan Electrical Supply Co., of New York City, have heretofore not enjoyed as wide a use in motor car service as their unusual amperage and voltage otherwise would warrant, but because of the results they have shown even in a limited application to automobiles, the company has made a modification in the prices that is calculated to popularize their use. Although the Hi-Up name will be continued, the price no longer will accord with the name, and the 2½x6¾ size will sell in quantities less than one dozen at 35 cents each. It is claimed for the battery that it will register from 15 to 20 per cent. higher in amperage than the standard types of dry cells, and that it is superior in endurance work and quick recuperative power. Like the Red Seal batteries, which the company also makes, it is furnished in either round or square cartons, as desired, though the square carton is most used and is the shape which is recommended most strongly.

Paper as Substitute for Lamp Lenses.

In case of either of the lenses of a tail lamp being broken it should be remembered that inasmuch as there is little or no draft on them a temporary repair often may be made with a sheet of fairly tough transparent paper. Incidentally, two thicknesses of waxed paper wired in place in front of a broken headlight lens have been known to hold at speeds up to 20 miles an hour.

Rambler

1912—Cross Country—\$1650

IT'S 38 horse-power, five-passenger, with 120-inch wheel base and 36 x 4-inch wheels and tires. *It's long, it's low, it's roomy.* Low, with drop frame—long, with front axle set forward and straight line torpedo body. Roomy, with 27 inches from front seat to dash and 30 inches from seat to seat in tonneau. No outside door latches. Enclosed ventilated front and hooded dash. A car of exceeding beauty, finished in English Purple Lake—it's a rare shade of deep maroon—trimmed in nickel. Radiator to conform to body lines, high and distinctive in appearance. Fenders with sweeping grace. Powerful brakes. To drive this car is exhilarating. It runs like a spirited horse. You touch the throttle and it's away. It's the Rambler Cross Country and the flag-bearer for 1912.

Equipment, Bosch magneto. Fine, large, black and nickel headlights with Prest-o-lite tank. Black and nickel side and tail oil lamps; large tool box; tool roll with complete tool outfit. Roomy, folding robe rail; foot rest, jack, pump and tire kit. Top, with envelope, \$30—wind shield \$35. Demountable Wheel, less tire, with brackets and tools, \$30. Eveready automatic engine starter \$175.

The Dash and the Various "Fixings" Thereon

Perhaps there is no better evidence—visible, at least—of the simplicity which at present is the keynote of automobile design than the dash boards of modern cars. No more are they cluttered with miscellaneous adjuncts, necessary or unnecessary. The driver's attention is required only for driving and he is sure that things are as they should be, for the good and sufficient reason that they are made right and are automatically operated. No longer

estimation of the average owner. Of course, there are those "sporty" individuals who hanker for something that looks hard to manage, whether it is or not, and to them a clean dash is an eyesore; there number is small, however; the great majority desires simplicity.

And now they have Simplicity with a capital S and it is easy to see that only greatly improved designing and manufacturing methods made possible the clearing

tates a stretch to manipulate it, or a kick which endangers the paint work. Several cars, including the Lozier, the S. G. V. and others, have the ignition switch on the steering column and that is its best location. In the Lozier it is just below the wheel on the column, and on the S. G. V., in which fixed ignition without batteries is used, it is a tiny button on the top of the column in the center of the steering wheel; its only function in the latter case is to short circuit the magneto to stop the engine.

Of course, with dual ignition systems in which the battery coil and transformer are enclosed in a casing to which the switch is attached, the logical place for the ensemble is on the dash. In some the cylindrical coil casing is affixed vertically on the dash and carries the switch on its side. On other, the switch is at the end of the casing, in which case the coil and transformer are behind the dash, the switch alone projecting through and being visible. Such an arrangement is shown in Fig. 2, which depicts a Stevens-Duryea dash. The simplicity of the arrangement is at once apparent. The same disposition of coil and switches is illustrated in Fig. 6, in which the Oldsmobile dash is shown. In Fig. 7, which shows a Stoddard-Dayton dash, the arrangement is slightly different, the switch coming not on the dash proper, but on the sloping foot board.

Coils of the box type belong on the dash or off it, according to whether they are vibrating or non-vibrating, respectively. Which is to say that as there are no coils of the vibrating type, which do not require attention and adjustment from time to time, they should be easily accessible. The dash therefore suggests itself as being the most appropriate place for them, because they are then instantly accessible for inspection, and also because of the greater facility with which the wires can be led to the engine. Non-vibrating coils on the other hand never require attention unless they burn out, which does not happen frequently. When they do become deranged it seldom is possible to repair them on the road, and because of this and in view of the fact that they contain no moving parts and therefore cannot get out of adjustment they really do not belong on the dash and might just as well be behind it or in some other place.

In Fig. 1, which is illustrative of Lozier construction, is depicted a clever arrangement of a vibrating coil, which is not on the dash and yet which is adjustable from the driver's seat. The coil is carried behind the dash, the tremblers being ad-

FIG. 1—ENCLOSED SPARK COIL ON LOZIER DASH

must be watch lubricators, drip feed or mechanical; ignition long since has ceased to be a source of extreme vexation, coils, even, being relegated to places of obscurity and need not be touched, let alone watched, which was quite necessary not so very long ago. An ignition switch, a single oil sight feed and possibly a gauge to indicate the amount of gasoline or the air pressure in the tank are all he has to worry about and in not a few cases all other things have been expunged and the ignition switch occupies the dash alone.

All of which proves that automobiles are that much better to-day than they were a year or so ago. And they must be better or people will not buy them. Nowadays no one wants a car with a dash board that resembles the boiler front of a locomotive. The less there is on the dash—in the way of permanent fixtures—the better, in the

away of the multitudinous appliances which once were the bane of the motorist's life. But motorists have not yet got all that is coming to them in the way of simplicity of dash equipment. Some day there will be absolutely nothing on the dash. But what is a great deal more likely is that there will not be even a dash to put things on. Dashes are getting smaller every year and it is perfectly reasonable to expect that in the not far distant future they will disappear entirely.

But dashes remain at present and things are affixed to them. Just what legitimately belongs on them is a matter over which there is a wide diversity of opinion. Almost invariably the ignition switch is placed on the dash, though why it should be there is not quite clear. The dash is not the most convenient place for it, from the driver's point of view, as it necessi-

justed by lifting the door, A. In the lower half of the picture the door is shown opened and the coil tremblers, A', can be seen. In Figs. 3 and 4, in which the Matheson and Rambler dashes are shown, respectively, the orthodox arrangement of a four unit vibrating coil is shown. In both of them the ignition switch is carried on the coil box, the Matheson switch being of the "kick" variety and the Rambler being of the usual hand-operated

FIG. 2—UNMARRED STEVENS DASH

type. The non-vibrating coil with which Ohio cars are equipped, is shown in Fig 5, and on this also the switch is placed on the coil box.

One of the most noticeable changes which has been made in dash arrangements within the last few years is the removal

FIG. 3—MATHESON OIL FEED AND PUMP

of cumbersome and unsightly mechanical or drip feed offers, with their multiplicity of oil pipes and adjustments. That the change has been for the better goes without saying. To-day a single sight feed drip, as designated B in Figs. 1 and 3, is all that is seen and lubrication is carried out a great deal better than it ever was when dashes were nearly obscured by oilers and oil tanks with a dozen feed pipes or so. In some makes of cars the

oil is fed under pressure, a gauge serving to indicate to the driver the fact that the system is in operation. The arrangement of a gauge, B, for this purpose, as

FIG. 4—LOCATION OF COIL ON RAMBLER

used on some models of Oldsmobile and Stoddard-Dayton cars is shown in Figs. 6 and 7, respectively. In a great many cars even the sight feed is missing and yet lubrication is effected continuously, perfectly, without the slightest attention from the driver beyond the occasional refilling of the oil reservoir, generally located in the

FIG. 5—THE OHIO DASH COIL

engine base, where it is out of sight and thoroughly protected.

When carburettors are so constructed that the air or gasolene may be varied while the car is running and at the option of the driver, it is obvious that the proper place for the lever, by means of which the

adjustment may be made, is on the dash. Carburettors of this type are used by several manufacturers, and though the adjustment lever generally is placed on the dash, somewhat after the manner depicted in Fig. 2, in which the lever A operates an auxiliary air port, on some makes of cars the lever is placed on the steering column.

With the pressure feed fuel supply system it is customary to equip the car with a gauge to indicate the amount of pressure on the gasolene. Such gauges, of

FIG. 6—OLDSMOBILE SWITCH AND GAUGES

course, should be placed on the dash, as in no other place are they directly in sight of the driver. The Stoddard-Dayton gauge

FIG. 7—STODDARD-DAYTON "CLEAN" DASH

A is so placed and conforms to general practice. In the Lozier arrangement, shown in Fig. 1, however, the gauge, D, is located on the sloping foot board beside the hand pump, C, used in obtaining the initial pressure in the tank. The cock, C', is used to release the pressure when the car is left unattended for long periods.

Regarding the disposition of gasolene

ORIGINAL PLANT 1902

RIM AND TIRE PLANT

Non-skid in fact
as well as in name—
"Firestone"
NON-SKID TIRES

LOOK at the tread. The mass of sharp edges, angles, sides and hollows show you why this tire won't let your car skid or slide, no matter how slippery the street.

This thick raised lettering is all extra. After it is all worn down you still have left a regular smooth tread, giving you an extra mileage that no other tire can offer.

The world's record for durability and speed is held by Firestone tires—and the Non-Skid combines this wear-resisting quality of rubber with the only tread construction that is non-skid in fact as well as in name.

Only slightly higher in price than our regular tread—your safety and economy demand the use of Firestone Non-Skid Tires.

The Firestone Tire & Rubber Co.

"America's largest exclusive tire and rim makers"

Akron, O. and all Principal Cities.

NEW PLANT—CONTAINS THE LARGEST TIRE BUILDING IN THE WORLD

gauges, there can be no question as to the right of such fixtures to a place on the dash. Obviously, if a gasoline gauge is to fulfil its mission as a telltale of the amount of fuel available it should always be in plain sight, and the dash is the proper place for it. A few years ago a gasoline gauge on the dash was an almost unheard of luxury. To-day it is a necessity and the number of manufacturers who are supplying one as regular equipment steadily is increasing. Among the first of the cars to be so equipped was the Oldsmobile, and the arrangement of the gauge, A, on the dash is shown in Fig. 6.

While the necessity for a dependable speed indicating instrument generally is conceded and one usually is found on the dash it is an open question whether the dash is the best place for it. In closed front cars the better location is on the top of the door (provided it is supposed to remain closed) far enough forward to be out of the way of the driver, and yet near enough to be visible. The dash of closed front cars is more or less dark, and on some a meter in the orthodox place scarcely can be seen even in broad daylight without a dash lamp. When the meter is placed on the top of the door, or on the skuttle dash it is easily seen, and in the majority of cases, when properly placed, can be read almost without the necessity of the driver removing his eyes from the road. When

the meter must be placed on the dash, there being no other place to locate it conveniently, it should be placed in the left side if the car is driven from the right side, or vice versa if the car is steered from the left side. This will enable the driver to see it easily without the necessity for craning his neck to look under or through the steering wheel, and also leaves it in sight of the occupant of the other seat.

A clock should have a place on the dash, though its exact location is a matter of small moment, provided it can be seen without undue exertion. The exertion in any case will be less than is required to unbutton several coats and after removing heavy gloves fish out a watch. Of course, if the clock is supported on the same bracket with the speedometer a single light will serve to illuminate both dials at night; during the day both can be read at a glance.

Devices for automatically lighting the acetylene headlights are being used now to a considerable extent, and obviously the place for them is on the dash, as convenience of their control is their principal advantage. Electric side and tail lamps also are coming into much more general use, though the switches, by means of which they are controlled, have no place on the dash. They should be, and generally are, placed on the riser board, between the floor board and the seats.

That a perfectly "clean" dash should be the object of every designer is obvious; it would indicate very nearly the acme of simplicity. While cars have been vastly improved in the last few years there still is room for improvement, and it profitably can be made in the elimination of fixtures, other than accessories, from the dash. Summed up, the whole situation resolves itself into the statement that with due regard to convenience the dash should be kept as free of equipment as possible consistent with proper control of the car.

Acid That Destroys Leather Handles.

Storage batteries that are equipped with leather strap handles always should be handled gingerly and with the full expectation that at any moment the handles may give way and let the battery down with a crash that will ruin it. The reason for this is that the acids which are an inevitable part of lead pipe batteries attack leather and destroy it more quickly than generally is supposed. If immunity from this trouble is desired the straps should be removed and soaked for an hour or so in melted paraffine and then hung up to drain and dry. Though there may be no appreciable slopping of acid it should be remembered that all storage batteries require vents because of the chemical action which takes place in them and that the fumes which are emitted are sufficient to rot the leather.

995,858. Internal Combustion Engine. Hugh Francis Fullagar, Newcastle-upon-Tyne, England. Filed Nov. 4, 1909. Serial No. 526,227.

1. An internal combustion engine, comprising two double cylinders arranged close together and twisted at their central portions about one another by a half turn so that the two outer straight portions of each cylinder are brought into line with those of the other cylinder, substantially as set forth.

995,873. Running Gear for Automobiles. Clinton C. Jones and Clinton Bradner Jones, Albuquerque, N. Mex. Filed Apr. 12, 1909. Serial No. 489,453.

1. The combination with the axles of a vehicle, of a frame adapted to support the body of said vehicle, said frame comprising parallel truss members, connections between the truss members, end springs supporting said connections, side springs flexibly connected at one end with said truss members and at the other with said end springs, blocks supported upon said axles and carrying the side springs, compression springs arranged between said blocks and the truss members, and anti friction devices comprising rollers interposed between the said blocks and vertical portions of said truss members.

995,915. Change Gear Mechanism. Allen

Eugene Schmidt, Elizabeth, Ill. Filed Feb. 14, 1910. Serial No. 543,793.

1. The combination with a drive shaft, of a lay shaft; constantly meshing gears fixed to said drive and lay shafts; constantly meshing gears loose on said drive and lay shafts; sprocket wheels rotatably mounted on said drive and lay shafts; a sprocket chain engaging said sprocket wheels and adapted to be connected to drive a driven shaft; means for connecting the drive shaft to the sprocket wheel thereon, simultaneously connecting the loose gear on the drive shaft with the sprocket wheel thereon and the loose gear on the lay shaft with said lay shaft, or simultaneously connecting the loose gear on the drive shaft with said drive shaft and the loose gear on the lay shaft with the sprocket wheel on said lay shaft, substantially as described.

Underwood Standard Typewriter

UNDERWOOD SERVICE

A few years ago typewriters were used only for letter writing. But it is different today. Their field of usefulness has increased many fold. The UNDERWOOD introduced typewriter bookkeeping and the use of the typewriter for special accounting, recording and statistical purposes.

There are over a score of special model Underwoods for special uses. Many corporations use four times as many UNDERWOODS for accounting work as for correspondence.

Department stores, banks, insurance companies, corporations, manufacturers and retailers use Underwood systems—condensed billing system, unit bill and order system, bill and charge system, and others planned for their particular needs.

COURT TO RULE ON NOBBY TREADS

Two Big Tire Companies at Law Over Right to Their Use—Republic Brings Patent to Bear.

Whether the so-called "nobby," "knobby" or staggered tread is a patentable invention, and whether a patent for a tire tread of that type, granted to one Tod J. Mell in 1908, covers an original and valid invention, shortly will be made known as a result of litigation which now is occupying the attention of Judge Lacombe of the United States Circuit Court for the Southern District of New York.

That the right to use these anti-skid treads was a matter of dispute became generally known on Monday last, 16th inst., when there was called for trial the case of the Republic Rubber Co., of Youngstown, O., against Morgan & Wright, of Detroit, Mich. The plaintiffs claim the exclusive right to use such treads by virtue of their ownership of the Tod patent, No. 898,907, granted September 15th, 1908, and duly assigned to them. Morgan & Wright are charged with infringement of this patent, and the usual accounting and injunction are prayed for.

The case occupied the attention of Judge Lacombe for two days, during the course of which Morgan & Wright, in their defense, held that the Tod patent long had been antedated. In support of their contention they cited bicycle tire treads, which had been illustrated and described in English cycling publications of 1896 and 1898, and also a so-called Duryea tread which Charles E. Duryea, late of Reading, Pa., had ordered made by the Hartford Rubber Works Co. in 1901-03.

After hearing the argument the court took the case under advisement.

Retires from Automobile Business.

A. Massenat, for many years associated with the Panhard & Levassor establish-

ment, as manager of its American branch in New York, has relinquished that office and all other connections with the automobile industry. He has sailed to France for a vacation and on his return will engage in an entirely different business. The management of the Panhard branch has been taken over by Gustave Prost, who for seven years has been Mr. Massenat's righthand man.

Hupp Purchases Site for New Plant.

The Hupp Motor Car Co., of Detroit, has purchased a site of seven acres at Mt. Elliott and Milwaukee avenues in that city, on which it purposes erecting a new factory about three times the size of the one occupied at present. The plans for the new buildings already are in hand.

Ford Building a Foreign Factory.

Although it is not generally known, the Ford Motor Co., of Detroit, is busily engaged in erecting a factory in Manchester, Eng. It will have a capacity of 5,000 cars per year and will supply both the British and Continental markets, in which the Ford cars already are well established.

Whitesides Truck Going to Newcastle.

The Whitesides Motor Truck Co., of Franklin, Ind., has completed arrangements for removal to Newcastle, in the same State. It is understood that it will be affiliated with the same interests which control the Safety Shredder Co.

Republic to Issue Million Preferred.

The directors of the Republic Rubber Co., of Youngstown, Ohio, have voted an issue of \$1,000,000 in preferred stock. The issue is subject to the ratification of the stockholders at a meeting which will occur on November 10th.

Jeffery Sails for Glimpse of Europe.

Charles T. Jeffery, president of the T. B. Jeffery Co., of Kenosha, Wis., sailed yesterday for Europe. He will remain long enough to take a survey of the foreign situation, including the London Show.

SAURER-MACK MERGER COMPLETED

Ten Million Dollar Holding Company With Notable Directorate Assumes Control—Electrics May Be Added.

With several modifications from the earlier plans, the merging of the Saurer Motor Truck Co., of Plainfield, N. J., and the Mack Brothers Motor Car Co., of Allentown, Pa., took place this week, to the extent of their both passing into the control of a \$10,000,000 holding company styled the International Motor Co., incorporated under Delaware laws on the 13th inst. The new company has in it not only the direct Saurer and Mack interests, but also boasts an array of banking and industrial names of prominence in its directorate.

While for the present the manufacturing end of the business will be conducted by the Saurer and Mack companies on the same lines as heretofore, as separate and distinct organizations, the selling management and general supervision of both companies have been combined and taken over by the International company. A combined output of 2,000 trucks from the two factories is planned for the coming fiscal year, but the development of the selling organization is to be carried forward on a scale looking to great expansion of production thereafter. The branches and the agencies of the subsidiary companies now bear the same relations to the International company, in addition to which the latter also will conduct in all of the principal cities service stations for the maintenance of Mack and Saurer trucks.

Electric trucks also may be added to the company's offerings, though this phase of the future is one that the officers are as yet unwilling to discuss.

The officers and directors of the International Motor Co. are: President, C. P. Coleman; chairman of board, W. D. Sargent; vice-president, J. M. Mack; treas-

urer, F. C. Richardson; secretary, Vernon Munroe. Directors, Otis H. Cutler, president American Car and Foundry Co.; Benjamin Strong, Jr., vice-president Bankers' Trust Co.; Arthur H. Lockett, of Pomroy Bros., bankers; Hunter Marston, of Blair & Co., bankers; Charles H. Sabin, vice-president Guaranty Trust Co.; George B. Case, of White & Case, attorneys; William G. Parce, vice-president American Brake Shoe and Foundry Co.; C. P. Coleman, formerly secretary and treasurer of Singer Sewing Machine Co., president of Saurer Motor Co.; W. D. Sargent, president Reading Steel Casting Co.; Herbert H. Dean, of Edward B. Smith & Co., bankers; John M. Mack, president Mack Bros. Motor Car Co.; Joseph S. Mack, treasurer Mack Bros. Motor Car Co.; Montgomery Hare, attorney; Thomas E. Rush, attorney; Warren A. Wilbur, president E. P. Wilbur Trust Co.; Harry W. Davis, secretary Delaware Trust Co.; Martin E. Kern, vice-president Mack Bros. Motor Car Co.

The general offices of the company will be at 30 Church street, New York City, on the 20th floor of the Hudson Terminal building, where the offices of the Saurer company will be greatly enlarged to meet the new conditions.

Before the negotiations for the merger had reached a consummation it was indicated that the basis for the merger would be the net quick assets of the Saurer and Mack companies. The Saurer company was capitalized at \$1,600,000 and the Mack company at \$1,000,000, giving a combined capitalization of \$2,600,000. How nearly the net quick assets of the companies approach this figure is not disclosed, nor is it indicated what proportion of the \$10,000,000 capital stock of the International Motor Co. goes to the acquiring of the Saurer and Mack companies and what proportion is to be represented by new cash capital, the acquirement of additional properties or patent rights, and distributions for promoting and underwriting. Efforts to get President Coleman, who also is the head of the Saurer company, to make any statement concerning the \$10,000,000 capitalization or whether it implies further extensions, have met with polite refusal.

Brown-Sautter Truck is Reorganized.

The Brown-Sautter Motor Truck Co., of 893-895 Frelinghuysen avenue, Newark, N. J., has been reorganized with the following officers: President and secretary, R. G. Chace; first vice-president, G. W. Sautter; second vice-president, Benjamin F. Stephens; treasurer, Harry Sautter. In addition to these officers the board of directors comprises R. C. Jenkinson, Edward T. Ward, Colonel Allan B. Wallace, Adolph Hensler, E. Alvah Wilkinson, Dr. Ludwig R. Sattler and John E. Brown. As a result of the reorganization the company expects to be enabled to carry out its original plans and to prove a real factor in the trade.

LEAGUE CAN'T EVEN BUY KLAXONS

Buffalo Institution Is Sweepingly and Permanently Enjoined—Is Notified Also That it is "Objectionable."

Among the wares which the peculiarly constituted International Automobile League, of Buffalo, N. Y., can neither buy nor sell under any circumstances or conditions, or at any time, are the Klaxon and Klaxonet horns. This perpetual and far-reaching prohibition has been placed on the so-called League as a result of an action brought by the Lovell-McConnell Mfg. Co., of Newark, N. J., which controls the Klaxon patents and product. The Lovell-McConnell people have also served formal notice on the league that it is "objectionable" to them as makers of the Klaxon devices, and that any sale of these articles by the league will constitute a violation of the Klaxon license.

The Lovell-McConnell suit was instituted in the United States Circuit Court for the Western District of New York, and charged infringement of the basic Klaxon patents, Nos. 923,048, 923,049 and 923,122, the infringement having been committed by cutting the price of the Klaxon horn and otherwise violating the terms of the license set forth on the tag sealed to every Klaxon and Klaxonet before they are placed on the market.

The case came before Judge Hazel, in Buffalo on September 26th, and as a result of the evidence submitted he granted the permanent injunction asked for. The decree, in the usual language of such decrees, not only forbids the league from directly or indirectly making, or causing to be made, used or sold any horns or articles embodied in the Klaxon patents, or infringing or violating them in any way whatsoever, but also prohibits it "from purchasing, using or selling, directly or indirectly any of the complainants' horns marketed and sold by complainants under their conditional licenses set forth in tags or labels upon or secured to said horns, unless in accordance with each and all the terms of said conditional license."

This Klaxon conditional license contains an express stipulation against selling the Klaxon devices at cut prices, and also the following provision: "No license whatever is granted for purchase or sale by anyone who has been notified that he is objectionable to makers; nor for purchase to or through, or sale by or to any person, company, concern or association which offers or affords purchasers or users any membership, profit sharing or co-operative right or privilege."

It was in accordance with the terms of this latter provision that the Lovell-McConnell company has notified the league that it is "objectionable"—which suggests

trouble for anyone who should try to sell Klaxons to the league.

Factory Completed for Newark Truck.

The Newark Motor Car Co., of which Joseph J. Rafter is president, and which will manufacture a light truck, has completed the erection of its factory on Bigelow street, near Frelinghuysen avenue, Newark, N. J., and is about ready to begin active operations. The new factory is a one story brick structure, 125 feet by 75 feet. A two story building also is in course of erection, part of which will be occupied by the Commercial Car Sales Co., a subsidiary, which will market the product of the Newark factory. Incidentally, the number of directors of the Newark Motor Car Co. has been enlarged from five to seven, the two new directors chosen being H. V. Radowitz, of Elizabeth, Pa., and Carl W. Johnson, secretary of the English & Mersick Co., of New Haven, Conn.

Elmira Prepares to Honor Willys.

Evidence that John N. Willys, president of the Willys-Overland Co., Toledo, Ohio, is full of honor in his home town, will be given on Tuesday, October 31st, when a complimentary banquet will be tendered him by the Elmira Chamber of Commerce and the Elmira Business Men's Association. It was in Elmira—the one in New York State—that Willys made his first real start on the road to industrial achievement and he not only retains his interest in the Elmira Arms Co., in which he began his career, but several months since he revisited the city and erected a plant which produces some of the fittings that go into the Overland car.

Prest-O-Lite Gets Two More Injunctions.

In the United States Circuit Court in Indianapolis, on the 5th inst., Judge Anderson issued injunctions restraining Orin K. Stuart and the Autogas Co. from further infringement of the Prest-O-Lite patents. The Autogas Co. had been charged with manufacturing tanks which infringed the patents, and Stuart with having recharged these autogas tanks. The suits, of course, were prosecuted by the Commercial Acetylene Co. and the Prest-O-Lite Co.

Scioto Company Changes Its Title.

The Scioto Auto-Car Co., of Chillicothe, Ohio, has changed its title to the Arbenz Car Co., taking its name from the car which it has manufactured for the past several years. The car in turn is named for F. C. Arbenz, who is secretary-treasurer and general manager of the company.

Kelly-Racine to Double Capitalization.

The Kelly-Racine Rubber Co., of Racine, Wis., has called a meeting of its stockholders, to occur to-morrow, for the purpose of increasing its capital stock to \$1,000,000. At present it stands at half that sum.

MADE SPRING REPAIRERS MULTIPLY

Morris and Grinberg Accused of Performing a "Miracle"—Conflicting Story of Job Lot Sale.

Adolph Morris and David Grinberg, who played picturesque parts before and since they began trading in New York under the style the Manhattan Storage Co., were on Monday last, in the person of their counsel, before Judge Hazel sitting in the United States Circuit Court for the Southern District of New York, charged by the Auto Spring Repairer Co. with having, after a fashion, emulated the loaves and fishes parable not wisely but too well. Specifically the complaint charges the Manhattan storage pair with having infringed patent No. 899,468, which was granted September 22nd, 1908, to William R. Petze, and which covers an automobile spring repairer.

The manner of infringement was considerably out of the usual. According to the complaint and the evidence presented the Manhattan Storage Co. in 1907 placed an order for a number of the patented spring repairers, all of which were supposed to have been disposed of. In the latter part of 1909 the Auto Spring Repairer Co., to which Petze had transferred his patent and from which he then had withdrawn, discovered that a large quantity of devices strikingly similar to those of its own production had appeared on the market. Convinced that they were not of their handiwork the Repairer people say they traced the imitations to the Manhattan Storage Co. They certainly filed suit in the United States Circuit Court in New York, and as a result of this litigation they obtained a preliminary injunction from Judge Hand, which forbade the Storage company from making or selling the alleged infringing device pending a decision of the case. Twice during last year Morris and Grinberg applied, first to Judge Coxe and later to Judge Ward, seeking to have the injunction vacated, but in both instances their application was denied.

The facts in the case were brought out in the argument for an accounting and a permanent injunction, which was before the court on Monday last. In their defense, Morris and Grinberg held that the alleged counterfeit repairers traced to them were manufactured out of a job lot of parts for 1,500 repairers purchased from the Repairer company. The latter, however, maintained that the job lot purchased by the Storage pair was sufficient for the production of scarcely 100 repairers. How Morris and Grinberg could perform the miracle of making 15 repairers out of material sufficient for but one was not made wholly clear to the lay mind, but served to stimulate imagination.

Judge Hazel probably will render his decision on Monday next, when final arguments will be heard.

Willis Twice Elected Vice-President.

Fred I. Willis, of the Hearsey-Willis Co., Indianapolis, who recently acquired a block of stock in the Kokomo Rubber Co., of Kokomo, Ind., has been elected vice-president thereof. George H. Hamilton, who at the same time secured a similar financial interest in the Kokomo concern, has been chosen sales manager. D. C. Spraker remains president, D. L. Spraker, treasurer, and George W. Langdon, secretary. As Willis's new interests will require that he divide his time between Kokomo and Indianapolis, he has resigned the secretary-treasurership of the Hearsey-Willis Co., and has been succeeded by Robert H. Coburn, of Atlanta, Ga. Willis, however, will retain identification with the Hearsey-Willis Co., as following his resignation as secretary-treasurer he was at once elected vice-president.

Georgia to Get a Michigan Plant.

According to reports from Georgia, J. E. Keith, who is described as the "general manager of the Howard automobile plant, of Jackson, Mich.," has induced the citizens of Macon, Ga., to subscribe \$200,000 to bring the plant from Jackson to Macon for the organization of a new company there. It is stated that a factory will be erected and that the car will be called the Macon.

Boston Lists General Motors' Securities.

Following the example of the New York Exchange, the governing committee of the Boston Stock Exchange has formally admitted to listing the securities of the General Motors Co. The securities comprise 123,113 shares of preferred stock voting trust certificates and 13,022 shares of common stock voting certificates; provision also is made permitting an increase of these amounts.

Prest-O-Lite to Make Self-Starters.

Quick to appreciate that self-starting devices at last have attained real importance, the Prest-O-Lite Co., of Indianapolis, is almost ready to place on the market an invention of the sort which will be operated by acetylene gas. The Prest-O-Lite self-starter will be sold at a popular price, and it is such that it may be easily attached to any standard make of car.

Another German Bearing for America.

Reuben Allerton and Joseph Schaeffers, of New York, who have associated with the automobile industry, have secured the United States agency for the German H. C. B. Ideal ball bearings, and to market them have formed the Steel Products Import Co., capitalized at \$50,000. They have opened offices at 50 Church street, New York.

BLOOD TO LEAD ELECTRIC MAKERS

Bostonian Re-elected President of Their Association—Other Officers Retained—Topics Discussed in Convention.

Electric vehicle manufacturers, their agents and sales representatives and the central station men, to whom the electric motorist must turn for charging current for his batteries, held their second convention Tuesday, 10th inst., on the occasion of the annual meeting of the Electric Vehicle Association of America in New York. About 300 were in attendance at the morning, afternoon and evening sessions, and it is noteworthy evidence of the interest displayed in the topics presented that although the final meeting was prolonged until 11 o'clock the audience was not visibly diminished. During the year that has elapsed since its formation the ranks of the association have swelled to 200, while enthusiastic members do not hesitate to attribute the marked increase in electric vehicle business during the past twelve months in large measure to the general publicity campaign which the association has conducted through the medium of periodicals and the daily press.

The election of officers, which was the first item on the program of official business, resulted in the reinstatement of the entire standing board, as follows:

W. H. Blood, Jr., Stone & Webster, Boston, Mass., president; Arthur Williams, the New York Edison Co., New York City, vice-president; C. E. Firestone, Columbus Buggy Co., Columbus, Ohio, secretary; Harvey Robinson, the New York Edison Co., New York City, assistant secretary.

Directors: H. H. Rice, the Waverley Co., Indianapolis, Ind.; F. W. Smith, United Electric Light & Power Co., New York City; P. D. Wagoner, General Vehicle Co., Long Island City, N. Y.; Louis Burr, Woods Motor Vehicle Co., Chicago, Ill.; W. P. Kennedy, Studebaker Automobile Co., South Bend, Ind.; Frank L. Dyer, Edison Storage Battery Co., Orange, N. J.; James T. Hutchins, Rochester Railway & Light Co., Rochester, N. Y.; Louis A. Ferguson, Commonwealth Edison Co., Chicago, Ill.; W. W. Freeman, Edison Electric Illuminating Co., Brooklyn, N. Y.; F. M. Tait, Dayton Lighting Co., Dayton, O.; Hayden Eames, Society for Savings Building, Cleveland, O.; Charles Blizard, Electric Storage Battery Co., Philadelphia, Pa.

The invitation of the Boston Edison Illuminating Co., to hold the next convention in Boston in season for the electric show there next fall, was referred to a committee without debate. The invitation of the management of the electrical show now running in Grand Central Palace, New York, was accepted by the delegates, the

convention itself being in the nature of an opening function for the motor vehicle display of that exposition.

The set program, which, with the discussion of the papers, served to crowd every moment of the meeting, comprised these papers:

Morning Session — "Electric Vehicle Commercial Problems," R. L. Lloyd and John Meyer of the Philadelphia Edison Co.; "An Accounting System for Electric Trucks," E. W. Curtis, Jr., assistant to the president of the General Vehicle Co., New York; "Proper Illumination of the Electric Garage" (illustrated by stereopticon views), J. G. Henninger, of the National Electric Lamp Co., Cleveland, Ohio.

Afternoon Session — "Effect of Low Temperatures on the Alkaline Battery," W. E. Holland, of the Edison Storage Battery Co., Orange, N. J.; "The Electric Vehicle in Smaller Cities," F. N. Golding, of the Rockford Electric Light Co., Rockford, Ill.; "Vehicle Battery Practice in Central Station Companies," S. C. Harris, of the New York Edison Co.; "The Battery Truck Crane and Its Applications," R. H. Rogers, of the General Electric Co., Schenectady, N. Y.

Evening Session — "Impediments to the General Introduction of Power Wagons," Hayden Eames, Cleveland, O.; "The Central Station Back of the Electric Vehicle" (supplemented by motion pictures), E. S. Mansfield, Boston Edison Illuminating Co.; "Some Comments on Moving City Freight With Electric Current," William P. Kennedy, consulting engineer, New York City, N. Y.

M. A. M. Adds Twenty-five to Roll.

Twenty-five new members were admitted to the Motor and Accessory Manufacturers at the October meeting of the Board of Directors, as follows: Automobile Supply Mfg. Co., Brooklyn, N. Y.; The Batavia Rubber Co., Batavia, N. Y.; Bower Roller Bearing Co., Detroit, Mich.; The Buda Co., Harvey, Ill.; Carnegie Steel Co., Pittsburgh, Pa.; Detroit Electric Appliance Co., Detroit, Mich.; Doehler Die Casting Co., Brooklyn, N. Y.; The Eagle Co., Newark, N. J.; The Esterline Co., Lafayette, Ind.; Falls Machine Co., Sheboygan Falls, Wis.; Federal Rubber Mfg. Co., Cudahy, Wis.; The Hess Spring and Axle Co., Carthage, O.; International Acheson Graphite Co., Niagara Falls, N. Y.; Jacobson-Brandow Co., Pittsfield, Mass.; The G. Piel Co., Long Island City, N. Y.; The Simms Magneto Co., New York, N. Y.; The Start-Line Co., Chicago, Ill.; Stutz Auto Parts Co., Indianapolis, Ind.; The United Rim Co., Akron, O.; Universal Tire Protector Co., Angola, Ind.; Universal Wind Shield Co., Chicago, Ill.; Voorhees Rubber Mfg. Co., Jersey City, N. J.; Waukesha Motor Co., Waukesha, Wis.; Widmer Machine Works, New York, N. Y.; Wolverine Lubricants Co., New York, N. Y.

M. A. M. LINE-UP FOR BOSTON SHOW

Fair Representation for Both Weeks of New England Exhibition—Members Who Have Booked Space.

In addition to allotting their share of the space at the Madison Square Garden show in New York and the show in the Coliseum in Chicago, as detailed last week, the Motor and Accessory Manufacturers have also apportioned their space for both weeks of the Boston exhibition. How the M. A. M. members view the respective pleasure car and commercial car sections of the latter function is evidenced by their selections, as follows:

For Two Weeks.

Ajax-Grieb Rubber Co., The Baldwin Chain & Mfg. Co., Bosch Magneto Co., S. F. Bowser & Co., Coes Wrench Co., Columbia Lubricants Co., Consolidated Rubber Tire Co., Continental Caoutchouc Co., The Wm. Cramp & Sons Ship & Engine Building Co., The Dean Electric Co., The Diamond Rubber Co., The Electric Storage Battery Co., Empire Tire Co., Firestone Tire & Rubber Co., The Fisk Rubber Co., G & J Tire Co., The B. F. Goodrich Co., Gray & Davis, A. W. Harris Oil Co., The Hartford Rubber Works Co., Hartford Suspension Co., The Hofecker Co.

The Jones Speedometer Co., Leather Tire Goods Co., J. Ellwood Lee Co., Morgan & Wright, A. R. Mosler & Co., The Motz Clincher Tire & Rubber Co., National Carbon Co., N. Y. & N. J. Lubricants Co., Pennsylvania Rubber Co., Remy Electric Co., C. F. Splittdorf, Swinehart Tire & Rubber Co., Vacuum Oil Co., The Veeder Mfg. Co., Federal Rubber Mfg. Co., International Acheson Graphite Co., United Rim Co., Jacobson-Brandow Co., Goodyear Tire & Rubber Co.

For First Week Only.

Allen Auto Specialty Co., Apple Electric Co., Auburn Auto-Pump Co., Booth Demountable Rim Co., Borne-Scrymser Co., Champion Ignition Co., Adam Cook's Sons, Jos. Dixon Crucible Co., Dorian Remountable Rim Co., Dover Stamping & Mfg. Co., Gabriel Horn Mfg. Co., Havoline Oil Co., George A. Haws, Heinze Electric Co., W. H. Leland & Co.

Lovell-McConnell Mfg. Co., Michelin Tire Co., National Coil Co., National Tube Co., Oliver Mfg. Co., The Pantasote Co., Pittsfield Spark Coil Co., The Republic Rubber Co., Wm. C. Robinson & Son Co., C. A. Shaler Co., Stromberg Motor Devices Co., Valentine & Co., Vesta Accumulator Co., Warner Gear Co., Warner Instrument Co., Weed Chain Tire Grip Co., The White & Bagley Co., Detroit Electric Appliance Co., The G. Piel Co., The Esterline Co., The Batavia Rubber Co., Voorhees Rubber

Mfg. Co., Wolverine Lubricants Co., The Connecticut Telephone & Electric Co.

For Second Week Only.

Ross Gear & Tool Co., Standard Roller Bearing Co., Whitney Mfg. Co.

Changes Among Prominent Tradesmen.

Paul L. Roche, well known in Boston trade circles, has become associated with the F. E. Wing Motor Car Co., New England agents of the Marmon car.

Robert Jardine, long associated with the Royal Tourist interests, who recently joined the engineering staff of the T. B. Jeffery Co., of Kenosha, Wis., has relinquished that connection.

H. B. Curtiss, who previously was connected with the Pierce-Arrow factory, has been made superintendent of the service department of the Stevens-Duryea Co.; he will be at the Chicopee Falls factory.

Ole Hibner, formerly president of the Central Tire & Rubber Co., of Omaha, Neb., and later head of the Hibner Sales Co. of that city, has been appointed sales manager of the newly formed Knight Tire & Rubber Co., Canton Ohio. He, of course, will make his headquarters at the factory in Canton, which is in course of erection.

W. W. Garrison, for several years with Lord & Thomas, of Chicago, and managing editor of Judicious Advertising, has resigned from the Chicago agency and joined the advertising staff of the Hudson Motor Car Co. of Detroit. He will be associated with C. C. Winningham, director of Hudson advertising, who once was chief of Lord & Thomas's copy staff.

J. E. Lewis, who at one time was identified with the Hartford Auto Parts Co., has become manager of the recently organized Tube Bending & Polishing Machine Co., of Baltimore, Md. Among other things the company will market seamless copper pipe bends and manifolds for motor connections, made by patented processes which it controls and which avoid soldered joints.

W. P. Kennedy, formerly sales manager of the electric vehicle department of the Studebaker Brothers Automobile Co., of New York, but who more recently has been devoting his time to consultation work, has been retained by the Baker Motor Vehicle Co., of Cleveland, in an advisory capacity. He will devote his time mainly to sales work and the development of garage systems for users of Baker equipment.

S. L. Stone, for the past three years assistant sales manager of the Oakland Motor Car Co., Pontiac, Mich., under J. B. Eccleston, has been appointed manager of the Centaur Motor Co., of Buffalo, which handles the Oakland car in Western New York and Pennsylvania. As he previously was associated with Eccleston when the latter was in the automobile business in Buffalo, it follows that Stone is no stranger to the trade in that city and vicinity.

Albert Yackley is erecting a public garage at Valley Spring, S. D.

David J. Crimmins has opened a garage and livery business in Cambridge, N. Y.

The Lovell Motor Sales Co. has "opened up" in Los Angeles, Cal. It will handle the Colby line.

Schneider & Held is the style of a new firm which has opened a garage and salesroom in Hinton, Ia.

The Auto Parts Sales Co. has opened a salesroom at 3408 Lindell avenue, St. Louis, Mo. C. D. Robinson is the general manager.

James Mitchell is building a garage at the corner of Vreeland avenue and East 35th street, Paterson, N. J. It will cost \$2,000.

Willard Loomis, of Wellston, Ohio, and J. L. Fleming, of Logan, in the same State, have opened a garage, livery and supply business at Wellston.

Claude McAuley has opened a repair shop at 950 Canal street, Grand Rapids, Mich. He will do business under the style the Creston Auto Co.

J. M. Wolf and F. C. Beting, both of the town of Albert Lea, Minn., have formed a partnership and opened a garage in Fairmont, in the same State.

Biwabik, a small village in Minnesota, now boasts of an up-to-date brick garage with cement floor, 50x70 feet in extent. It is owned by C. J. Verrill.

The North Star Iron Works, of Owatonna, Minn., has added automobile repairing to its other enterprises and opened a garage in a building adjoining the factory.

Alexander Allen has broken ground for a garage on Highland avenue, near Germantown avenue, Philadelphia, Pa. It will be two stories high, of stone and brick construction.

J. Larkin is building a garage to cover the block from 24th to 25th streets, west of Eleventh avenue, New York City, at a cost of \$20,000. It will be 197.7 x 150 feet, one story high.

Charles G. Andrews and M. A. Dykeman have formed the Moon Motor Car Co. of New England, with headquarters in the Motor Mart, Boston, Mass. As the name indicates Moon cars will be handled.

Harry Endicott, of racing fame, will manage the garage which is being built on the southeast corner of Avenue P $\frac{1}{2}$ and Tremont street, Galveston, Tex. The garage is owned by Moritz O. Kopperl.

Clarence Heiderschide has formed a partnership with C. H. Wedding, who con-

ducted a garage at Jerseyville, Ill. They will operate under the style of Wedding & Heiderschide and sell Ford and Reo cars.

H. R. Stone has been appointed receiver for the Hazen Automobile Co., of Memphis, Tenn., on the petition of the Security Bank and Trust Co., representing the creditors of the company. The assets and liabilities have not been made public.

The Marmon Motor Car Co. is the style of a new concern which has opened salesrooms at 221 East Sixth street, Waterloo, Ia., with G. W. Kimball as general manager. As the name indicates Marmon cars will be handled exclusively.

White uniforms for its chauffeurs will be the advertisement of a new garage which is in course of construction for the Auto Owners Service Co., at 15-17 East Pratt street, Indianapolis, Ind. The building is 106 x 122 feet, two stories high and will cost \$10,000.

The New York City salesroom of the Oakland Motor Car Co., which formerly was located at 1659 Broadway, has been moved to 1600 Broadway, near 55th street. Roger R. Hall is in charge of the salesroom, which will be operated as a direct factory branch.

Lawrence Kittell, an engineer on the Chicago & Northwestern R. R., and Charles W. Collier, a former grocer, have formed a partnership and opened a garage and salesrooms at 510 South Monroe street, Green Bay, Wis. They will do business under the style the Fox River Motor Car Co., selling Ford cars.

W. J. Kirkland, who is secretary of the Omaha Motor Club, and George V. Hicken have formed a partnership under the style the Kirkland-Hicken Co., and opened salesrooms and offices in the Brandeis Theater building, Omaha, Neb. They will act as sales agents for a number of accessory manufacturers.

Theodore E. Schulz, a member of the one-time firm of Homan & Schulz, and one of the earliest automobile dealers in New York City, has filed a petition in bankruptcy, which lists his liabilities at \$8,748 and his assets at \$6,412. The latter consist of cash \$3, accounts \$357 and claims for damages \$6,052.

George W. Houk, who until a few weeks ago was manager of the Oldsmobile branch in Boston, has filed a voluntary petition in bankruptcy. His liabilities are \$42,080, all unsecured, and his assets \$45,76. Most of the creditors are in Lon-

don, England, where Houk was in business several years ago.

A. G. Albrecht, formerly connected with the Dayton's Bluff Auto Co., St. Paul, Minn., has purchased an interest in the White Bear Auto Co., 199 West Fifth street, in the same city. A. J. Diamon is the other partner of the company, which sells Regal, Oakland, Firestone-Columbus gasoline cars and Columbus electrics.

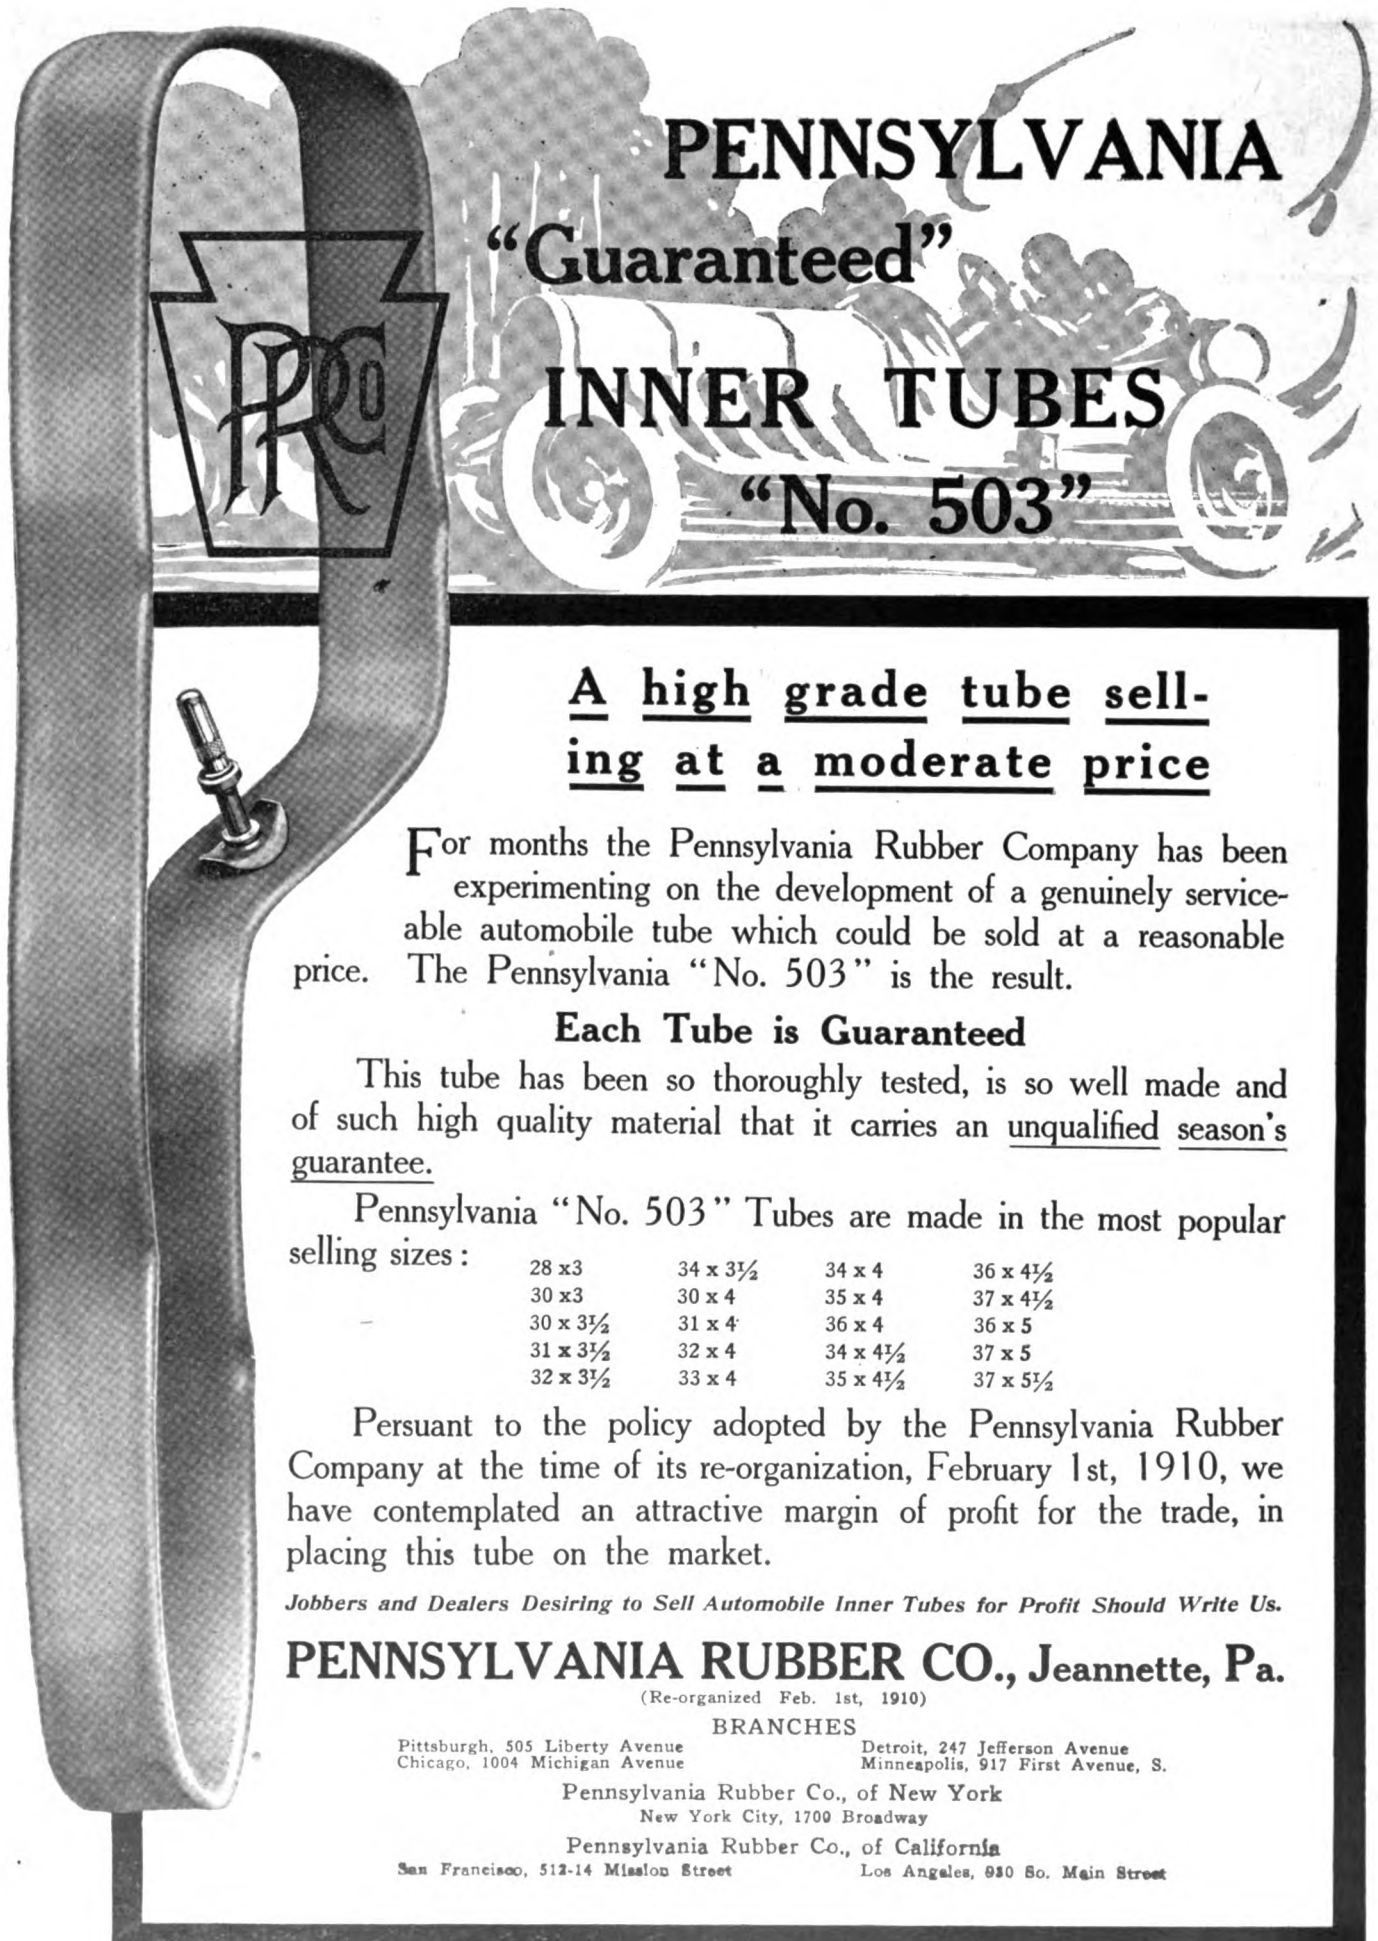

A petition in involuntary bankruptcy has been filed by Joseph B. Roberts against the Brown Auto Sales Co., of Ridgewood, N. J. Roberts, who is a director of the company, as well as a creditor, filed the petition and immediately accepted service in behalf of the company. The liabilities and assets of the company are not given.

The Yeggy-Trevor Motor Co., which operated a garage and salesroom in Rock Island, Ill., has been dissolved, A. W. Trevor retiring from business. His partner, G. A. Yeggy, will continue the business under his own name, relinquishing the Overland agency, which was held individually by Trevor, but continuing the agency for Knox gasoline and Woods electric cars.

Emil Metzger, proprietor of the Reliance Garage, 100 South Madison avenue, Peoria, Ill., has been sued for \$10,000 damages. The complaint alleges that when Metzger purchased the Central City Garage he agreed not to start a taxicab business until after 1915, but that instead he already is operating a taxicab livery. The damages asked are for violation of this agreement.

Schedules in the bankruptcy proceedings against the Victor Auto Supply Co., of New York City, show liabilities of \$33,355 and assets of \$1,828 in cash and tools. Frank J. Dorlan, the hotel clerk, who was president of the company and who was sentenced to prison last week for embezzlement is listed among the creditors, with \$25,202. He used most of the hotel money, which he stole, to keep the supply company afloat.

The Oldsmobile Co. of Minnesota, which has been incorporated to do business in that State and which has taken over the Olds agency in Minneapolis, has secured temporary quarters at 1202 Hennepin avenue. Later it will locate in a fine new building at No. 1629 on the same avenue. W. J. Mead, general manager of the Olds Motor Works, is president of the Minnesota company, R. N. Mosher is treasurer, Standish Backus, secretary, and F. R. Barlow, manager.

PENNSYLVANIA

"Guaranteed"

INNER TUBES

"No. 503"

A high grade tube selling at a moderate price

For months the Pennsylvania Rubber Company has been experimenting on the development of a genuinely serviceable automobile tube which could be sold at a reasonable price. The Pennsylvania "No. 503" is the result.

Each Tube is Guaranteed

This tube has been so thoroughly tested, is so well made and of such high quality material that it carries an unqualified season's guarantee.

Pennsylvania "No. 503" Tubes are made in the most popular selling sizes:

28 x 3	34 x 3½	34 x 4	36 x 4½
30 x 3	30 x 4	35 x 4	37 x 4½
30 x 3½	31 x 4	36 x 4	36 x 5
31 x 3½	32 x 4	34 x 4½	37 x 5
32 x 3½	33 x 4	35 x 4½	37 x 5½

Persuant to the policy adopted by the Pennsylvania Rubber Company at the time of its re-organization, February 1st, 1910, we have contemplated an attractive margin of profit for the trade, in placing this tube on the market.

Jobbers and Dealers Desiring to Sell Automobile Inner Tubes for Profit Should Write Us.

PENNSYLVANIA RUBBER CO., Jeannette, Pa.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, OCTOBER 19, 1911.

Automobiles for Municipal Service.

Despite the many stumbling blocks which beset the paths of the municipal engineer and the manufacturer who is anxious to see his product installed in city service, the opportunities for automobile development which the modern city presents are manifold and most alluring. Furthermore, there can be no question that in process of time practically all of the enormous transportation of cities will be carried by automobiles. With the more general use of motor vehicles by individuals and private corporations heavy contracts for passenger vehicles and trucks destined for city service logically are bound to follow. Special apparatus for street cleaning, garbage disposition, street repairing and even remote works are plainly evident as future realities.

Yet at the present time the fire departments alone seem to have mastered the problem of successful introduction and put

the municipal motor car on a safe and sane footing alike with the administration and the taxpayer, though they have done so not so much by superior acumen as by the very urgency of their need. As far as passenger conveyances and standard commercial trucks are concerned, the situation still is troublesome.

The average tradesman who has dodged the sharp corners of ancient charter regulations, circumventing tricky modern ordinances and wrestling with problems of graft and incompetence is apt to be in the frame of mind of one of the class who declared himself as "sick of the whole blamed smear." From the mercantile point of view there is very little money in the municipal market at present; that is, where fair standards of civic honesty prevail.

Observers who have watched the development of New York's interesting experiment, some of the details of which are printed elsewhere in these columns, are gratified to learn that a measure of slow but certain progress is being made. In at least one department the expensive and discreditable practice of joy-riding has been reduced to terms by the adoption of a simple cross-check system of accounting such as any other business corporation than that of a great city would have seen the need of from the very beginning. Henceforth in that department whatever joy-riding is done will be done through the breaking down of the system. In other words—and taking this practice as symbolic of all that goes to make New York's automobile experiment a costly one—everything depends on the administration.

The way to betterment has been made plain enough for all to see. Just as is true with any other installation of business vehicles, the first step is to determine through a standard accounting system what the transportation needs really are; the second, to determine what sort of equipment best will satisfy them; the third, to adopt a routine method of operation; the fourth, to put that system into operation and see that it is not broken down.

As business corporations, big cities are more or less like overgrown and very naughty boys. They mature slowly, but they are full of promise and they generally come out all right in the end. Incidentally, the present and seemingly exorbitant cost of operating New York's ill-assorted and tattered array of motor cars will bear close analysis. Scandalously high it un-

doubtedly is, but by comparison with other of the city's expenditures, the glories of its shame diminish. And when its direct effect in reducing the outlay for horse upkeep is contemplated the effect is most cheering, for it indicates something of what eventually will be brought about.

Position of the Electric Vehicle.

Whether due largely to the activities of the Electric Vehicle Association of America, as some supporters of that promising organization would have it believed, or wholly to natural processes, the fact remains that the cause of the electric vehicle is being strengthened very rapidly. This is particularly true of the commercial vehicle, a circumstance which alone leads to the supposition that, with all deference to strong publicity efforts, logic and business economy have had a great deal to do with the case. While the upbuilding of the entire commercial vehicle industry has been rapid and most encouraging since the movement really gained appreciable headway, it would seem that in the realm of the delivery wagon the progress of the electric has been more rapid than that of the light gasoline car.

This conclusion points directly to the segregation of apparatus according to service and the practical isolation of the electric in the short-haul field—which is just what its advocates have claimed to be its proper sphere. Some of them go even further than this and allege that properly speaking no real rivalry should exist between the two classes of equipment. Assuming that the operators of large installations, whose interests naturally lie in the direction of highest efficiency, really have studied the problem from all possible points of view, it certainly is significant that their purchases contemplate principally the use of the gasoline machine in long-haul, heavy duty service.

"The field of the light gasoline car is so well defined in long-haul, light load service and in circumstances which demand running over bad roads and, similarly, the advantages of the electric are so marked where the runs are short and the pavements uniform, that the natural separation between the two classes of machine should be perfectly evident," said one man in discussing the point. "Saving in the imagination of over-zealous salesmen there never was any real rivalry between the electric and the gasoline car."

Philadelphia, Pa.—Quaker City Supplies Co., under Pennsylvania laws, with \$10,000 capital; to deal in automobiles and accessories.

Grand Rapids, Mich.—Cogswell Motor Car Co., under Michigan laws, with \$10,000 capital; to manufacture and deal in automobiles and motors.

Soranton, Pa.—Eureka Motor Car Co., under Pennsylvania laws, with \$25,000 capital; to manufacture and deal in automobiles and accessories.

Chicago, Ill.—Harbeck Motors Co., under Illinois laws, with \$50,000 capital; to manufacture motors. Corporators—A. T. Ewing, E. S. Hartman, C. Bender.

Chicago, Ill.—Chicago Motor Omnibus Co., under Illinois laws, with \$1,000 capital; to operate motor vehicles. Corporators—Henry P. Schandler, J. M. Johnston, K. Cornwell.

Kenosha, Wis.—Purdy Garage Co., under Wisconsin laws, with \$10,000 capital; to deal in automobiles and maintain a garage. Corporators—Frederick Purdy, C. H. Nellis.

Pella, Iowa—The Pella Motor Car Co., under Iowa laws, with \$10,000 capital; to operate and deal in automobiles. Corporators—W. H. Fowler, H. P. Van Grop, E. J. Van Grop.

Albany, N. Y.—The Tri-City Motor Co., under New York laws, with \$5,000 capital; to deal in automobiles. Corporators—Rutherford B. Hayes, Harold F. Andrews, Arthur S. Andrews.

Buffalo, N. Y.—The Baker Bros. Motor Co., under New York laws, with \$10,000 capital; to deal in automobiles. Corporators—Edward Green, Edward H. Baker, Clarence W. Baker.

Fond du Lac, Wis.—Service Motor Co., under Wisconsin laws, with \$5,000 capital; to deal in automobiles and motor vehicles. Corporators—W. T. Mitchell, E. G. Mitchell, W. A. Meikeljohn.

Indianapolis, Ind.—Madden-Copple Co., under Indiana laws, with \$1,000 capital; to repair automobiles and motor vehicles. Corporators—Thomas Madden, Tom E. Madden, Elbert Copple.

Chicago, Ill.—University Taxi Service Co., under Illinois laws, with \$2,500 capital; to operate taxicab and livery business. Corporators—Frank H. Drury, W. Perry Hahn, Walter D. Launder.

Jersey City, N. J.—Sterling Top and Equipment Co., under New Jersey laws, with \$50,000 capital; to manufacture motor cars and accessories. Corporators—F. Grundy, W. C. Rands, C. Copp.

Elmira, N. Y.—Heater Muffler Co., under New York laws, with \$50,000 capital; to manufacture appliances for automobiles, motors and engines. Corporators—W. Kinzie, L. D. Curran, A. G. Ingham.

Chicago, Ill.—South Shore Garage Co., under Illinois laws, with \$12,000 capital; to conduct taxicab and automobile business. Corporators—Charles M. Mudge, H. U. Mudge, L. C. Stewart, E. A. Fleming.

New York City, N. Y.—Russian Tire Co., under New York laws, with \$30,000 capital; to deal in automobile tires and rubber goods. Corporators—O. Braunwarth, H. Weiss, New York City; J. Klein, Hawthorne, N. J.

Dayton, O.—Acme Carburetter and Mfg. Co., under Ohio laws, with \$10,000 capital; to manufacture carburetters. Corporators—Charles S. Barkeler, W. H. Johnson, E. Leibel, McCallay, Lester Carson, Charles E. Margerum.

Meridian, Miss.—Meridian Auto School and Garage Co., under Mississippi laws, with \$10,000 capital; to maintain a garage and conduct an automobile school. Corporators—William M. Stone, Jr., J. M. McBreather, R. E. Stone.

Dayton, O.—Baker Taxicab Co., under Ohio laws, with \$10,000 capital; to deal in and operate automobiles and motor vehicles. Corporators—George L. Baker, Frank R. Baker, Harry W. Baker, John N. Van Deman, Charles D. Heald.

Nowata, Okla.—Nowata Motor Car Co., under Oklahoma laws, with \$2,500 capital; to deal in automobiles and operate a garage. Corporators—Walker K. Campbell, Independence, Kan.; George Gordon, Stanley J. Campbell, both of Nowata.

Owego, N. Y.—Motor Specialties Co., under New York laws, with \$175,000 capital; to manufacture motors, engines and motor vehicles. Corporators—A. Lovell, Plainfield, N. J.; H. H. Williams, New York City, N. Y.; H. V. Walsh, Brooklyn, N. Y.

Little Rock, Ark.—The Auto Supply Co. of Little Rock, under Arkansas laws, with \$10,000 capital; to deal in automobiles and motor supplies. Corporators—President, George McLean; vice-president, W. A. Lombard; secretary-treasurer, W. H. McLean.

Cleveland, Ohio—Broadway Garage and Livery Co., under Ohio laws, with \$10,000 capital; to deal in automobiles and maintain a garage and livery service. Corporators—Frank Popicki, Frank Puritowski, Henry Muszynske, Alexander Maryofsky, B. K. Zbornik.

Cleveland, Ohio—The Automobile Owners' National Association, under Ohio laws, with \$5,000 capital; to obtain statistics affecting manufacture and sales of automobiles. Corporators—Arthur Cobb, S. H. Blakeslee, J. A. Suster, M. Goodhue, G. S. Beckwith, all of Cleveland.

October 12-22, Berlin, Germany—International automobile show in Exhibition Hall, Zoological Garden.

October 14-25, New York City to Jacksonville, Fla.—American Automobile Association's eighth annual national reliability tour for the Glidden trophy.

October 21, Minneapolis, Minn.—Columbia Heights Hill Climb under auspices of the Minneapolis Motor Club.

October 27-November 3, Chicago, Ill.—1,000 mile reliability contest under auspices Chicago Motor Club.

October 28, Newark, N. J.—Newark Motor Club's reliability contest.

November 1, Waco, Texas—Racemeet under auspices Waco Automobile Club.

November 2-4, Philadelphia, Pa.—Reliability contest under auspices Quaker City Motor Club.

November 3-4, Columbia, S. C.—Automobile Club of Columbia's track racemeet.

Nov. 3-11, London, England—Society of Motor Manufacturers' and Traders' annual show in Olympia Hall.

November 4-6, Los Angeles, Cal.—The Phoenix road races under auspices Maricopa Automobile Club.

November 9, Phoenix, Ariz.—Track races under auspices Maricopa Automobile Club.

November 9-12, San Antonio, Texas—Racemeet under auspices San Antonio Automobile Club.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

November 29, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

November 30, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

January 6-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual show in Grand Central Palace.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association annual show at Wayne Garden.

January 27-February 10, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in Coliseum and First Regiment Armory.

Glidden Tour Becomes a Fearful Mud Wallow

Less than Half-way to Jacksonville, Heavy Rains, Southern Mud and Swollen Streams Play Havoc — Brave Start, Resembling a Road Race, Followed by General Upset of Schedule and Scores—Maxwell Team Alone Retains Unblemished Record.

Winston-Salem, N. C., October 18—The Glidden tour became almost a rout today. Of the 64 contestants who started so bravely from New York but 25 are here tonight. Following the terrific rain storm cars were strung out all along the route

New York City on Saturday last, 14th inst., and more than that it is the second largest event of its kind that ever was held in America. The cars of 64 competitors, alternately headed and flanked and followed by 10 others containing officials, timers, judges and newspaper men—a total

largest reliability tour was started exactly 10 years later than its larger prototype, which was the original touring contest to be held in this country. The first one was started on September 9th, 1901, under the auspices of the Automobile Club of America, and those who have good memories will have little difficulty in recalling how some 80 cars were sent away from New York City on what then was considered to be an enormous undertaking—a six days' journey of approximately 465 miles to Buffalo, N. Y.

That the run was no "joy ride" (they scarcely knew what such journeys meant at that time) and was in truth a terrible test, for the halting cars of a decade ago is history; but 41 of them reached Rochester, 394 miles away, where the tour was terminated on September 14th, 1901, owing to the assassination of President McKinley.

But the present Glidden tour is no "joy ride" either, despite assurances and hopes bred of reports of the excellent roads which would be encountered, that it would be one. On Tuesday night, 17th inst., with 438 miles of the journey covered, the tourists being in Roanoke, Va., but two teams of the 18 that started were able to exhibit perfect scores, while of the 10 unteamed

MAXWELL TEAM AT HEAD OF THE LINE IN NEW YORK

and few of them were able to make the night control on time. At first it was decided not to make a start until the roads had dried out a little, and the pilot car was sent out to make an investigation in the meantime. Eventually a start was decided on, but schedules were thrown to the wind and the cars were started almost when the drivers pleased for a terrible mud plug from Roanoke to Rock Mount, 30 miles away. Few of the cars were able to travel on other than low gear and the swollen fords and slippery hills were twin terrors to all. Of the 25 who got here tonight, many of them arrived long after dark; the others are not expected till tomorrow. A wilder night ride scarcely can be imagined. Regarding scores scarcely anything is known beyond the fact that the Maxwell trio got in on time and retains its perfect score.

The big "if" which at one time threatened the demise of the 1911 Glidden tour has lost its significance. The tour was started, as per much revised schedule, in

IN JERSEY CITY, WHERE THE REAL START WAS MADE

of 74 all told—were sent away on the first leg of their 1,460 miles journey to Jacksonville, Fla., where they are due on Wednesday night, October 25th.

By a curious coincidence this second

competitors who started only three retained unblemished records. The clean score artists are the Tarrytown team of three Maxwells and the Waltham (Mass.) team of three Metz cars; of those that are

not teamed the two Mitchells, Nos. 26 and 73, entered by the Ad Men's Club and Chamber of Commerce of Anderson, S. C., and the Winston-Salem Board of Trade, respectively, and the Haynes (No. 72), entered by John Keiley, of Atlanta, Ga., have perfect scores.

This is the third time that the Charles J. Glidden trophy has been competed for by teams of cars. Because it is three years since the trophy was competed for in this way it may have been forgotten. The first team competition was held in 1907, and that year and the following year teams composed of the cars of members of affiliated automobile clubs strove for the prize. This year the teams are composed of three cars each, the only condition imposed in the teaming being that the owners of each car in a team must be from the same city.

GOVERNORS SMITH AND WILSON

The tour is designated by the American Automobile Association, which organization is running it, as a Grade IV contest. Which is to say that penalties will be imposed for lateness at controls only, preliminary inspection, penalties for road work and the final technical examination being omitted. To the team making the best score will go the Glidden trophy. In case of a tie the winners will be decided by lot. Indicative of the interest which the tour has raised in the South, the city of Anderson, S. C., has donated a handsome trophy to be known as the Anderson trophy, and which will be awarded to the individual owner whose car makes the best score on the run, regardless of whether that car is in a team which is competing for the Glidden trophy or not.

As a matter of fact, the whole tour is permeated by the spirit of the South. The route lies South and nearly 80 per cent. of the entrants are from Georgia or South Carolina or Florida. Adding further to the unmistakable Southern atmosphere, Georgia's highest official, Governor Hoke Smith, and his daughter are participants, and competitors, too, in a 1912 Maxwell. Incidentally, this is the first time that such a high government official has become so

prominently connected with a purely sporting event. The route of the tour is over the proposed National highway from New York to Atlanta and Jacksonville, and though the mileage is only about half that covered in the 1910 tour 10 States will be traversed.

Long before the time for the start the cars were lined up on 41st street west of

generally and giving the last few touches to equipment. And what a pile of equipment some of the cars carried! They nearly all carried blocks and tackle; all had a few extra cans of oil; extra tools were scattered over tonneau floors without regard to order, and one man was thoughtful enough (or thoughtless enough, according to those who did not have them)

start away with a big bag of sand for ballast. Some of the cars were just a little bit crowded, however, and eventually an equitable division of passengers was made and all the cars were filled.

Though the tour did not start, officially, until Jersey City was reached, the real start was made promptly at 9 o'clock from in front of the A. A. A. headquarters on Fifth avenue, at 41st street, and from there down to the ferry, Metropolitan motorists, at least, had the time of their lives. Headed by a big red car bearing the insignia of the New York Fire Department, and in which rode Commissioner Johnson, the tourists made the trip downtown at a speed that was variously estimated at from 20 to 40 miles an hour, but which probably was not less than 30. There were no traffic stops, nor rules of the road, nor anything else except "get there and get there quick." Motorcycle "cops" held the rest of the traffic in check and got quite indignant if it interfered with the Glidden procession, and if a driver could not pass a trolley car or other vehicle in the right way, why he went the other way and no one said a word.

Of course, all the cars could not be put on one ferryboat, and so they went over in sections. There was no changing of licenses on the boat either, as is the usual

MISS BIRDIE MARKS (MAXWELL) THE ONLY WOMAN CONTESTANT

Fifth avenue. That is, some of them were; some of them were on Fifth avenue, and nine of them did not show up at all. The nine absentees were H. M. Atkinson (Packard), C. J. Hood (Columbia), W. E. Aycock (Knox), R. D. Drysdale (Cadillac), Henry Tift (Rambler), Roberts Motor Car Co. (Flanders), Asa G. Candier (Lozier), H. H. Raymond (Oldsmobile) and Lindsay Hopkins (Overland).

All of the teams were there, however, but the Maxwell trio was the only one that really looked like a team. The three cars were identical and the drivers and their "left hand men" were clad in spotless white. The cars are numbered 1, 2 and 3 and were first in line. Some one said they had been "on guard" all night to insure the position, but corroboration was not forthcoming.

Not all of the participants are of the sterner sex, either. More than a score of them are ladies, and disdaining the services of mere man, several of them drive their own cars and handle them like veterans, too. Of these, Miss Birdie Marks, of Georgia, is perhaps the most conspicuous. It is said that Miss Marks came all the way from Europe in order to drive in the tour and she sticks right with the bunch all the time.

It is probable that the residents of that ordinarily quiet street have not seen such a scene of bustle and bother for many a year. Everybody was busily engaged strapping on trunks and fastening things

R. M. OWEN AT THE WHEEL OF THE REO PILOT CAR

to provide a shovel—of the variety that Italians use most when they dig holes in New York streets for subways and sundry other purposes.

Though it might be supposed that there would be little difficulty in obtaining passengers for the trip such was not the case. Several of the cars came very near not starting because the owners could not obtain the four passengers that the rules required to be carried, and one man had to

custom, because for the day the New Jersey "pay-as-you-enter" restriction had been removed, though everyone did not know it, and the wise ones proceeded to put the fear of the Jersey laws into the hearts of the timid. But it did not work; they were not as green as they looked, though one man—he rode in a green car, too—wrote out a fake Jersey number on a piece of cardboard and would have hung it on his car except that he "caught on" in time.

When the cars all were on Jersey soil they were parked out on two sides of the City Hall, while Governors Wilson, of New Jersey, and Hoke Smith, of Georgia, got together and shook hands and stood talking for such a long time that a young lady in one of the cars got impatient and wanted to know "if it always took that long to induce Jerseyites to take a ride in an automobile." Finally Governor Wilson joined Governor Smith in the latter's Maxwell—it is part of the plan of the tour to have the Governors of the States through which the procession passes join Governor Smith in his car and ride to the boundary line of their respective States—and after a few more speeches by Mayor Wittpenn, which not many heard, the checking out process was begun.

The cars were sent away at one minute intervals, and right away the tour became a race. Nobody wanted to tour alone, and to catch friends who had been sent on ahead almost any number of minutes up to 64, which was the number of cars that were checked out, required a pretty wide open throttle most of the time. It might be well to add that there were no such things as speed limits for the Gliddenites, or if there were nobody regarded them and nobody was "pinched."

"Say, what is this, a road race or a tour?" the Motor World man was asked, when a

to make adjustments if they become necessary.

The roads were excellent, but the dust was very thick and some of the tourists were anxious for the welfare of Governor Smith, for he was one of several who made the trip to Trenton—at something like 40 miles an hour—without goggles. Everywhere along the line of march the natives

ton for luncheon the start for Philadelphia was made. The roads were rougher than those encountered in New Jersey, or they seemed to be, and the dust was just as bad as ever. Also the pace that was struck was just as fast, and the only time the car in which the Motor World man rode was slowed down to 25 miles an hour was when an irascible bridge tender rushed out in

GOV. SMITH AND THE PENNANT THAT HE FLIES

THE "WELCOME" SIGN DISPLAYED AT THE VIRGINIA LINE

stalled railroad train just outside Jersey City necessitated an involuntary stop. But before he could answer one of the Gliddenites piped up: "Yes, it is—it's both and it's neither. It is likely to be a race to Philadelphia, but from there on it is supposed to be a sort of take-it-easy tour." But it was not. Anyone who has been on a reliability tour knows that nobody misses a chance to "loop it out" whenever they can in order to have plenty of time

turned out and waved flags and handkerchiefs and aprons, and in nearly every town a delegation met the procession and handed out flags bearing the name of the town. According to the number of flags that were distributed and tied on the cars by the time Trenton was reached some of the cars at least ought to be able to give a correct imitation of a college boy's room when they get to Jacksonville.

After an hour and a half stop in Tren-

front of it and, excitedly waving his arms, asked if the driver "didn't see that there sign," which cautioned against a greater speed than eight miles an hour. It was learned afterward that he had stopped every car in the tour and got just as much worked up over every one.

Governor Tener of Pennsylvania was supposed to meet Governor Smith at the end of the Morrisville Bridge but he did not meet the Georgia Executive until that night in Philadelphia. Arrived at Philadelphia the cars were checked out in front of the Walton, and afterward parked in the inclosure in the City Hall. Entertainment was not lacking. There was a smoker at the Walton for the men of the party, and the women's auxiliary of the Automobile Club of Philadelphia entertained the women.

There was also a dinner at the Union League Club, given by Howard Longstreth, chairman of the Touring Board of the A. A. A.; Powell Evans, president of the Automobile Club of Philadelphia, and Robert P. Hooper, president of the A. A. A., at which were present Governor Smith, Charles J. Glidden, State Senator Sproul and others.

The total mileage for the day was 95.1, and all of the cars made the trip without incurring penalization.

Gettysburg, Oct. 15.—The second day of the run had a materially different outcome from the first day. It rained hard all the morning and the run from Philadelphia to

Lancaster, 67 miles, the first half of the day's journey, was hard going for some of the cars. The afternoon stretch, from Lancaster to this place, wound up with penalizations for eight of the cars. Two of them were Halladays, competing in the Albany (Ga.) team. No. 34 Halladay was debited 63 points for lateness, caused by tire troubles, and No. 36 was charged 31 points

which have the most toll gates have the worst system of roads, but as regards a large part of the Lancaster Pike this is not so. The road is in fine condition. So, too, is the road from Lancaster to York, although, according to the custom, the roads in York are very inferior. Columbia, Pa., has some brick water breaks or cross road gutters that are terrors on springs. As a

the motorists had to climb high into the foothills and then drop down on the other side. An early start was made, in order to give the cars every chance to get through unscathed, and the running schedule was so liberal that it achieved just that purpose. A great many of the cars had their troubles ascending the grades, but none failed.

On the other side, where the cars cut into Charlestown and then ran the rest of the way to Winchester, it was easy going. All this time the weather was bad, a heavy mist being on the ground. The sun was trying hard to get through the clouds to cheer the damp drivers. This it did not succeed in doing until later in the afternoon.

It was just beyond Charlestown that the tourists who came after found a big Pierce-Arrow lying on its side. It had gone off the road on a curve and hit a telephone pole, and to its top was pinned a sign, which read: "No one hurt or even scratched," to satisfy the many who stopped. It was the starter's and press car, owned by O. A. Britson, of South Dakota, who drove it. R. E. Anderson, another South Dakotan, E. L. Ferguson, the A. A. A. official starter, and H. P. Burchell, of the New York Times, were in the car when it tipped over.

In the afternoon the tourists got an early start from Winchester, and hurried over

TOWNSPEOPLE GATHERED TO WITNESS THE "ROAD RACE" PASS

for time lost in straightening out a bent rim, caused by getting caught in a car track.

Misunderstanding of the rules was fatal to three of the Cadillacs, two of them, Nos. 28 and 29, being members of the Florida team. Cadillac No. 74, of the Live Oak team, was another to suffer through a misunderstanding regarding checking out. The penalties on Nos. 28 and 29 amounted to 19 points all told, and the other Cadillac received 3 points. J. M. Marsteller, in charge of Chalmers No. 27, didn't know that separate runs stood by themselves, and thought being late at noon didn't count if he was on time at night. He paid 13 points to learn the lesson. The Chalmers is not competing in any team.

This being a Sunday the roads were lined with folks to watch the tourists go by. The rather extraordinary idea that many of the competitors have that this is a road race cannot greatly help the cause of automobilism.

It is clear the folks in Gettysburg recognize that they have something to do, because they had up two signs, one of which read: "Better Roads in 1912," and the other, "Our People are Better than Our Roads." By an arrangement concluded by Governor Tener, all the tolls at the various gates were paid by the State for the tourists. This amounts to a large sum in a day's run, and the idea was highly pleasing to the motorists.

It is a curiosity of touring that the places

GIVING THEM THE WHOLE ROAD NEAR GETTYSBURG

particular feature must be mentioned the last 10 miles into this city, from Abbottstown to Gettysburg. This road abounds in bad spots and bounced the Gliddenites like mechanical jumping jacks.

Staunton, Va., Oct. 16.—The Glidden tourists had a very long run to-day, but one that after the first 15 or 20 miles was not punishing. Going out of Gettysburg at the beginning of their 180-mile journey

the Shenandoah Valley Pike, a wonderful road, in fine shape, through the valley between two ranges of the Blue Ridge Mountains, into this place. A fine, sunny afternoon, with beautiful country to look at, appealed to some of the automobilists, but most of them just "beat it," with eyes for nothing but the road and the car ahead.

Some of them were in such a great hurry that they fell foul of the law in Harrisonburg, about 20 miles from here, where

THE MOTOR WORLD

it was court day, and the town was crowded. Law officers warned all the motorists to come down to about 10 miles an hour, and finally had the woman toll gate keeper, whose house is a mile out of the town in this direction, drop the bar, with instructions to collect \$10 from every carload. Argument proved availing, however, and the tourists were let go after their license

five cars are ditched far from this place, and among them is the car of President Hooper of the A. A. A. It skidded off the road and turned over, but without hurting anyone. In no case was any accident the cause of injury to contestants. The day's penalties were as follows:

H. B. Race (33-Cole), 87 points; Frank M. Hardart (41-Winton), 21 points; Caro-

mobile), 1 point; James R. Gray (6-Thomas), disqualified.

The only teams having perfect scores are the Tarrytown Maxwells and the Waltham Metzes. The Atlanta teams, Nos. 5, 6 and 7, also have apparent perfect scores, but in each case one car is out on the road and its late arrival will mean heavy impost. The contest for the Glidden trophy, therefore, has narrowed down to two teams. The Atlanta Journal team lost out when J. R. Gray's Thomas was towed into a control and therefore disqualified. The standing of the teams for the Glidden trophy to date is as follows:

Team.	Penalization.
Tarrytown	0
Waltham	0

A hilly trip to Lexington and Natural Bridge was the morning jaunt. At Lexington there was a parade of the Virginia Military Institute cadets. The afternoon began with rain that got heavier momen-

VIRGINIA'S WELCOMES—CADETS PARADE AND PRESENT ARMS

numbers had been taken down. Further along, at Mt. Crawford, they got a friendly tip to reduce speed. This place is a Shaker settlement, but apparently not a shake-down settlement.

Flanders No. 53, made ready for the road, joined the party at Gettysburg at 3 o'clock this morning, having earned a terrific penalization of 591 points for its lateness. The E. M. F. No. 42 was late because it did not leave its Philadelphia control on time. In a run like this, where nothing but lateness counts, the returns are laconic in the extreme.

No penalizations were recorded at the end of to-day's run, except that E. M. F. No. 42 was still unreported late this evening.

Roanoke, Va., Oct. 17.—This day's operations caused much confusion. The run purposely was short, about 90 miles. A terrific rainstorm in the afternoon, however, made the already hard road from Natural Bridge to this place so much more dangerous that penalizations were many, and late to-night there are still a half dozen cars out, which will spoil several team scores. Because many of the contestants lost a lot of time on account of the way they were hampered on the narrow roads by the others, willfully or otherwise, Referee Walker decided to add 26 minutes leeway to each one's running time. The decision saved a lot of folks from penalty, but it did not please everyone.

It was a day of mishaps. No less than

lina Portland Cement Co. (43-Ford), 125 points; J. Howard (46-White), 4 points; L. C. Denmark (47-Cadillac), 23 points; J. R.

VIRGINIA'S WELCOMES—THREATENED WITH ARREST FOR SCORCHING

Sandlin (51-Cadillac), 13 points; James K. Brennan (52-Packard), 14 points; J. M. Downing (56-Marathon), 72 points; Dr. V. L. Hutton (58-Marathon), 9 points; Martin & Reese (59-Cadillac), 5 points; I. M. Powell (65-Oldsmobile), 4 points; E-M-F Atlanta Co. (61-Flanders), 7 points; E. Rivers (64-Pierce-Arrow), 3 points; Atlanta Chamber of Commerce (66-Stevens-Duryea), 10 points; I. M. Powell (68-Olds-

tarily. The fords began to rise and so deep was the water that the latest comers found the going perilous, as well as difficult. Two pieces of motor fire apparatus blocked the way for the motorists, getting mired in the mud in the worst possible places. The hills were too much for some of the cars and some of them failed at critical moments and delayed many others. It was almost a ghastly day.

LIGHTNING SPEED AT SANTA MONICA

Herrick Averages Nearly 75 Miles per Hour, Effacing Nazzaro's Record—The Others Who Scored.

To Harvey Herrick belongs the distinction of having driven an automobile—a National—in a road race at a higher average rate of speed than any other driver in the world. On Saturday last, 14th inst., he won the free-for-all division of the annual Santa Monica (Cal.) road races—202.8 miles—in 2:42:24.60, which is at the rate of 74.93 miles an hour and is a new world's record.

Until Herrick finished the race, the record stood at 74.3 miles an hour and was made by Felice Nazzaro in 1908 when he won the Florino cup race in Italy. But there is greater glory in Herrick's triumph for it was made on a comparatively short course—8.4 miles—whereas Nazzaro drove over one of the longest circuits ever used in a road race. Last year, the world's record came very near to being beaten in the same race when "Teddy" Tetzlaff averaged 71.31 miles an hour, and as a matter of fact the American road record did go, Bruce-Brown's record of 70.55 miles an hour, made in the Grand Prize race at Savannah a few weeks before being eclipsed by Tetzlaff, who held the record up to last week.

Herrick's National was not the only car of that brand to show first at a finish, for Charles Merz, whose name scarcely sounds familiar unless "National" is tacked on behind, also gathered in a first prize, his victory coming in the "heavy car" race at 151.506 miles. He, too, bettered Tetzlaff's old record, his time being 2:02:38.45.

But as much in the limelight as were the two National pilots, they did not bag all the glory. Great things had been predicted for the four Marmon cars and drivers that were entered and all four of them finished "in the money." Cyrus Patschke and Joe Dawson were second and third, respectively, in the free-for-all, while Bruce Keen, hitherto practically unknown, and Joe Nikrent, were first and second, respectively, in the 231-300 inch class race, which went 151.506 miles.

Dave Lewis, at the wheel of one of those new but consistent performers, a Stutz car, accounted for third place in the heavy car race, and Harrison Hanshue, who deserted his Apperson, temporarily at least, for a Mercer, was third in the 231-300 inch class. Joe Nikrent (Buick), A. J. Charles (Ford) and B. Seibel (E-M-F), finished in that order in the light car race (under 231 inches) at 101.004 miles.

Fair weather marked the day, though the crowd which turned out was not as large as lined the course last year. Accidents were conspicuous by their absence despite

the fact that there were 32 cars on the course at one time and the finish in each race was very close, especially in the heavy car class. The summary:

Free-for-all—202.08 miles.	
Harvey Herrick, National.....	2:42:24.60
Cyrus Patschke, Marmon.....	2:45:42.73
Joe Dawson, Marmon.....	2:47:54.55
301-450 inches—151.506 miles	
Charles Merz, National.....	2:02:38.45
Bert Dingley, Pope-Hartford....	2:02:26.35
Dave Lewis, Stutz.....	2:05:56.95
231-300 inches—151.506 miles.	
Bruce Keene, Marmon.....	2:12:09.95
Joe Nikrent, Marmon.....	2:13:03.05
Harrison Hanshue, Mercer.....	2:15:41.20
Under 231 inches—101.004 miles.	
Joe Nikrent, Buick.....	1:42:21.70
A. J. Charles, Ford.....	1:45:22.85
B. Seibel, E-M-F.....	1:55:50.29

Lee Oldfield Proves His Identity.

Lee Oldfield is Lee Oldfield after all—or to be more correct, Leonides Oldfield, the former appellation being his given name. After the disaster in which Oldfield was involved in Syracuse, N. Y., when his identity was called into question, American Automobile Association officials investigated his history and it was found that according to his birth certificate, which was produced, his name really is Oldfield, despite even the assertions of a man who claimed to have known him under another name on the Pacific Coast. Oldfield, it is said, purposes instituting a large number of suits for damages against the various public prints that cast doubts on his identity and against Berna (Barney) Oldfield, who declared that Lee had been introduced as his brother.

Why Wagner Will Take Nazzaro's Seat.

Felice Nazzaro, the noted Italian race driver, will not be seen in the Grand Prize race after all. After mature deliberation the officials of the parent Fiat company in Turin, Italy, have decided to use Louis Wagner, who also has an international reputation, and he will take Nazzaro's place at the wheel of one of the Fiat entries at Savannah on November 20th next. Following the example of Lancia, who quit racing to take up the manufacture of automobiles, Nazzaro has been working for some time on a car of his own design, which, if successful, will be marketed. Deeming it poor policy to employ a driver whose sole interest is not in the Fiat car Nazzaro was "given the gate."

Rain Stops Two Eastern Meets.

On account of rain and mud the races announced for the closing day of the Danbury fair at Danbury, Conn., 7th inst., were abandoned.

The dangerous condition of the course at White Plains, N. Y., on account of recent rains caused the program of races for the 13th inst. to be abandoned. They will be held on November 7.

MOROSS DENIES DISBROW CONTRACT

Burman's Manager Offers \$2,000 for Its Production but Declares It's Wholly Imaginary—Burman's Position.

Robert Burman and Ernest A. Moross, his manager, were in New York for several days preceding Tuesday last. On that day they took steamer to Germany, where at the Benz factory Burman is to be fitted to a 300 horsepower car, which, it is anticipated, will throw a shadow on all the existing records which stand to Burman's credit, and develop such speed as to make spectators gasp.

While they were in New York Moross particularly was more than anxious to meet Louis Disbrow, who unfortunately was in California. Disbrow is the racing man who told the Motor World and a number of others that he had signed a contract with Moross to compete at Moross's Labor Day meet at Brighton Beach, which bound him not to defeat Burman. Disbrow's statement had been discussed at the meeting of the Motor Racing Drivers' Association and had been related to so many others that it was almost common gossip around New York. When the Motor World representative saw him Disbrow repeated the assertion, and went into considerable detail to explain how, when he discovered that the Mercedes car that Moross had delegated to him to drive was capable of much more speed than it generally was credited with possessing, he determined to defeat Burman "contract or no contract," as he expressed it. He further stated that he so notified Burman, and that as a result, when he appeared on the track on Labor Day, Moross hopped aboard the Mercedes, switched off the ignition, and informed him that he was free to make himself scarce. The interview with Disbrow, in which he gave voice to those statements was made in the presence of a witness, and he repeated more than once that the contract was still in his possession, but when asked if he would permit it to be seen he refused to do so.

Before he sailed to Europe, Moross stated in substance that the reason for Disbrow's refusal is simple, i. e., he does not and never did possess such a contract. Considering the nature of the accusation against him Moross was extremely self-contained in talking of the matter. He declared with the utmost sincerity that neither by word nor deed had he even suggested a contract of the sort, much less executed one. He offered to place \$2,000 in the hands of the Motor World or any other responsible source, the money to be paid to Disbrow when he produced the alleged contract. He not only denied having been party to anything of the sort, but asserted that even Disbrow's statement

that he (Moross) had boarded the Mercedes when Disbrow appeared with it on the track at Brighton Beach and relieved him of its control was a tissue of falsehoods. He laughed at Disbrow's assertion that the Mercedes was capable of much greater speed than it had been permitted to develop and that it was competent to beat Burman's big Benz.

"If that were true," remarked Moross, "Is it reasonable to suppose that Burman, our star, would not be driving it? There never was a time when I asked any man to lay down for Burman or any one else! Naturally, I gave Bob the fastest car at my command—there is nothing wrong in that—and if any one can beat him he is free to do so and the opportunity is an open one. He has not dodged any man; instead, he has gone out of his way to enter open competition. He lined up against all comers on the Daytona (Fla.) Beach last April and met the best the country affords in the International Sweepstakes at Indianapolis on May 30th, and he will do so again in Savannah next month. The only thing I have ever said to any of the men with whom I have had anything to do has been occasionally to suggest that they 'make a race of it' solely with a view of preventing runaways and to give the spectators a real run for their money. Never have I sought to shield Burman or any one else from defeat, by contract or otherwise. I, myself, am 'on the level,' and every race with which I have had anything to do is in the same category. If any one can beat Burman he is welcome to his victory and will deserve it."

Moross expects to have a personal interview with Disbrow on his return from abroad and will give the latter a chance to produce the alleged contract and earn \$2,000 and possibly "something else."

Montana Organizing State Association.

Motorists of Western Montana met last week at Helena, Mont., to form the Montana State Automobile Association, with Lieutenant Governor W. R. Allen chairman and P. M. Barnard, secretary. Representatives were present from Lewis and Clark, Silverbow, Granite, Jefferson, Deerlodge, Powell, Missoula, Cascade, Broadwater, Beverhead, Madison, Flathead and Teton counties. A committee consisting of E. P. Mathewson, A. T. Morgan and W. R. Allen was appointed to draft by-laws and designate a meeting day in November at Butte, Mont., when delegates from all sections of the State can be present and elect permanent officers.

Oklahoma Racemeet Falls Through.

The Oklahoma State Automobile Association did not hold its racemeet in Oklahoma City on the 11th inst., as had been planned. Lack of entries caused it to fall through. The association, however, is making arrangements for a big spring meeting.

NO HOODOO AT PEORIA'S RACEMEET

Ominous Date Fails to Affect It—Two Days of Good Sport, With Honors Well Distributed.

Although Friday the 13th is supposed to carry a hoodoo it failed to affect the two days' racemeet fathered by the National Implement and Vehicle Fair Association at Peoria, Ill., which opened on that day. Ideal weather, a huge crowd, good sport and no accidents combined to put superstition to rout.

The races were contested on a mile flat dirt track with rather dangerous turns, which, however, did not serve to prevent H. J. Kilpatrick, at the wheel of a Hotchkiss; Lou Heineman, driving Ray Harroun's Marmon, and C. J. Raimey, piloting a Cino, from trying for local records. They shared honors, Kilpatrick being credited with establishing what is termed a State record for five miles at 4 minutes and 32 seconds, while Heineman set up a mark of 54½ seconds for a mile and Raimey negotiated ten miles in 9 minutes and 56½ seconds.

Harroun himself did not drive; in the events for which he entered the Marmon Heineman was the pilot. In other races Heineman drove a Case and was beaten by Gus Monckmeier (Staver-Chicago), and C. J. Raimey (Cino). The three miles match between private owners driving Buicks went to Wonderlich, and the slow race on a high gear was captured by Foutz (Inter-State). Gus Monckmeier (Staver-Chicago) won the Australian pursuit race from Joe Jagersberger (Staver-Chicago), and the three miles, free-for-all handicap was won by Heineman in Harroun's Marmon. The summary:

Friday, October 13th.

One mile time trials—Won by H. J. Kilpatrick (Hotchkiss), time, 0:55½; second, Lou Heineman (Marmon), time, 0:55½; third, J. Raimey (Cino), time, 0:56; fourth, Gus Monckmeier (Staver-Chicago), time, 1:00; fifth, Foutz (Inter-State), time, 1:01½.

Five miles, class C, 231-300 inches displacement—Won C. J. Raimey (Cino); second, Gus Monckmeier (Staver-Chicago); third, Lou Heineman (Case); fourth, Knudson (Staver-Chicago). Time, 4:59½.

Two miles, Australian pursuit—Won by Gus Monckmeier (Staver-Chicago); second, Joe Jagersberger (Staver-Chicago). Time, 5:08½.

Ten miles, class E, under 400 inches displacement—Won by C. J. Raimey (Cino); second, Mortimer Roberts (Abbott-Detroit); third, Gus Monckmeier (Staver-Chicago). Time, 9:56½.

Three miles, class E, free-for-all handi-

cap—Won by Lou Heineman (Marmon); second, Maxwell (Case). Time, 3:04.

Ten miles, class C, 301-450 inches displacement—Won J. Stickney (Velie); second, Foutz (Inter-State). Time, 10:03.

Saturday, October 14th.

One mile time trials—Won by Lou Heineman (Marmon), time, 0:54½; second, C. J. Raimey (Cino), time, 0:56½; third, H. J. Kilpatrick (Hotchkiss), time, 0:57½; fourth, Mortimer Roberts (Abbott-Detroit), time, 0:57½; fifth, Gus Monckmeier (Staver-Chicago), time, 0:59½; sixth, J. Stickney (Velie), time, 1:00½; seventh, Walker (Inter-State), time, 1:02½.

Three miles match, Wonderlich (Buick) vs. Ross (Buick)—Won by Wonderlich. Time, 3:41.

Five miles, class C, 231-300 inches displacement—Won by C. J. Raimey (Cino); second, Gus Monckmeier (Staver-Chicago) third, Lou Heineman (Case). Time, 5:14.

Three miles, handicap match, Lou Heineman (Marmon) vs. Maxwell (Case)—Won by Heineman. Time, 2:57½.

Five miles, class C, 301-450 inches displacement—Won by Walker (Inter-State); second, Foutz (Inter-State); third, J. Stickney (Velie). Time, 5:21½.

One mile slow on high gear—Won by Foutz (Inter-State); second, Bert Bartholomew (Glide); third, Gus Monckmeier (Staver-Chicago).

Ten miles, class E, under 450 inches displacement—Won by Gus Monckmeier (Staver-Chicago); second, Walker (Inter-State); third, J. Stickney (Velie); fourth, Lou Heineman (Case). Time, 10:05.

Five miles time trials—Won by H. J. Kilpatrick (Hotchkiss), time, 4:32; second, Lou Heineman (Marmon), time, 4:33.

Five miles, class E, free-for-all handicap—Won by C. J. Raimey (Cino); second, Lou Heineman (Case); third, Knudson (Staver-Chicago); fourth, H. J. Kilpatrick (Hotchkiss). Time, 4:40.

Blue and Yellow for Maine Motorists.

Maine has decided to use yellow and blue license plates for the year 1912. These will take the place of the red number plates which have been employed ever since the license law first went into effect. The letters will be blue enamel, raised on yellow background. The Secretary of State has asked for bids on 10,000 sets for automobiles, 999 sets for motorcycles and 300 sets for dealers. The automobiles will begin with No. 1; motorcycles No. A1 and dealers No. B1.

Dearholt Heads the Milwaukee Club.

At its annual meeting last week the Automobile Club of Milwaukee, Wis., elected the following officers for the ensuing year. President, Lee A. Dearholt; first vice-president, Arthur C. Brenckle; second vice-president, Frederick Gettleman; secretary, Leonard E. Mayer; treasurer, Charles S. Drake.

NO CLEAN SCORES IN DENVER'S RUN

Technical Examination Decides Awards for Five Days Contest—Flanders Entry Secures the Newspaper's Purse.

After five days' travel, from the 9th to the 13th inst., during which 880 miles of good, bad and indifferent roads in the heart of the Rocky Mountains were covered, five of the 12 contestants in the Denver (Col) Times's reliability tour returned with perfect road scores. They were E. Linn Mathewson (Reo), A. T. Wilson (Mitchell), Bert Hall (Cadillac), William Thorney (Ford) and E. Fernald (Maxwell). Then it was that the technical committee started a rigid examination, which lasted two days.

As has often been the case, a perfect road score does not necessarily carry the prize with it, for although the Studebaker-Colorado company's Flanders, which was piloted by Terry Ward, was penalized 17 points for road work and being late at controls, it passed the technical examination with flying colors and without further debit, and thus secured the Times purse of \$750. On the other hand, all of the five cars which checked in on the last day with perfect road scores were penalized for loose bolts, nuts and other things. William Thorney, Ford, lost 19 points in the examination and finished second, while the third prize went to Bert Hall, Cadillac, whose penalties amounted to exactly 23 points.

Though the tour required five days for completion it was made in two jumps, so to speak, the contenders taking three days to make a roundabout journey west and south and back to Denver, when a fresh start was made, and for two days the trail led northward and then southward over an out-and-home course. It was in no sense a sociability run, even though the tourists were well entertained at the various controls, for the roads traversed, while not generally bad, included many miles that were sandy and others that were decidedly rocky. There were hills aplenty, too, and as the scene of the whole tour was laid in a section of country noted for the height of its mountains, few of the elevations encountered would be considered mere pimples.

Salida was the destination the first day, which was the longest day's travel of the tour, it being 205 miles from Denver. The cars left the Denver Times building at 5 o'clock in the morning at one minute intervals, in the following order: William Thorney, Ford; Bert Hall, Cadillac; M. B. Fletcher Everitt; E. Linn Mathewson, Reo; W. H. Thayer, Elmore; Better-Than-Air-Tire Filler Co., Buick; A. T. Wilson, Mitchell; O. S. Wilson, Flanders; Studebaker-Colorado Vehicle Co., Flanders; J.

E. Barker, Regal; Ford Motor Co., Ford; E. Fernald, Maxwell. Hartzell was the noon control, and the morning run was made in good order, a stop of a few minutes being granted at Colorado Springs in order that the hill leading to Hartzell could be taken with comfort. From there to Salida was a continuous grind up and down grades and when the night control was reached three of the drivers had rolled up penalties as follows: W. H. Thayer (Elmore), 1 point; J. E. Barker (Regal), 3 points, and Studebaker-Colorado Vehicle Co. (Flanders), 17 points.

Pueblo was the destination the second day, and the course passed through Canon City along the famous Rainbow route, where the road winds under the shadow of beetling cliffs and below them the Arkansas river. Lunch was taken at Canon City and from that point on to Pueblo many of the contestants took the wrong trail, with the result that several perfect scores were blemished. The second day's penalties were: M. D. Fletcher (Everitt), 1 point; W. H. Thayer (Elmore), 67 points; Better-Than-Air-Tire Filler Co. (Buick), 269 points; O. S. Wilson (Flanders), 10 points.

From Pueblo to Denver along the State highway very little difficulty was encountered, and most of the contestants reached the Colorado capital without incident or accident. The Buick entered by the Better-Than-Air-Tire Filler Co. continued to behave badly and when Denver was reached it was withdrawn, the penalties by that time having reached 285 points.

Cheyenne, Wyo., by the way of Boulder, Colo., was the destination on the fourth day, a route which followed the recently constructed State road, which was built by prison labor. The pike has been raised 50 or more feet above the old roadbed and the contestants raced to Marrison, the noon control, in good order. A short stop was made at Boulder and all of the eleven cars reached Cheyenne with perfect scores for the day.

The return by the way of Greeley was over what proved one of the worst roads of the entire trip. Most of the distance was sandy and considerable trouble was encountered. Six of the contestants, however, who had retained perfect scores did not suffer, but W. H. Thayer (Elmore) lost 76 points; J. E. Barker (Regal), 12 points, and Ford Motor Co. (Ford), 16 points.

The final score follows:

Owner and Car	Penalties
Studebaker-Col. V. Co., Flanders..	17
William Thorney, Ford.....	19
Bert Hall, Cadillac.....	23
Ford Motor Co., Ford.....	26
J. E. Barker, Regal.....	30
M. B. Fletcher, Everitt.....	31
O. S. Wilson, Flanders.....	35
A. T. Wilson, Mitchell.....	40
E. Linn Mathewson, Reo.....	42
E. Fernald, Maxwell.....	45
W. H. Thayer, Elmore.....	144
Better-Than-Air-Tire F. Co., Buick Out	

SPOKANE MIXES SPEED AND STUNTS

Alderson and Neher Fastest in Bore-Restricted Races—Wright and Merrill Slowest on High Gear.

H. C. Alderson, at the wheel of a Chalmers, not only lowered the track record for a mile to 1:15 at the Interstate Fair, Spokane, Wash., on Saturday, 7th inst., but succeeded in capturing the five miles for cars of 4½ cylinder bore and under, and also the five miles free-for-all, and thereby occupied most of the limelight. Floyd Neher, driving a Regal, captured the race for small cars at five miles in 7:05, and the slow race for four cylinder cars on high at 220 yards was won by H. E. Wright, Cadillac, in 2:32½. In a similar event for six-cylinder cars on high speed George W. Merrill in a Thomas made the distance in 1:54½ and annexed the honors. The summary:

Five miles, under 3¾ inches cylinder bore—Won by Floyd Neher, Regal; second, Harold Hahn, Ford; third, Vern Pence, Ford. Time, 7:05.

Two hundred and twenty yards slow race for four cylinder cars on high gear—Won by H. E. Wright, Cadillac; second, C. S. Brown, Overland; third, Ned Week, Chalmers. Time, 2:32½.

Five miles, under 4½ inches cylinder bore—Won by H. C. Alderson, Chalmers; second, William Falk, Abbott-Detroit; third, V. Volverton, Everitt. Time, 6:23¾.

Five miles, free-for-all—Won by H. Alderson, Chalmers; second, William Falk, Abbott-Detroit; third, Floyd Neher. Time, 6:23.

Two hundred and twenty yards slow race for six cylinder cars on high gear—Won by George W. Merrill, Thomas; second, R. Paulsen, Winton; third, Hugh Churchill, Winton. Time, 1:54..

One mile time trial—Won by H. C. Alderson, Chalmers. Time, 1:15.

Iowans Organize Cross State Club.

Motorists of Oskaloosa (Iowa) have formed the Cross State Automobile Club to protect a new route which has been laid out between Davenport and Council Bluffs, which reduces the distance between the extreme eastern and western end of the State 68 miles. The officers are: President, Charles E. Walling; secretary, W. R. Lacy. Vice-presidents will be selected in each of the following counties through which the route passes: Muscatine, Washington, Keokuk, Mahaska, Marion, Warren, Madison, Adair, Class and Pottawatomie.

Because of the presence of the racing stars due to the Santa Monica road race, the Los Angeles Motor Club has arranged a two-days' racemeet for the 20th and 21st inst. It will be held at the motordrome.

TRUCK RESULTS MUST BE REVISED

Wrong Method of Calculation Employed for San Francisco Contest Affects Ten Scores—Eleven "Perfects" Stand.

Although the "final" awards in the two days reliability and economy contest for motor trucks, which was held under the auspices of the San Francisco Examiner, October 4 and 5, were made last week, it seems that they were not quite so "final" as they appeared to be and that the standing of the trucks is likely to undergo a considerable change owing to the peculiar way in which the total cost per ton-mile had been figured by the experts of the technical committee. How these figures were obtained by the committee at first appeared somewhat mystifying, as the method of calculating was one which hitherto had not been used in such contests, but a close study of the figures revealed that it was not the arithmetic which was at fault, but the formula used in fixing the monetary equivalent of the penalizations.

According to precedent in similar trials, the total cost per ton-mile plus penalties should have been calculated in the following manner: Divide total cost of operation by number of ton-miles; divide total penalizations by 10, the latter quotient being the monetary equivalent of penalizations in cents; add the two quotients. The San Francisco committee, however, before resorting to addition divided the second quotient by the number of miles covered, and as a result obtained figures which considerably altered the records and standing of the ten trucks which suffered penalties, although the 11 which obtained perfect scores are, of course, in no wise affected. These differences are as follows:

Truck	Official Figures	Correct Figures
7—Brush	\$0.1815	\$0.2617
24—Reo	.0973	.1827
20—Grabowsky	.1189	.1388
6—Franklin	.1194	.28983
3—Federal	.0803	.6262
21—Kelly	.0390	.0449
9—White	.0396	.0714
11—Reliance	.0405	.5585
18—Pope-Hartford	.0577	.1470
10—Lewis	.0306	.0802

The Reo, No. 24, which, on the face of the returns won first prize in division 3K, should have been last in that division, with \$0.1827, while in the division 8K, the No. 28 Packard, should have been first, and the No. 13 Gramm second, instead of being third and fifth, respectively. That someone on the coast has discovered the flaw in the calculations, is evidenced by a belated announcement that the original figures will be revised. Nothing, however, can take first honors from the White trucks, Nos. 19 and 23, which tied with the lowest cost, 2½ cents per ton-mile.

Electric Truck Develops a New Field of Utility

Demonstrating in a novel way the extreme flexibility of the modern motor truck in its application to industrial uses, the General Electric Co., the precise relation-

the returns are sure and liberal. To meet as many of the demands of this traffic as possible and to accomplish the desired ends with economy and rapidity the General

crane and vehicle, all of stable design and conveniently arranged. The vehicle is a one-ton storage battery truck made very short and having the battery mounted on the top of the frame at the rear end. This places the greatest weight over the traction wheels and makes a splendid counterweight for the crane. The wheels are made smaller than normal, and a greater speed reduction to the drive wheels is employed to insure a high draw-bar pull when used as a 'tractor.' The springs under the front end are of double strength to bear the over hung weights liable to be handled by the crane. The battery, motor and controller are of the standard type and as a vehicle the handling presents no new features except the small radius in which the machine can be turned.

"A crane arranged to swing 180 degrees is mounted on the extreme front of the vehicle and is supported near the upper end by a pivoted 'A' frame and guy rods and at the bottom by a large ball and socket joint which allows some desirable flexibility without binding. The crane is equipped with special attachments to suit the character of the work contemplated. These consist of rope and chain slings, barrel tongs, bale grapples, box hooks, snatch blocks and small tools. For very special work other equipments are designed and built to meet the requirements.

THE BATTERY TRUCK CRANE "HAULING ON THE HOOK"

ship of which to the automobile industry is far more intimate than ordinarily supposed, has produced a new vehicle type which is termed the battery truck crane. This is, in fine, nothing more nor less than a self-propelled derrick, comparable in purpose and utility with the similar units frequently employed in railway work. A sample vehicle of this class is on view at the electrical show in New York City, which will close next Saturday evening, while the general purpose of the machine, its application and the self-sustaining economy that results from its use formed the basis of a paper by R. H. Rogers, which was read before the Electric Vehicle Association of America, at its annual meeting last week.

"Marvelous reductions have been made during the past few years in the cost of handling free flowing bulk freight by means of electrically operated machinery. On the other hand, the method of handling package freight, as such, and of the infinite variety of materials in our factories that are being changed from one kind of freight to another, is still in most cases a prolific source of high labor cost," Rogers observed.

"This line of work presents almost as many phases as it does kinds of material to be handled, its problems are intricate and its needs are varied and urgent; but

Electric Co. has devised the battery truck crane. This machine is designed to lift, carry and pull and in one, two or all three

TRUCK CRANE USED AS A TRACTOR HAULING COTTON

of these functions is found the most economical solution of almost every problem in the handling of package material. The battery truck crane . . . is a neat and mechanical looking combination of hoist,

The height of the crane can be made to suit local conditions, as several booms of different lengths can be used.

"The electric hoist is a compact weather-proof motor, controller, gears and drum in

one unit, capable of lifting one ton twenty feet per minute, handles thirty feet of cable and takes its current from the vehicle battery. This hoist is securely bolted to the vehicle frame at the foot of the crane with its cable passing up through the hollow top pivot over the sheaves and ending

unloaded with material from or to convenient piles or to other means of transportation.

"In this way 360 castings aggregating 65,000 pounds have been removed from a gondola car in five hours. This gives an average of 1.2 lifts per minute, the limit

UNLOADING A GONDOLA CAR WITH THE TRUCK CRANE

in a swiveled hook. When loads of a half ton or less are handled the pulley is removed and the swiveled hook is used direct. With loads of over one-half ton the pulley is put on and the cable end is hooked to a shackle leaving the pulley hook to carry the heavy loads. The hoist controller handle is connected to a lever convenient for the operator, who pulls to raise, pushes to lower, and lets go to stop at any point, for the lever goes to the central (off) position if released. The hoist contains, besides the automatic holding brake, a load brake which prevents excessive speeds when lowering. Lubrication is obtained from compression grease cups wherever needed. All of these practically standard and well-known components are welded into a well-balanced and convenient machine, easy to operate and maintain. . . .

"The practical time, money and space-saving applications of the battery truck crane may be divided into three classes, viz: hoisting, hoisting and carrying on the hook, towing trailers. . . .

"Where material which may be subdivided into parcels of one ton or under has to be moved through a vertical distance of ten feet or less and deposited within a six or eight foot radius, the machine is brought to an advantageous position, the brakes set, and the hoist put into operation. The boom swings back and forth between the picking up and depositing points with each load. By this means box cars, gondola cars, wagons, power trucks, trailers and lighters are loaded or

being the speed with which slings could be attached to the castings by two men. A box car was loaded with 64 800-pound bar-

rel of plumbago in 25 minutes and four cars were loaded in two and one-half hours, which included spotting the cars. This work averaged two barrels per minute, hoisted nearly five feet and swung well inside the cars. In each of the above cases, not only was the usual time greatly reduced, but fewer men were required. . . .

"This class of service is more often used than either of the others, and ranges from the transfer of a thousand packages between a lighter and a nearby warehouse to the hasty trip to the stockroom for a barrel of oil. Its flexibility, simplicity and speed make it well adapted for heavy errand work about factory buildings even when they are fully equipped with cranes and industrial railway. Derailed cars and spilled loads on the narrow-gauge railway are quickly replaced, and the line cleared by the battery truck crane.

"By this pick-up-and-run method sixty 800-pound barrels of plumbago were moved 300 feet in one hour, one helper only being used. One hundred and fifty 300-pound boxes of rubber were loaded into a box car from seventy-five feet away in fifty

BATTERY TRUCK CRANE USED IN UNLOADING A BOX CAR

minutes. Three boxes were slung together and a round trip was made every minute. "For the miscellaneous transfer of large quantities of package freight or other material through distances over about 400 feet the best procedure is to use the battery truck crane to tow trailers of about four each. To secure the maximum results there should be a train loading and another unloading while the machine with

minutes. Three boxes were slung together and a round trip was made every minute.

"For the miscellaneous transfer of large quantities of package freight or other material through distances over about 400 feet the best procedure is to use the battery truck crane to tow trailers of about four each. To secure the maximum results there should be a train loading and another unloading while the machine with

the third train is on the road between, thereby eliminating any waiting, for as soon as the load is delivered the vehicle immediately starts out with the empties from the previous trip. The number of trailers per train and the number of trains will depend on the distance, character of load and time taken to load and unload the trailers. Twelve is the usual number, divided into three trains. It will thus be readily seen that one battery truck crane and operator keeps about 600 square feet of loading space working to its full capacity, a performance that can be seen any day at the Bush Terminal.

"From the logs of a number of these machines for a long period of service in the Bush Terminal, New York, the following average week's work at towing trailers has been deduced:

Number of packages handled..	7,500
Average weight per package..	230 lbs.
Total weight handled (900 tons)	1,720,000 lbs.
Average distance packages were moved	900 feet
Of total time machine was working	80 per cent.
Packages delivered per working minute	3
Number of different jobs worked on	30
Heaviest single load drawn...	12½ tons
Cost of operator, interest, depreciation and power.....	\$24.00
Cost of moving one package 900 feet	⅓ cent
Cost of moving one ton (9 packages) 900 feet.....	3 cents

"Thirty tons of freight per hour can be moved one-half mile by this method under ordinary circumstances. For instance, 600,000 pounds of cotton have been moved one-half mile in a day, taking 24 bales per load and making a round trip every 12 minutes. This shows an average of two bales (500 pounds each) per minute through a distance of one-half mile. On a hurry order for cotton, 48 bales were alongside the lighter within 25 minutes after the order was given, thus demonstrating the flexibility and promptness of this system by which one man can handle more ton-miles than by any other method. On small package freight (canned salmon) using two trailers per train, one battery truck crane has moved 1,000,000 pounds 600 feet in 19 hours.

"A special line of trailers has been built for this work. The three wheels are 24 inches by 5 inches with roller bearings and the deck is 12 x 4 feet. The capacity is three tons if well distributed. The heavy towing tongue readily couples to the vehicle or to another trailer and no trouble is experienced in towing a long string around obstructions, as they follow perfectly in the course of the battery truck crane. In serving warehouses or shops with low doors the trailers are pushed, the front wheel of the string being steered by hand. This procedure expedites the interchange of empties for loads and vice versa at the loading and unloading points."

BUICK REARRANGES THE LEVERS

Departs Radically From General Practice
and Strikes a "Happy-Medium"—
Other Features of the New Line.

Opinions differ as to the proper arrangement of the control levers on a car built for right hand driving. It is probable that the verdict of the majority would be for the mounting of the levers inside the door on a car of the enclosed front type were it not for the fact that that arrangement not infrequently, and particularly in small cars, is apt to cause inconvenience through the proximity of the levers to the knees of the operator. In seeking a perfectly safe

BUICK ENCLOSED CONTROL SET

and satisfactory middle course the designers of the new model closed-front Buick cars have hit upon the expedient of "splitting the difference," figuratively speaking, and in eliminating the inaccessibility of the outside mounted levers and the awkwardness sometimes experienced with the inside arrangement, have mounted the levers on the dividing partition. That is to say, the levers are housed entirely save for the handles, which protrude above the side rail of the car in easy and natural positions.

The arrangement, which is here illustrated, is shown as installed on the new models 34 and 35, which just have been announced by the Buick Motor Co., of Flint, Mich. These correspond roughly to models Nos. 32 and 33 of last year's production, but in a number of respects besides that of the control are improved. As far as the control feature itself is concerned it need only be added that in principle and general arrangement it is precisely the same as the standard control mechanism. The only point of difference lies in the housing of the levers and the removal of the lever segment with its notches and slots from the lower end of the levers to the upper end. By the change it is likely that the movement of

the levers may prove to be rendered considerably more stable, while it almost goes without saying that the operations of gear shifting may be more easily performed.

Like the models already mentioned, the new chassis have a four-cylinder motor of 3¼x3¼ inches bore and stroke and built in the Buick style, which is to say with valves mounted in the cylinder heads and operated by means of overhead gear. A self-contained splash system of lubrication is used, circulation of the oil being maintained by means of a gear pump. Ignition is by a dual system using the Split-dorf magneto, and the general construction and equipment is such as experience in building immense quantities of similar motors has rendered standard.

Unlike the somewhat less pretentious models of last year the new cars are fitted with a three-speed selective type of change gear, the mechanism being of the pattern which usually is designated as "vertical," that is to say, having the lay shaft mounted directly under the driving shaft, instead of alongside it. The gear shafts are mounted on annular ball bearings, while the propeller shaft is carried on Hyatt roller mountings, as are the live members of the semi-floating rear axle.

As far as power plant and general chassis construction are concerned the two models are alike, they differ, however, in that model 34 is a two-passenger runabout, while model 35 is a four-passenger touring car. In wheel base and one or two other features outside the mere matter of body construction, they vary slightly. Model 34 has a 91-inch wheel base—one inch longer than that of the corresponding runabout of last year—and model 35 has a 102-inch base, which is two inches longer than that of the former model 33. The runabout has 30x3½-inch tires, which are the same size as those used on model 32, but on the touring car the tires have been increased from 30x3½ to 32x3½.

In increasing the prices of both models considerable additional equipment has been included. Model 34, which sells for \$900, is fitted with top, windshield and Prest-O-Lite gas tank, in addition to the more ordinary items of head, side and tail lamps, horn, tool and tire outfits. The touring car, on the other hand, now sells for \$1,060 and likewise is supplied with top, windshield and Prest-O-Lite tank. The prices of the former corresponding models were, respectively, \$800 and \$950.

Whips as "Automobile Accessories."

Whips henceforth may be included in the "accessories" for automobiles—in Germany! It seems that German cows do not mind the imperious toots of the horn and that more efficient, although old-fashioned, means are needed to drive them out of the way. Hence, a German manufacturer has supplied the deficiency by bringing out a whip for motorists, which can be folded into small compass when not in use.

ELECTRIC VEHICLES ON DISPLAY

Pleasure Cars and Trucks That Form
Part of New York's Electrical
Show—Features Disclosed.

An unusual amount of novelty marks the display of the nine electric vehicle manufacturers whose products are on exhibition at the electrical show which is drawing toward its close next Saturday evening, 21st inst., after a fortnight's run in the new Grand Central Palace, New York. Enlarged chassis and more commodious bodies are much in evidence, together with a well manifested tendency further to discard the practices of early carriage making days and build to the more modern and approved automobile standards. Several radical developments are apparent on entirely new models.

The respective makes on view are the Babcock, Bailey, Baker, Detroit, General Electric, General Vehicle, R. & L. Studebaker and Waverley. The total exhibit, including the cars which are used for demonstration purposes, includes about 30 vehicles, one-third of which are commercial cars or chassis and the remainder pleasure vehicles. Of the entire number just 21 machines are on the main floor.

The third floor of the building, which is really in the form of a second balcony, though separated from the main rotunda by a lattice, is given over entirely to automobiles—and the band. A suitable rink has been formed by roping off a path around the great floor and between the numerous pillars and there such of the visitors as are disposed to test the joys of electric motoring at no expense whatever are given "demonstrations."

The cars while not in use are stored—perhaps in view of the immensity of the floor space, "parked" would be the better word—at one side of the demonstrating track, in what by courtesy is termed a model garage. That it is so designated probably is due to the fact that a half-dozen different types of charging apparatus, including switchboards for direct and rectifiers for alternating current transformation, are installed and regularly used for replenishing the vehicle batteries.

Expressing the highest degree of vehicular convenience the new Waverley "Limousine Five," the most recent and proudest product of the Waverley Co., of Indianapolis, Ind., is one of the most striking vehicles on view among the main exhibits. It is of the modern inside-driven coupe type, the extreme length which is 144-inch wheel base renders available being made use of in the arrangement of a commodious interior capable of seating five passengers. Of these three must sit on the rear cross seat, one in a comfortable chair which is provided for the driver on the

left side of the body and about midway of its interior length, and the fifth on a universal folding seat beside the driver, which may be made to face either front or rear and which, when not in use, folds back against the side wall. The car has the standard Waverley motor and noiseless enclosed transmission, is swung on full elliptic springs both front and rear, and by reason of the separation of the battery into two sections, one of which is carried in front and the other in the rear, is of nicely balanced appearance. In the matter of appointments it is complete, its chief distinguishing point in this respect being the application of electric lighting to the steps. Whenever either of the doors is opened at night a concealed dome light beneath the sill of the body is lighted, thus causing the step and the ground immediately in front of it to be clearly illuminated. A Waverley brougham of standard pattern and a three-ton truck chassis complete the exhibit.

While the neat coupe which is shown at the exhibit of the Studebaker Automobile Co., of South Bend, Ind., is practically the same in design and construction as the corresponding model 17 of last year, it commands renewed attention by reason of the fact that its price has been reduced from \$2,400 to \$1,775. With an extra victoria body interchangeable with the coupe, thus making a summer and winter equipment complete, the machine sells for an even \$2,000. The victoria itself, a neat and attractive model, now sells for \$1,500, instead of \$1,850. A covered platform truck and a light delivery wagon likewise are shown.

The Bailey exhibit is graced with a new type runabout, the model on view being an "endurance car," which recently completed the 250 miles run to New York City from Boston, Mass., in 124 hours, with an average speed of 20 miles an hour, and a maximum at no time exceeding 26 miles an hour. The machine differs materially from the standard Bailey victoria, which also is on view, having an extremely low body somewhat resembling that of the conventional gasoline car type, full elliptic rear springs and a semi-elliptic cross spring in front, not to mention a tray body of wood heavily trussed with steel braces. A peculiar feature of the machine is that the motor, together with the silent chain reduction gear and the counter shaft, is boxed up in the body with the second section of the battery under the rear deck, thus silencing the action of the power plant. One of the original control features of the machine is a kick switch, by which a portion of the battery can be cut out, thereby affording eight running speeds.

The new style extension coupes which are shown by the Rauch & Lang Carriage Co., of Cleveland, O., differ from the corresponding types of last year in that they are fitted with double drop frames, whereby the central portion of the body is

brought four inches nearer to the ground. Larger wheels and an increase in the battery to 44 A-6 Edison cells are other noteworthy changes.

The construction of the Detroit electric, which is made by the Anderson Electric Car Co., of Detroit, Mich., is illustrated by the display of a handsome low-hung extension brougham, a "gasolene type" roadster, a neat little ambulance and a delivery wagon chassis. All types are shaft driven, of course, and as compared with corresponding models of last year embrace such changes as larger bodies, longer wheel bases and longer springs, frames lower by four inches, full floating rear axles, ball bearing steering knuckles, enlarged brake drums and a positive controller brake acting on the rear wheels.

One of the most luxuriously appointed, as well as one of the largest of the extension broughams shown is that exhibited by the Baker Motor Vehicle Co., of Cleveland, O. The machine is the new style "Special," that designation being applied by reason of the extra size and luxurious equipment of the body. The heavy truck chassis shown on the same stand is one of the finest examples of its class, indicating a careful application of standardized automobile parts.

A "gasolene type" runabout of comfortable size and de luxe equipment graces the stand of the Babcock Electric Carriage Co., of Buffalo, N. Y., as does a rather unusual type of vehicle which may be described as a coupe-landaulet, and which, like the other, has a battery equipment concealed under a false bonnet of the sort that ordinarily houses a gasoline engine. The General Vehicle Co., of New York, which builds commercial types exclusively, shows one of its 700-pound delivery wagons, which is probably the lightest commercial electric on the market at the present time, and also a 2,000-pound transfer wagon. By far the most novel feature of the commercial vehicle display is the General Electric Co.'s new battery truck crane, a portable hoist designed for yard work about industrial plants, and which is on view only in the "model garage" on the third floor of the Palace.

In addition to the exhibits of cars there are a number of displays of batteries, electric automobile lamps and lighting equipment, rectifiers, transformers and other equipment and apparatus of use to the manufacturer or operator of an electric car. Among such exhibits are included those of the Edison Battery Co., Edison batteries and battery testing device; Electric Storage Battery Co., Exide and Iron-clad batteries; Empire Engineering and Supply Co., charging sets; General Electric Co., charging sets and lamp equipment; Gould Storage Battery Co., Gould batteries; St. John Corporation, ignition battery charging rectifier sets; Standard Oil Co., of New York, lubricants; Westinghouse Electric Co., charging sets.

WEDGE PRINCIPLE IN WHEEL DESIGN

Radical Construction Makes Progress That Compels Attention—Adjustability and Long Tire Life Its Advantages.

Of many attempts to improve on the standard types of wheels, few have reached beyond the files of the patent offices. About the only notable exception to the rule is the so-called Wedge wheel, which appeared on the English market a year or so ago and which was of such radical design that few accepted it seriously. In the interim, however, it has made such substantial progress that it now is commanding respect and general notice and no longer is to be sneezed at.

Wedge Wheels, Ltd., a London concern, which produces the wheels under the patents of L. Turner, already has succeeded to the extent of placing over 600 sets of wheels in the service of the London Gen-

between certain pairs of spokes in the hub and are tied through to the band by means of rods and turn-buckles. The hub wedge

FIG. 2

is shown in Fig. 1, while one pair of wedges, assembled as in the finished wheel, is shown in Fig. 2. Successive steps in assembling the wheel are illustrated by

FIG. 1

FIG. 3

FIG. 5

eral Omnibus Co., that great 'bus "trust" having also paid royalties on 1,600 sets. A large armament, ship building and motor manufacturing company has taken out a license to manufacture the wheels for military purposes, while the controlling company itself has just opened a factory of its own and begun to build the wheels on a large scale.

The Wedge wheel construction introduces both the tension and compression principles. Instead of being assembled in the regular way and set up by the contraction of a shrunk-on felloe band, the spokes and felloe are expanded outwardly into the band. That is its radical feature. In accomplishing this object certain of the felloe segments are separated by wedges, like that shown in the upper part of Fig. 1, which are anchored to the band and drawn outwardly toward it when the bolts are set up. The effect, of course, is to expand the felloe against the band.

Similarly other wedges are introduced

Figs. 3 and 4, while the finished wheel is shown in Fig. 5.

Among the advantages claimed for the wheel are that no forge work or cold pressing is necessary in assembling or repairing

FIG. 4

it; that it may be adjusted to compensate for shrinkage at any time—even on the road, if need be—that the tensioning of the wedges tends to keep it true better than the ordinary method of wood wheel construction; that its resiliency is increased owing to the yielding nature of the assemblage; that the wheel is lighter and more durable than the ordinary type of artillery wheels.

In proof of the latter assertions it is claimed that one wheel has made a record of one million ton miles running on a seven-ton London omnibus, while as indicating its resilient qualities it is said that the first 'bus wheel installed in London has made several record tire mileages; the first tire mounted on it having run 26,900 on a six-ton 'bus. In respect to the weight question these figures are given: Wedge wheel artillery type, 216 pounds; ordinary wood artillery wheel, 224 pounds; steel artillery wheel, 423 pounds. The saving in weight thus indicated is respectively 8 and 207 pounds.

That the wedges are only a first cost, be-

ing useful in successive wheels; that damaged portions of the wheel may be replaced at slight expense and with ordinary tools and labor; that wheels may be shipped "knocked down;" that the wheels are adaptable to a wide variety of rim shapes and wheel designs in general, and that the life of a Wedge wheel is three times that of the standard artillery type, are other salient points which are urged in its favor.

Cleaning Exterior of the Radiator.

"Scale" inside a radiator is not the only cause of defective cooling. In time all radiators collect a certain amount of dust and mud from the roads and, as a result, cool air is prevented from coming in direct contact with the tubes. To clean the radiator a stream of water should be gently turned on it, but first a piece of tarpaulin should be placed behind it to prevent the motor, and particularly the magneto, from becoming wetted.

New York Makes a Start in that Direction—System Evolved to Check “Joy Riding” and to Keep Track of Cost of Operation and Maintenance.

rection. The system employed by the branch of the government in which the most headway has been made and which seeks to keep track not merely of the cars' half hourly movements, but to make the

Commissioner Fosdick is by no means the first to take cognizance of the muddled state of affairs, however, and the steps which he advocates are in line with the urging of others, notably Borough President McAneny, of Manhattan, and Aldermen Smith, Folks, Brady, Cunningham and Delaney, comprising a special automobile investigating committee. These and others have given the peculiar existing conditions much thought. President McAneny, whose department always has been noted for the conservatism of its automobile mileage requirements, enjoys the reputation of being the only official who actually knows how much it costs to run the cars in his department. The distinction is one that sundry other officials might not covet, inasmuch as in their respective cases its revelations might prove of an embarrassing character.

It is upon the accounting system which is in use in the Borough President's office that Commissioner Fosdick bases his recommendation that a uniform cost system be installed in all departments. This measure he urges not only for its intrinsic value, but also as the only legitimate way of determining the degree of centralization possible in handling city cars—even as the only proper basis of determining

REVERSE OF THE "ANTI-JOY-RIDE" REPORT CARD

Since the time several years ago when the Motor World printed the faithful and illuminating story and diary record of a chauffeur employed by a municipality and at least temporarily checked the scandalous "joy riding," efforts have been made in several departments of several cities to evolve systems that would serve not only to lessen, if not eradicate, the evil, but to render possible an accurate check on both the use and the cost of operating the cars which the taxpayers provide.

New York is one of the cities in which at least a start has been made in that di-

nitude of the problem seems to have been brought home most strongly, and probably for very good reason, is Commissioner of Accounts Raymond B. Fosdick, an individual who has been particularly active in prosecuting the affairs of his depart-

what the municipal transportation requirements really are. That the resulting records would serve as an accurate index of the doings of the city's servants when away from their desks is an interesting phase of the project which the commis-

SPECIMEN RECAPITULATION SHEET EMPLOYED BY NEW YORK'S COMMISSIONER OF PUBLIC WORKS

sioner tactfully permits himself to overlook.

The commissioner's recommendation takes the form of a memorandum addressed to the mayor and bearing date October 31d. In it he sets forth that there are at present 130 machines owned and maintained by the departments and bureaus, the original cost of which aggregates approximately \$300,000. The annual payroll for the 110 chauffeurs, whom a munificent civil service bureau has saddled with the title of "automobile enginemen," amounts approximately to \$110,000, while maintenance of the machines, including repairs and renewals for the first six months of the current year amounted to \$68,550.86. But, as the commissioner adds, "in the absence of uniform expense records, this figure only approximates the true operating cost."

After referring to the one department (President of the Borough of Manhattan) in which automobile expense records are kept which reflect the true cost of operation, he goes on to remark that where expense accounts are maintained at all in other departments they are founded on various bases. Not only are most of the systems employed inaccurate, no allowances being made for remaining service value or depreciation, but the absence of uniformity renders impossible a study of comparative costs.

One or more central garages located in each borough and a centralized, rather than an individual departmental control of the city's cars, would be instrumental in bringing about a number of improvements. It is possible, for example, that the number of automobiles actually needed for essential service, might be reduced and a corresponding degree of convenience and economy secured. Such a system, of course, would not be immediately applicable to all sorts of service, and the commissioner makes haste to except the police and fire departments from consideration. What he particularly urges is that the number and type or size of cars maintained in each of the several municipal garages could be adapted exactly to the probable requirements of the service, while the number of chauffeurs and the hours of their labor might be better regulated. Economy in the wholesale purchase of supplies and parts is likewise foreseen, while the commissioner adds that "it is more than probable that arrangements could be made with manufacturers to purchase, for the city's use, uniform types of cars at dealers' prices, with a corresponding gain in the matter of replacements through the use of standardized interchangeable parts."

Nothing of the sort is possible, however, as he points out, until a standard accounting system shall have been installed, and he urges the importance and thorough practicability of an immediate move in this direction.

As an interesting sidelight on the re-

port in question is this table, showing the state of the city's automobile equipment on June 30th last:

bureaus with which the report deals is the mileage by speedometer record included. These are the Department of Water Sup-

*Sold one car during the period.

†Includes salary of "enginemen," maintenance (repairs and renewals), and expense for cars hired.

‡Purchased four cars for \$9,239.51 and afterward sold them at cost. Operating cost includes salary of three enginemen for January, \$216.00; and rental, \$1,409.95.

Persons of mathematical inclination are at liberty to determine the average cost of the cars purchased by the various departments and also to work out by long or short division the average cost of maintenance and repairs per car, as well as to speculate on the probable causes of the resulting lack of harmony. As the commissioner of accounts observes, in slightly different language, it doesn't matter much anyhow. Being computed to different standards and lacking the all-important mileage totals, the figures are interesting, but not conclusive. That they err on the low side, if at all, is probable.

Hardly more satisfactory are the findings of the Aldermanic investigating committee, which filed its 27-page report under date of July 25th last, the report being a brief digest of the 900 pages of sworn testimony taken by the committee in its effort to ascertain the advisability of establishing a central municipal garage. As the period of its investigations is different from that covered by Commissioner Fosdick's report, it follows that the data established by the Aldermen are not in absolute agreement with those presented by the commissioner of accounts.

For example, the total number of machines in use during the year 1910 is shown to have been an even 100, 16 of the 21 departments and bureaus now employing automobile transportation being accounted for. The approximate total cost of the equipment is given as \$220,500, and the total operating cost, including livery charges for hired cars, aggregates \$176,570 and some odd cents.

In only 8 of the 16 departments and

ply, Gas and Electricity, Presidents of the Boroughs of Richmond and Brooklyn, Commissioner of Accounts, Department of Bridges, President of the Borough of Manhattan, Department of Parks for the Boroughs of Brooklyn and Queens and the Department of Correction. Forty-eight automobiles were operated during the year by these eight departments at a total operating expense for the year of \$73,148.07. The sworn statement of mileage by cyclometer reading adds up to a total of 272,228 miles, which amounts to an average operating expense averages 26.83 cents than two miles per car per day. The average operating expense averages 26.83 cents per mile, including gasoline and oil, salaries of engineers, storage, repairs, tires and sundries. At that the total and average cost figures must be regarded as conservative, since they are reduced to some extent by non-allowance for interest on investment, depreciation and other legitimate "overheads," while in one instance repair costs are omitted altogether on the innocent appearing pretext that repairs are made by departmental labor on the official premises, and, therefore, are costless.

As is usually the case with the reports of investigating committees the aldermen concluded their efforts by draughting a set of earnest recommendations based on their researches. The aldermanic suggestions in this instance are numbered consecutively from 1 to 15, with appropriate subdivisions marked (a) and (b), and set forth a number of radical opinions, as, that no car should be purchased for officials' use costing more than \$2,000, while those for subordinates should cost between \$750

and \$1,500. They embody the central garage and purchasing bureau ideas and other up-to-date features, and, if destined to bear fruit, might be considered a noteworthy memorial to a serious and well-wrought undertaking. But as they now lie moldering in the archives with the dust of three months already upon them they may be dismissed as of no further relevance.

It must not be imagined for a moment that the city's automobile expense account is high as a result of lax bookkeeping or anything of that sort. Indeed, the amount of accounting done by the various departments in an effort to find out how much their respective "rides" cost is positively stupendous—stupendous because of the misdirected energy which it reveals. As has been indicated, most of the department heads ignore the matter of mileage, and hence have no basis of comparison with the results obtained by more legitimate

andum showing that \$152.05 worth of new casings, but no inner tubes, were purchased during the year 1910, also are designated.

As further showing the painstaking accuracy of the departmental bookkeeper, a further memorandum lists in extreme detail articles "lost, condemned or disposed of" during the year 1910. Among others it is recited that "½ set" of Weed chains, 1 square key, 1 valise key and 1 Solar tail lamp were "lost while in use." Such articles as a gasoline funnel, a spark plug wrench, a tire pump, water pail, pair of pliers and a brass three-way valve, it is not surprising to find described as "lost in garage."

The most valuable part of the document, however, is that dealing with the net cost performance of the car during its 28 months of department service. Its total travel, as the record goes to show, was 14,139 miles, and as 1,892½ gallons of gaso-

of 442 miles of streets, 500 miles of sewers and 63 buildings.

Although the "master sheet" or summary, shown on an adjoining page, indicates that the various cars are used mainly by certain designated officials, it is explicitly stated by officials of the department that no one has exclusive use of any of the cars, not even Borough President McAneny himself. The car which is used mainly by the president, and which, by the way, was rescued from dead storage, after having been discarded by a former president and put into commission again at a cost of \$996, is sent out only on assignment by the properly constituted official, just like the others.

An official who can show good reasons why he should use one of the department machines on a given day and date makes application to Secretary Case, of the Department of Public Works, which is a part of the same general department, and receives an assignment. Each morning the various chauffeurs are given assignment cards on reporting for duty. These are cards dated and charted to show the assignments for different portions of that day. For example, the form here reproduced would indicate that on the day in question Commissioner Patterson required the services of the rejuvenated Peerless car, above mentioned, from 8 to 11:30 in the morning and again from 3:30 to 6:30 in the afternoon. The intervening time, from 1 to 3:30 the car was at the disposal of Mr. Albright. So much for the assignments.

In addition the chauffeur has a daily report card—"anti-joy ride card," it might be termed—both front and back sides of which are here reproduced, which is made to check against the assignments, and this card really constitutes the key to the system. Thus, on leaving the garage in the morning the date, car, driver's name, time "out," cyclometer reading and gasoline gauge reading items are properly filled. Similarly, on arriving at the first place of assignment, and later, on finishing the assignment, the clock time, elapsed time, places visited and "in charge of" or "passenger list" blanks are filled, thereby completing the performance record of the car for that particular job. At the end of the day the mileage, gasoline and time totals are added to the card, while on the back side are entered reports as to the purchase of supplies and also a complete "trouble" report. The card then goes in the diary or permanent record kept by Secretary Case, reference to which enables every movement of the car to be located, traced and accounted for at any hour of the day or night.

The sheet recording system embodies five form styles, all of which are shown in the accompanying reproductions, and all of which are practically self-explanatory. Needless to indicate, the "daily record of automobiles" is made out from the

means. In other cases, where great pains are taken, the cost still remains exorbitantly high.

An idea of the minutiae of municipal accountancy may be obtained from a glance through the 14-page inventory of the automobile equipment of the commissioner of accounts, "as of January 1, 1911." A 1905 Pierce Great Arrow car of 28-32 horsepower constituted the sole piece of apparatus, it having been purchased in 1908 for \$980. "Appurtenances" tires and "betterments" to date of inventory brought its total theoretical value up to \$1,560.95. Depreciation, based on decrease in its model and market value only, reduced this amount by \$640, leaving a net worth to the city of \$920.95. The car was sold at public auction February 21, 1911. But to return to the inventory.

Among the duly credited items are included "1 chain and lock (Yale)," purchased August 24, 1908, at a cost of \$3.50, which is reported to be in "bad condition;" likewise "1 oil can, 1 small and 1 medium screwdriver, 1 strap for battery box and 1 detachable tonneau valise," all of which are "worn." Such items as a grease gun, a gas generator, a 12-ounce hammer and "1 special iron" (history and purpose undefined), are among items mentioned as being in "fair" condition. The total value of the appurtenances named and others on the long list is \$278.71. Tire casings to the value of \$182.05, together with a memor-

lene were used it follows that its average performance was something like 7.43 miles to the gallon. The total cost figures, item by item, together with the averages per mile are as follows:

Cost of	Total	Per Mile
Gasolene	\$303.68	\$0.0215
Oil and Supplies.....	94.41	.0067
Storage and Cleaning...	640.22	.0453
Tires	679.35	.0480
Repairs	1,040.27	.0743
Depreciation	394.70	.0279
"Auto-Engineman"	2,140.00	.1520
	\$5,292.63	\$0.3757

It was the high cost per mile coupled with the fact that the car was idle a great part of the time that induced the conscientious commissioner to dispose of it.

The system by which the performance of the six cars operated by the office of the President of Manhattan Borough is kept track of and which has proved so effectual as to attract the commendation of the commissioner of accounts, not to mention the jibes of other departmental officials, is neither complicated nor liable to miscarriage through petty negligence. It involves a simple system of instruction, report and cross-check cards, together with proper sheet forms for preserving the records. The department affected by the system includes in its jurisdiction highways, sewers and public buildings, save those of the fire, police and school departments. Its duties involve the supervision

report cards just described and covers normal performance only. The "short sheet" is supplementary to this and is intended to cover repair specifications and costs, down to repairs to tires—tire replacement date being carried on the main record. In addition a complete service record of tire casings is maintained on an appropriate sheet which forms the fourth part of the record.

For purposes of comparison and performance check the facts embodied in these record sheets are collected and entered in the form of a monthly statement, in which the data pertaining to all the cars are assembled in parallel columns, first in totals, second in averages to date, third in averages for the month closed and fourth in grand total and total average forms. This presents at a glance the entire operating record of the department in respect to both cost and performance. Likewise it renders a complete accounting for the entire time of each of the cars, which is the feature relied on to put the shackles on the departmental joy-ride. The figures given in the accompanying sample sheet, "as of July 31st, 1911," are both instructive and suggestive.

It usually is reasoned by impatient individuals that New York's badness is entirely comparable with her bigness. Hence the revelations of the 1911 budget and its attendant exposition on lower Broadway are apt to be received with a succession of long-drawn groans. Figures relating to the city's automobiles are by no means excepted from the lamentation. Every department that has tested the advantages of automobile transportation is ready to convince the first listener that it is urgently in need of more facilities of the same sort.

For the maintenance of automobiles alone the sum of \$108,215 is asked, being an increase of nearly \$20,000 over the amount nominally expended for that purpose during the current fiscal year, and not to mention further expenditures of the same sort which may have been concealed beneath the well-worn "contingency" blanket. To the taxpayer who is convinced that automobiles are used by the city's servants mainly for joy-riding purposes this is almost too much for words. But here is an item or two out of another column just by way of counter-irritant: "Forage, shoeing, boarding of horses, \$1,119,951.84; decrease over last year, \$86,923.30. Hired teams, horses, etc., \$1,155,197.25; decrease, \$176,420.05. Purchase of horses, \$168,125; decrease, \$39,524. Purchase of automobiles, \$7,000; increase, \$3,000." The casual and perfectly innocent item "miscellaneous" alone amounts to \$442,039.75—the fractional appendage being particularly important, because the entire amount is exactly \$235,799.75 greater than the corresponding requirement of the 1909 budgetary affliction.

More than a million and a tenth for horse fodder and shoes, as against a hun-

dred thousand for automobile upkeep! If the latter item were not so large it might not seem quite so scandalous. Borough President McAneny has been able to show a saving of \$13,000 a year by lopping off \$33,000 for horse, carriage and automobile hire and spending \$20,000 to operate his half-dozen cars. The saving in legitimate time investment, of course, cannot be shown by figures, but the testimony of other departments that use motor transportation may be taken in this connection without the slightest question either of veracity or exactitude. They unanimously agree that it is impossible to calculate, but is of prodigious benefit to their great and beloved metropolis.

Ignition Lock With 1,000 Combinations.

To discourage and prevent the unauthorized use of automobiles, A. D. Methven, who is chief inspector at the Cartecar

factory, in Pontiac, Mich., has patented and is preparing to market a combination ignition switch and lock which embraces a number of novel features. As may be seen in the accompanying illustration, the lock is constructed somewhat after the manner of those on bank vaults and like them may be adjusted for an almost infinite variety of combinations. The switch itself is of the orthodox type and size, but until the dials are turned to obtain the predetermined combination, the switch handle cannot be moved; it turns quite easily, however, to connect either battery or magneto when the proper combination is set. The particular virtue of the device is that as no key is required none can be lost or mislaid, and in view of the fact that upward of 1,000 combinations can be obtained, it might require a greater amount of tinkering for a person other than the owner to strike the right one than it would for an expert to pick an ordinary lock and make off. The lock may be applied in place of the ordinary type of coil switch in a short time and without the use of special tools or accessories.

To Obtain Most Use from Studded Tires.

Using a steel-studded anti-skid tire after the studs have been worn down, is a mistake, says a Michelin tire man—and a costly one. For no matter how hard the steel of which the studs are made, constant use eventually will cause them to wear down. This is proved by the fact

that the best cutlery steel cannot resist the friction of a grindstone.

In districts where the roads are uniformly good, the studs are very long-lasting, and even on rough roads they will stand a great deal of work. But in time, constant usage wears them down. Even though the casing may be in good condition, the leather covering never should be made to serve as a tread. Its purpose is simply to afford greater protection against possible punctures, and to give extra support to the steel studs. Invariably the total destruction of the tire quickly follows when the leather tread is pressed into a service for which it was never intended. The casing is of no further use after the leather has gone. If the canvas is not too much worn, the envelope can be restudded and fitted with new leather or it can be fitted with a plain tread, and utilized for one of the front wheels.

It should be remembered also that the efficiency of a steel studded anti-skid tire depends almost entirely upon the air pressure maintained in it. The leather band in which the steel studs are imbedded is a great deal less elastic than rubber, and, as a result, a certain amount of stress is created between the two materials.

When Bearings May Cause Jerky Running.

While inequality of compression and the consequent jerky running of a motor generally is caused by a compression leak somewhere, it sometimes is caused by a difference of distance between the respective piston heads and the crankshaft. Which is to say that when a motor has been overhauled, more metal may have been scraped from the bearings of one connecting rod than from another, with result that when the cylinders are replaced the compression space in that cylinder is slightly larger and the compression is therefore less than in the others. The easiest way of detecting any difference is to line the tops of the pistons up and place a straightedge across them; if one piston is low it will show readily. The remedy consists of scraping the other bearings down to match the one which has been scraped too much, or else fitting a new bearing in place of it. No matter how little the difference in the heights of the pistons may be it should be corrected.

What Leaky Front Hubs May Indicate.

Leaky front hubs are by no means uncommon, but whereas the condition generally indicates an over supply of lubricant, it may foretell a shortage instead. The reason for the apparent incongruity is that very nearly all greases will liquify to a greater or less extent when subjected to a continual churning action. When in a semi-solid state the grease cannot work out because the interstices are too small. When the grease is almost as thin as water, however, aided by centrifugal force it readily oozes out.

CANNOT CUT RATES FOR INSURANCE

New York's Superintendent Interprets
New Law Forbidding All Discrimina-
tions—A. C. A. Loses Case.

Hereafter, in New York State, at least, no insurance company, or broker, can "split commission" with, give a rebate or quote special rates to, the Automobile Club of America or any other club or corporation, however large or however desirable may be their business. The New York State Insurance Department has so decided.

The ruling, which was rendered last week by W. H. Hotchkiss, superintendent of the department—who, incidentally once was president of the American Automobile Association—in the complaint of discrimination brought by several fire insurance brokers against the London, Liverpool and Globe Insurance Co., the discrimination consisting of a contract to write fire insurance policies on the cars owned by A. C. A. members at 80 per cent. of the prevailing market rate.

Both the insurance company and the club interposed a defense, the former making the most of the comparative lack of "moral hazard" and the small loss—about 20 per cent.—sustained under the agreement, while President Sanderson, of the A. C. A., maintaining the club's "right of contract," put these two questions to Superintendent Hotchkiss:

"Is it the duty of the Superintendent of Insurance of this State

"First—To accept as final and proper the rates made by a combination of companies?

"Second—To prevent the citizens of the State, individually or as members of a club, from obtaining any lower rate than is quoted by the combination?"

Answering "No" to both questions, Supt. Hotchkiss proceeded to inform Mr. Sanderson that "the discriminations aimed at by section 65 (the anti-rebate section) and by section 141 (the rate-making association section) is clearly any discrimination which may be practiced by companies irrespective of whether the rates used by such companies are those suggested by rate-making associations or not. The association suggests the rate; the company, so far as the citizen is concerned, makes and charges it. If the rebating of premiums paid in connection with indemnity against the fire hazard is wrong—and since June 23, 1911, it has been a crime—the giving and acceptance of a discrimination, amounting in effect to a rebate, is equally wrong, and, while not a crime, must, as provided in section 141, be removed whenever adjudged such by this department. The latter is perfectly aware of the tests on which its judgment must be based. It

is also aware, as should be yourself, the members of your club and all other citizens, that under the present law the giving of cut rates of automobile insurance is not only a moral rebate but a legal discrimination, unless the facts clearly meet such tests."

Mr. Hotchkiss amplified this opinion in a memorandum issued in connection with the case, in the course of which he said:

"At the hearing it appeared that, in deference to the views of the department that this was a violation of the new law prohibiting discriminations, the company has discontinued the practice and did not intend to resume it. For this reason there being some doubt as to a technical breach of the law—none of the policies written by this company for members of such club having been so written after September 1, when the law went into effect—the memorandum of the Superintendent, filed today, indicates that the pending proceeding has been dismissed.

Such memorandum, however, discusses the meaning of the new law against discriminations and its interrelation with the coincident statutes prohibiting rebating and requiring the licensing of agents and brokers, and the following conclusions are stated:

"First, That section 141, enacted by the recent Legislature, gives the department power not merely to supervise and examine so-called rate making associations but also to look into any rate charged by any corporation authorized to transact fire insurance business in the State, to determine whether such rate discriminates unjustly between risks similarly situated and having the same fire class record.

"Second, That so far as automobile insurance policies are written by fire insurance companies and insure against the fire hazard the function of the department is the same.

"Third, That consequently the department has jurisdiction to examine into the basis of rates of any rate making association which purports to fix rates on automobile policies involving the fire hazard.

At the hearing it was urged that these powers were limited to corporations forming part of such rate making associations and that to rule otherwise would be tantamount to declaring that the State of New York had undertaken to make the rates of fire insurance. As to this the memorandum states:

"There is no magic in the phrase 'rate making associations.' . . . The purpose of this section is to prevent discriminations not between corporations obligated by contract or in honor bound to accept the decision of a rate making association and companies not so obligated, but in the rates charged citizens of New York by any specified corporation authorized in this State. The rate making association does not 'make the rate,' it suggests it; the insuring corporation both makes and

charges the rate which the insured citizen pays."

In answer to the contention that in issuing an automobile policy a fire insurance corporation was giving indemnity against a transportation hazard, and therefore was doing the business of marine insurance, the memorandum states:

"The test by which this question is to be determined is not the character of the property insured but the words of the section itself. If, as previously concluded, the discrimination practiced by a corporation may after proper inquiry and hearing be ordered removed, any corporation which is 'authorized to transact the business of fire insurance within this State' is by the words just quoted made subject to a proceeding to that end. . . . This does not mean—as has been suggested in some quarters—that . . . the State has undertaken to make rates. The State has justly undertaken to unmake rates which unjustly discriminate."

The memorandum concludes in discussing the contention of the insurance company and the club that the surrounding circumstances—namely, such club's fire-proof garage, the loss ratio of previous insurances to its membership, and the like—is justifying such discrimination, as follows:

"Clearly, if a fire insurance company should give a lower rate to a corporation owning 100 taxicabs than it gave to a corporation owning 10 such vehicles, there would be little debate based upon the moral hazard of the officers of such corporation as to where such taxicabs were kept or as to the rules regulating the drivers thereof. Just as clearly would it seem to be the duty of the department to order discriminations removed where the persons in whose favor the discriminations are made are members of a single organization, there being concededly many persons of the same class owning generally the same kind of cars and employing similarly reliable chauffeurs, but who, perchance, are not associated together. . . . The same kind of an argument would justify a railroad's rebate to a big and well-managed manufacturing corporation as against a small and struggling shipper. While insurance companies are not common carriers, the principle in both is the same.

"It is thought that this New York law, as thus interpreted, carries the supervision of insurance rates and the preventing of discriminations and rebates in connection therewith much farther than the law of any other State has yet gone."

Wisconsin Adopts Red and White Tags.

Red and white will be the color scheme of Wisconsin's license plates for the year 1912. They will replace the green and white which have been in use this year. The letters will be white enamel raised on the red background.

995,925. Starting Device for Explosion Engines. Herschel B. Strunk, Detroit, Mich., assignor of one-third to Edward P. Lang, Chicago, Ill. Filed Aug. 1, 1910. Serial No. 574,974.

1. The combination with a drive shaft having an internal combustion engine connected thereto, of a spring drum loosely mounted upon said shaft; an annular ratchet secured to a face of said drum; spring pawls engaging said ratchet for preventing rotation of the latter in one direction; a spiral spring within said drum and having its outer end connected therewith; a sleeve loosely mounted upon said shaft and connected with the inner end of said spring; ratchet teeth upon the end of said sleeve; pawls co-operating with the ratchet upon said sleeve for normally preventing rotation of said sleeve in one direction; manually operable means for releasing said last mentioned pawls; a pawl and ratchet connection between said sleeve and said shaft whereby upon release of said spring when in wound condition, said shaft will be rotated to start the engine; a friction disk splined to said shaft and adapted to engage a side of said drum to effect the winding of said spring when said shaft is in operation; and means for manually operating said friction disk, substantially as described.

995,948. Engine Crank. John W. Bracken, Lakeland, Fla. Filed Apr. 20, 1910. Serial No. 556,495.

In a device of the class described, the combination of a reciprocating member of a two part driving shaft, stationary disks surrounding the ends of the driving shaft and mounted eccentrically thereto, guiding members keyed to the ends of the driving shaft, cranks slidably mounted upon said guiding members and adapted to rotate the same, a pair of sleeves surrounding the stationary disks, a wrist pin having its ends keyed to the sleeves and having the cranks and reciprocating member journaled thereon, a balance shaft and an inter-gear connection between each end of the balance shaft and the respective ends of the driving shaft.

995,949. Truck Side Frame. Albert O. Buckius, Jr., Chicago, Ill., assignor to The National Malleable Castings Company, Cleveland, Ohio, a Corporation of Ohio. Filed Sept. 10, 1910. Serial No. 581,464.

1. A truck side frame having two bearing faces at an angle to each other, a journal box seated on said faces and a strap arranged to draw and hold the box against said faces; substantially as described.

995,961. Valve Base for Pneumatic Tires. George W. Greene, Watertown, Mass., assignor to Shawmut Tire Company, Boston, Mass. Filed May 21, 1910. Serial No. 562,734.

As an article of manufacture an inner tube for pneumatic tires composed entirely of rubber and having at a suitable point upon the inner face thereof a plane patch or reinforcement composed of layers of fabric and rubber vulcanized together and to the inner surface of the tube for the

support of a metal valve stem, substantially as described.

995,976. Carburetter. Charles Edward Maud, Monterey, Cal. Filed May 14, 1909. Serial No. 495,921.

A carburetter comprising a fuel chamber having an air passageway therethrough, a fuel jet connected with the chamber and arranged to discharge in the said air passageway, an air nozzle surrounding the fuel jet, a collar provided with air passages and supporting the nozzle in the before mentioned air passageway, said collar and air nozzle being longitudinally adjustable in the air passage and with respect to the fuel jet and a valve flange slidably mounted upon the nozzle and normally closing the air passages in the collar.

995,989. Spark Plug. Joseph E. Schaefer, Jr., Detroit, Mich. Filed July 28, 1910. Serial No. 574,239.

In a spark plug, a casing provided with a screw-thread at each end thereof and having a bore extending therethrough, the bore at one end being larger than the bore at the other end so that an annular shoulder is formed within said bore, an insulating member arranged in said bore and having an annular shoulder arranged to abut against the shoulder in said bore, said insulating member being also provided with a recess at each end and a curved annular shoulder on its exterior surface intermediate of its ends, a union adapted to slip over the outer end of said insulating member and having a screw-thread arranged to engage the thread on the adjacent end of the casing, said union having an annular angular shoulder on its inner surface arranged to register with the curved seat on the insulating member, a flexible washer arranged between said seat and said shoulder, a spindle arranged in said insulating member and extending beyond said insulating member at each end, the said ends being screw-threaded, a nut arranged on the outer end of said spindle, said nut having a reduced portion which extends down into the recess in the outer end of the insulating member and being also provided with a recess in its outer face, a ring arranged in said recess, a lock nut arranged over said ring, a disk arranged on the inner end of said spindle and a series of screws having conical shaped points mounted in said casing in the plane of said disk.

995,995. Shock Absorber for Vehicles. David E. Bennett, Rochester, N. Y., assignor of one-third to George W. Watters and two-thirds to Henry McGoughran, Rochester, N. Y. Filed Aug. 31, 1910. Serial No. 597,885.

1. A shock absorber comprising a fluid containing cylinder, a piston therein, a tube extending from one end of the cylinder to the other through a corresponding bore in the piston, said tube being provided at each end with one or more lateral openings, means for controlling the flow of fluid through said openings at one end of the tube, a lever arm, and means connecting said arm to the piston for imparting motion thereto.

996,017. Axiometer. Charles M. Haynes, Chillicothe, Ohio. Filed Nov. 3, 1910. Serial No. 590,417.

1. In an axiometer, the combination of a rotatable carrier, lens-holding mechanism mounted on the carrier, yielding actuating means associated with said mechanism to cause the same to engage the lens and bring the center of the lens into alignment with the axis of rotation of the car-

rier, manual means for actuating said mechanism to release the lens, a circular scale and an index associated with the carrier, and a target having a test-line in position to be observed through the lens and outside of the lens simultaneously.

996,035. Truck Side Frame. Albert O. Buckius, Jr., Chicago, Ill., assignor to The National Malleable Castings Company, Cleveland, Ohio, a Corporation of Ohio. Original application filed Sept. 10, 1910, Serial No. 581,464. Divided and this application filed Nov. 9, 1910. Serial No. 591,483.

1. In a truck frame, a side member having overhanging end portions provided with journal box seats at the under side thereof, and a securing member extending longitudinally underneath the side frame and having its end portions secured in the overhanging portions of the truck frame, said members being adapted to engage the journal boxes and hold them to their seats; substantially as described.

996,048. Spring Tire Wheel. Richard M. Batzer, Albuquerque, N. Mex. Filed June 22, 1909. Serial No. 503,674.

The combination with a wheel having a rim provided with spaced threaded apertures, of a tread rim concentrically disposed with respect to the said first named rim, coiled retractile springs having straight alining ends, each spring being connected at its outer end to the said tread rim to lie flush with the outer face of the said rim and at its opposite inner end passed through the alining aperture in the wheel rim, bushings detachably threaded in the apertures and surrounding the inner ends of the said springs, the said bushings being held fixed when engaged in the rim, jam nuts adjustably connected with the inner ends of said springs and bearing upon the bushings whereby the wheel may be centered with respect to the tread rim, and means for preventing relative lateral movement of one rim to the other.

996,119. Automobile Sleigh. Lionel Norman, Brookline, Mass. Filed Nov. 18, 1904. Serial No. 233,243.

1. An automobile sleigh, having, in combination, a body, a source of power carried thereby, runners and wheels for supporting the body, and mechanism actuated by the source of power acting, under control of the operator, to move the runners out of and the wheels into, or the runners into and the wheels out of, operative position to support the sleigh.

996,120. Signaling Attachment for Speedometers. William J. Norton, Denver, Colo., assignor of one-half to Hamilton Armstrong, Denver, Colo. Filed Aug. 4, 1909. Serial No. 511,186.

1. In an apparatus of the class described, the combination with a speed indicating instrument including a dial having an arcuate, graduated scale, of an electric alarm, an element carrying two insulated arcuate contact plates in a circuit with said alarm, said element being movably mounted on said instrument with the two contact plates in concentric relation to said scale, means for adjusting the position of said element so that corresponding extremities of the contact plates at one end thereof may be brought in radial alinement with any graduation of said scale, a pointer pivotally mounted on said dial and a contact device associated with said pointer and adapted to simultaneously engage the two contact

plates so as to close the circuit in which they are located.

996,130. Automobile Heater. Clyde S. Pelton, Akron, Ohio. Filed Mar. 12, 1910. Serial No. 548,863.

1. The combination, with an engine exhaust pipe, of a radiator comprising a plurality of radiator units communicating with the exhaust pipe, an outlet pipe common to said units, the radiator units being so arranged as to provide a series of ducts of varying length interposed between the radiator inlet and outlet, whereby the impulses from the engine are broken up and discharged in substantially continuous stream through the outlet.

996,144. Tail Light and Traffic Signal for Automobiles. George A. Robinson and Frederick Grinham, St. Louis, Mo. Filed Jan. 23, 1911. Serial No. 604,018.

A tail light traffic signal for vehicles, comprising a brake-lever, a brake, a tail-light rotatably mounted in the rear of the vehicle, a pushing-and-pulling rod connecting the said tail light and the said brake lever by a yielding connection, a bracket

upon which said tail light is rotatably mounted, and stop pins projecting downwardly from said lamp to contact with said bracket and thereby limit the movement of the said tail light.

996,190. Hub Attaching Device. Earl S. Woodbury and George H. McKelvey, Augusta, Mont. Filed Feb. 17, 1910. Serial No. 544,442.

1. The combination with an axle and a vehicle wheel therefor, of a hub attaching device comprising a collar surrounding a portion of the hub, fastenings securing the collar to the hub, retaining means supported by the axle and engaging the collar to hold the wheel operatively associated with the axle, and spring gripping arms on the collar engaging the spokes of the wheel so that strain on the collar is in part transmitted to the spokes.

REISSUES.

13,260. Clutch. Charles Clayton Rich, Mount Vernon, N. Y., assignor to The Hydro-Kinetic Transmission Company, Mount Vernon, N. Y., a Corporation of

Maine. Filed May 6, 1911. Serial No. 625,557. Original No. 988,817, dated Apr. 4, 1911, Serial No. 573,569.

1. A clutch of the character described, comprising, in combination with drive and driven shafts, a rotor connected to the drive shaft, a rotor casing connected to the driven shaft and formed with inlet and outlet ports, and a shell casing inclosing and surrounding the rotor casing and embodying two parts, one of which is adapted to close said ports and the other of which is designed to establish communication between the ports, the shell casing having a longitudinally sliding movement on the driven shaft.

HUPP DECLARES HE WITHDREW

Tells His Side of the Story in Answering Hupp Company's Suit—Legal Proceedings Become Quite Tart.

Although in its suit to restrain R. C. Hupp and the Hupp Corporation from using the name "Hupp" in the automobile business the Hupp Motor Car Co., of Detroit, alleged that Hupp's connection with the Hupp company was terminated by the board of directors largely because of Hupp's undue activities in promoting his personal interests, Hupp, in his answer, which was filed in Detroit on Tuesday last, 24th inst., states that there was another reason. He states that he withdrew from the Hupp Motor Car Co. because in August last it decided to discontinue the manufacture of the "Little Hupmobile" runabout and concentrate on the larger and higher-priced touring car, and also because against his protests large dividends were declared instead of the money being applied to the building of a factory for the production of necessary parts.

In his answer Hupp claims that the Hupp Motor Car Co. was fully aware that the name "Hupp" would be used in designating the various companies organized by R. C. Hupp to make the Hupmobile and other parts, and that no objection was made to the use of the name "Hupp" until after he announced his new car, the "R. C. H."

Whereas the Hupp Motor Car Co. charged that Hupp's action was designed to trade on its reputation and to cause confusion, he retorts that the effort to prevent his use of the name "Hupp" in connection with the new car has as its object to lead the public to believe that R. C. Hupp is still identified with the Hupp Motor Car Co., "thereby preventing him from going before the public and stating the true facts of the case."

Hupp's answer calls attention to the differences between the R. C. H. and the Hup-

mobile and also directs the court's attention to the fact that Hupp now is advertising the R. C. H. car over his name as an individual and distinctly stating that he has no connection with the Hupp Motor Car Co., thus seeking to prevent confusion and to show that he is not seeking to profit by the prestige of the Hupp company.

No Tire Reductions Until January.

Reports that the price of tires would be reduced on November 1st have been set at rest by guarantees issued by the more prominent manufacturers that present prices will not be disturbed until the end of the year. At that time, however, it is quite generally believed that substantial reductions will be announced in sympathy with those which recently went into effect abroad.

Regal Representative to Girdle Globe.

R. M. Lockwood, manager of the Regal Motor Car Co.'s export department, sailed last week on what practically is a globe-girdling journey to extend the Royal's foreign interests. He will visit not only England and the principal continental countries, but will go to Egypt, India, Ceylon, China, Japan and the Philippines, returning by way of Honolulu and San Francisco.

Parker Assets Offered for Sale.

The Parker Motor Co., of Hartford, Conn., which some two months since made an assignment for the benefit of its creditors, has been unable to overcome its difficulties and, accordingly, its affairs will be liquidated. The assignee, J. C. Wilson, is offering the machinery, tools, patterns, unfinished motors and materials for sale at bargain prices.

Schlotterback to Make Motor Trucks.

The Schlotterback Mfg. Co., of East Orange, N. J., has leased a factory building at Fourth avenue and Ogden street for a term of five years and is preparing to engage in the manufacture of motor trucks. The building has a floor area of 40,000 square feet.

FOUR SUCCEEDS ONLY "ONE-LUNGER"

Long Island Company Finally Abandons Unusual Model and Makes Real Start —Florida Capital Assists.

After two years of unavailing effort to popularize a big "one-lunger" designed by Francois Richard, a Frenchman, and of a type which found at least a small measure of success in France, the Only Motor Car Co., of Port Jefferson, N. Y., finally has seen the light and henceforth will devote itself to the production of four-cylinder cars.

As a matter of detailed fact, the company had not gone very deeply into the production of its "one-lunger." It had one car which it exploited with a view of attracting capital, in road races and hill climbs, in various parts of the country and with extremely varying success, and according to reports it was the only car the company ever produced. It acquired a factory building in Port Jefferson, but the floor was never laid and until very recently it contained only pure Long Island air; no manufacturing machinery ever had been installed.

F. W. Edwardy, the prime mover in the company, persisted in his search for capital, however, and finally he found it away off in Florida. In April last he incorporated, under Delaware laws, the Only Motor Car Co., of New York, capitalized at \$500,000 and with himself, F. Seymour, of East Orange, N. J., and H. M. Dikeman, of Brooklyn, N. Y., as incorporators. A month later, also under Delaware laws, he incorporated the Southern Only Motor Car Co., of Jacksonville, Fla., capitalized at \$100,000, and with himself, C. N. Edwardy and D. O. Pons as incorporators.

With the capital thus obtained he was able to make some progress, and during last month he equipped the factory in Port Jefferson with the necessary machinery, and Richard having designed a four-cylinder

car, its manufacture now is being undertaken.

Like the more or less famous "one-lunger," which mounted an engine of remarkable dimensions, 5½-inch bore by 10-inch stroke, the four-cylinder model will also employ an engine of large proportions. It will have a bore of 4¼ inches and a stroke of 7½ inches, thus acquiring an A. L. A. M. rating of 30 horsepower, but there are expectations that it will develop nearer 90 horsepower. It will sell for \$1,000, and it is stated that the makers themselves will guarantee that it will attain a speed of 75 miles per hour.

Tire Men Discuss 1912 Trade Policies.

What is styled the "first trade policy meeting" held by the United States Tire Co. since its organization occurred at Hotel Astor in New York on Sunday last, 22nd inst. It was attended by all of the company's branch managers and salesmen in the Central and Eastern districts, to the number of 150. The meeting was presided over by J. D. Anderson, general sales manager, and was addressed by J. M. Gilbert, general manager, who made the principal address; A. I. Philp, manager of the Central District, and O. S. Tweedy, manager of the Eastern District, and William MacMahon, chairman of the Factory Committee. Trade policies for the coming year, and the plans for taking care of the country's tire demands were the high spots that were touched, and optimistically, too.

Penn Prepares To Go To Newcastle.

Bonds to the amount of \$150,000 having been subscribed by residents of Newcastle, Pa., the Penn Motor Car Co. has definitely contracted to remove from Pittsburg to Newcastle, instead of Sharon Pa., as was first reported. Nor has the company lost any time in making ready to begin operations in Newcastle, work having already been begun on its factory, which it is expected will be completed by January 1st. It will have an annual capacity of 6,000 Penn "30" cars.

Fire Damages Lawrence Wheel Factory.

Two drying sheds of the Archibald Wheel Co., Lawrence, Mass., were destroyed by fire on October 18th. The fire departments of several adjoining towns and villages after six hours' struggle succeeded in saving the main buildings. The sheds contained lumber and partially manufactured wheels valued at \$60,000.

Hupp Begins Work on Bigger Factory.

Having purchased the site of seven acres at Milwaukee and Mt. Elliott avenues in Detroit, the Hupp Motor Car Co. lost no time in breaking ground for its new factory, which already is under way. It will comprise three brick and steel buildings, viz: an assembly and paint shop, 400 x 70; motor assembly building, 200 x 70 feet,

and the stock building, 320 x 70 feet. There also will be a two-story office building of vitrified brick, 150 by 45 feet. The entire plant will afford approximately 125,000 square feet of floor space, which is about three times that available in the present factory. The capacity will be 15,000 to 20,000 Hupmobiles a year.

Changes Among Prominent Tradesmen.

F. V. Coville has been appointed buyer for the H. H. Franklin Mfg. Co., of Syracuse, N. Y. He succeeds W. G. Lindsey, who resigned.

Don C. McCord has been elected general manager of the Flanders Mfg. Co., of Pontiac, Mich., R. M. Brownson relinquishing that office but retaining the presidency of the company. McCord joined the Flanders establishment a few months since as manager of its newly-created electric car department.

M. H. Snyder has been appointed sales manager of the Day Utility Car Co., of Detroit. Until two weeks ago he was in the automobile business in Bozeman, Mont., and according to the story went to Detroit to obtain the Day agency and wound up by becoming the company's sales manager.

A. L. Dixon, manager of the General Vehicle Co.'s service department in Long Island City, has resigned that position and on November 1st will join the truck department of the Waverley Co. in Indianapolis. He has been succeeded by E. W. Gough, formerly assistant general manager of the Queens (L. I.) Electric Light & Power Co.

W. S. Hathaway, supervisor for the United States Motor Co. in the Western States, has retired from that office, and it is stated probably will remain out of business for a year or so. Hathaway, whose headquarters were in Kansas City, was widely known, having been, previous to his recent connection, identified with the Buick interests.

H. F. Donaldson has sold his interest in The Commercial Vehicle to the United Publishers Corporation, and has tendered his resignation as president and editor of that publication. Donaldson intends to join the S. A. E. party sailing for England November 1, and while abroad will investigate commercial vehicle conditions in Europe.

J. B. Morrow has been appointed manager of the Stromberg Motor Devices Co.'s Indianapolis branch, which just has been removed to new and more commodious quarters at 514 North Capitol avenue. Morrow succeeds Charles Kolbenstetter, who has returned to the Stromberg headquarters in Chicago, to which he will be attached as special traveling representative.

Gets Lower Duty on Goggle Glasses.

The Board of United States General Appraisers has sustained the contention of

the Motor Car Equipment Co., of New York, for a lower duty on disks for automobile goggles. They were returned by the Collector for the Port of New York as manufactures of glass, with a duty at the rate of 10 cents per dozen pairs and 45 per cent. ad valorem. According to the importers, the disks are in the category of "glass, ground," and as such entitled to enter at 1¾ cents per pound and 5 per cent. on the value. This claim is sustained and the Collector reversed.

S. A. E. Selects London Headquarters.

St. Ermins Hotel, St. James Park, London, S. W., has been selected as the official headquarters for the Society of Automobile Engineers during its forthcoming visit to London. The hotel is centrally located, near Westminster Abbey and the Houses of Parliament, and is connected by a private corridor to a subway station, from where trains run direct to Olympia, where the London show, which is the chief cause of the S. A. E.'s visit, will be held. The party will sail from New York November 1st.

Ohio to Establish Service Stations.

The Ohio Motor Car Co., of Cincinnati, is about to establish five factory service depots in as many parts of the country, at least one of which will be located in Dallas, Tex. These depots will carry a full stock of parts for the Ohio car and will be manned by mechanics direct from the factory.

Four More Join Credit Association.

The Alexander-Seewald Co., Atlanta, Ga.; Consolidated Lubricants Co., New York City; Gray-Hawley Mfg. Co., Detroit, Mich., and the Jackson-Church-Wilcox Co., Saginaw, Mich., have been admitted to membership in the Automobile Trade Credit Association.

Economy Formally Declared Bankrupt.

Having been formally adjudicated bankrupt, the first meeting of the creditors of the Economy Motor Car Co., of Joliet, Ill., has been called to occur in that city on Saturday next, 28th inst. At that time a trustee will be selected.

Auburn Locates "Six" Plant in Angola.

The Auburn Automobile Co., of Auburn, Ind., has established a branch factory in Angola in the same State. It will be devoted wholly to the production of the six-cylinder car which the Auburn company is adding to its line.

Disco Self-Starter Now in Detroit.

The Ignition Starter Co., which manufactures the Disco self-starter, has completed its removal from Grand Rapids, Mich., to Detroit. In the latter city it has established its office at 724 Ford Building.

RELIEVING STREATOR STRINGENCY

**Company's Creditors Favorably Inclined
and Settlement Likely Within Ten
Days—Bonds Offered Them.**

Efforts to relieve the Streator Motor Car Co., of Streator, Ill., from its embarrassment still are in progress, a meeting of its creditors which will occur Nov. 1st, having been called by the referee in bankruptcy, at which time any objections to the offer of settlement made by the company will be publicly aired.

It is believed that the offer will be accepted, creditors at the meeting held last week having requested the court to delay action in the bankruptcy matter until the creditors could pass on the offer which had been submitted.

At the same time these creditors asked that the business be continued as heretofore and that F. B. Wilkinson, A. O. Smith and W. H. Boys be constituted a creditors' committee to inquire into the nature of the securities furnished by J. C. Barlow and Paul R. Chubbuck, president and vice-president, respectively, of the embarrassed company; also that this committee be permitted to conduct the affairs of the company until other arrangements are effected.

Messrs. Barlow and Chubbuck are the owners of a large amount of real estate in Streator and vicinity and they propose to issue bonds against this property and give them to the creditors of the Streator Motor Car Co., thus serving to put that corporation practically out of debt by transferring the indebtedness to the shoulders of Barlow and Chubbuck, who will have from one to five years to pay it, under the terms of the bonds.

The schedules in bankruptcy, as finally filed by the company, placed the total assets at \$673,426.83, the largest items of which were stock and material on hand, \$211,302.28; plant and equipment, \$158,665.33; accounts and machinery on consignment, \$185,181.68; promissory notes and securities, \$101,734.35. The liabilities total \$341,282.79, of which \$291,927.70 represents unsecured claims.

Five Tire Thieves Are Rounded Up.

As a result of the arrest of five men last week, the New York police and the United States Tire Co. believe they have put a stop to the theft of tires which had attained a value of possibly \$20,000. The stealing had been systematically conducted and had continued for several months, most of the tires disappearing between the tire company's warehouse and its retail store in New York. Transfer slips were the means employed. They were made out by certain of the United States Tire Co.'s employees, but the tires, instead of being taken to the retail store, were delivered to

a distributing agency where they were disposed of at cut prices. The stealing first was discovered when the company's representatives sought to collect from persons whose names appeared on its books as purchasers, but who asserted that they had bought no tires. The five men who were arrested include three United States Tire Co. employees, who were charged with grand larceny, another man who was accused of receiving the stolen goods and a fifth who acted as a go-between.

Palmer-Singer Reduce "Six" and "Four."

Of the several front rank manufacturers of high-priced cars, the Palmer & Singer Mfg. Co., of New York City, is the first to lower its list. Early this week the company announced a reduction that affects its entire line, and that is a substantial one, amounting approximately to \$1,000 on all of its six-cylinder models.

The six-cylinder, 60-horsepower, seven-passenger car which heretofore has been catalogued at \$4,200 has been reduced to \$3,200, and the five-passenger car employing the same chassis from \$4,000 to \$3,000. Both have a $4\frac{7}{8} \times 5\frac{1}{2}$ -inch motor, four speeds forward, multiple disk clutch, 138-inch wheelbase and 36-inch wheels. The models using the P-S four-cylinder chassis are similarly affected, the four-cylinder, 50-horsepower car being marked down from \$3,500 to \$2,850.

No announcement of it yet has been made, but it is known that the P-S line will shortly be further increased by the addition of a "little six," which is now well under way, and which will sell for \$2,000.

Show That is Not Promoted by M. A. M.

Although several papers that ought to know better are carrying this in their list of fixtures: "January 10-17, Annual Show, Motor and Accessory Manufacturers, Madison Square Garden, New York," the M. A. M. are promoting no show of the sort and never have acted as show promoters. The dates January 10-17 are those of Part II of the Automobile Board of Trade's show, which will be constituted of commercial vehicles with accessories, as heretofore. M. A. M. members, as usual, will display the bulk of such wares during both weeks of the Board of Trade's function at the two other national exhibitions.

The Effect of "Knighting" the Stearns.

If ever the F. B. Stearns Co., of Cleveland, had even a lurking doubt when it decided to wholly cast out the poppet valve engine for the Knight slide-sleeve motor, that doubt has been quite effectively removed. Since the decision was made in July last the Stearns people report that they have booked more than four times as many orders as were received during a similar period of the company's history and that these orders represent a greater number than the total output of Stearns poppet valve cars during all of the year.

JAMES LINES UP THE TAXICABBERS

Twelve Hundred Enrolled in His Co-operative Purchasing Association—Plans Enlarged to Include a Cab.

Though it was expected that the International Motor Service Association would commence active operations on October 10, by which time its charter was to have been received and its officers elected, unforeseen complications arose, according to Charles C. James, who is the organizer and the moving spirit, and made necessary a postponement. The election of officers did not take place on October 10, for as a matter of fact it was not until the 23rd inst. that the application finally was forwarded. It is probable, therefore, that on November 1st the machinery of the association formally will be set in motion. Meanwhile, however, the growth of the movement has been not short of astounding and has attained strength that requires that it be no longer considered lightly.

As already has been told in the Motor World, the association is to be in effect an immense purchasing agency and will contract for the sale or distribution of such supplies as tires, spark plugs, tire chains, and gasoline and oil, as are in constant demand by its membership, which comprises taxicab and livery companies. Eventually an association taxicab, also, will be assembled and marketed and it is expected that it will become standard for service in all the larger cities, this latter being a development which was not included in the original plans.

The association was started with a nucleus of 10 New York rental and taxicab companies, viz: the Packard Renting Co., Peerless Rental Service, Renault Taxicab Co., Thomas Flyer Renting Co., Universal Taximeter Co., Interborough Taxicab Co., Imperial Taximeter Co., Crawford Taxicab Co., Broadway Taxi Operating Co., and the Nautilus Taxicab Co. From this beginning, a month since, it has grown with surprising rapidity, until at present, according to James himself, there are in round figures 1,220 members in the association, 800 of whom represent taxicab operating companies of various sizes throughout the United States. Proportionate to its size, each of the rental service and taxicab companies represented in the association owns a number of shares of stock in it, valued at \$10 each.

Owing to the immense amount of detail work necessary and to obviate the possibility of confusion resulting among the members provided, instructions regarding the whole gamut of supplies with which the association eventually will work were given at the one time, tires alone will be given attention first. The decision to attend to the tire question first is due to the

fact that tires are at once the most expensive and perishable accessories which are used.

Though originally it was intended to use the products of the United States Tire Co., negotiations which were perfected have been abandoned, and instead the Goodyear Tire & Rubber Co. and "one other large tire manufacturer" will supply the association demand. The modus operandi of the purchasing plan also has been changed slightly. Under the new arrangement members will not purchase supplies from local dealers, pay for them and receive from the association the difference between the price paid by the member and that quoted to the association, which was the original plan.

Instead, members will purchase supplies from local dealers and drive the best bargains they can, as heretofore. Duplicate receipted bills are to be sent to the association's New York office to serve as evidence to the manufacturer that a certain quantity of his goods has been sold to an association member. Based on the quantity of their products sold to members, certain manufacturers have agreed to allow the association a rebate. The rebates which are received will be pooled and will form the association's gross earnings. The net earnings will be distributed to the stockholders in the usual way.

Briefly, this is the plan under which members will purchase Goodyear tires and tubes and other supplies except spark plugs, which will be contracted for and sold to members direct by the association. The arrangement with "the other large tire manufacturer," whose name James would not divulge, will be entirely different. It is proposed that the association contract for a certain quantity of tires of the one size, 32 x 4, these to be delivered to the manufacturer's branch houses and dealers throughout the country and sold to members at a flat rate without the guarantee.

Regarding the production of the association cab, a number of well-known cab builders will be asked to bid on specifications covering a vehicle embracing the latest taxicab practice. Though reports have been current that the association cab would be a United States Motor product, they are emphatically denied by James, who says that the United States Motor Co.—with which until recently he was identified—has refused to build the cabs, stating as its reason that its shops are full and the business could not be handled.

Alco to Erect a Service Building.

The American Locomotive Co. is preparing to join the several prominent automobile companies who have erected service buildings in the Long Island City section of New York City. The Alco structure will be located on Jackson avenue, where a site 212 x 100 feet has been purchased for the purpose.

Lakeland, Mich.—Lakeland Motor Works, under Michigan laws, with \$10,000 capital; to manufacture and deal in motors and automobiles.

Missoula, Mont.—Garden City Garage Co., under Montana laws, with \$10,000 capital; to maintain a garage and deal in automobiles and accessories.

Kalamazoo, Mich.—Burdick Motor Transfer Co., under Michigan laws, with \$10,000 capital; to operate automobile livery and deal in motor vehicles.

Oskaloosa, Iowa—States Auto Supply Co., under Iowa laws, with \$50,000 capital, to manufacture and deal in automobiles. Corporators—D. P. McClure, C. W. Payne, A. O. Watland.

Linton, Ind.—The Linton Garage Co., under Indiana laws, with \$10,000 capital; to maintain a garage and deal in automobiles. Corporators—A. T. Custer, G. C. Porter, T. J. Holden.

Grand Rapids, Mich.—Michigan Auto Joint Co., under Michigan laws, with \$10,000 capital; to deal in and repair automobiles. Corporators—Charles E. Perkins, J. F. Carter, F. S. Perkins.

Montclair, N. J.—Frank A. Reeve Co., under New Jersey laws, with \$50,000 capital; to manufacture motor cars. Corporators—F. A. Reeve, J. A. Butler, Montclair; D. H. Slayback, Verona.

Vinita, Okla.—Vinita Automobile Co., under Oklahoma laws, with \$10,000 capital; to deal in automobiles and accessories. Corporators—Walter A. Cronan, M. R. Kapp, Mrs. M. R. Kapp.

New York City, N. Y.—Manhattan Top & Body Co., under New York laws, with \$50,000 capital; to manufacture automobile equipments. Corporators—G. B. Radford, H. Schuler, C. D. Heintze.

Evergreen, Ala.—Evergreen Motor Car Co., under Alabama laws, with \$2,000 capital, to deal in automobiles and maintain a garage. Corporators—C. P. Deming, E. W. Dunn, R. L. Whitcomb.

Boston, Mass.—Amplex Motor Car Co. of New England, under Massachusetts laws, with \$25,000 capital. Corporators—President and treasurer, I. B. Spafford, of Newton, Mass., and others.

St. Louis, Mo.—Lewis Sales Co., under Missouri laws, with \$2,500 capital; to deal in automobiles. Corporators—William J. Lewis, 23 shares; L. M. Lowrey and Harry A. Williamson, one share each.

Chicago, Ill.—C. W. Haas Tire Seal Co., under Illinois laws, with \$50,000 capital; to manufacture and deal in automobile tires

and rubber goods. Corporators—C. W. Haas, R. C. Uckens, E. C. May.

Elmira, N. Y.—The Heater-Muffler Co., under New York laws, with \$40,000 capital; to manufacture a muffler heater for automobiles. Corporators—Wilber Kenzie, Lanson D. Curran, Ansel G. Ingram.

Indianapolis, Ind.—Indiana Gas Engine Co., under Indiana laws, with \$25,000 capital; to manufacture gas engines. Corporators—G. G. Westerfield, I. W. Connaty, S. S. Brewer, Bernard Korbly, C. A. Korbly.

Albany, N. Y.—Kupke Garage Co., under New York laws; to deal in automobiles and maintain a garage. Corporators—Theodore Kupke, Eugenie Kupke, both of Albany; Willard W. McCune, of Watervliet.

Buffalo, N. Y.—Queen City Electric Automobile Co., under New York laws, with \$50,000 capital; to manufacture automobiles. Corporators—A. C. Towne, Kenmore; C. S. Chamberlain, M. T. Day, both of Buffalo.

St. Paul, Minn.—Northwestern Motor Supply Co., under Minnesota laws, with \$50,000 capital; to deal in automobiles and motor vehicles. Corporators—P. F. Daly, J. C. Stegmeier, E. A. Teureaud, Helen M. Daly, John Coates.

Cleveland, Ohio—Moore & Rigley Garage and Sales Co., under Ohio laws, with \$10,000 capital; to deal in automobiles and operate a garage. Corporators—William H. Moore, John Moore, A. V. Rigley, C. F. McGee, C. E. Alden.

Sacramento, Cal.—Sacramento Motor Sales Co., under California laws, with \$25,000 capital; to deal in automobiles and motor vehicles. Corporators—W. R. Gore, Fair Oakes; C. M. Wilson, S. R. Rodgers, both of Sacramento.

Portland, Me.—Gilson Auto Co., under Maine laws, with \$10,000 capital; to deal in automobiles, supplies and maintain a garage. Corporators—President, L. C. Gilson, Portland, Me.; treasurer, George D. Pastorius, Newcastle, Me.

Cleveland, Ohio.—Richardson-Neighbors Motor Co., under Ohio laws, with \$5,000 capital; to deal in automobiles, motors and motor vehicles. Corporators—F. E. Richardson, H. F. Neighbors, W. J. Dawley, Sidney Seidman, Stephen N. Young, Jr.

New York City, N. Y.—Fear Naught Co., under New York laws, with \$100,000 capital; to manufacture motors, machinery and vehicles of all kinds. Corporators—R. T. Hughes, Rutherford, N. J.; J. M. Davis, F. C. Munson, both of New York City.

Increases of Capital.

Louisville, Ky.—Clark Motor Car Co., from \$30,000 to \$60,000.

Racine, Wis.—Kelly-Racine Rubber Co., from \$500,000 to \$1,000,000.

Memphis, Tenn.—Noble S. Bruce Auto Co., from \$10,000 to \$50,000.

Charles Reed is building a two-story garage in Great Barrington, Mass.

Richard Hill is to be manager of a new garage which is being built in Coal City, Ill.

Albert Cutts has opened a garage in Wautoma, Wis. He will operate an automobile library and deal in used cars.

H. F. Wessel has broken ground for a garage on West Fifth street, St. Paul, Minn. It will be of brick and cost \$12,000.

John D. Webster & Co. have opened a garage and repair shop in Alexandria, Va., at the corner of Prince and Strand streets.

Andrew Bruno is building a two-story brick garage in Newark, N. J. It is located at 60 Marshall street and will cost \$9,000.

At a cost of \$18,000 J. Kaufman is building a four-story garage in New York City. It is located at the corner of Third avenue and 123rd street.

A three-story garage and salesroom is in course of construction at 538 North Main street, Decatur, Ill. It will be occupied by Leggett & Grant.

The Motor Car Co. is the style of a new concern which has opened salesrooms at 94 Massachusetts avenue, Boston, Mass. It is handling the Nance "Six."

John E. Boyle, proprietor of the Boyle pharmacy in Fairfield, Conn., has leased a building in the rear of the Hargrove School in which to establish a public garage.

Norman Devaux has been appointed Reo distributor for California, Arizona and Nevada. His headquarters are in San Francisco. A branch will be opened in Los Angeles.

Baker Bros., who operate a garage and salesroom in Buffalo, N. Y., under the style Baker Bros. Motor Car Co., have opened a branch in Geneva, N. Y. They handle the Cole line.

William N. Haa, a farmer of Vriesland, Mich., has sold his farm at auction and moved to Grand Rapids, where he will open a garage and salesroom for several low priced cars.

John F. Lynch, who formerly sold Stearns and Mora cars in Minnesota territory, has opened a salesroom at 441 St. Peter street, St. Paul, Minn. He will handle Kissel cars.

H. S. Knickerbocker, of Arlington, Mass., has entered the automobile business at Worcester, that State, where he will handle Cole cars. His headquarters are at the Norcross Garage.

At a cost of \$160,000 the Cadillac Automobile Co., of Chicago, Ill., is building a

five-story garage and service structure on the southeast corner of Michigan avenue and Twenty-third street.

Harry Spencer, who for some years has worked in one of the garages in Springfield, Mass., has gone into business on his own account. He has opened a garage and repair shop in Bridge street.

The Hexter Motor Truck Co., which has the distribution of Gramm trucks in Greater New York, is erecting a six-story service building at 155-159 Perry street. The structure will be 100 x 72 feet.

F. O. Calkins, who conducts a livery business in Wadena, Minn., has decided to forsake horses and woo the motor car. He therefore is remodeling his stables into a modern garage and machine shop.

Carl Christensen, who for some time past has had the Oakland (Cal.) agency for National cars, has purchased an interest in the Howard Automobile Co., of the same city. He takes the National agency with him.

The Cole Motor Co. of Wichita is the style of a new company which has been organized in the Kansas city of that name. Its salesrooms are at 315 East Douglas street and it will, of course, handle Cole cars.

C. K. Cramer, Taylor Allen and John Wallis have formed the Motor Car Repair Co., with headquarters at 409 Fifth street, Des Moines, Ia. All three men formerly were connected with the Sears Auto Co., of the same city.

The State Auto Co., of Indianapolis, Ind., has outgrown its present quarters and next week will move into the premises at 235 North Pennsylvania street, formerly occupied by the Gibson Co. It handles Marion and Krit cars.

W. E. Lahr, of the Lahr Motor Sales Co., Bismarck, N. D., has purchased the interest of his brother, F. A. Lahr, and assumed entire control of the company. F. A. Lahr has engaged in the real estate and loan business.

The American Locomotive Co., manufacturer of the Alco car, has opened a factory branch in Boston, Mass. George Hudson, formerly of the Hudson-Colby Co., is manager of the establishment, which is located at 567 Boylston street.

The Donaldsonville Garage & Automobile Supply Co., which was incorporated last month with \$10,000 capital, in the Louisiana town of that name, has opened a garage and salesroom in the Lemann Annex. James P. Kock is the president and A. A. Sassadet the secretary.

Reed & Gage, who for two years have been selling Ford cars and conducting a garage on North Main street, Janesville, Wis., have decided to retire from business. The garage will not be closed immediately, but will be managed by Lane until the affairs of the firm are wound up.

The McCarty-Parker Automobile Co., which was formed several months since to handle White cars in Los Angeles, Cal., has dissolved and discontinued. E. K. Parker retired from the company soon after its organization and now Walter McCarty has decided that he has had enough and has shut up shop.

W. A. Crowe, W. A. Crowe, Jr., H. A. Crowe and C. G. W. Wernicke, hardware and implement dealers of Minneonta, Minn., have formed the Marion Motor Car Co. and opened salesrooms at 1027 Hennepin avenue, Minneapolis. They have the Marion distributing agency for Minnesota, North Dakota and part of Wisconsin.

The Ideal Garage Co., which recently was formed in Frederick, Md., has taken over the business of the Frederick City Garage, and John H. Grove, proprietor of the latter, will be manager of the merged concerns. The new company will handle E-M-F, Flanders, Buick, Everitt, Dart gasoline cars and one or two lines of heavy commercial trucks. Its headquarters are at 114 East Patrick street.

Adolph J. Munich, one of the partners in the White-Munich Motor Car Co., of New Orleans, La., has petitioned the court to restrain his partner, Harry A. White, from withdrawing \$1,240 from a bank in which the funds of the company are kept. The co-partnership was to have ended on August 1, last, but during the absence of Munich from the city, White is said to have taken possession of all the papers belonging to the firm and to have left the city. The petition furthermore asks for the appointment of a liquidator to take charge of the assets of the company and to wind up its affairs.

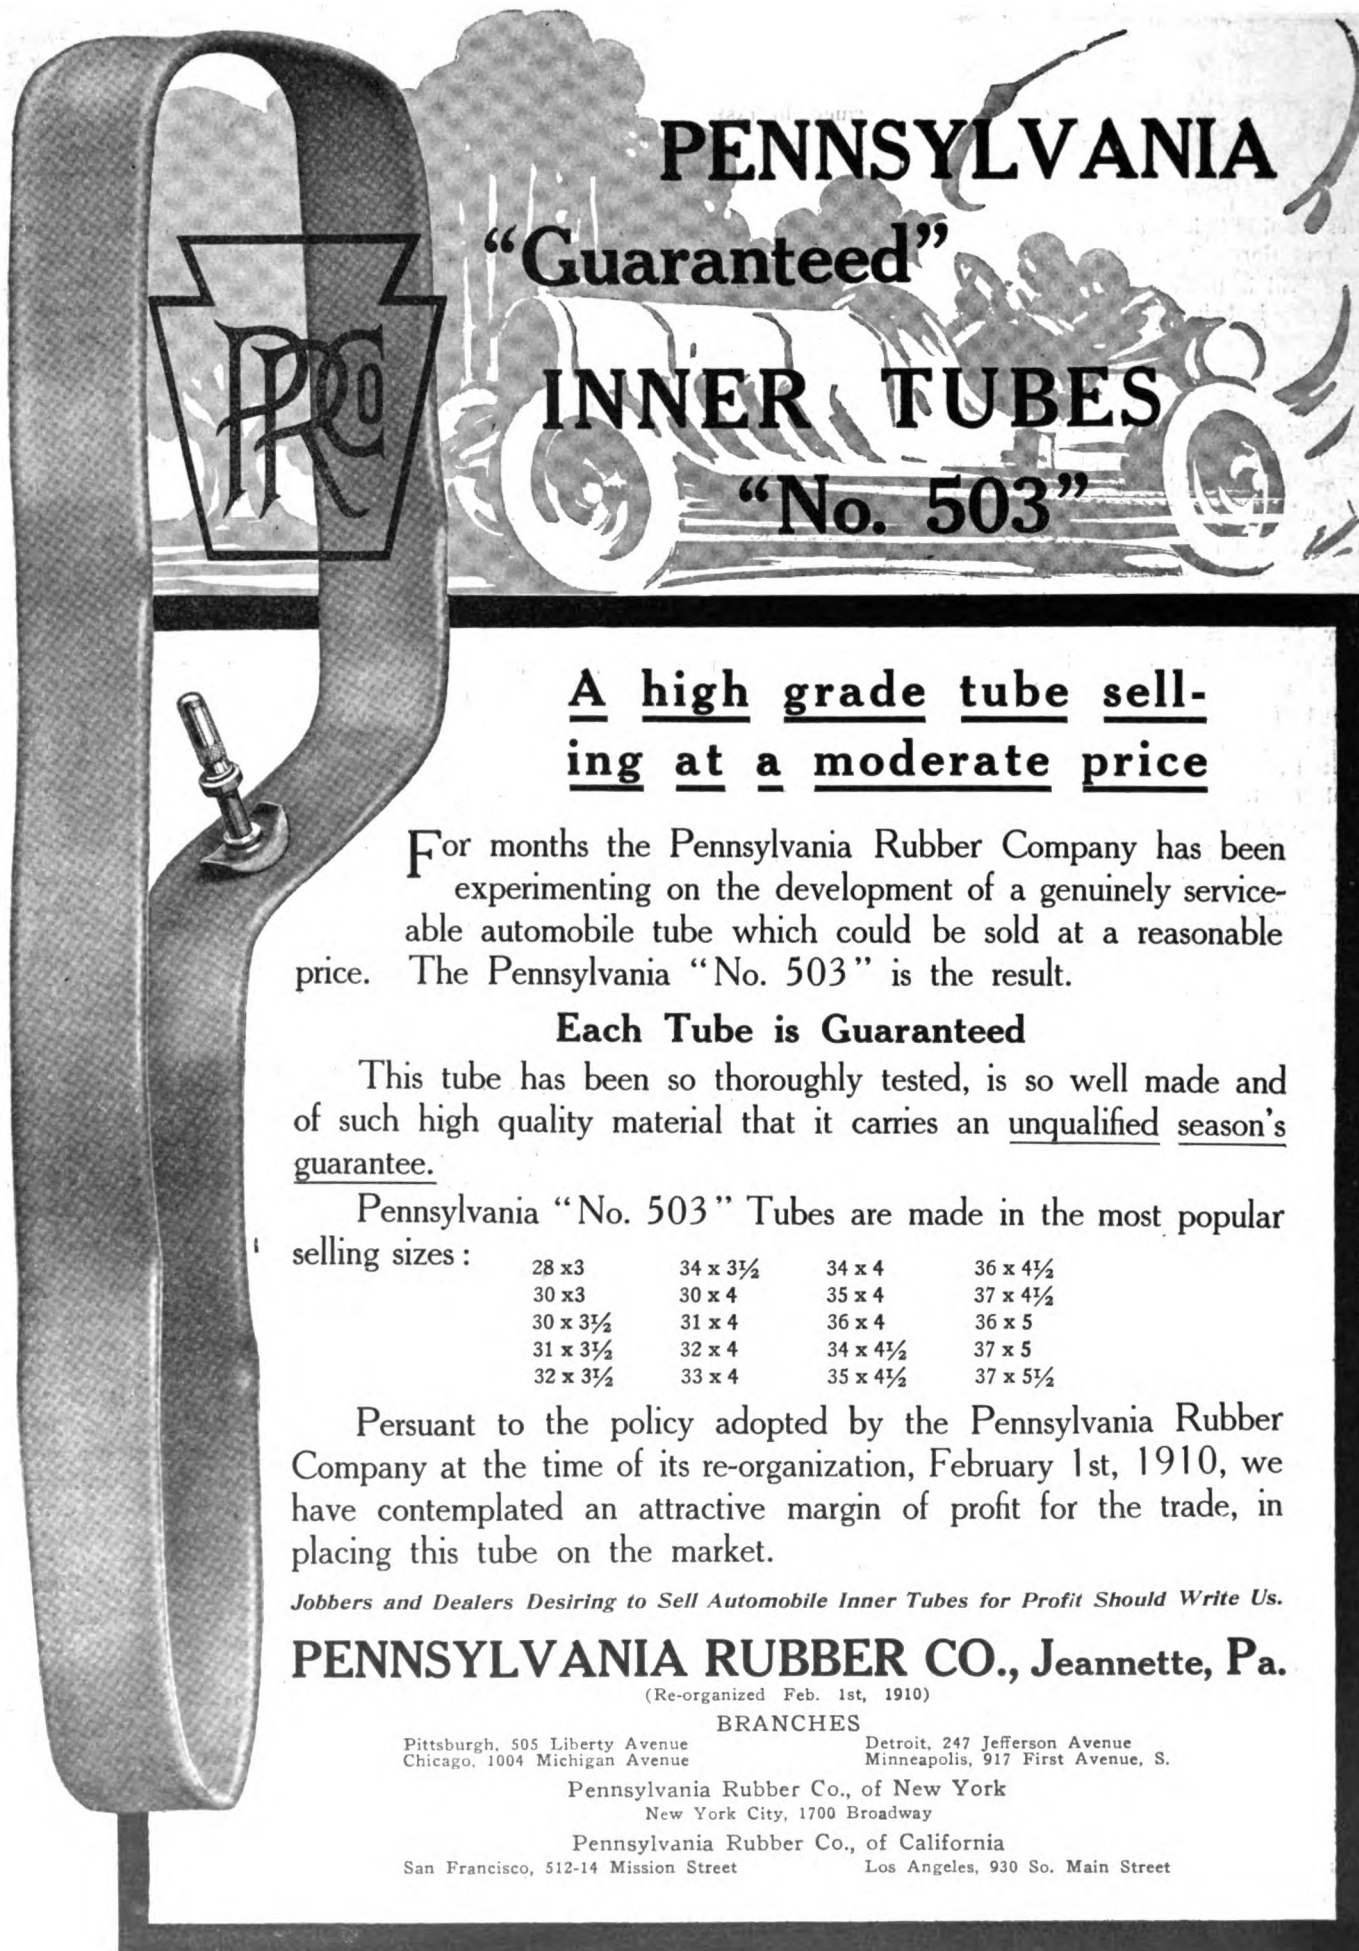

Recent Losses by Fire.

Lawrence, Mass.—Archibald Wheel Co.'s drying sheds and contents burned. Loss, \$60,000.

Frankford, Pa.—William Clarke & Son's garage and two automobiles destroyed. Loss, about \$3,000.

Dorchester, Mass.—Joseph P. Morse's garage, 43 Greenwood street, and one car burned. Loss, \$3,500.

New York City—Acton Garage, 137 West 89th street, damaged and two cars burned; 100 others saved. Loss, \$5,000.

PENNSYLVANIA
"Guaranteed"
INNER TUBES
"No. 503"

**A high grade tube sell-
ing at a moderate price**

For months the Pennsylvania Rubber Company has been experimenting on the development of a genuinely serviceable automobile tube which could be sold at a reasonable price. The Pennsylvania "No. 503" is the result.

Each Tube is Guaranteed

This tube has been so thoroughly tested, is so well made and of such high quality material that it carries an unqualified season's guarantee.

Pennsylvania "No. 503" Tubes are made in the most popular selling sizes:

28 x 3	34 x 3½	34 x 4	36 x 4½
30 x 3	30 x 4	35 x 4	37 x 4½
30 x 3½	31 x 4	36 x 4	36 x 5
31 x 3½	32 x 4	34 x 4½	37 x 5
32 x 3½	33 x 4	35 x 4½	37 x 5½

Persuant to the policy adopted by the Pennsylvania Rubber Company at the time of its re-organization, February 1st, 1910, we have contemplated an attractive margin of profit for the trade, in placing this tube on the market.

Jobbers and Dealers Desiring to Sell Automobile Inner Tubes for Profit Should Write Us.

Samuel M. Butler.

Many men have succumbed because of participation in sport, and some of the glory of the gladiator has been theirs. But it has been given to few men to die actually in the service of it—in the cause of the administration of laws which are not a part of the statutes of the land. Samuel M. Butler is one of what truly may be termed the precious few who thus have died. He met his death literally in the service of his chosen sport. Let the fact be not overlooked or forgotten. None but those who have experienced it can conceive what the administration of the laws of sport entails, and usually the burden is self-imposed and is borne with small recognition and smaller gratitude. When the attempt is made, as in motoring, to cause to mix such opposing elements as trade and sport, the burden is doubly great—the position of the man who attempts to carry it is doubly trying. It was that trying office which

Samuel Butler filled and filled well, with credit to himself and to the sport and the conflicting interests which he served. He performed the task with rare judgment and he performed it modestly, capably and without vainglory. He played a man's part in a modern and modernizing movement, and he played it well; he assisted in its advancement. He deserves to be gratefully remembered by all who had to do with it. His deeds will live after him, but his death is not less a misfortune. His work had not been wholly done.

Wherein Truck Contests Fall Short.

Equally evident after a perusal of the revised results of the San Francisco truck contest are the ridiculousness of continuing such performances in the name of sport and under the regulations framed for the guidance of a purely sports-governing body, and the utter uselessness of the conclusions reached in the name of scores. The circumstances that the services of an expert accountant were required in order to straighten out the mathematical tangle in which the system served to involve the luckless promoters of the affair merely add to the mirth-provoking quality of the outcome. To be declared the winner of such a contest is something less an honor than it seems.

Need for revision of the score, as first announced, was realized when it was found that a mistake had been made in reckoning the drivers' wages. Thereupon the professional calculator to whom the task was entrusted proceeded to "raise the pay" of all the operators, even doubling that of some. At the same time someone discovered that a gallon has eight pints, instead of two, as the technical committee evidently believed, and that all cost figures of oil had been calculated four times too high. The outcome was a complete revision of the results.

Not only that, but by retaining the peculiar system of reducing the technical penalties to points per mile of travel it happened that no less than five vehicles with absolutely no road or technical penalties against them received higher final costs, or "scores," than others which had suffered to some extent, or even broken down, on the road. Yet, in the estimation of the average business man, whom the affair was supposed to instruct, delays by the roadside, or break-downs, would be considered far more serious than would high fuel costs.

That in several instances cars which were not declared winners in their class actually evidenced lower fuel and oil costs than the winners but adds to the peculiarity of the logic which deems such results in any sense—other than satirical—an educational demonstration.

Plainly the truck rules of the American Automobile Association are in need of revision. If such a method of scoring is to be preserved, the A. A. A. must enter the labor unions and fix the wage scale of truck drivers for all time. Otherwise a crafty competitor might enter a heavily laden truck with a boy driver at a boy's wage and fairly run away with the honors. Not only that, but it must standardize the cost of fuel and oil for all contests, otherwise results obtained in different competitions and in different localities in no sense will be comparable; they cannot be accounted "records." Opinion is still divided as to the ultimate good truck contests can do the industry, and likewise as to the quality of the interest which they attract, but whether they are to be a permanent form of sport or whether they are to drop from sight altogether depends rather more on the success or failure of efforts to put them on an equable and intelligent basis.

The Passenger as a "Look-out."

The refusal of the Supreme Court of the United States to review the Pennsylvania decision which held that the passenger occupying the front seat of an automobile was guilty of contributory negligence because he failed to warn the driver of an impending accident is regrettable. The approval of such a precedent which thus may be implied seems to add unfairly to the motorist's already large burden, and the precedent is a mischievous one. It practically requires that the front-seat passenger constitute himself a lookout, but it is extremely questionable that his services in that capacity will serve the public welfare. Few drivers there are who will not agree that nothing is more irritating and distracting or better calculated to keep a driver's nerves on edge than oft-repeated warnings to "look out" for the one thing or another which may loom ahead. There is enough of that sort of thing without its being imposed by law. Anything that distracts a driver's attention from his work or that startles him scarcely can be considered as making for greater safety for the passengers or the man in the street.

CHAIRMAN BUTLER'S TRAGIC END

Killed by Overturning of Car While Leading Glidden Tour Through Georgia—His Notable and Useful Career.

For the second time since it was inaugurated, eight years ago. Death entered the Glidden tour yesterday morning, 25th inst., and cut down the man who had most to do with it, Samuel M. Butler, chairman of the Contest Board of the American Automobile Association, who, because of his high office, stood more prominently before the public than any other man connected with either the sport or the trade.

Butler's death was tragic and came so suddenly that he never spoke a word after the car in which he was riding overturned, near Tifton, Ga., and crushed out his life. It was the official pace-making car, a Cunningham, and besides Butler conveyed E. J. Walker, referee of the contest, who is chairman also of the California State Automobile Association, and Mrs. Walker, the latter of whom suffered a dislocated shoulder. Mr. Walker escaped with a broken collarbone.

The car was leading the cavalcade at a high rate of speed when, apparently, its steering gear jammed, causing it to skid in the sand, run off the road and overturn in the ditch. It skidded for perhaps fifty yards and the occupants were aware that they were in peril, but as the top was up they had no opportunity to jump or otherwise make their escape. The chauffeur alone, Charles F. Kellman, escaped injury. The others were pinned under the car, Butler being thrown under the left rear wheel. He was badly crushed and never uttered a word after the accident.

Butler's body was carried to Atlanta, and from that place was shipped, via Pennsylvania Railroad, to New York, where it is due to arrive tomorrow (Friday), at 12:40 P. M.

Samuel McKnight Butler was born in Camden, N. J., December 30, 1866, and, therefore, was in his forty fifth year at the time of his death. He first came into prominence as secretary of the Automobile Club of America, previously having been an advertising man on a New York automobile publication. He served the A. C. A. for some ten years and as one of its delegates at the meeting for organization he was one of the founders of the American Automobile Association. He also was one of the organizers and the first secretary of the Aero Club of America, which was formed within the A. C. A. He left that club two years ago to become chairman of the contest board of the national organization, an exceptionally trying position, which he filled with rare ability. He performed his work without fuss or fireworks and without seeking the limelight. He

was at all times self-contained and displayed splendid judgment and tact in overcoming the many difficulties which his office entailed. He served in the Spanish war as a member of the signal corps.

He resided in Brooklyn, N. Y., where he is survived by his wife, two daughters and a son. In deference to the wishes of his widow, his funeral probably will be a private one.

Company to Insure Automobiles Only.

The Automobile Insurance Co. of America is being organized in St. Louis and will apply for a charter as a Missouri corporation. It proposes to insure automobiles only and to issue a policy covering in a single contract all lines of indemnity in connection with an automobile. Its rates will be based on a combination of the rates at present used by other companies in writing policies which provide, in two or more contracts, indemnity against loss by fire or theft, collision, property damage and liability for injury to other persons. The company plans to have a capital stock of \$250,000, with \$50,000 surplus, its stock to be sold at \$125 a share. The organizers expect to start business about November 15, and the company, it is planned, will enter a number of States at once. Charles W. Disbrow, a prominent figure in St. Louis insurance circles, will be president. With him will be associated several other experienced insurance men.

Farmer Loses "Millions" in "Auto Water."

According to Raymond W. French, an Adams County (Ind.) farmer, Colonel Seller's eye water had nothing on the "non-freezing auto water" which Frank de la Claire, a chemist, figuratively poured out before his astonished gaze. The millions that were in it, as pictured by the chemist, made the Seller's eye water appear a mere drop in the bucket. French saw so many millions that he was persuaded even to sell his farm and to invest the proceeds, \$3,300, in Le Claire's famous water, which was to pay such large returns, and which, of course, was designed to prevent the freezing of water in the radiators of automobiles during the winter months. When convinced that he had been swindled the deluded farmer had the chemist arrested and charged that the chemist had appropriated the \$3,300 to his own use. The pitiful story came out at the trial in South Bend last week.

Illuminating the Door Step at Night.

One of the conceits of the 1912 Alco car is an electric bulb concealed beneath the tonneau door, which lights automatically when the door opens. It is designed to illuminate the step and assist the passengers in alighting after nightfall. So far as known it is the first gasoline car to be so equipped, the Waverley electric being the only other automobile to employ a light in such a place and for such a purpose.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association annual show at Wayne Garden.

Glidden Contest Near to Its Destination

Scattered Ranks Close Up After Wallowing in Virginia Mud and Find Good Roads and Enthusiasm Further South—Tarrytown-Maxwell Team Still Retains Clean Score and Seems Sure of Victory—Chairman Butler's Sudden Death Saddens the Tour.

Live Oak, Fla., Oct. 25—With but one day more of running, nine teams remain in the contest for the Glidden trophy, the Tarrytown-Maxwell trio still retaining its premier position with a perfect score. The day was a sad one because of the untimely

testants for the Anderson trophy. No. 22 Thomas was the car to suffer, a shortage of gasoline causing lateness at control.

The sand that was predicted was encountered today, and for the biggest part of the 149 miles it was a hard plug over primitive

New York on the 14th there were only 53 that checked out from here this morning; the others are scattered over the roads somewhere between Staunton, Va., and Winston-Salem, N. C., where last night was spent. Rain, mud and hills, to say nothing of the occasional spots of deep sand, are responsible for the non-appearance of these cars. Yesterday's near-rout will not be soon forgotten. The wonder is that so many surmounted the hardships and that the scattered ranks closed up so well.

What to-day's run did develop was that there are counties in the State of North Carolina which are spending money lavishly for road improvement, and spending it intelligently, too. The counties of Guilford, Davidson, Rowan and Mecklenburg, through which led to-day's trip of 130-odd miles, have a most excellent road system. There was hardly a bit of bad going in the district, and the cars easily were able to cover 91 miles before reaching the noon control, and there was a "joy ride" in the afternoon over the Mecklenburg roads.

It was therefore an almost featureless day from the competition point of view. This sort of day leaves very little to describe, and it is likely that the others will be like it until the bad lands are reached.

Governor Smith of Georgia has left the tour because official duties at Atlanta necessitated his making greater haste than the rules of the tour will permit. His daughters, Mrs. Ranson and Miss Lucy Hoke Smith, are, however, still with us.

Seven withdrawals from the tour were announced to-day, and as a result six of the 18 teams competing for the Glidden trophy are out of the running. The teams still "in the ring" and their scores are as follows:

Team.	Score.
Tarrytown	Perfect
Atlanta No. 2	19
Jacksonville	23
Cordele	112
Atlanta No. 3	125
Everglades	208
Florida	244
Live Oak	265
Nashville	478
Detroit	1,028
Atlanta No. 1	1,125
Atlanta No. 5	Unknown

The teams that are out are the Atlanta Journal, Atlanta Nos. 4, 6 and 7, Albany,

CHAIRMAN BUTLER (CONTEST COMMITTEE), CHAIRMAN BATCHELDER (EXECUTIVE COMMITTEE) AND REFEREE WALKER HALTED NEAR ATLANTA

death of Samuel M. Butler, who was riding in the Cunningham pace-making car when its steering gear became deranged and the car dropped into a deep hole by the side of the road. Butler was killed instantly, but the others who were in the car escaped without serious injuries. P. J. Walker, referee of the tour, and his wife were in the car at the time. Walker sustained a broken collar-bone and his wife's shoulder was dislocated. The driver escaped practically unhurt. The accident occurred a short distance from Tifton, Ga.

Robert P. Hooper, president of the A. A. A., and A. G. Batchelder, chairman of the Executive Committee, assumed charge of the tour after Butler's death.

The tenseness of the day was increased by an altercation between R. S. Hall, driver of Cadillac No. 39, and Starter E. L. Ferguson, that ended in a fist fight. Hall's car was disqualified and this put the Florida team, in which the car was competing, out of the contest. One more perfect individual score was spoiled, leaving 14 con-

roads. For the first 70 miles the route led through a wilderness with nothing to relieve the monotony except an occasional turpentine camp. On the run from Cordele to Valdosta the cars were not checked but were allowed to make their own time. From Valdosta, which was the noon stop, to this place, however, regular checking proceedings were inaugurated again. Many of the cars did not get in till after dark.

Tomorrow is the last day of the tour and there are those who are not in the least sorry. From this place to Jacksonville it is just 85 miles, the shortest day's run so far, and it is expected that team standings and individual scores will not be altered on the comparatively easy run over good roads.

Charlotte, N. C., Oct. 19.—As far as the contest end of the Glidden tour was concerned, this—the sixth day—was a very easy day, and as such was a great relief from what has been going on for the last two days. Of the 74 cars that started from

HOW SOME OF THE GLIDDEN CARS CROSSED THE TREACHEROUS FORD NEAR MARTINSVILLE, VA.

Ga., and Waltham, Mass. The individual entrants who have withdrawn are James R. Gray, Thomas; B. M. Grant, Marmon; Wm. D. Alexander, White; Metz Co., Metz; Griffeth Implement Co., Schacht; D. P. De Berry, Hallady, and C. A. McCardle, E-M-F.

The entrants whose cars retain perfect individual scores and thus remain in the hunt for the Anderson trophy are: United States Motor Co., three Maxwells; Governor Hoke Smith, Maxwell; Claude Nolan, Cadillac; H. P. McNeil, Cadillac; R. S. King, Cadillac; Crawford Wheatley, Stevens-Duryea; E. M. Willingham, Ford; I. O. Teasley, Ford; Inman Gray, American; J. Epps Brown, Thomas; Athens Motor Car Co., Columbia; Studebaker Corp., Flanders; I. M. Powell, Oldsmobile; Winston-Salem Board of Trade, Mitchell.

will improve the roads in Virginia. Otherwise there is a long stretch of such formidable going that few tourists will care to undertake the trying journey.

Although there was nothing but straight touring for a distance of 160 miles over roads that presented no features of difficulty, three cars were penalized. One of these, Oldsmobile No. 60, was set back 39 points, which affected the team made up of three of these cars so that it dropped back to fifth place. The Ford team moved up to fourth place. The Oldsmobile penalty now amounts to 151 points. The Maxwell Tarrytown team retains its clean score for the Glidden trophy, and as there are only four days of travel left, with only one hard one in prospect, it is likely that it will stay in the lead. The other penalizations

make of it a novelty. This little machine has come through after many perils and difficulties. The very bad stretch in the hills delayed it long, but it struggled through eventually.

Though very little has been said about the work that has been done by the Reo and Federal baggage trucks, it has been none the less remarkable. Every day they reach the night controls on time, though it almost was expected that in view of the morasses through which the tour led they never would get through. These trucks have earned their praise.

Atlanta, Ga., Oct. 21.—The Glidden tourists were given an enthusiastic welcome at this city. At Buckhead, which is six miles from here and is where the competing cars

NOT ALL THE SOUTHERN ROADS ARE VILE—WITNESS THESE CONTRASTS

Anderson, S. C., Oct. 20.—This town, which is famous for having been the last home of the Confederate States Mint and Treasury, received the Glidden tourists to-day with no counterfeit welcome. About the only drawback to the reception was the fact that this is a place of about 18,000 inhabitants, and therefore the hotel accommodations couldn't assimilate the 250 souls on the Glidden tour. Perhaps the fact that the proprietor put a car in the tour had something to do with the selection of the place. At that, the meals are a lot better and not more expensive than those which were had at the last night stop, which was in Charlotte.

The run to-day was a comparatively easy one, through part of the northwest corner of the State of South Carolina. It gave an opportunity to compare the roads of this State with those of North Carolina, with the advantage somewhat in favor of the Tarheels, it may be added. The roads here are of sand-clay and graded, but not finished off as well as are the North Carolina highways. Either State, however, has it "all over" Virginia for roads. It is clear that if the National Highway, so called, is to be a real road from North to South there will have to be done something that

to-day did not affect any team or other standing.

This city has another claim to fame in that its Chamber of Commerce offered the Anderson trophy, to be given to that owner whose car makes the best individual showing on the tour.

One feature that appealed particularly to the tourists was the alertness and activity in the cities passed through. Spartanburg, Greenville, Blacksburg and this place all have the appearance of active manufacturing towns. There are cotton mills now building and others which look new, indicating that fresh capital is coming into the district.

The tour is a source of great amusement to the negroes along the line, and they in turn amuse the tourists quite as much. A sort of holiday has been declared wherever the tour goes, and little cotton has been picked since the cars entered the cotton belt. All those who live on the line of the tour hurrah for the cars as they whizz by and exhort the drivers to "hit it up," because they have the idea—shared, too, by some of the drivers—that this is a road race and not a tour.

A car that interests many is the Motor-ette, because it is small and its three wheels

checked in, local motorists formed in a big parade and escorted the Gliddenites to the city. Two whole days will be spent here and the tired tourists will rest and be entertained, if such things can be said to go together. Anything that isn't automobiling will be a grateful change after what has been gone through in the last few days. Poor hotels and the many miles of bad roads that have been encountered make the prospect of a sojourn at a real hotel, and no touring, alluring to say the least.

The day's run was from Anderson to this place, with the noon stop at Commerce, a distance of 144 miles. At Commerce a barbecue was given in honor of the Glidden party. There, too, the tourists were met by the advance guard of the Atlanta reception committee. A large blue badge to identify Gliddenites was given to each person in the tour and cards of admission to a dozen clubs in the city also were presented.

At a dinner this evening at the Piedmont Driving Club, Governor Hoke Smith spoke and said that when he got to the United States Senate he would urge that the Government build a road through the Virginia region where such bad roads were encountered. President Hooper of the A. A. A.

SOME OF THE PICTURESQUE BUT STRENUOUS STRUGGLES OF THE GLIDDEN TOUR

WAYSIDE MEETING OF THE PRESENT AND THE PAST

gave the guests something to cheer for when he said he would recommend that the Glidden tour in 1912 come down this way again. P. J. Walker, the Californian who is referee of the tour, said he was glad he came, even though there were folks in the tour who wouldn't speak to him now.

There are but 10 teams now left competing for the Glidden trophy, two more having been disqualified by the withdrawal of one car from each. These two are the Cordele team and the Atlanta team No. 5.

Atlanta, Ga., Oct. 22.—With nothing to bother their minds, Glidden tourists to-day got a much-needed rest—the first real rest they have had since they left New York eight days ago. They were literally overwhelmed with the hospitality of the citizens of Atlanta. A great many of the Gliddenites hail from this city, and that they are proud of their home city goes without saying. As a result nothing is too good for those other tourists who, in the estimation of Atlanta's citizens, are unfortunate enough to live elsewhere. Already regrets are heard that the schedule does not permit a stop-over here on Tuesday as well as to-morrow (Monday).

Atlanta, Ga., Oct. 23.—To-day was really the first day that the Gliddenites have had a chance to enjoy the simon-pure hospitality of the citizens of this place. Yesterday being Sunday, entertainment was necessarily curtailed, but to-day the town was thrown wide open.

The chief feature of the entertainment consisted of a genuine barbecue, with roast pig, Brunswick stew and all the other delectable dainties that are part and parcel of a sure enough Southern shin-dig. The barbecue was attended in the afternoon, the motorists having practically owned the city all morning. In the evening theater parties

were the order of proceeding, the Gliddenites returning late to pack away glad rags and lay out their "working" clothes in preparation for the 167-mile run to Cordele to-morrow.

Harrowing tales of roads in which the sand is of awful depth have been going the rounds, but far from discouraging the tourists they have had almost the reverse effect. The enforced two days' rest has made everybody anxious to get out on the road again, and even those who suffered most on the Virginia roads are eager to be on their way. Sharp at 8 o'clock in the morning the checking out process will be started again and the procession will start on the last leg but two of the journey.

Cordele, Ga., Oct. 24.—The expected bad roads, predicted by the know-it-alls yesterday, did not materialize, and the run from Atlanta over 167 miles of excellent roads was one of the most enjoyable of the tour. Despite the good road conditions, however, and the very much slower schedule that was maintained, several penalizations were recorded, though in no case was the general standing of the teams competing for the Glidden trophy affected nor were any clean-score cars competing for the Anderson trophy blemished.

The White car entered and driven by Julian Howard for the city of Jacksonville met with an accident and was withdrawn. The crew arrived here to-night, having come in by train. John Keiley withdrew his Haynes and the Case car entered by the Greensboro Chamber of Commerce was assessed nine points on account of tire trouble.

Tire troubles were rather more numerous to-day than on any other single day of the tour. Practically every car made at least one stop because of the fact, though little time was lost by the majority on this account. The Chalmers "six" press car, which up to this time had come through without a tire change, made its first stop to-day to have a shoe replaced.

At Griffen, one of the smaller cities through which the tourists passed, almost the entire population had turned out, though it was not discovered till afterwards that the real reason for the gathering was the presence of a circus in town. But the natives turned their attention from the circus long enough to wave the Gliddenites a welcome and urge them to greater speed.

The two days' stop which was made at Atlanta was regretted when it came time to go to bed to-night, for the motorists had

IN THE HEART OF THE MOUNTAINS OF THE SOUTH

INTEREST IN THE TOUR RAN HIGH IN HIGH POINT, N. C.

learned of the comforts of real hotels during their stay there and almost had to camp out at this place to-night. Four or five in a single room was common, and baths could not be had for love or money. But the majority of the Gliddenites are near-veterans and are accustomed to roughing it. Little protest was heard regarding what Cordele had to offer.

During the day's run there was one accident, the Metz car driven by L. Cathcart hitting a bump in the road with rather too much force and turning over. No one was hurt and the car reached control on time.

Denver Abandons Most Ambitious Contest.

Although the Denver Motor Club, of Denver, Colo., had received the sanction

of the Contest Board, A. A. A., to hold an ambitious reliability tour, covering a distance of 2,149 miles, from Denver to New York City, October 24th to November 7th, the plans have been abandoned. It is stated that the project probably will be lived in the spring. Fifteen entries had been received when the affair was called off.

Two Days' Sport in Sioux City.

With excellent weather, large crowds and prompt work, the events constituting the three days' racemeet held on the mile dirt course at Woodland Park, near Sioux City, Ia., Friday, Saturday and Sunday, October 20th, 21st and 22nd, proved up to anticipations. The meet was promoted by the

Sioux City Automobile Club, with the co-operation of the Inter-State Live Stock Fair Association, the owners of Woodland Park. The races had been announced for the 20th and 21st inst. only, but at the last moment, on account of the interest of merchants who donated prizes, Secretary Reid wired the Contest Board of the A. A. A. and received permission to extend the meeting over Sunday.

Of all the thrills—and there were many—the 50-mile free-for-all on Saturday proved the most exciting. It was a battle of tires as well as machines, for with a recent sad tragedy in mind the officials took no chances with doubtful tires. Twelve entrants were away at the drop of the flag, and for more than 30 miles there was small choice, although John Sparling, a Buick, was leading most of the time. The pace, however, proved too much for his tires, and at the 37th mile he was ordered to the pit to replace them. He did so, but when he got going again he was unable to make up lost ground. During the next few miles eight other contestants were motioned to the pit for tire changes, and the stops put them out of the race. Harry Wetmore (Chalmers) proved the winner. W. Marvel (Abbott-Detroit) was second by a few lengths, with John Sparling (Buick) third and Wess Shrunk (Paige) fourth.

On account of the death of William Pearce, the star of the Colby team, who was killed during a practice trial two days before the opening, the set program was disarranged, as all of the Colby entries were withdrawn. The summary:

Friday, October 20.

Ten miles, Class C, 161-230 inches displacement—Won by J. W. Shrunk (Paige); second, Walter Gnehm (Reo); third, J. Ralston (Ford). Time, 10:12.

Australian pursuit, Class D, free-for-all—Won by Phil Wells (Moon); second, John Sparling (Buick).

Ten miles, Class C, 301-450 inches displacement—Won by John Sparling (Buick); second, Harry Woodruff (Jackson); third, E. J. Delaney (Cutting).

Twenty-five miles, free-for-all—Won by John Sparling (Buick); second, J. W. Shrunk (Paige); third, Phil Wells (Moon); fourth, H. A. Wetmore (Chalmers). Time, 25:27.

Saturday, October 21.

Ten miles, Class C, 161-230 inches displacement—Won by J. W. Shrunk (Paige); second, H. A. Wetmore (Chalmers); third, Walter Gnehm (Reo). Time, 11:04.

Ten miles, Class C, 301-450 inches displacement—Won by John Sparling (Buick); second, Fred Young (Jackson); third, Phil Wells (Moon). Time, 10:17.

Fifty miles, free-for-all—Won by Harry Wetmore (Chalmers); second, W. Marvel (Abbott-Detroit); third, John Sparling (Buick); fourth, J. W. Shrunk (Paige). Time, 56:57.

GLIDDEN TOURISTS ON THE OUTSKIRTS OF ANDERSON, S. C.

REMARKABLE EFFECTS OF REVISION

Untangling of San Francisco Muddle Causes Perfect Score Trucks to Lose Awards—Peculiarities Involved.

Having undertaken to revise the official figures in the San Francisco Examiner's economy and reliability test for commercial motor vehicles, which occurred October 4-5, the technical committee, aided by a firm of expert accountants, has prepared a new table of performances, which gives the first declared standing of competitors a severe shaking up and changes the prize winners in several of the divisions. The revision was made necessary by the discovery of several glaring errors in calculation and also included the establishment of a totally different schedule of wages for the drivers of the various trucks. No change, however, has been made in the formula according to which the work of the vehicles was rated, the inconsistency of which was pointed out in last week's Motor World.

The arithmetical errors consisted chiefly of the assumption that a gallon has only two pints—the cost of the oil supply used by each car therefore being four times too large. As this cost, however, was wrongly calculated for all the cars, it would not have made much difference in the classification of the winners. The main issue centered around the drivers' wages, which in the first "official" table ranged from \$2 to \$6 per day, according to no particular schedule. In the new table drivers of wagons carrying less than 1,000 pounds are credited with receiving \$2 per day; from 1,001 to 1,500 pounds, \$2.50 per day; from 1,501 to 3,000 pounds, \$3 per day, and over 3,001 pounds, \$4 per day. Other changes in the table include a reduction of penalties, particularly in the case of the Franklin No. 6, which had its penalty of 2,800 points cut down to 4 points. Where it ever got the enormous penalty is not discernible from the itemized list of penalizations.

The revised figures still are based on the formula which appears to have been invented for this contest, although the official announcement accompanying the publication of the revised figures distinctly states that the formula used is the same as that employed in the endurance and economy test held in Chicago last August. This formula consists of dividing the penalties by ten, and adding the quotient to the cost per ton mile. In San Francisco, however, the penalties, divided by ten, were added to the total cost and then divided by the mileage, bringing the cost of penalization to a very low point. One of the peculiar results of using the San Francisco formula is that in three of the divisions perfect score trucks did not win the

first prize, simply because their gasoline and oil consumption was slightly larger than that of the declared winners, which had earned demerits. The most remarkable instance of this sort is evidenced in Division 3K, in which the No. 24 Reo was declared the winner. Despite the fact that the Reo used $1\frac{3}{4}$ gallons of gasoline and $4\frac{1}{2}$ pints of oil more than the White, and that it was penalized 86 points while the White had a perfect score—despite these facts the Reo won, while the White received last place.

The appended table gives the original figures, the revised figures, and also the figures which the trucks would have earned had the results actually been based on the formula employed in the Chicago test, the latter being calculated by the Motor World on the basis of the "revised" figures.

Illinois Association Re-elects Williford.

A. J. Williford, of Nokomis, Ill., will continue to lead the Illinois State Automobile Association for another year. At the annual election of officers, held last week in Chicago, he was re-elected president. The other officers are: First vice-president, W. P. Graham, Rochelle; second vice-president, J. B. McGuire, East St. Louis; third vice-president, Arthur Ware, Hillsboro; secretary and treasurer, Henry Paulman, Chicago; directors, Dr. H. A. Gunther and C. G. Sinsabaugh, Chicago Motor Club; R. J. Ton, Roseland; R. B. Roggeveeb, Blue Island; C. G. Miller, Cairo; C. H. Lockhart, Witt; T. M. Beatty, Quincy; X. E. Miller, Spring Valley; H. Vredenburg, Springfield; W. D. Snow, Bloomington.

HOW HERRICK AVERAGED 74.93 MILES

The Story of How, at Santa Monica, He Wiped Out Nazzaro's Long Standing Record—Huge Crowd Saw the Four Races.

It was over a very dusty course that automobiles speeded in the annual Santa Monica road races on the 14th inst. Last year, it may be remembered, the events were run off on Thanksgiving Day and Teddy Tetzlaff and his Lozier gave Californians and others a new American road record to be thankful for. Now Westerners have still more to be thankful for and to crow over; they can point to a new world's record made right at home on the same old Santa Monica circuit that always has given promise of being the scene of just such a coup. Harvey Herrick, who is a Californian who seldom, if ever, gets much further East than the boundary line of his home State, "owns" the new world's mark; it stands at 74.93 miles an hour and was made with a National car, as briefly was stated last week.

Herrick's win was not unlike Tetzlaff's of a year ago. Tetzlaff was an unknown quantity till after he annexed the big prize for last year's heavy car race over the same course and then went right back and after a 20-minute rest walked off with the free-for-all prize money. Herrick, too, was almost as unknown when he lined up with the other national characters, for about the only good work he previously had done was the winning of the last Los Angeles to Phoenix desert race—a feat by no means to be sniffed at. But he is well known now and his name and his achievement will be graven on the record books of automobile sport.

Weather conditions were ideal—California has a record for perfectly sublime weather that it would be hard to beat anywhere. The sky was flawless and the sun shone brilliantly, though none too ardently. Like other big road events that are started almost before sun-up, the occasion was an all-night affair for a big percentage of the estimated 200,000 spectators who eventually lined the course. On the Friday night preceding the big day thousands and thousands of motorists chugged their way to the seaside circuit, and long before the morning sun had chased away the light haze campfires were going everywhere and sleepy spectators crawled out of curtained-in touring cars, runabouts, motor trucks and limousines and stretched their legs.

By the time the so-called heavy, medium and light car races (301-450 inches, 231-300 inches and under 231 inches displacement, respectively) were put on—the two former events at about nine o'clock—the grandstand showed a very fair sprinkling of spectators; but it was not until a little more

than two hours later, when the piece de resistance, the free-for-all, was started, that the crowd deserved the name. There was not a vacant seat in the big grandstand and the course was lined solid almost the whole way around. Despite the record crowd, policing facilities were adequate, and, as has been the case in the past when Santa Monica offered road racing, there were no fatalities. Though there were several "near" accidents, only one of them really materialized. "Farmer" Bill Endicott skidded into the fence on "Death turn" and broke his car, which was an Inter-State, and also his heart, for he was more than ordinarily determined to share in the distribution of prize money and was "going some" when he had to quit after completing only three laps in the free-for-all.

The races in the morning were fast and they provided lots of thrills and excitement, but the real interest of the crowd was not in them, but in the free-for-all, which was started last and which was not finished till almost sun-down.

Slightly changing the usual method of procedure, the cars in the "heavy" and "medium" classes were sent away first on their 151-mile journey. In the 301-450-inch class

there were but four starters, and of them Bert Dingley pressed foot on an accelerator and got away first. He was followed at 30-second intervals by Charles Merz (National), Dave Lewis (Stutz) and Harvey Herrick in the same National with which he later won the free-for-all. There were nine starters in the 231-300 class, and many of the drivers in this event, as well as in the others, had been seen in previous struggles over the same course. The order of start for the "medium" car race was as follows: Harris Hanshue (Mercer), Charles Bigelow (Lexington), John Jenkins (Cole), Joe Nikrent (Marmon), Louis Nikrent (Buick), Clarence McKeague (Durocar), Bruce Keene (Marmon), Frank Siefert (Cole) and Rupert Jeffkins (Schacht).

Right from the start Dingley decided to make a runaway of his section of the race and he succeeded up to the 11th lap. But Merz had all this time been attending strictly to his own business, and when Dingley stopped for tires in the 12th lap Merz passed him and never was headed. Dingley made a game fight of it despite the handicap entailed by many tire changes, but at the finish he was nearly three minutes behind Merz's blue streak. Lewis, in

the Stutz, drove consistently and did not take any chances. He was always a dangerous contender, his steady driving and evident headwork making him, after Dingley, a prime favorite for first honors. He, too, had his share of tire troubles, and the best he could do was third place. No particular interest attached to the driving of Herrick, his blue National slipping around the circuit with clocklike regularity and making very little fuss. Perhaps if he had not had the surfeit of tire troubles that was his a different story might have been written. As it was, he finished in fourth place, showing little of the form that afterward won him the free-for-all and established a new world's mark. Merz's time for the 151 miles was 122 minutes 8.45 seconds, and his average speed was 74.42 miles an hour.

Pursuing almost the same tactics as did Dingley in the race for heavier cars, Harris Hanshue held his Mercer in the lead in the "medium" car race up to the 10th lap. Then it was that Bruce Keene, who captured a Marmon for the first time, though he has been first lieutenant to Dawson for some time and rode with him in the last Vanderbilt race, showed his metal and forged to the front. Joe Nikrent, also a

recruit in the Marmon camp, was right behind him, and in these positions these two Marmon pilots finished in 2:12:09.95 and 2:13:05, respectively. Hanshue and his Mercer had been forced back to third place just a few seconds behind Nikrent, and finished in 2:13:41.20. Nikrent's brother Louis was fourth, at the wheel of a Buick, and all the others were flagged going strong. Bigelow (Lexington), Jenkins (Cole) and McKeague (Durocar) were each two laps behind the leaders, and Jeffkins (Schacht) and Seifert (Cole) were three and four laps behind, respectively. Nikrent's loss of time was caused by a flooded carburettor in his Buick, and minor troubles, not the least of which were caused by tires, caused the others to lag.

Nine starters, or just three times as many as last year lined up, were sent away in the class for cars of under 231 inches piston displacement, and as they sputtered and snapped around the course their staccato exhausts were in marked contrast to the heavier thuds of the larger cars. They occupied the whole course to themselves. George Soules in a Flanders was the first to get away, and was followed by Harris Hanshue, this time at the wheel of a Reo.

The rest were sent away in the following order: Louis Nikrent (Buick), De Quela (Sunset), Clarence Smith (Maxwell), Bruno Seibel (E-M-F), A. J. Charles (Ford), Vic. Fleming (Locomobile) and A. C. Anthony (Regal).

As early as the second lap trouble commenced to be experienced, Smith, who had driven furiously and was giving promise of better things to come, retiring, the fly-wheel of his Maxwell having broken. Hanshue in the Reo then was in the lead with Nikrent and his Buick second and Seibel in the E-M-F third. The rest were strung out behind in practically the order in which they started. Nikrent was the next man to make an involuntary stop, a flooded carburettor causing it, and soon after Hanshue, too, was compelled to stop and make adjustments, allowing Seibel to drive his E-M-F up into first place, where he stayed till the ninth lap.

Nikrent's trouble cost him a loss of a little over two and one-half minutes, but when he did get back in the race he drove to such good advantage that he overhauled everyone in front of him except Seibel in the E-M-F. Seibel had his share of trouble in the beginning of the 10th lap and Nikrent went to the front and A. J. Charles, who up to that time had been driving a pretty race that brought him up from the tail-enders to the front, slid into second place and stayed there till the end. From the 10th lap to the finish Nikrent never was headed, his time for the 101 miles being 1:42:21.70, which figures out at the rate of 59.20 miles an hour. Seibel was third and George

Soules, who drove a Flanders, landed in fourth place.

Of the others, Hanshue finally got going properly again, but was flagged in the 10th lap, as was Vic. Fleming in a Locomobile. A. De Quela (Sunset) had engine trouble and quit in the eighth lap, and the same variety of trouble forced Anthony (Regal) out in the fifth lap.

By the time the "baby" cars had stopped running the really big crowd was on hand, and as the big cars entered for the free-for-all began to appear in front of the grandstand the drivers were given separate ovations varying in size according to their popularity and reputation. In view of his previous performances, Tetzlaff was the ruling favorite, though the crowd looked askance at his Fiat mount. It was rumored that the car was not in the best of condition, that it had a new engine and that the engine itself had "cut up" so in practice that new pistons had to be fitted. As it afterward turned out, popular opinion regarding the car was not altogether wrong, for of the two cars that had mechanical trouble Tetzlaff's Fiat was one. Tom Dubey's Midland was the other car to suffer mechanical trouble, though it was no fault of the car's. Dubey tried to take a corner too fast and bumped the fence, the resultant shaking up putting the engine out of business in the very first lap.

For the race an even dozen cars were started away in the following order: Howard Wilcox (National), Bert Dingley (Pope-Hartford), William Endicott (Inter-State), Joe Dawson (Marmon), Charles Merz (National), T. Dubey (Midland), Dave Lewis (Stutz), Teddy Tetzlaff (Fiat), Harris Hanshue (Mercer), Joe Nikrent (Marmon), Harvey Herrick (National) and Cyrus Patschke (Marmon).

From the first the race was principally a battle between the National pilots and those who guided the Marmon cars. Dingley was an odds-on favorite and up to the 22d lap, when repeated tire changes put him far behind the leaders, he was a dangerous factor. As already has been chronicled, Tom Dubey went out in the first round of the 202-mile grind, and he was followed in the third lap by "Bill" Endicott, who, it is said, was forced into the fence by Tetzlaff. The Inter-State was wrecked, both

rear wheels being torn off, but driver and mechanic escaped unhurt. The place where this accident occurred is known locally as "Death Turn."

Both Tetzlaff with his Fiat and Wilcox in a National "50" set out at a terrific pace, and at the end of three laps, when Dubey and the Midland came to grief, Tetzlaff was leading by just a minute. Bert Dingley had worked his Pope-Hartford into third place. Soon after this all the leaders had tire trouble and Patschke moved up into second place and pushed the others back. The other cars were bunched in pretty much the same order they started, Patschke being 11 seconds ahead of the Pope pilot.

In the ninth lap Tetzlaff still retained the lead, but only by the hardest kind of driving, as repeated tire changes caused him to lose time as fast as he gained it. Patschke then was second, something like three minutes behind the Fiat driver, and almost on Patschke's rear wheels Herrick pounded along. He had not made a single stop for tires and rapidly was overhauling the leaders.

Tetzlaff met his Waterloo in the 10th lap when he tried to take a corner too fast and blew out both rear wheels at once. While new tires were being fitted Patschke caught up with him and flitted by, to be followed a few seconds later by Herrick, whose National was humming along in perfect contentment. All of the other drivers had been suffering from an abundance of tire trouble, and, with the exception of Dawson, who moved up to third place in the next lap, were far behind the leaders.

In the 13th round Patschke led, with Herrick second and Dawson third, Herrick having made up three seconds on the first man. These positions were maintained to the 15th lap, when Herrick made his only stop to change tires and went back to fourth place, Dawson going up one and Dingley, who had been trailing along behind, slipping into third. From the 16th lap to the finish it was anybody's race, the anybody in this case embracing Patschke, Herrick, Dingley and Dawson. All except Herrick took a turn at leading the bunch and then had to drop back for tire changes. Herrick alone made no stops, and when in the 22d lap he gained the lead he held it to the finish. Between Herrick and Patschke when the wire was crossed the last time there was a little over three minutes, while approximately two minutes separated Patschke from his team-mate, Dawson.

Herrick's time for the 202 miles was 162 minutes 27.6 seconds, and his average figured out in terms of miles per hour is 74.93. Patschke covered the distance in 165 minutes 42.73 seconds, and Dawson required 167 minutes 54.53 seconds.

The summaries of the four races are shown by the accompanying tables, which are reproduced from the official report filed with the A. A. A. and are free from discrepancies which appear in other tables that have been published.

RUSSIA'S REMARKABLE "GLIDDEN"

Despite Damaged Cars, Moscow Team Gets "Perfect Score" and Czar's Trophy—Graft, and Strenuous Going.

Russia has had its "Glidden Tour," and while the participants are certain they did not engage in a pleasure jaunt, they are not yet fully decided whether it was or was not the greatest fake ever palmed off as an endurance contest. According to their European rivals, Russians do not rank high as sportsmen, but even their worst enemies were not prepared for such partiality and unfairness as evidenced in the distribution of awards. First prize was given to the Moscow Automobile Club, which had entered a Mercedes, Berliet, Minerva and La Buire. This in itself would not have been remarkable, but for the fact that the Mercedes broke its steering gear, and the Berliet all of its springs, and that despite this damage the "team" finished with a "perfect score." A certain high official informed one of the participants that the Moscow club was bound to win the trophy, and so it happened. The distribution of prizes, therefore, is one which has no real bearing upon the performance of the cars.

Among the 63 cars that lined up for the start in St. Petersburg, on September 18, were four American, including three Fords and one E-M-F, 21 German, 4 Italian, 18 French, 8 Russian, 2 British, 1 Spanish, 1 Belgian and 4 Austrian productions—a thoroughly international showing. The route led through Wischny, Moscow, Tula, Kursk, Charkow, Jekaterinoslav, Melitopol and Sevastopol, covering 2,086 versts, or 1,300 miles, divided into trips of from 168 to 396 versts per day, according to the character of the roads. The latter were conspicuous by their absence for hundreds of versts and the cars had to go cross country through hub-deep sand on more than one occasion. Despite this fact, 46 cars survived the journey.

The famous Russian "official graft," before which the American article pales into insignificance, had its greatest chance on the laps between Moscow and Kursk. Here the president of the railroad which parallels the route, placed old worn-out sleeping cars, lighted with tallow candles, at the disposal of the "tourists" for three nights, charging each man six dollars per "bed" per night, and finally confiscating all the baggage until \$500 were forthcoming to pay for the transportation of "extra baggage." Every contestant had to pay an entry fee of \$50, and if he dared to question any entry made by the official "observers"—some of whom did not know a four cylinder motor from a six—he had to pay a deposit of \$50 and file his objections within 12 hours. As all the entries were

made in the Russian language, and the majority of the contestants understood no word of it, it is clear that few objections were raised to anything the observers might choose to enter in their books.

The abominable roads were responsible for the early elimination of the Ford cars, which dropped into some of the big holes in the so-called roads and broke axles and springs, or bent a frame member. Only a few of the cars managed to get through with truly "perfect scores," while others obtained the coveted honor by hook or crook. For instance, the Wiesbaden Club of Germany was fined 10 points because one of the nuts on a spring clamp had cracked—while the Rheinische Club (which included among its members the personal aide of the Czar) had all its penalizations remitted; and the Moscow Club, as stated, won the Emperor's prize—although two of its cars should have been disqualified. When one of the contestants, whose car had a perfect score, filed a protest to the president, who also was an aide of the Russian Emperor, against the awarding of the Czar's gold cup (valued at \$3,000) to the Moscow Club, he was told that as the club had all its four cars at the finish line that was reason enough why it should get the prize, but that in consideration of the fine work done by the protestant's car he would be given a special silver prize. The president of the association gave the gentleman five minutes' time to accept this proposition and—the gentleman accepted!

The contest was promoted by the Automobile Club of Russia and was replete with picturesque incidents, not the least of which was the reception at Moscow, where 150 cars bearing members of the Moscow Automobile Club, met the "contestants" six miles from the city, where a splendid banquet was served in tents. While the "tourists" enjoyed the club's hospitality, two aviators came flying through the air, circled above the heads of the guests and showered them with flowers.

Economy Tests to Replace Reliability.

Lack of entries caused the abandonment of the reliability contest of the Motor Club of Harrisburg, Pa., announced for October 16th to 18th. Instead the club will hold economy tests for dealers and private owners November 13th. The former will be judged on the amount of gasoline and oil used, while the owners will be awarded according to the consumption of gasoline only.

Minneapolis Hill Climb is Postponed.

There was no hill climb at Minneapolis Minn., October 21st. At the last moment the Minneapolis Motor Club, under whose auspices it was to have been held, announced a postponement until today (Thursday), the 26th inst. The change, it is said, was made at the request of out-of-town motorists who were not able to be on hand on the 21st inst.

REVISION OF THE FRANKLIN LINE

Changes in Price, Power and Details—Big Six Dropped, Littler Six Added—Auxiliary Exhaust Abandoned.

In an industry which exhibits the imitative faculty as strongly as does the body of American automobile producers, it is a striking distinction for one builder to continue year after year to produce a distinctly differing type and to do so with unfaltering success. The position of the H. H. Franklin Manufacturing Co., of Syracuse, N. Y., in this respect is unique. A long-continued adherent to the air-cooling prin-

draught the peculiar conditions which rendered the auxiliary valve a necessity are thought to have been eliminated, and tests covering a period of two years have demonstrated to the satisfaction of the Franklin engineers that the motor is "fully efficient" with the single exhaust.

An advance rather more in the direction of modern design is the adoption of a self-contained oiling system of the "pump-over" type, in which a gear pump, drawing from a base reservoir, forces the oil through individual leads to the main bearings, through which it finds its way to the lower connecting rod bearings through drilled ports in the shaft. The overflow from the "big end" bearings is distributed over the interior of the crank case lubri-

matter of spark adjustment. On the small runabout the fixed-spark magneto is retained, but on all others a governor is employed in connection with the magneto of the Bosch dual system, which serves to advance or retard the armature automatically, in direct relation to the speed of the motor, and thus to regulate the sparking point with mechanical exactitude.

The original form of carburetter is retained, together with the manual adjustment of the mixture, which may be actuated from the driver's seat. For the six-cylinder models, however, an automatic auxiliary air valve is provided. The hot and cold air regulating system previously employed is retained.

Fewer alterations have been made in the

FRANKLIN FOUR-CYLINDER LANDAULET AND THE NEW SIX-CYLINDER LIMOUSINE

ciple, and to other striking features, it is notable that, in announcing its new line, the essential characteristics are retained which have rendered Franklin cars not only marketable but desirable.

While the original method of engine cooling by means of an induced draught through air jackets surrounding the cylinder is retained, as are the use of full elliptic springs, laminated wood frame members, light body construction and very large tires in proportion to the weight sustained, the new line, nevertheless, embodies a number of distinct modifications as compared with the output of cars which is now being closed out. Among the more noteworthy alterations are several affecting engine construction in a general way. For example, the auxiliary exhaust has been dispensed with, thereby simplifying construction by eliminating one set of valves with their lifters and cams and at the same time, it is declared, in no way affecting the efficiency of the engine's performance.

The auxiliary exhaust, which was arranged to carry away 70 per cent. of the products of combustion through outlets in the lower part of the cylinders, was adopted in early models when unconfined air circulated over horizontal cooling flanges, and when, in consequence, it was difficult to secure adequate cooling effect. With the present method of distributing the air

cating the pistons, valve gear and all moving parts not directly provided for. The final overflow from the crank case drains through a fine-mesh screen into the base compartment, the screen forming the separation between the upper and lower compartments and therefore being free from the danger of clogging to which the small-bore strainers sometimes are subject. The sub-base on the four-cylinder motors extends beneath the entire crank case, but in the two six-cylinder models which are to be produced hereafter, it is built under the four rear cylinders. The reservoir is of graduated depth, its lowest point being under the rear cylinder, adjacent to which the pump is located. An oil gauge and a draw-off plug also are located at the same point.

In all save the last-named small motor, the valves are interchangeable and are actuated by an overhead walking-beam arrangement similar to that in use at the present time. One new point in the valve mechanism is the adoption of the integral type of cam, the use of cams separately made and affixed to the shaft having been done away with.

After considerable experience with non-variable ignition, which hitherto has been employed only on the small motor and in the form of a fixed-spark magneto, it has been found entirely practicable to relieve the operator of all responsibility in the

transmission construction than in that of the engine. The multiple disk type of clutch, which is retained, is released by means of a pedal, the shank of which passes through a small round hole in the dash, instead of through a slot; the lengthening of the universal joint blocks four inches, has permitted the gear shifting and emergency brake levers to be placed nearer the driver's seat by a proportionate amount; the shifting rocker shaft of the change gear mechanism now is mounted over the gear box, instead of passing through it, thus permitting the gear-changing movement to be accomplished with less movement of the hand. Timken roller bearings are used for the tubular front axle and likewise in the rear wheel bearings on all models except the small runabout.

Improvements in the matter of equipment include at least one conspicuous feature in the secondary windshield which is attached to the back of the front seat on all models except runabouts and roadsters. The effect, as has been proved by experiment, is to add materially to the comfort of the passengers in the rear seat, adding also a touch of "exclusiveness" to that portion of the vehicle. Other standard equipment includes front windshield, top, head, side and tail lights—the latter on the three larger models being of the combination oil and electric variety—tools and

MODEL H FRANKLIN TOURING CAR AND THE TORPEDO MODEL—BOTH SIX CYLINDERS

storage battery. A foot accelerator, muffler cut-out and a new form of gasoline shut-off, which in addition to affording "off," "main" and "emergency" positions, also permits the tank to be drained when the handle is turned in the proper direction, are other new points.

As heretofore, the line is divided into four groups, different chassis forming the

has 126-inch wheelbase, as was the case with the corresponding previous model when equipped as a torpedo-phaeton, and has 37 x 5 inch tires, both front and rear.

The same sized engine is used in model D, which, in price, wheelbase and tire sizes likewise corresponds with the previous model D, these items being, respectively, price \$3,500, wheelbase 123 inches, tires

front and 34 x 4½ rear, are the same sizes.

Model G is built in two styles, one, the small runabout before mentioned, sells for \$1,650 and has a 3¾ x 4 inch four-cylinder motor of 18 horsepower. The G touring car, which is listed at \$2,000, has a 4 x 4 inch four-cylinder, 25 horsepower motor, 103-inch wheelbase and 32 x 4 inch tires. In addition to the standard touring, run-

SECTIONAL, FRONT AND SIDE VIEWS OF FRANKLIN SIX-CYLINDER ENGINE

basis of each group. Together with the changes in construction already described, the details of the new line are clearly indicated by comparing the new models with those they are designed to supercede. Model H, the largest member of the line, now sells for \$4,000, instead of \$4,500, and is driven by a 38 horsepower 4 x 4 motor, instead of one of 4½ x 4½ inches cylinder dimensions and rated at 48 horsepower. It

36 x 4½ and 37 x 5 inches, front and rear. Model M now is listed at \$2,800, which is a \$100 advance over the price of the preceding M, but, instead of being propelled by a four-cylinder 4 x 4 motor, it has a 3¾ x 4 six-cylinder motor of 30 horsepower, and is the only "light" six thus far brought out. It has longer wheel base than before, its present length being 116 inches, as against 108, but the tires—34 x 4

about and roadster models, a special model D torpedo of striking form and finish is provided, all other models being equipped with both front and rear doors, though varying from the torpedo in line and form. Limousine and landaulet constructions likewise are offered, the H limousine being particularly distinctive in the manner in which the enclosure of the sheltered front seat has been treated.

THE FOUR-CYLINDER 25-HORSEPOWER AND THE SIX-CYLINDER FIVE-PASSENGER TOURING CARS

The Skuttle Dash; Its Origin and Its Effects

"And this model," continued the smooth-spoken salesman, "has a skuttle dash," and he went on to enumerate the advantages of the construction. The "prospect" looked bored by the recitation; he was clearly un-

tension of its sides over the "chute" to prevent the coals from scattering on the hearth when the receptacle is tipped up. When first automobiles were made with their sides extended upward and curved in

weather out and therefore increase the comfort of the passengers. Any device or method of construction which makes for the greater comfort of passengers is laudable. But some forms of present-day skuttle dashes are not to be commended for the simple reason that their intended effect is exactly reversed. Which is to say that the effect is not unlike that which would be obtained if heavy garments were worn in the middle of August to keep out the heat! On the assumption that "all cats look alike in the dark" and that one form of skuttle dash is as bad as another in this respect, some manufacturers consistently refuse to use them, and there is a well-defined tendency in Continental and British motoring circles to get away from this construction as much as possible.

But this question, like very nearly every other, has another side, and its essence is ventilation. An internal-combustion engine is essentially a heat engine, and though its temperature is kept fairly low by the cooling water, all engines of this type operate at temperatures considerably higher than normal atmospheric. It stands to reason, therefore, that some of this heat must be communicated to the dash itself and to the

FIG. 1—SHOWING DEEP SKUTTLE DASH—THE OVERLAND

comfortable and any student of human nature might have divined that he wanted to ask a question and yet was chary in the fear that it might parade his ignorance. At length he screwed up his courage to the breaking point and looking the salesman squarely in the eye, he said:

"What do you mean by skuttle dash? I never heard of one before."

The salesman looked his surprise. "Why it's this part here," he explained, as he passed his hand caressingly over the glossy paint on the extension of the engine hood which partly closed in the driver's compartment and made of it a cosy little "cubby" hole.

"Yes, but why skuttle?" asked the "prospect," and he raised a question which has stumped more than one salesman and more than one motorist as well. Most dictionaries reveal nothing in their stereotyped phrases: others that have illustrations are better, though the average individual scarcely might be expected to guess the connection between so plebeian and prosaic an article as a coal-skuttle and an automobile.

And yet that is exactly where the term "skuttle" as applied to that particular style of body construction originated. The kind of coal-skuttle used most "across the pond," where the phrase was coined, and to a limited extent in America, boasts an ex-

to be joined over the top of the dash, thereby partly closing in the driver's leg space, some one remarked the resemblance to the common or home variety of coal-skuttle and ever since then the name has stuck.

But whereas the object in so constructing coal-skuttles is to keep the coal in, the function of the skuttle dash is to keep the

flood boards, added to which there is a continual draft of hot air forced by the fan through the holes in the floor boards through which the pedals protrude.

It is the experience of motorists and manufacturers alike that unless some means of disseminating this heat is provided the driver's compartment of a skuttle dash car

FIG. 2—SKUTTLE MOUNTED WINDSHIELD ON KING CAR

speedily becomes unbearable in warm weather or torrid conditions. Of course the heat is desirable in cold weather, and though it has been suggested that the front doors be removed in warm weather, it is not always possible easily to detach them, particularly if the car is of the so-called torpedo variety. The problem has been, and in many cases still is, to provide some means of easily varying the amount of cold air which can be admitted.

Better than the suggestion that the front doors be removed, the scheme of some manufacturers, who have provided latches whereby the doors may be locked "ajar," still has its drawbacks, i. e., either too much cold air is admitted and the draft becomes uncomfortable, or none is admitted (when the doors are closed) and the conditions are not altered. Other manufacturers provide proper ventilators let into the sides of the dash beside the end of the engine

any unobstructed position a draft of "new" air can be obtained. That ventilation can be made very nearly perfect, however, is evidenced in a number of brands of car of which a complaint seldom if ever is heard.

must be when it is partly closed in. But this scarcely can be considered to be a serious drawback to the popularity of the construction, for the reason that dashes are becoming freer of equipment almost momentarily, and in the majority of cases it seldom is necessary that dash fixtures be consulted en route.

Foreign cars, on the other hand, have not attained that degree of simplicity that marks the American product, as a rule, and dashes still are receptacles for multitudinous devices. To make them plain, electric lights are fitted in some cases and in others they are not, while at least one manufacturer has hit upon the happy scheme of making part of the top of the skuttle of heavy glass. Thus is light admitted and protection from the elements obtained at the same time.

American manufacturers have not resorted to such methods as yet, and it is

FIG. 3—STODDARD-DAYTON CONSTRUCTION

hood, which may be opened or closed much or little at the will of the operator.

But while such ventilators undoubtedly better conditions materially, the fact remains that in a large majority of cases they are woefully inadequate and in nearly as many cases are placed wrongly to be of the greatest value. One of the more common faults is that ventilators are placed comparatively low down in the sides of the dashes of cars in which the engine is covered with a hood provided with vents. In which case it is obvious that not all the air which is admitted through them is fresh and cool; a part of it at least must have come, heated, through the vents in the engine hood.

Of course where the engine hood is not provided with vents, and a large number of cars are so constructed, a difference of a few inches either way in the height of the ventilators is a small matter, as in almost

FIG. 4—THOMAS CONVEX SKUTTLE

But their number is in the minority and until some more successful method of ventilation is devised by those who pay little attention to this feature it is doubtful if the skuttle dash ever will attain to that degree of popularity to which it is entitled by reason of its other advantages.

FIG. 5—MAXWELL SKUTTLE DASH

There is another feature which also has been charged against the skuttle dash and which is more or less of a bugaboo. This is the comparative obscurity in which the dash itself is placed when a skuttle is added. Of course the dash is darker; it

FIG. 6—JACKSON SKUTTLE DESIGN

unlikely that they ever will, because, as already has been stated, the simplicity which marks American cars makes it unnecessary for dash appliances to be continually under the surveillance of the operator.

Engine noises and other disturbances undoubtedly are accentuated by a skuttle dash, which acts much after the manner of the horn of a phonograph in intensifying such sounds and bringing them to the notice of passengers. But engines and other component parts of the car are quieter now than ever before, and in all probability will be still more quiet in the future, and the slight tapping of the valves, which is about the only noise which emanates from the modern engine, scarcely can be objectionable.

It is in the matter of protection that the skuttle dash scores most heavily. The beauty of outline which it allows naturally

is a factor in its favor, but the protection which it affords is of greater import and is its real *raison d'être*. Its effect in this respect may be judged from any one of the accompanying illustrations, which have been picked at random from the late models.

Illustrative of the tendency toward even longer skuttles, Fig. 1, which depicts the Overland car, shows graphically the protection they afford to the driver and the occupant of the seat beside him. In this particular instance the skuttle is in effect as well as in reality a continuation of the body sides up over the top.

In the King car, shown in Fig. 2, the arrangement is slightly different, the skuttle being shorter and set at a slightly greater angle. One of the noticeable points in the construction of the skuttle and the front part of the body is that there is no extension of the dash beyond the sides of the engine hood as generally is the case. Instead, the body is curved in to meet a dash of the same width as the hood, and the clean lined effect which is obtained is unmistakable. The location of a windshield on top of the skuttle simplifies the method of its attachment; several other manufacturers make use of this arrangement. In the attachment of the Chalmers windshield, which also is located on top of the skuttle, for instance, a novel scheme of ventilation has been made use of. The windshield does not rest on the skuttle proper but on a curved wooden piece which fits over the edge of the skuttle and leaves a space of approximately one-half inch which is open. The wind, deflected by this curved member, rushes down into the compartment, but is directed forward and impinges first on the dash itself and consequently there is no uncomfortable draft, though the forward compartment is thoroughly ventilated.

The finished appearance which a skuttle dash gives the body of a car is well illustrated in Fig. 3, which shows one of the late model Stoddard-Dayton "sixes." In this case also the skuttle is built integral with the body, though, unlike the others, it is finished at the edge with a narrow mahogany strip, which gives it a slightly more solid appearance and makes it more than ever an actual part of the body. The angle of the skuttle, too, is slightly less and conforms with the general straight-line effect which is produced in the rest of the body.

Though it may not be generally known, the exact angle at which the skuttle should be set is a matter which warrants a considerable amount of study. As already has been stated, the object of fitting skuttles is to increase the comfort of passengers, but when they are so arranged that wind is deflected directly into the faces of the occupants of the front seats, it is a question whether they properly perform their duty. Theoretically they should deflect the wind over the driver's head, though this

fact often is overlooked when a change of possibly only an inch would make a very great difference and the car would be very much more comfortable.

In the Thomas arrangement, shown in Fig. 4, wind deflection is changed considerably by forming the skuttle in a convex curve, the effect obtained being that the skin friction generated by the wind causes it to cling to the skuttle to a certain extent and it is dragged down and not projected directly in the driver's face, as it might be if the skuttle were straight or a concave curve. Incidentally eddy currents of air are caused to swirl downward and ventilation is made more perfect.

Maxwell construction, shown in Fig. 5, is illustrative of orthodox practice, which steadily is gaining in popularity by reason of its pleasing lines and the general clean-cut, smooth appearance which it gives. Obviously it affords all the protection that skuttle dashes in general do, and in addition it has the advantage that it is formed integral with the body and therefore serves to strengthen it. In this design, also, the dash is not extended beyond the engine hood and wind resistance is reduced in a measure.

A pleasing variation of the skuttle dash idea, which, in addition to enhancing the appearance of the car as a whole, also serves a useful purpose, is shown in Fig. 6, which depicts one of the late models in the Jackson line. As may be seen in the picture, the body is essentially a straight-line creation and is carried forward to meet the dash, which extends beyond the engine hood and mounts the lamps. From an esthetic point of view, the effect of the concave curve at the back of the skuttle may be judged better from a glance at the picture, or the car itself, than from a description. From a practical point of view, this construction allows of better ventilation and also of better light on the various dash appurtenances.

Of the many points which may be cited in favor of the skuttle dash, the reduction of wind resistance which it permits is of more than ordinary importance. It has been suggested on more than one occasion that "it is the maintenance expense rather than the actual first cost of an automobile which deters people from purchasing." And skuttle dashes have a direct bearing (slight but nevertheless apparent if time is taken to search it out), on maintenance cost. Without going deeply into the subject, it is apparent that it requires more power to propel a large surface against a head wind than it does a small one. For the reason that the skuttle dash reduces wind resistance it also reduces upkeep expense because it requires less power—which means less gasoline, and cylinder oil, and tire wear—to force a slightly pointed, or tapered, object through the air than it does to drive a square surface of the same area through it. That the skuttle dash has come to stay is beyond dispute,

and is evidenced by the fact that practically every manufacturer now lists at least one car which is so constructed.

Methods of Testing the Mixture.

Testing the mixture by the expedient of shutting off the gasoline supply to the carburetter, is a simple method recommended by William H. Stewart, Jr., of the Stewart Automobile Academy, of New York City. "If the mixture is too rich, the engine will speed up as the level of fuel in the float chamber is lowered by the reduction of the supply," as Stewart explains in substance, "while if the mixture is too rich that fact may be made plain by partly flooding the carburetter while the engine is running and before the fuel is cut off." Both tests, of course, are perfectly correct as far as they go, but in cases where the carburetter is not accessible while the vehicle is in motion, should not be taken as conclusive. In that connection it must be remembered that the mixture yielded while the engine is running without load, as a result of faulty regulation, may not be the same as that generated when the engine is "pulling" to its utmost capacity. Where such proves to be the case, the only successful method is that of successive trial and error.

Charles Y. Knight Patents New Piston.

To a long series of British patents covering various phases of engine construction, Charles Y. Knight, the American inventor, recently has added a piston design which is of peculiar interest because of its probable bearing on sleeve valve engine operation. The avowed objects of the invention are those of silencing the action of the motor and also of preserving the piston proper against the risk of seizure. To this end the piston is provided with a wide shield in the form of a spring ring which covers nearly the whole of the surface below the main packing rings. A space between the piston and shield ring is designed to be filled with oil, which is scraped from the cylinder wall by the edges of the ring, and which serves as a cushion to prevent the audible "slapping" of the piston alternately against opposite sides of the cylinder as its motion is reversed. In case lubrication should fail it also is anticipated that the shield ring, and not the piston, would seize, thereby limiting the resulting damage to a readily replaceable part.

Rendering Guideboards Luminous at Night.

Recognizing the uselessness at night of the ordinary form of guideboard, a Birmingham inventor has devised a new form of sign which is set with faceted and mirrored glass "jewels," which are designed to reflect the rays from automobile headlights and thus render the inscription visible from a considerable distance. The invention is further applied to the illumination of the conventional warning signals for turns, dangerous hills and obstructions.

BOSTON'S MODEL ELECTRIC GARAGE

Equipped and Maintained by Edison Company Chiefly for Educational Purposes
—Some of Its Features.

Recognizing the vital necessity of proper garage facilities in influencing the upbuilding of the electric vehicle industry, the Edison Electric Illuminating Co., of Boston, Mass., has sought to improve existing conditions by establishing a model garage in a building at 476 Atlantic avenue, which is owned by the company, and in conducting it according to plans which have been worked out with the co-operation of the garage committee of the Electric Vehicle Association of America. This is but one of several novel methods adopted by the Boston company in boosting the electric vehicle, another and equally radical scheme being the appropriation of a liberal sum of money for the use of the Massachusetts Institute of Technology in carrying out research work in regard to street transportation problems, particularly with the object of showing the relative efficiency of the electric and other types of vehicles.

This model garage, as described by E. S. Mansfield, in a paper on "The Central Station Back of the Electric Vehicle," which was read before the recent annual meeting of the Electric Vehicle Association, is a one-story concrete building formerly used as a garage for both electric and gasoline vehicles. In fitting up the building no attempt was made toward artistic effect, but every effort was exerted to provide means for the best of service in the simplest and most inexpensive manner possible, one motive being to prove to prospective garage owners that a model electric garage can be equipped at a moderate expense.

The portion of the building fitted for this purpose covers an area approximately 100 feet by 50 feet, capable of accommodating between 20 and 30 vehicles. The current for charging is obtained from the Edison company's direct-current three-wire mains, and is conducted to two charging panels in the operating room located in one corner of the building. Each panel has mounted upon it six charging switches, and charging rheostats from which the current is delivered to charging receptacles conveniently spaced about the charging area. Space has been reserved for additional equipment when required. Charging cables of various lengths carrying plugs at both ends are provided to accommodate vehicles in any part of the building.

The floor consists of a smooth concrete surface, and the entrance is of sufficient size to admit the largest truck when fully loaded.

The washstand is located at one end of the building, while at the other are the repair shop, battery space, work bench

with a full equipment of modern tools for light repair work, and facilities for charging ignition batteries.

The office, located in one corner of the room, is comfortably fitted for the convenience of operators, where it is planned to keep operating, repair and maintenance data in detail, so that exact costs of all descriptions can be figured out for customers' information, or for commercial comparisons.

A gallery at one end of the room contains the stock room where supplies and spare parts are stored, also the drivers' quarters, provided with lockers, table and chairs for their convenience. The entire room is lighted by Mazda lamps equipped with Holophane reflectors, so spaced as to give adequate illumination at a minimum expense.

Although the ultimate method of charge in electric garages will doubtless be on a kilowatt-hour basis plus a fixed garage cost, the company has offered its customers the option between this and a flat rate per vehicle per month, covering electric current for charging, irrespective of mileage, washing, polishing, flushing, battery testing, expert advice, adjustments and minor repairs. In addition to this regular service the garage is equipped to undertake at all times the overhauling of vehicles or batteries, battery washing, renewal of electrolyte, extraordinary repairs, replacement of worn or broken parts, and the supplying of new tires at regular commercial rates. It is planned to have spare vehicles at the garage which will be available for towing, in case of accident or failure of power, and for rental when machines are laid up for painting or repairs.

"In placing this garage at the service of the public," as the above-mentioned authority was careful to explain, "the company did so in an entirely non-competitive spirit, in no case seeking new customers or attempting to divert machines from other garages; but primarily to provide a home for commercial electricists in its immediate vicinity, and to offer the best service to any vehicles which were unable to secure it elsewhere. After being in operation about six months, its capacity already is nearly taxed to its limit, and it has proved itself to be of the greatest assistance to the electric vehicle interests in Boston, not only on account of the grade of service it has itself rendered, but by raising the standard of service in the other garages."

Nine More Electrics for St. Louis Mails.

The post office authorities of St. Louis, Mo., have found the electric delivery wagon so well suited to their needs that nine additional electrics have been added to the equipment. These nine cars will carry about 300,000 pieces of mail on each haul and will be capable of making 50 miles under full load before recharging. They are Waverley cars of 2,000 to 2,500 pounds capacity.

FRONT PASSENGERS AS LOOKOUT

State Court Held That They Must Act in That Capacity and Highest Court Refuses to Intervene.

Whether or not a passenger in the front seat of an automobile is obliged to assist the driver in looking out for dangerous crossings, while passengers in the rear seat of the same car are freed from this responsibility, is a question which the Supreme Court of the United States has declined to pass upon at the present time. The reluctance of the highest court in the country to place itself on record in this matter is believed to be due to the great confusion existing at present in regard to the contributory negligence clause in damage and accident litigation.

The case which was brought before the court was that of Charles D. Henderson, who was injured in a collision between the automobile in which he was riding and a Pennsylvania Railroad train, near Camden, N. J. Henderson, as well as a woman passenger, sued the railroad for damages, with the result that a jury in Camden decided in favor of the woman but against the man. It was brought out in the trial that Henderson had been sitting in the front seat alongside of the chauffeur, and that he had as much opportunity to see the approaching train as the chauffeur. His failure to warn the latter in time mitigated against him in the opinion of the court and the jury. The woman, which occupied a rear seat in the same car, was under no such obligation or duty and was awarded the damages asked.

Henderson appealed his case, the Supreme Court being asked to set aside the verdict of the lower court. The high tribunal, however, declined to review the evidence or to render any decision at the present time.

"Automobile School" Promoter Arrested.

At least one of the many men who have found the so-called "automobile school" a short cut to easy money is in trouble with the Federal authorities. He is Glen D. Gearhart, who conducted The Motor Car School in Houston, Tex., and is in a fair way of learning a new lesson himself. He has been indicted by the Federal grand jury on a charge of using the mails with intent to defraud. His bait was the usual one of offering to transform ambitious but unskilled young men into graduate chauffeurs and automobile mechanics in practically no time at all, and to secure jobs for them after they had "graduated." Five young Texans, who each parted from \$45 to be thus transformed, were the complaining witnesses in the case. They charge that Gearhart failed to carry out his part of the agreement.

"Keeping Tabs" on Taxicabs; the New York Plan

"You can't tell whether you are getting robbed or not, because the taximeters register what the drivers want them to regis-

8,961 meters, of which 1,400 were condemned, either for over-registry or under-registry. Furthermore, the inspection in

based on actual tests of revolutions of the front wheel.

The bureau, which is styled the Taximeter Inspection Bureau, and is under the Bureau of Licenses, maintains a big garage on the ground floor of the building at 248 West 49th street. Here a record is kept of every licensed vehicle in New York City, and the taxicab list is at present about 2,000. Over a dozen men are em-

DETERMINING THE "WAITING TIME" CLOCK'S ACCURACY

ter and not according to distance," is the way the cynical wisecracks talk about them. But it happens that in some respects these wisecracks are distinctly wrong, at least so far as concerns taxicabs in New York City. The city now sees to it that every taximeter in service is correct—and sees to it in no casual manner but with a vigilance and thoroughness of equipment that opens

**CITY OF NEW YORK
BUREAU OF LICENSES

CERTIFICATE DISPLAYED IN THE CAB

the eyes of anyone who, unacquainted with the system, has opportunity to see its workings. It is safe to say that few of those who have to do even with the automobile business of the big city are aware of the thoroughness that now prevails.

In the twelve months from August 10th, 1910, to August 10th, 1911, the municipal bureau in charge of taxicabs inspected

each case was made after the taximeter had been installed on the cab and was

is geared is jacked up opposite a testing machine and connected to the latter by

METER INSPECTION SEAL

ployed in the work of testing the taximeters. The old method of the bureau was to compel the cabs under inspection to travel a measured mile on Eighth avenue, but a much more satisfactory and rapid method is now employed. The correctness of the gearing on the meters themselves is determined by means of an electric meter device which revolves the wheel of the taxicab and counts the revolutions. The wheel to which the meter

COUNTING THE WHEEL REVOLUTIONS PER MILE

means of leather straps. The leather straps afford a flexible connection and avoid the necessity for universal joints or for accurate centering.

The cab wheel must revolve a given number of times for a mile on the meter. Most cabs used 32 inch tires, which, allowing for compression, means that the wheel would revolve between 637 and 638 times to the mile, but the inspection bureau gives the public a slight margin of advantage by making 640 revolutions to the mile the standard for this size of tire. Whatever slight variation the registration may exhibit, must be in favor of the public, though any error amounting to as much or more than 5 per cent. against the taxicab owner is ground for refusing inspection.

TESTING MACHINE AND ELECTRIC SOLDERING OF LAMP NUMBERS

tion approval. In this way the cab owner, as well as the public, is benefited. Although to the average man it would seem ridiculous that cab owners would ever equip their vehicles with meters that would under-register, nevertheless, mistakes in the gearing frequently are made and many meters in the tests have shown a large error operating against the owner.

The testing machines were built to order and cost \$125 each. The bureau itself owns six of them, while three more are privately owned by taxicab companies. One company operating about 600 cabs has two of the machines, while in another garage there is one. Inspectors from the bureau conduct tests in these garages in the same way that they are conducted by the official garage. In fact, one employee of the bureau spends his whole time at one of the big garages, where there are over 500 cabs.

Taxicabs must pay \$10 a year license fee and their meters must be inspected at least once every six months. Because of breakages the average of inspection is much more frequent than this, and whenever a new gearing is introduced in the installation there must be a new inspection before

the cab is put in service. The taxicabs are entitled to as many inspections as they require without cost. Each inspection carries with it an inspection certificate and the serial number of this certificate is marked on the meter itself by means of a small metal medallion, while inside the cab there is placed a conspicuous card in a metal frame, giving the same inspection number in large figures, together with the date of inspection. The simplest way for a passenger to make a complaint concerning any particular taxicab or its meter, according to John Drennen, Chief Inspector of Taximeters, is to indicate the inspection number as given inside the cab itself and on the metal tag attached to the meter, and from this the bureau can determine

exactly what cab is complained against and can order a new inspection.

Many of the complaints that are made against the cabs are ill-founded, Drennen says, and arise from the passengers' underestimating the distance they have traveled or from their not taking account of the rates that the companies charge. As an example, Drennen cites an instance where complaint was made of a \$2 charge for taking a passenger from Bretton Hall, Broadway and 86th street, to the Hotel Arlington, on 25th street. The passenger claimed that his charge was out of all proportion to the distance and that the taximeter must be wrong. The bureau has a map of New York City, showing all distances in fifths of a mile, and upon measuring the distance from Bretton Hall to the Arlington found the charge correct. So far as the meters themselves are concerned the passenger is safe in assuming them to be correct in their distance registrations.

If the passenger wishes to be sure that he will not be cheated he properly may take the precaution of seeing that when he enters the cab the taximeter is "clear," meaning that it has no charge indicated

on the dial. There is one style of meter in which the "extras" are added in with the total as well as being indicated separately on the lower face of the dial. These "extras," which are permitted for the carrying of trunks, etc., are added to the meter charges by the driver himself. It, therefore behooves the passenger to see that the "extra" dial is cleared or that it has no excessive charge on it. Otherwise the driver may add two or three dollars to the extras and by concealing the extra dial obtain more than he was entitled to in the total reading.

Among the other precautions that are suggested by the bureau is one that relates to the cabs at night. The law requires that meters be illuminated after sundown, and a passenger is quite right in refusing to employ a cab where the meter is not brightly lighted so that the figures may be easily read. No other person than the driver and the passenger is allowed to ride without the passenger's consent. In this case silence is regarded as consent, so that the passenger should make vigorous objection to the driver if the latter takes a companion on the front seat. For the purpose of making the identification of an offending cab complete, the passenger, in addition to taking the certificate number inside the cab, can also take the cab license number on the lamps.

The same ordinance that created the taximeter inspection bureau also set forth a scale of legal maximum charges, but these rates were declared void by Justice Bischoff, of the New York Supreme Court, about a year ago, on the ground that they were confiscatory. The charges allowed by the ordinance were 40 cents for the first half mile or any part thereof and 10 cents for each additional quarter mile or part thereof, with waiting time at \$1.50 per hour. Lower rates were set for taxicabs seating two people instead of four, but inasmuch as no taxicab owner is quite so dull as to fail to have seats for four, even if two of them be nothing more than the most uncertain sort of tiny folding perches, the two-seater rates never apply. When the rates as set by the ordinance had been knocked out, the taxicab concerns advanced their rates to 50 cents for the first half mile and 10 cents for each additional quarter mile. This later was followed by still another raise on the part of some of the companies, to 50 cents for the first two-fifths of a mile, which is eight city blocks, north and south, and 10 cents for each additional one-fifth of a mile, or four city blocks.

Still further increases in the taxicab rates are being projected, and the only legal limit that would obstruct their increase to whatever figures the cab owners might choose is the old coach rate law. This law applies to vehicles carrying four persons, and allows \$1 for the first mile or any part thereof, and 50 cents for each succeeding half mile or part thereof.

PREMIER UNDERGOES REFINEMENT

**But Not Much Room Was Found for It—
Cork Inserts Removed from Brakes,
but Retained in Clutch,**

Having developed a staunch and trustworthy car, the Premier Motor Manufacturing Co., of Indianapolis, Ind., is satisfied to continue to produce it with very few changes—with so few changes, indeed, as to indicate a full measure of confidence in its construction. Series M, as the new line will be known, while the same mechanically as its predecessor, saving in a few detail respects, will have a new line of

engagement. To facilitate the handling or removal of the clutch, the shaft which connects it to the change gear mechanism is arranged to telescope when a collar is released; any one part in the group thus may be dismantled without disturbing either the engine or gear box.

One of the new features of the latest model is the clutch release mechanism, which consists of a bronze collar carrying two annular ball bearings; these work against hardened and ground steel disks, the group forming a part of the clutch release cone assembly. The effect of the bearings is to avoid friction between the stationary and moving parts when the clutch is disengaged and thus to facilitate gear changing. The release of the two

THE PREMIER "CLUBMAN"—A "6-60" TOURING CAR

bodies, as a matter of course, and generally will be brought thoroughly up to date.

Of the alterations which have been made perhaps the one likely to excite the most remark is in itself comparatively small, i. e., the adoption of Raybestos linings for the internal-expanding service brakes which formerly were equipped with cork inserts. The Premier company was among the first to adopt cork inserts, and its use of that form of friction surface in the brakes has been one of its distinguishing features. The use of the special lining fabric, with its interwoven metallic strands, however, is directly in line with prevailing practice in the industry, affording, as it does, ample gripping power with good wearing qualities and also certain not unimportant structural economies.

The arrangement of the brakes also has been altered to some extent, the pull-rods now being carried entirely inside the frame and being led to equalizing beams which are attached to the rear of the sub-frame. This provides a better relation of parts, ensuring more reliable action and longer life, together with less risk of injury to the all-important braking mechanism. It also serves materially to improve the appearance of the machine.

The clutch still embodies the cork insert feature and is a strong point in the construction of the car. It is composed of 21 disks, alternate members being fitted with cork pellets to ensure smooth and gradual

groups of plates within the clutch itself is assisted by means of small steel springs which serve to pry them apart.

As heretofore, the Premier line includes both four- and six-cylinder models, the cylinder dimensions being the same in both cases, or $4\frac{1}{2}$ by $5\frac{1}{4}$ inches, bore and stroke. The cylinders are cast in pairs and in T-head form, and with the opening to the lower end of the water jackets closed by a light aluminum plate in each case. Besides relieving the motor of some weight, this design serves a useful purpose in enabling the jacket spaces to be cleared of all remnants of core sand, and also provides a yield point in the event of the freezing of the jacket water. The buckling or breaking of the cover plates, of course, would relieve the pressure sufficiently to save the far more intricate and expensive cylinder casting itself from rupture.

The valves are of ample area and are now fitted with an improved roller lift mechanism. With one manifold arranged on each side of the cylinders, the valve stems and springs are also more accessible. Contrary to familiar practice, the upper section of the crank case is made, not of aluminum, but of a semi-steel casting, which, in addition to great strength in proportion to weight, has the advantage over aluminum that it is well adapted to hold screw threads and maintain good alignment between parts, while its strength also permits it to be formed with thinner walls. Better uni-

formity of fracture and less uncertainty in manufacture likewise are assured. The lower section of the case, which serves merely as an oil pan, is cast in aluminum.

Lubrication is effected by means of a "pump-over" system with gear-driven gear circulating pump. For the connecting rod and cylinder supplies, the oil is delivered to transverse troughs, which are cast in the aluminum lower base section, and which are so arranged that the quantity of oil which they retain is practically constant at all times and irrespective of gradient or other disturbing conditions. Into these troughs dip little L-tubes, which are mounted on the caps of the connecting rod "big-end" bearings, and which scoop the oil at each dip of the cranks, and deliver it to the bearing surfaces. The size of the tubes has been nicely determined by experiment until, with the proper grade of oil, they may be relied upon to deliver just the right quantity of oil to provide adequate lubrication without any tendency to cause the motor to smoke. The oil is supplied through a large cored opening in one crank-case arm, its height being ascertainable by means of a petcock. Pockets outside the main shaft bearings serve to catch the oil and conduct it to the main bearings through oil holes. The pump and the oil leads as well are thoroughly accessible.

In the matter of ignition, adherence is now placed entirely on the jump spark, the dual system, employing both magneto and batteries selectively, being installed. The magneto is mounted on the exhaust side of the motor together with the water circulating pump, both being driven by the same shaft. The carburetter is carried on the other side of the engine, and is, therefore, well separated from the ignition distributor, which, in the opinion of many authorities, may become something of a menace if permitted to have too close proximity to the fuel and gas generating system. Saving these three auxiliaries, the exterior of the motor is unencumbered with the litter of small parts and miscellany such as impaired the accessibility of many an otherwise practical machine of the early days.

A three-speed selective sliding gearset is employed, the shafts of which are mounted on annular ball bearings. The gears are arranged to run in an oil bath and provision against loss of oil through working out along the bearings is made by an ingenious provision of collars on the shafts adjacent to the bearings. Oil which starts to work outward along the shafts is carried to the peripheries of the disks on reaching them, and thrown back into the case by centrifugal force. Final drive to the rear axle is through a propeller shaft connected with the gearset and driving bevel gears on the axle by two combination sliding and universal joints, which are enclosed and packed in grease.

One of the striking features of the rear axle design, which is patented, is the stiff-

LOCATION OF CARBURETTER AND MAGNETO ON "6-60" MOTOR, AND THE "4-40"

ening of the housing by means of internal ribs. The provision renders the "bridge" amply strong without the requirement of external truss rods, which always are liable to injury when traversing rough roads. The rear end of the driving shaft is made a taper-square fit, which is of recognized permanence; the driving bevel pinion is forged integrally with its shaft, it and the driven bevel which carries the bevel differential gear being mutually adjustable through hand-hole openings in the housing, while eight anti-friction bearings support the moving parts, these and other features contributing to the reliability and durability of the structure.

Thirty-six-inch semi-elliptical springs are used in front and three-quarter scroll ellip-tics in the rear, the bottom member of which is 50 inches long and the upper one 26 inches. To preserve the leaves of the front springs from breakage at the center, where the greatest stresses must be endured, stiffening plates are employed, which, in addition to clips of the ordinary pattern, serve to prevent the leaves from bending beyond their elastic limit. In the matter of tires, some liberality is afforded, all equipment being of 36-inch diameter and mounted on Firestone demountable rims.

In the body equipments the closed-front patterns for both the 6-40 and 4-40 types, which, save for the motor, are much alike, are made interchangeable. The bodies designed for the six-cylinder machine are built with extra seats for two passengers, rendering them of seven-passenger capacity. Seats of the same sort likewise may be obtained for the four-cylinder car bodies, but at an extra price. The "Clubman" type of body, a close-coupled small tonneau style of structure, which was evolved last year, has been continued with suitable en-

largement of its dimensions. It is now so arranged that the passenger load comes entirely between the axles, or within the wheel base, which is to say that the vehicle

trance and egress easy, while the provision of louvres in the side of the dash enclosure, as shown in the accompanying illustration of the clubman type of car, is intended to relieve the high temperature condition which has done so much to render the otherwise satisfactory closed-front style of body inconvenient for summer use. In addition to the touring and close-coupled bodies two-passenger roadsters of both four- and six-cylinder construction are produced, which are built in conventional style in so far as the provision of a large gaso-lent tank on the rear deck, a large amount of foot room and comfortable seating are concerned.

Brazil as a Field for French Cars.

Bearing out the assertions of American automobile exporters who have experienced difficulty in introducing their products in South America on account of European competition, it is stated that the hold of the French manufacturers in Brazil rapidly is being strengthened. As against \$102,000 worth of French cars imported into that country during 1910, \$740,000 worth were disposed of during the first half of the present year alone. As showing that the market is working toward that stage of popularity where the strength of the American builders of popular priced types may be felt, however, it is reported that over 400 miles of good roads were constructed during the first six months of this year under direction of the "Department for the Peopling of the Soil" in connection with its colonization work. In connection with commercial vehicle developments it is noted that 30 cars recently have been purchased by a company which is about to introduce a daily passenger and mail service between Atibaia and Curral-linho, in the State of Minas Geraes.

PREMIER CHASSIS PLAN

is possessed of naturally easy riding qualities.

In the new bodies all doors are particularly wide, thus improving the appearance of the machines and also rendering en-

HOW THE SPHINX DOES ITS WORK

Close-Range View of French Slide Valve Motor Now Offered Americans—
Inlet and Exhaust in One.

With the delayed introduction of the sleeve-valve motor in this country has come a general turning of eyes toward other styles of construction in which the familiar poppet, or mushroom, valve has given place

poses of both inlet and exhaust, of course, does not result in as great a saving in the aggregate of moving parts as at first might be supposed. In order to accomplish the proper movement of the valve sundry complications are introduced, but by dint of careful designing the motor has been rendered really simple—so simple, in fact, that it effects a saving of fully 20 per cent. in the total number of parts, as compared with the so-called L type of poppet valve engine, while it is said to be considerably cheaper

ment is plainly indicated in the accompanying Fig. 3, wherein the inlet and exhaust manifold openings are designated by A and B, respectively, while the ports proper are marked M and N. The valve member, C, is arranged to travel vertically in the cylinder above the point of highest piston travel, and in its full movement of less than one inch—in a motor of 100 by 140 millimeters, or 3 9/16 by 5.5 inches—it alternately uncovers first the inlet and then the exhaust ports. At the point of mid-travel both ports are

FIG. 3—THE VALVE AND PORTS EXPOSED

to other means for effecting the distribution of the gases. Among such engines one that, for a number of good reasons, is thought to contain great promise is the Sphinx, which recently came into the control of the Sphinx Motor Co., of New York City, but to which still clings the name Reno-Bois, by which it is known in France, where it originated. In France the corresponding type of engine already is being employed by Georges Richard, while in Germany the N. A. G. company, which is a derivative of the German General Electric Co., also is employing it. While none of the American motor car manufacturers as yet has announced its intention of adopting the Sphinx type of engine, it is well known that several of them have given it careful trial and have been favorably impressed with its properties.

While the general nature of the Sphinx, or Reno-Bois, construction already has been disclosed, the details of the engine, as presented in commercial form, just have been made public. From which it appears that while distinctly radical, such is the nature of its single moving valve part that absolute simplicity of operation is assured, together with relatively small likelihood of mishap under normal working conditions. The saving effected by the use of one valve, which is made to answer the pur-

to construct than the double sleeve valve pattern. In the way of both mechanical and thermal efficiency considerable advantages are set forth.

The cylinder of the Sphinx engine is formed with annular chambers surrounding the upper part of the bore and forming the valve ports. The openings, which best may be described as slots surrounding the cylin-

covered, and the valve is given a "dwell" of roughly two piston strokes at this point, corresponding to the periods of compression and expansion in the four-stroke cycle on which the engine operates.

The valve-operating mechanism is comprised of a horizontal cam shaft, marked E in Figs. 1 and 3, enclosed in a housing on the side of the block casting which forms the cylinder group. Above the cam shaft is a bell-crank lever, H, in each cylinder, the roller, J, at the lower extremity of which bears against the cam K, while a finger, G, forced downward by a spring housed beneath the cap, D, serves to hold the rocker arm in contact with the cam at all times. The inter-relation of the various parts is even better shown by means of the sectional Fig. 2, wherein also are shown the vertical valve motion shaft, the spiral reduction gears at its lower end, and the bevel distributing gears at its upper end.

The construction of the valve itself is shown to good advantage in Fig. 4. Essentially the valve consists of a split ring of just sufficient width to cover both valve ports when in mid-position. It is, however, cast with a central boss of circular section, which extends diametrically inward from one side and nearly to the opposite side, where the ring is split. Within the boss, which is hollow, is a socket fit-

FIG. 4—THE SPHINX SLIDE VALVE

der, are bridged at one point only, where the valve itself is made discontinuous for the purpose of permitting due expansion with heat changes. From one side cored openings connect the ports with the intake and exhaust manifolds, which are of the bolted-on variety. The general arrange-

Rambler

1912—Cross Country—\$1650

IT'S 38 horse-power, five-passenger, with 120-inch wheel base and 36 x 4-inch wheels and tires. *It's long, it's low, it's roomy.* Low, with drop frame—long, with front axle set forward and straight line torpedo body. Roomy, with 27 inches from front seat to dash and 30 inches from seat to seat in tonneau. No outside door latches. Enclosed ventilated front and hooded dash. A car of exceeding beauty, finished in English Purple Lake—it's a rare shade of deep maroon—trimmed in nickel. Radiator to conform to body lines, high and distinctive in appearance. Fenders with sweeping grace. Powerful brakes. To drive this car is exhilarating. It runs like a spirited horse. You touch the throttle and it's away. It's the Rambler Cross Country and the flag-bearer for 1912.

Equipment, Bosch magneto. Fine, large, black and nickel headlights with Prest-o-lite tank. Black and nickel side and tail oil lamps; large tool box; tool roll with complete tool outfit. Roomy, folding robe rail; foot rest, jack, pump and tire kit. Top, with envelope, \$80—wind shield \$35. Demountable Wheel, less tire, with brackets and tools, \$30. Eveready automatic engine starter \$175.

TO KEEP CAR LOOKING LIKE NEW

Even Manner of Applying Water is an Important Factor—Real Expert Offers Some Helpful Suggestions.

That there is a right way and a wrong way to do everything under the sun is generally recognized, and it applies with equal force to the washing of automobiles. Not every one knows how to accomplish this seemingly easy task in the proper way. That not even an experienced carriage washer can be trusted to do the work right—so as to remove the last vestige of foreign matter from highly polished paintwork without harming it—has been demonstrated on more than one occasion. The results which have accrued from such experiment have proved that to be efficient an automobile washer must make a business—almost a study—of washing automobiles and nothing else.

At the factory of the H. H. Franklin Mfg. Co., in Syracuse, N. Y., there is a foreman who has spent his life in painting vehicles and in keeping automobiles looking "like new," and his remarks on how the work should be done are interesting, inasmuch as among the innumerable instructions emanating from various sources and purporting to tell the "best way," is one making plain that, while water is necessary to wash a car, even the manner of applying the water is an important factor in the case. Even the kind of water that is used has a material bearing on the ultimate results, soft water being very much better for the work than hard.

Contrary to the general impression that to be kept in the best possible condition a car should be washed as little as possible, it should be cleaned as often as necessary, he says, but qualifies his statement by adding that improper washing is responsible to a greater extent than anything else for dimming the luster and otherwise spoiling paintwork.

"Never wash a car with hot or even warm water," he says. "Cool, perfectly clean water is much better, as it hardens the varnish, and in applying water with a hose, do not turn it on full force, but let it flow gently and thereby gradually loosen the mud. A forceful pressure of water against a body finish upon which mud has dried will knock off the mud and also pieces of varnish.

"When the mud has been loosened and partially washed away a wool sponge should be used, drying off the surface with a clean chamois. Care should be taken not to rub too hard, in fact, the pressure should be no greater than the weight of the chamois itself. When the chamois gets wet it must be wrung out, but do not expect to get the car perfectly dry with the chamois. Such slight dampness as may

remain will rapidly evaporate and do no harm. Proper washing will not hurt a car. Good, clean, cold water helps harden the varnish.

"Oils or polishes for brightening are not recommended, as they are likely to leave a sticky surface to which dust will cling. If a car has been out in a rain storm it should be immediately washed and dried off, for every drop of water, as it evaporates, will leave a small deposit which makes a white spot.

"Another important factor in the proper care of the car is the garage or building in which it is kept. Such a place should never be damp, for dampness leaves what painters call 'bloom,' a kind of a dull bluish coat, which sometimes will disappear if a car is left in the sun, but more often the car has to be revarnished. Neither should the garage be too cold, for then the surface of the car may get frosty and damp, and this also produces the 'bloom.' As the car warms up the frost is liable to sweat out.

"Careful owners will not unnecessarily place their hands on the body finish of their car nor allow others to do it. It is unnecessary and generally leaves marks that can only be removed by revarnishing. The car should not be left standing in the sun if it is possible to avoid it for the reason that if the sun's heat is great enough it may soften the varnish so that dust and dirt will stick in it and thus spoil the gloss.

"Another failing which some motorists have is wiping off the mudguards with any old rag when they become dusty. This helps to spoil the luster. There is only one way to properly remove dirt and dust from the car and that is by washing. Atmospheric conditions and different locations have different effects on the life of a car's finish. In a section which abounds in clay the mud is likely to be of a very sticky consistency which will require frequent and very careful washing. A sandy country is not so bad, although in the case of a high wind, sand is likely to be beaten against the varnish, acting just like a sand blast."

"Those are the principal things about keeping the outside of a car looking new," he sums up, "but the upholstery is just as important as anything else in the good appearance of a car." The foreman of the shop where Franklin cars are upholstered has been at his trade since boyhood, too, and one of the first things to be avoided, he says, is turning the hose on the leather work.

"It is a quite common bad practice," he continues, "and is the worst thing that can be done. Many motorists take this means to clean the backs and cushions, without realizing that water hardens the leather and makes it liable to crack. A sponge and a bar of good castile soap is about the best combination for cleaning leather, and for drying, a bit of clean

waste will answer but care should be taken to see that it is free from grit."

Chicago Livery Cars Not for Negroes.

That an automobile livery company is not a public conveyer in the sense of the law, and, therefore, is not compelled to carry negroes in its machines, is the decision of Judge Fred C. Hill, of the Municipal Court of Chicago, Ill. The opinion was rendered last week in the case of Emma Stewart, a negress, who sued the Emery Motor Livery Co. for \$500 damages for its refusal to transport herself and her family. The complainant testified that by telephone she had ordered a touring car to be sent to her home, but that when the chauffeur arrived and saw that his passengers-to-be were negroes he deliberately turned the car around and went back to the garage. She furthermore claimed that this action on the part of the chauffeur hurt her standing and reputation among the neighbors, and asked that damages be awarded to her. The judge, however, could not see it that way and instructed the jury to find for the defendant.

To Preserve Tires on Stored Cars.

When storing a car for the winter, remove the tires, advises the service bureau of the United States Tire Co. in a bulletin dealing with that perennial and much mooted subject. First wash them carefully with soap and water, and then wrap them in strips of paper or cloth, adds the bulletin. Store them in a dark place which is kept as nearly as possible at a temperature of 50 degrees. If the tires are to remain on the wheels for a considerable length of time when the car is out of service, jack up the wheels and leave only about five pounds of air in each tire. This keeps the tubes in shape and also keeps them soft and pliable. When the wheels are not jacked up and the car is allowed to stand for any length of time, the tires should be kept well inflated and the car moved occasionally, so that the tires do not flatten from standing too long on one spot.

Six Months Instead of Life Sentence.

Although first reports from Toronto stated that Alexander Tracey, the Port Huron (Mich.) chauffeur, who injured several people by driving his motor car into a crowd in the Canadian city, had been found guilty of criminal negligence and had been sentenced to life imprisonment, later news show that such was not the case. The prisoner was found guilty, but was remanded for sentence until Thursday of last week. On this day the judge sentenced him to pay a fine of \$1,000, with the alternative of spending six months in jail, instead of inflicting the severest penalty provided by the Canadian law. The court stated, however, that future offenders need not expect such leniency.

996,196. Internal Combustion Engine. Charles B. Baldwin, New York, N. Y. Filed Jan. 26, 1910. Serial No. 540,136.

1. In an internal combustion engine having a crank-shaft, a piston and a piston-rod, the combination of a spark-controlling slide governed by the crank-shaft, a spring-actuated sparking device, the spring of which is adapted to be put under tension by said slide, a slide-actuated quick let-off latch governing the operation of said sparking device, a trip for said latch, and a second quick let-off latch normally out of action and controlling the release of said sparking device and having a different let-off point from said first latch.

996,205. Method of Deodorizing Exhaust Gases from Internal Combustion Engines. Leopold Bregha, Vienna, Austria-Hungary, assignor of one-half to Heinrich Kaiser, Vienna, Austria-Hungary. Filed July 6, 1909. Serial No. 506,202.

The herein described method of deodorizing the exhaust gases of burned liquid fuel, consisting in introducing the exhaust gases before their exit into the open air into an enclosed space and bringing them into contact with a mixture of calcium oxid and calcium chlorid.

996,206. Ball Bearing. Fred Eugene Bright, Philadelphia, Pa. Filed May 18, 1906. Serial No. 317,553.

1. In a ball bearing, the combination of an inner and an outer bearing ring having a ball race, balls running in the races, a resilient lubricating separator having cup-shaped ends, intermediate each two adjacent balls, and a ring to which each of said separators is connected.

996,207. Bumper for Vehicles. Colin P. Brown and John L. Uhlik, Detroit, Mich., assignors to Wentworth Manufacturing Company, Detroit, Mich. Filed July 15, 1910. Serial No. 572,209.

1. In a vehicle bumper, a bumper rail consisting of a central portion supported by the vehicle, end portions extending therefrom and spring hinges connecting the end portions with the central portions and maintaining them yieldingly in alignment therewith.

996,230. Street Sweeper. Eustace Senior Estlin, Winnipeg, Manitoba, Canada. Filed June 2, 1910. Serial No. 564,623.

1. A street sweeper comprising a box-like body provided with a transverse opening, upwardly inclined walls leading from the edges of the opening and dividing the lower part of the body into compartments, a rotary brush suspended from the box-like body and rotating within the opening in the bottom, means for rotating the brush, and conveyers mounted above the aforesaid inclined walls and adapted to receive sweepings from said brush.

996,241. Support for Wheel Rims. Edward V. Hartford, New York, N. Y. Filed Mar. 29, 1909. Serial No. 486,429.

1. In a device of the character described, in combination, a base member having a pair of laterally projecting lugs to engage the felly of a vehicle wheel, a bearing plate on the base member, a screw connected with said plate to adjust the same toward and from the base member, an arm connected with the base member, and a clamp on said arm for attaching the device to the vehicle wheel, as set forth.

996,246. Resilient Tire Seating Rim for Vehicle Wheels. John G. Hodgson, Maywood, Ill. Filed Mar. 21, 1910. Serial No. 550,739.

1. In a resilient tired wheel, the combination with a metal band on the wheel, of a tire seating rim having a tire engaging flange thereon at one side, and a removable ring having an opposing tire engaging flange, said metal band and removable ring having two sets of interengaging double cone or wedge faces, and connecting means for clamping together said metal band and said removable ring, substantially as specified.

996,247. Tire Protector. Edmund C. Hoelsche, South Chicago, Ill. Filed May 14, 1910. Serial No. 561,377.

A tire protector comprising a plurality of scales forming a complete investment of the tire and arranged in transverse parallel series, with the scales of one series in staggered relation to the scales of the adjacent series, and each series overlapping the succeeding series, each of the scales having a longitudinal slot at one end and ears at opposite sides, and the scales of one series being connected to one another and to the scales of the adjacent series by having the ears of adjacent scales of one series passing through the slots of the overlapping end portions of the scales of the adjacent series.

996,299. Resilient Tire. Jacob Thissen, Bangor, Pa. Filed Mar. 22, 1910. Serial No. 551,016.

1. A tire embodying a rim, compression springs mounted in said rim and projecting outwardly therefrom in a radial direction, blocks secured upon the outer ends of said springs and arranged in a circumferentially extending series with spaces between, a plurality of segmental plates encircling the blocks, the plates being secured at one end to the respective blocks, and overlapping the ends of the adjacent block, and the ends of said plates being chamfered and overlapping each other for a slight circumferential movement, and a casing surrounding said plates and secured to the rim.

996,315. Suspension Wheel. Herbert Clifford, New Haven, Conn. Filed Nov. 22, 1910. Serial No. 593,637.

1. A suspension wheel comprising a felly, hub and spokes, blocks secured at equidistant points to said felly between the spokes, said blocks formed with radial slots, a rim-band formed with bends corresponding in number to the number of blocks, a tire carried by the rim-band, and yokes engaging with the said blocks and connected with said band at said bends.

996,318. Double Friction Clutch. Paul Daimler, Unterturkheim-Stuttgart, Germany. Filed July 7, 1910. Serial No. 570,706.

1. A double friction coupling, comprising a shaft, a friction element provided with two oppositely arranged friction faces and keyed on said shaft, a second shaft, a second friction element mounted on and rotating with said second shaft while capable of sliding axially into engagement with a face on the first mentioned friction element, a third friction element mounted on and rotating with said second friction element while capable of sliding axially into engagement with the other face on the first mentioned friction element, elastic means for normally holding said second and third mentioned friction elements in engagement with the faces on the first mentioned element, and externally operated toggle levers connected to and outside said elements for moving said second and third mentioned elements uniformly in opposite directions against the influence of said elastic means so as to disengage said elements.

996,319. Friction Clutch. Paul Daimler, Unterturkheim-Stuttgart, Germany, assignor to the firm of Daimler Motoren-gesellschaft, Unterturkheim-Stuttgart, Germany. Filed Nov. 15, 1910. Serial No. 592,416.

1. A friction cone clutch comprising, in combination a shaft, a friction element fixed on said shaft and having a conical friction surface, a second shaft axially aligned with said first shaft, anti-friction devices intermediate said shafts, a second friction element splined on said second shaft and having a conical friction surface, means for normally holding said friction surfaces in engagement, a fixed part on said second shaft and toggle lever mechanism operatively connected between said fixed part and said second friction element and operating to disengage said friction surfaces.

996,326. Wind Shield. Thaddeus Galvin, Detroit, Mich., assignor to Detroit Steering Wheel & Wind Shield Company, Detroit, Mich., a Corporation of Michigan. Filed Dec. 27, 1909. Serial No. 535,164.

1. In a windshield, the combination with a transparent panel, apertured in proximity to the frame, of apertured clamping plates upon opposite sides of the panel registering with the opening therein and bearing at their outer ends against the frame, a bushing of yielding material within the panel opening, cushioning material between each clamp and the panel, and a connection between the clamps projecting through the bushing.

996,339. Internal Combustion Engine. Edvard Hoiland, Auckland, New Zealand. Filed Apr. 14, 1910. Serial No. 555,395.

1. In an internal combustion engine, a cylinder formed with a number of alternately arranged inlet and exhaust ports, a piston, a sleeve formed with a single set of ports adapted to coincide alternately with the inlet and exhaust ports of said cylinder, and means for reciprocating and oscillating said sleeve in said cylinder.

996,351. Pneumatic Vehicle Tire. Grant Lambright, Newark, N. J., assignor of one-half to Frank A. Magowan, New York, N. Y. Filed Sept. 25, 1907. Serial No. 394,431.

1. A pneumatic tire for vehicles comprising a cover having a solid tread which is materially thickened integrally only along its middle portion so that the interior contour of the tread is cordiform in cross-section, a series of flexible inextensible metallic cables extending around the tread within said thickened portion; said cables separated one from another and embedded in the rubber of the tread and vulcanized thereto.

996,258. Pneumatic Pressure Gage. Ole Olsen, Fruitvale, Cal. Filed Oct. 6, 1909. Serial No. 521,391.

1. A pneumatic pressure gage comprising inner and outer tubes, said outer tube inclosing the lower portion of the inner tube and having an opening in its side through which the inner tube is exposed and having graduations on its side adjacent said opening, the inner tube being transparent and closed at one end and the outer tube having a removable cap at the upper end into which the upper end of the transparent tube extends, a plunger operating within the inner tube and against which escaping fluid acts to form a pressure in the portion of said tube above the plunger, said graduations indicating the amount of pressure, and an elastic sleeve fitted in the lower end of the exterior tube and serving to form a tight joint with a part to which the gage is fitted.

996,378. Changeable Compression Engine. Elihu Thomson, Swampscott, Mass., assignor to General Electric Company, a Corpo-

ration of New York. Filed Sept. 11, 1907. Serial No. 392,274.

1. The combination with a cylinder of an internal combustion engine, of an auxiliary compression chamber communicating with the compression space of the cylinder, a conduit, a valve controlling communication between the conduit and the chamber, means for actuating said valve, a second valve for connecting the chamber with and disconnecting it from said space, a stem or spindle for the second valve that is mounted in the first valve for movement relative thereto, and a manually actuated device acting on said stem or spindle to open and close the second valve independently of the first valve.

996,384. Driving Wheel. John B. Wiard, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed Jan. 11, 1909. Serial No. 471,612.

A driving wheel comprising a spider having arms separated at their outer ends, a loose rim surrounding said spider and having a cylindrical inner surface, friction shoes engaging substantially the entire width of said cylindrical surface and fitting between the outer ends of said arms, clamping plates fastened to said arms, holding said rim in place and forming guides for said friction shoes, and adjustable springs forcing said shoes outwardly.

996,410. Spark Plug. Fred E. Harpst, Houston, Tex. Filed Oct. 27, 1910. Serial No. 589,399.

1. In a sparking plug, a shell provided with a bore extending therethrough and having an annular chamber at one end spaced from and surrounding said bore, an insulator extending into said bore and having its inner end in spaced relation to the bore and terminating adjacent said chamber whereby air entering the chamber will impinge upon the insulator, a projection on one side of said shell opposite said annular chamber, said projection having a hollow body communicating with said chamber, a check valve held in said projection, and sparking terminals supported by said insulator and the inner end of the shell.

996,446. Rod Packing. Charles C. Anderson, St. Joseph, Mo., assignor to Uhler Motor Co., St. Joseph, Mo. Filed Dec. 16, 1910. Serial No. 597,703.

1. Metallic packing including a cylindrical member having an inturned flange at one side providing a stuffing box, a gland fitting in the open side of the stuffing box and having a peripheral groove and engaging the inner wall of the stuffing box, and a spring washer carried within the stuffing box and being interposed between the flange and the gland whereby the latter is yieldingly extended.

**ANDERSON GETS EDISON BATTERY**

Detroit Manufacturer Secures Exclusive Rights for Use in Pleasure Cars—European Market to Be Invaded.

Although it did not appear probable that any one manufacturer would be able to obtain the exclusive rights to the use of the Edison battery in his particular field, the Anderson Electric Car Co., of Detroit, makers of the Detroit car, has effected a coup of the sort, the Anderson company and the Edison Storage Battery Co. having entered into an agreement of the sort which will endure at least during 1912.

In order to consummate the contract, however, the Anderson people agreed that from the quota of batteries reserved for them the Edison company shall be permitted to supply the wants of F. R. Bailey & Co., of Amesbury, Mass., and Healey & Co., of New York, Mr. Edison personally having promised principals of those concerns that he would take care of their demands, which, however, are not expected to be very heavy. Among other things, the contract guarantees that the Edison battery supplied the Anderson people will be capable of developing its rated capacity for a period of four years.

It is understood that W. C. Anderson, president of the Anderson Electric Car Co., went abroad, met Mr. Edison in Berlin while the "wizard" was abroad this summer and there secured the influence that made possible the contract, which is sure to set the electric vehicle trade by the ears.

So far as commercial vehicles are concerned, however, the Edison battery will remain on the open market.

While abroad Messrs. Edison and Anderson met John F. Monnot, a mining engineer of American birth, who now resides in Europe, and practically consummated plans which will result in the invasion of the foreign markets by both the Edison battery and the Detroit electric car. Monnot al-

ready has secured the European agency for the latter and is in a fair way of obtaining the representation of the Edison battery in at least a considerable portion of Europe. It is his purpose to open depots in both London and Paris.

Another Durant Company Organized.

For the purpose of operating the plant of the Flint Wagon Works, in Flint, Mich., which, as the Motor World stated three weeks ago, had been acquired by interests representing W. C. Durant, there has been organized the Little Motor Car Co., capitalized at \$1,200,000, of which \$500,000 is preferred stock. The incorporators of the company are W. H. Little, who was Durant's chief lieutenant, first in the Buick company and later in the General Motors organization; C. M. Begole and W. S. Ballenger, president and secretary-treasurer, respectively, of the Flint Wagon Works, which concern has been manufacturing the Whiting car. As the Little Motor Car Co., however, it will produce both four-cylinder and six-cylinder cars.

Board of Trade Admits Six Applicants.

The Automobile Board of Trade has added six new members to its roll, viz.: The Garford Co., Elyria, O.; Warren Motor Car Co., of Detroit, Mich.; James Cunningham Sons Co., of Rochester, N. Y.; Rapid Motor Vehicle Co., Pontiac, Mich.; Reliance Motor Truck Co., Owosso, Mich.; Marquette Motor Co., Saginaw, Mich. They are the first new members to be admitted since the Board of Trade succeeded the old A. L. A. M.

Timken-Lindsay Litigation Settled.

The differences and litigation that have existed for several years between the Timken companies and Lindsay and Harmon, of Indianapolis, regarding the Lindsay patents on rear axle constructions, under which the Timken companies have been operating, have been amicably settled and adjusted; the Timken-Detroit Axle Co. retains complete shop rights under the patents.

GRANT PATENT BOBS UP AGAIN

Supreme Court Agrees to Review Good-year Case—Will Decide on Customer's Immunity From Prosecution.

Although in April last the Supreme Court of the United States declared the patent on the Grant solid tire, No. 554,675, issued February 18, 1896, to be a valid patent, not even that decision served to end the prolonged and many-sided litigation in which the patent has been involved for some thirteen years.

Before the Supreme Court had handed down its ruling the patent similarly had been held valid by several United States circuit courts, but in the Indiana circuit and also in the Ohio circuit, where the Consolidated Rubber Tire Co., the owners of the patent, and most of the alleged infringing tire manufacturers are located, it had been declared invalid, and such are the peculiarities of law that not even the ruling of the highest tribunal of the nation served to give the patent standing in these districts.

As a result the several tire manufacturers in Ohio and Indiana have enjoyed immunity not shared by their competitors located in other circuits, and they have claimed immunity not only for themselves but for their customers doing business in these other circuits. One of them, the Diamond Rubber Co., tested the law in the New York Circuit Court in Utica only last July and lost the case. But several others, among them the Goodyear Tire & Rubber Co., pursued a different policy, and when the Consolidated company sued their customers in other States they brought counter-suits in the Ohio district and succeeded in obtaining injunctions restraining the owners of the Grant patent from prosecuting their actions against the Goodyear patrons; indeed, the court threatened the Consolidated people with punishment for contempt if further such injunction pro-

ceedings were instituted against customers of the Goodyear company.

An application for a writ of certiorari which would bring the Ohio decision into the Supreme Court of the United States for review had been denied by the Supreme Court, but the application of the Diamond company to review the proceedings of the New York court by certiorari was subsequently allowed, and in this way the case first reached the Supreme Court, there being no appeal to the Supreme Court or no chance to get into that court on the decision affecting a patent as a matter of right, but only by grace of the court. The Supreme Court duly upheld the validity of the Grant patent, and later, as also has been stated, the United States Circuit Court in Utica, N. Y., also upheld the patent on all points and ruled that no one has the right to make, sell or use infringing tires in that circuit.

Pressing their advantage, the owners of the Grant patent brought suit against one Dougherty, a Goodyear customer, in New York City, and Goodyear promptly applied to the Circuit Court in Ohio and secured an injunction restraining the Consolidated company from prosecuting that suit. The latter then petitioned to the Supreme Court for a writ of certiorari to review the case and correct the court below, and last week the highest court granted the writ and in due course the case will come to trial. The result cannot fail to be of general and far-reaching importance, and will settle for all time whether the immunity granted to a manufacturer in one circuit extends to his customers in other circuits and serves to protect them from legal proceedings of this nature.

A second writ of certiorari filed by the Consolidated company asked that the original decision in the Ohio circuit which held the Grant patent invalid—it was rendered in 1902—be set aside on the ground that the recent decision of the Supreme Court in the case of the Consolidated company against the Diamond Rubber Co. superseded and overruled the Ohio decision. The Supreme Court, however, denied this application at the same time last week that it consented to review the other case involving the immunity of customers.

Chalmers on N. A. A. M. Executive Board.

At the November meeting of the National Association of Automobile Manufacturers, which occurred in New York yesterday, Hugh Chalmers, of Detroit, was elected a member of the executive committee to succeed C. C. Hildebrand, who previously represented the Chalmers Motor Co. M. L. Downs, of The Autocar Co., was made a member of the association's commercial committee, and the L. J. Bergdoll Motor Co., of Philadelphia, which had been disqualified from participation in sanctioned shows because of having exhibited at the so-called "independent" show in Grand Central Palace in New York last

January, had its disabilities removed and was restored to good standing so far as shows are concerned. The Bergdoll company, therefore, will be enabled to exhibit at the forthcoming N. A. A. M. show at the Palace.

Frank Briscoe Removes to New York.

Frank Briscoe, who as president of the Brush Runabout Co., of Detroit, made the Brush runabout famous, has become a New Yorker, having been appointed chief of the designing department of the United States Motor Co., with headquarters at 1 West Sixty-fifth street. In addition to being president of the Brush company, Briscoe was also head of the Briscoe Manufacturing Co. and treasurer of the Alden Sampson Manufacturing Co., all of which positions he relinquishes. They will not be filled, as his removal to New York is merely a further step in the concentration which is a part of the policy of the United States Motor Co. Eventually all of its executive and department officials will be located in New York and its several plants will be left to the direction of factory managers.

Grinberg's Rubber Company Goes Broke.

As a result of an involuntary petition in bankruptcy against the Hayes Rubber Co., 57 Warren street, New York, S. Lawrence Miller has been appointed receiver of the concern. Its liabilities are \$20,000 and its assets \$1,000. Among its debts is one of \$683 for rent. The company, which was incorporated in February, 1908, with capital stock of \$3,000, did a cut-price business in automobile accessories and bicycle supplies, and attracted interest chiefly because of the fact that its financial sponsor was David Grinberg, of the picturesque firm Morris & Grinberg, which usually trades as the Manhattan Storage Co.

Cleburne Gets a Factory Through Luck.

Having secured sufficient support, H. E. Luck, of Cleburne, Tex., has completed the organization of the Cleburne Motor Car Manufacturing Co., which will engage in the manufacture of automobiles in that rather remote little town in Texas. It will be chiefly an assembled car, incorporating a notion or two originated by Luck himself. The board of directors of the company are as follows: J. E. Poindexter, Brown Douglass, George A. McClung, S. B. Norwood, T. N. Brown, Otho L. Bishop, Robert E. Gatewood, A. V. Barber, Judge J. M. Moore. R. H. Crank will be secretary.

Nyberg Takes Title to Anderson Plant.

Having paid the last \$10,000 instalment on the total purchase price of \$40,000 for the plant of the Ryder-Lewis Motor Car Co., in Anderson, Ind., Henry Nyberg, of Chicago, who for several months has been operating the plant under the style the Nyberg Automobile Works, has obtained

formal and complete title to the property. It was sold to Nyberg in April last by the receiver for the Ryder-Lewis company, which failed for \$180,000. The receiver believes that the Ryder-Lewis creditors will obtain 10 or 15 per cent. of their claims.

Reeves to Act as Western Supervisor.

For about three weeks Alfred Reeves, general sales manager of the United States Motor Co., will be the company's western supervisor also and will circulate in the territory radiating from Kansas City. He will perform the duties previously carried out by W. S. Hathaway, who recently resigned, and will serve as western supervisor only until that position is permanently filled. He then will return to his duties in New York.

Darracq Retires from Business Life

A. Darracq, the well-known French automobile designer and president of A. Darracq & Co., Suresnes, France, has retired from active business. Ever since the big factories were purchased by an English syndicate his activities had been curtailed until this curtailment resulted in his complete withdrawal from the company. An engineer named Garrard has been elected president of the concern.

Hupmobile Runabout to be Continued.

Reports that the Hupp Motor Car Co., of Detroit, purposed discontinuing the manufacture of the famous little Hupmobile runabout and concentrating on the touring car are authoritatively denied. Charles D. Hastings, general manager of the company, states that "the runabout will continue to enjoy the same large part in our manufacturing plans that it occupies at present."

Fire and Water Damage Detroit Factory.

The factory of the Phipps-Grinnell Co., manufacturers of electric automobiles, at 16 Atwater street, Detroit, Mich., was visited by fire on Tuesday morning, October 31, and damaged to the extent of \$30,000. Spontaneous combustion in the varnishing room is believed to have started the blaze. Most of the damage was caused by flooding the building with water.

Marburgs Open a Branch in Detroit.

Marburg Brothers, importers of the Mea magneto, have opened a branch office in Detroit, Mich., of which R. J. Taylor will be the manager. In addition to the Mea magneto, Marburg Brothers are importers of the S. R. O. ball bearings, and they have also completed arrangements for the agency of the Marburg-Hagen springs.

To Enlarge the Rauch & Lang Plant.

The Rauch & Lang Carriage Co., manufacturer of the R. & L. electric, has placed contracts for the erection of a four-story addition to its plant on West Twenty-fifth street, Cleveland, Ohio.

COURT RULES ON PRICE CONDITION

**Mosler Secures Injunction in One Suit;
Loses the Other—Wholesaler's Sales
Did Not Violate Stipulation.**

That the only conditions attaching to the sale of a patented article are those which are expressly stipulated by the patentee, is the substance of a decision handed down by Judge Noyes in the United States Circuit Court for the Southern District of New York in the case of A. R. Mosler & Co. vs. the Motor Car Equipment Co., of New York. Mosler sued both the Equipment company and the E. J. Willis Co. for

In denying the injunction in the Motor Car Equipment case, Judge Noyes said:

"The notice in question restricts the price at which the patented article is to be resold, 'when sold to the public.' The defendant appears to have sold at a lower price only at wholesale, and the question is not free from doubt whether in case its retail price is maintained there is any violation of the condition. Indeed, in my opinion the question makes the case too doubtful to warrant the issuance of a preliminary injunction. Consequently it is not necessary to determine whether in the present state of the law, it can be regarded as settled that a patentee can fix the price at which the patented article is to be sold by persons not in privity with him and

ENGINEERS' EXPEDITION NOW AT SEA

**S. A. E. Party Sails to See London Show
and to Meet Foreign Kindred—De-
parture Marks an Epoch.**

Not merely stretching hands across the sea but sailing across the sea and carrying their hands with them, 60 members of the Society of Automobile Engineers departed yesterday, 1st inst., aboard the great Cunard liner Mauretania, to London, where the Americans figuratively and literally will link arms and exchange opinions with their British kindred comprising the Institution of Automobile Engineers. On the other

SOME MEMBERS OF THE S. A. E. EUROPEAN "EXPEDITION" GROUPED ABOARD THE MAURETANIA

infringement of the patents covering the Spitfire spark plug, the alleged infringement consisting of the sale of plugs at less than the price named on the packages in which they were contained.

In defense, the Motor Car Equipment Co., set up that not only had it purchased the plugs direct from Mosler & Co., but that it had not violated the printed conditions of sale which required that the price be maintained "when sold to the public." The Equipment company sells only to the trade. Accordingly Judge Noyes denied the application for the preliminary injunction which Mosler & Co. sought. The Willis company, on the other hand, had sold the plugs to the public at retail and "acknowledged the corn" by consenting to the issuance of injunction against it, the usual payment of damages being waived by the complainant.

treat as infringers those not maintaining such price."

Almost immediately following this decision, Mosler & Co. filed another suit against the Motor Car Equipment Co., alleging violation of its patents by the sale of infringing plugs.

Owosso Decides to Discontinue Trucks.

The Owosso Motor Car Co., of Owosso, Mich., which for two years has been more or less engaged in the manufacture of a light motor truck, has decided to go out of business. Formal action to this end was taken at a meeting of the stockholders on Thursday last. Several days preceding this decision, James P. Waters, superintendent of the company, instituted suit for \$4,000, alleging breach of contract in that the company had dispensed with his services in violation of an agreement.

side, the S. A. E. party will be joined by several members who already are there.

The occasion is a memorable one and marks a distinct epoch in the automobile history of the two nations. It is something more than an exchange of international courtesies. It is an international meeting such as has marked the progress of few industries and one which a year ago would have seemed highly improbable, so far as the automobile trade of the two countries is concerned. The small idea, which grew out of the lone visit of an English editor to the S. A. E. meeting in this country last June, expanded in a fashion that scarcely dared be hoped for. The size of the party that sailed to London yesterday far exceeded original anticipations and constitutes a representative group. It includes not only Henry Southcr, president of the S. A. E., and Howard

E. Coffin, former president of the society, but W. E. Metzger, the head of the National Association of Automobile Manufacturers, and, almost as a matter of course, Coker F. Clarkson, secretary and main-spring of the S. A. E., who chiefly is responsible for the visit, as he is responsible for giving the organization real life and real purpose.

Special honors, privileges and concessions on board ship are to make the six days' voyage especially pleasant for the S. A. E. members. They not only will have a headquarters and meeting room on the boat but will have a space reserved on the sunny side of the deck for their steamer chairs, will have a privileged position in the dining salon, and a host of extra attentions of one sort and another to make them happy and to fill in the odd moments between times.

In London, on the 7th inst., they will be met at Paddington Station by the president and other officers of the Institution of Automobile Engineers. The headquarters in Europe in connection with the visit are St. Ermins Hotel, St. James Park, London, S. W., and the Institution of Automobile Engineers, 13 Queen Anne's Gate, Westminster, London, S. W.

Three days will be available for visiting the Olympia show, and on the 8th inst. the joint session with the Institution engineers takes place, at which Howard E. Coffin, former president of the S. A. E., will deliver an address on "Chassis Design." On the following day the Institution will give an entertainment for the Americans. The program for the next four days provides a busy round of sightseeing and visiting among factories in Birmingham, Coventry and other places, and includes a dinner given by the British engineers. London's biggest taxicab garages will be inspected on the 14th, and after two days' visiting in Newcastle-on-Tyne, the Americans will see a special series of races and contests arranged for their benefit at the Brooklands track on the 16th.

Two days later they will "invade" France, where R. W. A. Brewer, an English consulting automobile engineer, who is a good linguist, will act as a guide to the party. The factories to which they will be given a welcome will include such famous establishments as Panhard et Levassor, Delaunay-Belleville and the like, and possibly the Clement and DeDion plants. Automobile clubs, museums, testing laboratories and similar institutions in both England and France are preparing to open wide their doors for the reception of the visitors.

It is expected that the trip of the S. A. E. party will be the first of an interchange of visits of American and European engineers and that it will open the way for international co-operation in the solution of technical problems in common, relating to the construction and use of pleasure and business vehicles.

The party that left New York on Wednesday is constituted as follows;

Henry Souther (and wife), president Society of Automobile Engineers; Howard E. Coffin (and wife), past president of the S. A. E. and vice-president Hudson Motor Car Co., Detroit, Mich.; H. F. Donaldson, member of the council and chairman committee on arrangements; A. J. Slade, consulting engineer and member committee on arrangements; Wm. E. Metzger, president National Association of Automobile Manufacturers and secretary and treasurer Metzger Motor Car Co.; Coker F. Clarkson, secretary Society of Automobile Engineers; G. R. Wadsworth, assistant to president Peerless Motor Co.; Walter C. Baker (and wife), American Ball Bearing Co., Cleveland, O.; Hugh Kerr-Thomas, assistant manager Pierce Arrow Motor Car Co.; T. R. Thomas, mechanical engineer, Thomas & Thomas, Racine, Wis.; D. G. McDiarmid, superintendent and designer C. P. Kimball & Co.; W. G. Wall, chief engineer National Motor Vehicle Co.; William Kelly, vice-president and engineer Metzger Motor Car Co.; Horace T. Thomas, chief engineer Reo Motor Car Co.; Robert A. Lloyd, vice-president General Vehicle Co.; C. H. Foster, president and general manager Gabriel Horn Mfg. Co.; J. B. Hull, patent attorney and vice-president Perfection Spring Co., and president Goby Engine Co., Cleveland, O.; H. W. Aldeh, chief engineer Timken Detroit Axle Co.; Arthur B. Cumner, maintenance engineer Autocar Co.; Ralph L. Morgan, chief engineer Morgan Motor Truck Co.; Albert Champion (and wife), first vice-president and general manager Champion Ignition Co., Flint, Mich.; W. P. King (and wife), vice-president, treasurer and sales manager Aluminum Castings Co., Cleveland, O.; Aldon L. McMurtry (and wife), engineer Gray & Davis; F. S. Duesenberg, assistant manager Sears Automobile Co.; H. G. Stutz, engineer and factory manager Stutz Auto Parts Co.; E. A. DeWaters, assistant engineer Buick Motor Co.; F. C. Avery, gas engineer Avery Portable Lighting Co.; A. R. Miller, manager of sales Barthol, Daly & Miller; B. B. Bachman, assistant engineer Autocar Co.; John G. Wood, general manager Empire Motor Car Co.; Ralph H. Rosenberg, mechanical engineer Kinnear Mfg. Co.; Robert T. Hendrickson, engineer Lauth Juergens Motor Co.; Charles J. Moore, factory manager Packard Motor Car Co.; H. D. Church (and wife), commercial vehicle engineer Packard Motor Car Co.; J. S. Bretz, president J. S. Bretz Co.; George W. Kerr, body designer and superintendent of coach work, Stevens Duryea Co.; Bert Morley, Kelsey Wheel Co.; C. J. Metzger, general sales manager Woods Motor Vehicle Co.; H. J. Hayes, Hayes Mfg. Co.

The following will join the party abroad:

A. J. Moulton, 7 Rue Scribe, Paris, France; A. Ludlow Clayden, chairman English committee on arrangements, editor Automobile Engineer, London, England;

Fritz Loeffler, Betriebsingenieur, Zellstoff-fabrik, Waldorf, Mannheim, Germany; Alfred J. White, managing director White & Poppe, Ltd., Coventry, England; Marcel DeJarney, technical manager British Motorcab Co., London, England; Rene M. Petard, European manager Mitchell Lewis Motor Co., Paris, France; Charles L. Lawrence, 6 Rue de Bellechasse, Paris, France; Arthur Ziltener, Wessen, St. Gallen, Switzerland; Louis C. Marburg, Marburg Bros., New York; Adolph Rosner, experimental department Locomobile Co. of America; David R. Wilson, Ferro Machine & Foundry Co., Cleveland, O.; C. E. Davis (and wife), Warner Gear Co., Muncie, Ind.; A. J. Myers, 5 Villa Victor Hugo, Paris, France; Hugh Miller, Warner Gear Co., Muncie, Ind.; Walter C. White, The White Co., Cleveland, O.

Changes Among Prominent Tradesmen.

H. W. Moore has been appointed treasurer of the Mais Motor Truck Co., of Indianapolis. He formerly was cashier of the Capital National Bank of that City.

Frank W. Poche, formerly secretary of the Motor World Publishing Co., has purchased Automobile Topics. The paper will be issued by the Motor Trades Publishing Co., of which Roche will be president.

Dayten E. Keith has been appointed manager of the Ford Motor Co.'s Indianapolis branch. He succeeds R. F. Bartol, who relinquished the office to go into business for himself in Anderson, Ind., where he will continue to sell Ford cars.

Floyd A. Allan has been appointed assistant secretary-treasurer of the Buick Motor Co., Flint, Mich. He has been connected with the Buick establishment for some five years, serving as buyer for a time and latterly as assistant to the general manager.

Montgomery Hallowell, advertising manager for the United States Motor Co., has resigned that position to join the H. E. Lesan Advertising Agency, which handles the big company's advertising accounts. He will be succeeded by Gridley Adams, who recently was added to the United States Motor's publicity staff.

Having disposed of his interest in the Horseless Age, Fred J. Wagner has resigned the presidency of the company which published it. Wagner will devote himself to a Long Island farm which he possesses, but will continue to serve as the A. A. A. official starter, which position he has filled for many years, and thus will not be wholly lost to the automobile interests.

D. C. Fenner, sales manager of the Alden Sampson Truck Division of the United States Motor Co., has resigned that position and joined the recently organized International Motor Co., which will market the Saurer and Mack trucks. Morris Grabowsky, former head of the Alden Sampson manufacturing department, will succeed to the vacancy created by Fenner's resignation.

Harry Reading, of Richmond, Texas, has sold his garage to G. W. Schwatzer.

William Rober, has sold his garage at Salem, S. D., and retired from business.

P. J. Clark last week broke ground for a garage on Flensburg avenue, Dalton, Mass.

Nathan C. Lane has broken ground for the new garage and repair shop in Bristol, Pa.

William Nelson, a blacksmith of Spicer, Minn., has added a garage and repair shop to his smithy.

Robert E. Thomas and Walker Williams have formed a partnership and opened a garage on Broad street, Riverton, N. J.

J. H. Tufts, a livery man of South Haven, Minn., finds the livery business too slow and accordingly has added a garage to his stables.

The old Park Theater building in Joliet, Ill., is being remodeled into a garage. Richard Hill will occupy it when the work is completed.

The A. C. Fuge Hardware Co., of West End, Wis., has branched out in the automobile business. It has taken the agency for Buick cars.

G. W. Schwartz, of Breunham, Texas, has purchased the garage of Harry Reading, in Richmond, Texas. He will continue the business under his own name.

The Fiat Automobile Co. of Rhode Island has opened a large service building at 26-28 Snow street, Providence, R. I. It is under the management of J. K. Crawford.

Tiner Nelson, of Grand Meadow, and Cornelius Viss, of Austin, Minn., have purchased the entire business of the Thoen-Bradley Automobile Co., of the latter place.

Edward L. Warnecke, of Hampton, Ia., has opened a garage at Sterling, Ill. It is located at the corner of Fourth street and Avenue A, is 50 x 100 feet and two stories high.

H. N. Stewart, of Waterloo, Ia., has formed the Stewart American Motor Car Co., with headquarters at his home town. He will distribute American cars in his territory.

W. J. Kempf, of Forman, N. D., has removed to Graceville, Minn., where previous to his arrival no garage existed, and supplied the deficiency by opening one in the Ebert building.

F. R. Lobdell has purchased the interest of his partner, Walter Francois, in the Lobdell & Francois Garage, Redwood Falls, Minn. He will continue the business alone, under his own name.

Under the style Peck, Haynes & Co., a new company has "opened up" in Grand

Rapids, Mich. William A. Peck is the president and chief stockholder of the concern, which will handle Packard cars.

In order to accommodate its growing business the Ebann & Beringer Auto Co., of Utica, N. Y., has purchased the entire building at 12-14 Burnet street. The company handles Marion and Oldsmobile cars.

The Pierce-Arrow Auto Co., of St. Paul, Minn., is erecting a one-story building at Fifth and Seventh streets, to be used as salesroom and repair shop. The structure is 85 x 40 feet and will cost when complete \$15,000.

George M. Saul, John Meissner and Henry Stange have purchased the old Buchanan livery stables, Reinbeck, Ia., and will construct a garage on the property. A brick building, 100 x 44 feet, is in course of erection.

Cory & Copher is the style of a new firm which has opened salesrooms and a garage on College avenue, near Sixteenth street, Indianapolis, Ind. Besides storing cars the company will make a specialty of dealing in accessories.

Owing to the confusion in names, caused by the existence of two automobile companies in New York State styled La France Motor Car Co., the Elmira garage concern of that name has changed its title to La France Garage Co.

The Roberts-Toledo Auto Co., in the Ohio city of that name, has found its old quarters too small, and moved into its new building at the corner of Eleventh and Madison streets. Ford cars form the chief stock in trade of the concern.

The Western Motor Car Co., of San Francisco, Cal., has filed a voluntary petition in bankruptcy, giving its liabilities as \$1,447.59 and assets as \$763.10. The company was a co-partnership composed of James E. Nicholson and H. C. Hoffman.

The Moran Auto Sales Co., of Grand Rapids, Mich., has found its old quarters at 45 Kent street too small for its needs and has moved to 91-99 Jefferson avenue, formerly used as a salesroom by the Riley Auto Co. Maxwell cars will form the chief stock in trade.

The Highland Garage, at Five Points, Ala., formerly owned by Hooper & Sharpe, has been purchased by F. E. and L. E. Whitehead, who will continue the business under the old style. Simultaneously the capital stock of the company has been increased from \$5,000 to \$25,000.

The L. A. Mitchell Motor Co. has opened sumptuous salesrooms in the Engle building, Jacksonville, Fla., where Stoddard-Dayton, Courier and Brush cars will be

shown. L. A. Mitchell, president of the new company, has been manager of the Postal Telegraph Co.'s Jacksonville branch for seven years.

Philip and Walter Ruhlman, doing business as the Ruhlman Garage, Cincinnati, Ohio, have filed a statement giving a list of their creditors and claiming solvency. Bankruptcy proceedings had been started by creditors against the company, and that these proceedings be dismissed is the request of the petitioners.

The Cutting Motor Co., which conducted a garage at Le Mars, Ia., has moved to Sioux City, where a much larger garage will be operated. The Le Mars garage was at once taken over by Hauck & Grau, who will continue the business under their own name. Cutting cars are handled by both concerns.

As a result of the visit of C. F. Pratt, president and general manager of the Ohio Motor Car Co., to Toronto, the American Motor Sales Co., of that city, will hereafter handle the Ohio car in the Dominion. It has broken ground for a new building, part of which will be occupied as a factory service station of the Ohio company itself.

The Dayton and Troy Automobile Co., of Dayton, Ohio, has been incorporated for the purpose of taking over the business at present conducted by C. E. Emerich, S. S. Faulkner and W. J. Sherer on Fourth street. These three men, with their wives, will form the board of directors of the company, which will deal in automobile accessories and sporting goods.

A petition in involuntary bankruptcy has been filed against the Carter Garage Co., 2148 Broadway, New York City, by several of its creditors, whose aggregate claims amount to \$1,008. It is alleged in the petition that the company is insolvent and that on July 5th it assigned \$3,000 of accounts to the Alicia Realty Co., of New York City, to pay a debt. The assets are estimated at \$2,500. The company was incorporated several years ago with \$30,000 capital.

Recent Losses by Fire.

St. Louis, Mo.—Haywood Garage, 4225 Olive street, destroyed. Loss, about \$6,000.

Buffalo, N. Y.—United States Wood Working Co.'s plant damaged. Loss, \$5,000.

Grand Rapids, Mich.—Joseph H. Brewer's garage, 31 Gay street, and three bars burned. Loss, \$12,000.

New York City, N. Y.—United Motor New York Co.'s garage, 543 West Fifty-second street, and 30 cars wrecked. Loss, \$50,000.

PENNSYLVANIA

"Guaranteed"

INNER TUBES

"No. 503"

A high grade tube sell- ing at a moderate price

For months the Pennsylvania Rubber Company has been experimenting on the development of a genuinely serviceable automobile tube which could be sold at a reasonable price. The Pennsylvania "No. 503" is the result.

Each Tube is Guaranteed

This tube has been so thoroughly tested, is so well made and of such high quality material that it carries an unqualified season's guarantee.

We wish to announce that our line of No. 503 Inner Tubes is now complete, embracing the following sizes:

28 x 3	34 x 3½	34 x 4	36 x 4½
30 x 3	30 x 4	35 x 4	37 x 4½
30 x 3½	31 x 4	36 x 4	36 x 5
31 x 3½	32 x 4	34 x 4½	37 x 5
32 x 3½	33 x 4	35 x 4½	37 x 5½

Persuant to the policy adopted by the Pennsylvania Rubber Company at the time of its re-organization, February 1st, 1910, we have contemplated an attractive margin of profit for the trade, in placing this tube on the market.

Jobbers and Dealers Desiring to Sell Automobile Inner Tubes for Profit Should Write Us.

PENNSYLVANIA RUBBER CO., Jeannette, Pa.

(Re-organized Feb. 1st, 1910)

Influence of the Private Garage.

Motorists long ago came to recognize the garage as one of the big questions of the industry. Impatient at the slow and sometimes almost indistinguishable improvement in general garage conditions, particularly in large cities, some of them long ago gave it up as a bad job and decided to make the best of it. Notwithstanding which exhibition of despair, the average modern garage is far superior to its predecessor of but a few years ago, albeit no less avaricious in its treatment of the transient patron. But whatever may be said, favorable or otherwise, of the public garage, the garage problem, as such, has not been properly defined until mention has been made of the private establishment in which the owner houses his one, and occasionally his two or three, cars.

Be it barn, woodshed or concrete pavilion on the lawn, the private garage is a factor to be reckoned with, both in its effect on

the business of the public garage man and its influence on the trade. And it is a factor which rapidly is assuming more important proportions. To the automobile has been given credit for considerable assistance in suburban real estate development. Not infrequently an essential of such assistance is the private garage. To the automobile has been given the credit for the emancipation of the modern farmer from the thralldom of his old-time isolation. Invariably his release from bondage results from his ability to care for his own machine quite as much as from its mere possession; it is possible only where the public garage can be almost entirely eliminated from consideration. Thus the latter institution is coming to play much the same part in the realm of the automobile that the hotel does in human life; it is a resting place for transients and a home only in instances where inability or disinclination prevents the maintenance of a private establishment.

The changing status of the public garage should be fixed in mind for several reasons—principally because it involves an alteration in the very nature of the business. The public garage in the future, and particularly in the smaller towns and villages, is destined to become more and more dependent on the sales of supplies and spare parts, and to some degree on repair work, than it is on the apparent staples of storage and routine maintenance.

Little Things Coming to the Top.

If it is the little things that count—and there is small doubt about it—good as they are, motor cars cannot fail to become a great deal better, and due solely to the "little things" that now are occupying so much of the manufacturer's attention.

While none will dare venture to say that finality of design has been reached or even approached, it is apparent that the foundation of the modern car has been so well laid that in the light of to-day there is room for little more than refinement of details. It is not so much the prosecution of this refinement that holds promise of better cars as it is the exploitation of the refinements themselves.

Heretofore price or reputation or a few mechanical "high spots" have constituted the arguments on which the average salesman relied to effect sales. Generally speaking, if he knew anything of his car's "fine points"—and often he knew nothing—he

did not deign to mention them; they were trifles unworthy of notice, and as not even the manufacturer's catalogs referred to them perhaps the salesman was not wholly in fault. But as the "high spots" of most cars have been brought to such a state of perfection that in their respective classes they now are on a parity, the salesman who is not a mere order-taker, and, indeed, the car manufacturer, needs must find reasons to advance why his particular car is to be preferred over rival cars. Exploitation of details hitherto unknown, unsung or undeveloped affords the readiest and the most satisfying answer. Apparently there are those who have begun to realize the fact.

Thus, one manufacturer of a car of no mean repute has found even the size of the spokes of his wheels to be a detail worth advertising and exploiting. Nothing well could appear more insignificant or uninteresting, and yet the case of the wheel-spoke and the factor of strength which it adds is presented in a manner that commands instant attention and cannot well fail to induce thought. Until it was exploited probably not one person in a hundred was aware that this particular spoke was slightly stouter and heavier than other spokes in use. Another car manufacturer has discovered that it is worth emphasizing that his leather work is genuine leather. Another has learned that the depth of his upholstery is a feature not wholly to be overlooked; in fact, he advertised it conspicuously, and it is not to be denied that the picture of added comfort leaves an impression.

These are little things—trifles, if you please—but they are the sort of little things that are beginning to count; that are causing prospective purchasers to stop and reflect and inquire. They will count even more heavily as the years wear on and as competition becomes keener; their exploitation will force other manufacturers to devote more attention to other such little things, and thus will the "breed" of motor cars continue to be improved. There are many cars to-day which possess such "trifles" that can be made of potent value in influencing sales, but of which are turned to no advantage largely because they are permitted to remain unsung, if not unknown. But the automobile salesmen of the future will know more than the "high spots" of his car; he will know it inside and out, or he will not long remain a salesman.

New Orleans, La.—Hercules Tire Co., under Louisiana laws, with \$50,000 capital; to deal in automobile tires. Corporators—Dr. J. M. Underwood and others.

Indianapolis, Ind.—Auto and Mercantile Co., under Indiana laws, with \$3,000 capital; to deal in automobiles and accessories. Corporators—W. H., F. R. and E. F. Brown.

Newark, N. J.—Seventh Avenue Garage Co., under New Jersey laws, with \$25,000 capital; to operate automobile garages. Corporators—C. H. Weller, H. B. Hall, L. J. Cain.

Oskaloosa, Iowa — Oskaloosa Garage Co., under Iowa laws, with \$10,000 capital; to operate a garage and deal in automobiles. Corporators—E. L. Anderson, Howard Taylor.

Indiana Harbor, Ind.—The Northwestern Automobile Club, under Indiana laws, with \$1,500 capital; to deal in automobiles. Corporators—C. C. Robinson, B. S. Gardner, P. E. Stephens.

Dallas, Texas.—Michelin Tire Co. of Texas, under Texas laws, with \$20,000 capital; to deal in automobile tires. Corporators—Stephen Bridier, L. E. Burgess, J. L. Burgess and others.

Dayton, Ohio—Ohio Mercer Sales Co., under Ohio laws, with \$20,000 capital; to deal in automobiles. Corporators—George A. Ware, M. E. State, E. P. Chamberlain, B. L. Hull, J. I. Raberen.

Toledo, Ohio—Ford Bros. Auto Sales Co., under Ohio laws, with \$10,000 capital; to deal in automobiles. Corporators—Guy R. Ford, J. R. Ford, Margaret A. Ford, Blanche A. Ford, C. M. Kelly.

Schenectady, N. Y.—H. O. Craven Mfg. Co., under New York laws, with \$50,000 capital; to manufacture carburetors for gasoline engines. Corporators—H. D. Craven, J. A. Field, G. W. Donnan.

Salt Lake City, Utah—Merchants Package Delivery Co., under Utah laws, with \$25,000 capital; to operate automobiles and motor trucks. Corporators—Sol G. Kahn, Milton E. Lippman, Edwin C. Kahn.

Chicago, Ill.—Washington Park Garage Co., under Illinois laws, with \$1,200 capital; to maintain a garage and deal in automobiles. Corporators—Robert L. Dean, Julius Eisenberg, Harry C. Livinson.

Oklahoma City, Okla.—Cadillac Co. of Oklahoma, under Oklahoma laws, with \$25,000 capital; to deal in automobiles. Corporators—Charles Barbour, F. A. Billings, W. Mackintosh, Ross N. Lillard.

Greensboro, N. C.—Greensboro-Chal-

mers Co., under North Carolina laws, with \$25,000 capital; to deal in automobiles. Corporators—Garland Daniels, D. R. Hufines, Walter L. Griffith, Cooper A. Hall.

Memphis, Tenn.—Chalmers-Memphis Co., under Tennessee laws, with \$5,000 capital; to deal in automobiles. Corporators—H. C. Lockett, J. M. Stockle, P. W. Lytle, F. J. Ramier, W. P. Biggs.

Missoula, Mont.—Montana-Overland Co., under Montana laws, with \$5,000 capital; to deal in automobiles, motor vehicles and accessories. Corporators—George L., M., and William Steinbrenner, all of Missoula.

Grand Rapids, Mich.—Form Specialty Co., under Michigan laws, with \$3,000 capital; to deal in automobiles, motor vehicles and automobile supplies. Corporators—James M. Haynes, Richard Shoemaker, R. H. Shoemaker, C. E. Lewis.

New York, City, N. Y.—International Motor Service Association, under New York laws, with \$100,000 capital; to deal in automobiles and motor vehicles. Corporators—W. H. Brearley, W. W. Friend, I. A. Monsees, all of New York City.

Fort Madison, Ia.—Fort Madison Auto and Supply Co., under Iowa laws, with \$30,000 capital; to deal in automobiles and motor accessories. Corporators—Ernest Corsepius, T. P. Hollowell, A. B. Garrott, George B. Stewart, W. A. Scherfe.

Camden, N. J.—International Airless Tire Co., under New Jersey laws, with \$100,000 capital; to manufacture automobile tires. Corporators—J. H. Nixon, I. Zimmercan, both of Philadelphia, Pa.; T. B. Hall, Camden, N. J.

Lewisburg, W. Va.—The Greenbrier Motor Co., under West Virginia laws, with \$10,000 capital; to deal in automobiles. Corporators—Mason Bell, F. H. Campbell, F. M. Arbuckle, K. M. Snyder, all of Lewisburg; W. B. Hines, White Sulphur Springs.

New York City, N. Y.—United Automobile Owners' Protective Association, under New York laws, with \$25,000 capital; to deal in motor supplies, inspect automobiles and conduct a chauffeurs' employment agency. Corporators—A. J. Davenport, Flushing, L. I.; H. E. Troid, H. A. Trebing, both of New York City.

Increases of Capital.

Detroit, Mich.—Taxicab Service Co., from \$30,000 to \$100,000.

Detroit, Mich.—Edmunds & Jones Mfg. Co., from \$50,000 to \$500,000.

Decatur, Ind.—The Decatur Motorcar Co., from \$200,000 to \$350,000.

Pocatello, Idaho—Pocatello Auto and Garage Co., from \$12,000 to \$25,000.

Change in Corporate Name.

Seattle, Wash.—H. G. Kennedy Motor Truck and Wagon Co., changes name to Kennedy Wagon Co.

November 3-4, Columbia, S. C.—Automobile Club of Columbia's racemeet.

Nov. 3-11, London, England—Society of Motor Manufacturers' and Traders' annual show in Olympia Hall.

November 4-6, Los Angeles, Cal.—The Phoenix road races under auspices Maricopa Automobile Club.

November 9, Phoenix, Ariz.—Track races under auspices Maricopa Automobile Club.

November 9-12, San Antonio, Texas—Racemeet under auspices San Antonio Automobile Club.

November 13, Harrisburg, Pa.—Economy tests under auspices Motor Club of Harrisburg.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

November 29, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

November 30, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

January 2-10, New York City, N. Y.—Importers' salon at Hotel Astor.

January 6-13, New York City—Automobile Board of Trade's 12th annual show in Madison Square Garden. Pleasure vehicles only.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual national show in New Grand Central palace. Pleasure and commercial vehicles.

January 15-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden. Commercial vehicles only.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-27, Providence, R. I.—Rhode Island Licensed Automobile Dealers' Association's show in the State Armory.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association annual show at Wayne Garden.

January 27-February 3, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in the Coliseum and 7th Regiment Armory. Pleasure vehicles only.

February 5-10, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

No squabble can mark the award of the Glidden trophy this year, such as marred last season's contest. The Tarrytown team, composed of three Maxwell Special touring cars, won it unequivocally, absolutely. It was the only one of the 18 teams that left New York City on the 10th inst. that rolled into Jacksonville, Fla., 16 days later with

a perfect score. Of course these three cars won in their class, too, and to make the landslide even more complete Governor Hoke Smith's Maxwell also finished the 1,460 miles journey to Southern climes with a slate cleaner than ever was a schoolboy's. Naturally the Glidden trophy was the principal bone of contention. But the An-

derson (S. C.) trophy also loomed large on the horizon, and when it came time to hand it out there were no less than 15 contenders with perfect scores to claim it. The forethought of the donors had provided for just such a contingency, however, and it was drawn for. The drawing was a sort of double-barreled affair; the claim-

HOW SOME OF THE SOUTHERN CITIES FLUNG BANNERS TO THE BREEZE AND OTHERWISE WELCOMED THE GLIDDEN TOURISTS

ants drew numbers that designated the order in which they afterward drew for the prize. That "nothing succeeds like success" was proven again by the result; Governor Smith's driver, Arthur See, picked the lucky number out of the hat and turned the landslide into an avalanche for the house of Maxwell.

Only seven of the teams reached Jacksonville intact and six of these had amassed penalties ranging from 19 points, which was charged to the Jacksonville team of three Stevens-Duryeas, to 1,028 points, this number standing against the three Flanders cars that composed the Detroit team. As a matter of fact, it was thought right up to the last minute that the Jacksonville team had nearly as good a chance as had

could not run in the tracks made by the other cars and constantly were required to break their own roads. In the deep mud and sand they had a terrible time, for they seldom were on an even keel, and as a result they skidded much more than did the other cars. It was this continual skidding that eventually brought them to grief.

Other than the Glidden and Anderson trophies there were seven prizes of \$200 each divided among the winners of the seven price division classes. In conformity with the rules of the A. A. A., touring cars and runabouts were separated, and half of this amount went to the winner or winners in the touring car division of each class and the other half went to the lucky ones in the runabout divisions.

collision, and though nothing really serious resulted, both required minor repairs and Miller could not make the night control on time and the Mitchell was assessed 18 points. A number of other penalizations also were made, but no other perfect scores suffered.

According to those who crawled into Jacksonville on the evening of the 26th inst. that more cars were not held up on the road was nothing short of marvelous. From Live Oak to the last stop the schedule required a pace of 20 miles an hour with no intermediate stop for lunch. The harrowing tales of the terrible roads to be encountered on the last leg were calculated to set the drivers' teeth on edge, and it is said that among some of them the im-

GORDON, FLA., IS NOT MUCH OF A TOWN BUT ITS WELCOME WAS PICTURESQUE

the winning aggregation. For several days the term had bowled along unpenalized, and if the Stevens drivers did not wish the Maxwell trio trouble, at least they hoped for a continuance of their own good luck.

But it was not always luck that kept the cars on the road and the wheels turning. Cars have been perfected and made staunch till they will stand almost any kind of a racking, but they need a competent and careful guiding hand at the wheel. And this tour again demonstrated that to the driver belongs as much, if not more, of the credit for the performance of his charge as does the car itself. The conditions were of the sort that try men's souls, and their skill and muscle, too.

Ten of the teams were made ineligible by the withdrawal of one car from each, and the Waltham team of three Metz cars was withdrawn entirely, one of the cars being taken out on the fifth day because of a broken wheel and the other two retiring on the last day because of similar troubles. Despite their withdrawal, however, these three little cars really made a good showing in negotiating the distance they did under conditions that tried larger and more expensive cars to the limit. The principal trouble with the Metz cars is said to have been caused by their narrow tread. They

On the last day of the tour, when the 90 miles' run from Live Oak to Jacksonville was made, one more perfect score was spoiled. Inman Gray's American and the Mitchell driven by G. G. Miller for the Winston-Salem Board of Trade were in

GOV. HOKE SMITH—HE WINS, TOO

pression prevailed that the hard schedule had been set for the purpose of eliminating some of the perfect scores. It succeeded in the one instance only.

For miles and miles there was no road at all; it was merely a wearisome trail through seas of sand with nothing to relieve the monotony of the grind but tree stumps and nary a sign of habitations for hours at a time. On other stretches where the route was dignified by the name of road it was merely a wagon trail almost hub deep in sand. Under such conditions it was utterly impossible for the smaller cars—or the large ones either—to maintain the schedule of 20 miles an hour, and the only way they could hope to reach control on time was to travel "wide open" on every cow trail that for a time lost its resemblance to the Sahara desert and presented even an appearance of being a road.

There was not a piece of good road on the whole day's run. Through the deep sand the cars lurched and skidded, later to plunge into mud holes and through small streams. Despite the fact that nearly all the cars were equipped with non-skid tires, tire chains were very much in evidence, and not a few drivers put them on all four wheels the better to negotiate the so-called roads.

Even where the trail led over passable roads where a measure of lost time could be made up, it was so narrow that two cars could not pass, and when the bad spots were reached it often happened that one car, laboring, would hold up the whole procession. Whenever this happened, and it was by no means infrequent, the drivers and passengers of the following cars would turn in and, putting their shoulders to the wheels of the stalled car, help to get it out of difficulties.

Hours before Jacksonville was reached rain set in, and it was no gentle rain, either. Rather it was a cloudburst, and those who came through the fords dry were thoroughly "wetted down" in short order, for very few of the cars carried tops. The three Maxwell cars were among those that were innocent of coverings, and the natty white uniforms in which the team members started from New York soon were reduced to a state where the drivers and their assistants looked more like tramps than respectable citizens of the United States, although as a matter of fact the white had ceased to be white many days before.

With the advent of the rain road conditions rapidly went from bad to worse, and the hardships of the tourists were increased three or even four-fold. Besides, much of the sand had been passed and the run became an old-fashioned mud plug. Slipping and sliding, the cars proceeded at an even slower rate of speed than was necessitated by the sand, and when the mud disappeared for short stretches they were driven the limit. Often caution was thrown to the winds in the endeavors of the drivers to make up some of the time that was lost, and the real wonder is that serious accidents were avoided.

Despite the grueling conditions, however, the tour was not all hardship, and in practically every town that was entered an enthusiastic delegation met the Gliddenites and offered hospitality. Thus in Gordon

IN THE FLORIDA SAND, WHERE TRACTION WAS DIFFICULT

an immense arch, supposedly symbolic of the A. A. A. emblem and topped with three old carriage wheels, had been erected, and through it the procession passed in state while schoolboy cadets lined up and presenting arms. Many of the tourists were from the South, be it remembered—a matter of about 80 per cent. of them, in truth—and such demonstrations were as much a

home-coming welcome as anything else. Several of the cities and towns displayed bunting and flags, and in all of them the populations turned out en masse.

One of the notable incidents of the tour was the performance of the two baggage trucks. Both of them, one a Reo and the other a Federal, reached all the controls on time. They were passed repeatedly on the road, and just as repeatedly they passed the stalled touring cars and runabouts, but always they were on hand at the finish of the days' runs. They were in the tour to carry baggage, and they did it consistently, surely, and be it said to their credit that they made their schedule better than did many of the contesting cars.

Plugging along with the rest of the bunch, the solitary woman driver, Miss Birdie Marks, of Atlanta, handled her Columbia like a veteran and to such good purpose that she reached Jacksonville with a clean slate. Paul Kellar is generally credited with being the driver of the car, but Miss Marks did most of the driving herself and even disdained the help of mere man when "perfectly horrid" punctures had to be fixed.

The weariness shown by the tourists when they eventually pulled into Jacksonville was perfectly legitimate, for the tour undoubtedly was a terrible grind. Not

ATLANTA'S STEVENS-DURYEA TEAM MEETS PLEASANT ACQUAINTANCES

HUB-DEEP RUTS WERE REALITIES IN FLORIDA

many of them are sorry that it is over at last. During the last couple of days the grind was harder than ever, for much of the enthusiasm that marked the initial stages was knocked right out of the procession by the accident to the pacemaker's car in which Chairman Butler of the A. A. A. contest board met his death near Tifton, Ga.

In Jacksonville a great celebration had been planned, and though the program was carried out in part and such celebrating as there was spread over three days, the rejoicing which usually marks the termination of a Glidden tour scarcely was noticeable because of the shadow of gloom which resulted from the fatal accident. Referee Walker and Mrs. Walker, who were in the pacemaking car when the accident occurred, were on hand to help welcome the tourists at Jacksonville. Though both of them presented the appearance of being a little the worse for wear, they were smiling and cheerful and wished everyone all kinds of a good time.

The winning team of three Maxwell cars was captained by Mortimer C. Reeves, who kept a watchful eye over things in general and revived the spirits of the three drivers when they showed signs of slumping. The three cars were driven by Harry Wells, E. G. Gager and Thomas Costello, all three

of whom have been more or less prominent in the realm of sport for a number of years past. There is really little secret to the success of the team; it hung together through thick and thin. Speed was reduced when the going was bad, and whenever good roads were encountered or scores were in danger the hands on the three speedometers gradually crept up till they

reached considerably above the 40-mile mark.

One of the noteworthy features of their performance was that remarkably few stops were necessitated by tire trouble. The three team cars, as well as Governor Hoke Smith's Maxwell, were shod with Ajax non-skid tires, and it is said that eight of the original 16 still had New York air in them when Jacksonville was reached. Stromberg carburettors furnished the proper mixture of gasoline and air on all four of the winning Maxwells, and likewise all four were sparked by Splitdorf magnetos.

Arrived in New York after their arduous journey, the three victorious cars were unloaded from the steamer and in the hands of their respective drivers headed a procession of Maxwell owners that led to the headquarters of the United States Motor Co., where, after a dinner and much speech-making, each of the drivers was presented with a gold watch.

The 1911 Glidden tour was the eighth annual national reliability contest to be promoted by the American Automobile Association and covered approximately half the distance of last year's affair. In 1904 the first national reliability run was held and covered a distance of 1,318 miles from New York to St. Louis. It was not until the following year, however, that the tour really became a Glidden tour, for it was then for the first time that Charles J. Glidden put up the present trophy for competition. The 1905 run had its start and finish in New York, the itinerary embracing a roundabout tour of 871 miles through Hartford, Bretton Woods, Concord and New Hampshire. The trophy was awarded to Percy P. Pierce, driving a Pierce car. In 1906 the tourists covered 1,135 miles through eastern and central New York and up into Canada. C. W. Kelsey, driving a Maxwell, received the trophy that year and held it until 1907.

MISS BIRDIE MARKS PROVES HERSELF AN APT WORKWOMAN

WHERE ONE OF THE CARS HAD A NARROW ESCAPE

In 1907 the deed of gift of the trophy was altered so that the award could be made to the team of cars from one club that made the best aggregate score. Fifteen hundred and seven miles was covered in a trip starting at Cleveland and finishing at New York after a roundabout route through a number of the larger Western cities. The trophy was won by the Automobile Club of Buffalo, whose team consisted of two Pierce-Arrows, two Thomases and one Packard. In 1908 the tour was started in Buffalo, and from there the tourists went to Pittsburg, Philadelphia, Albany, Boston and Saratoga, a total distance of 1,670 miles. This was the second time that the Glidden trophy was competed for by teams, a team in this case consisting of

three cars from the same club. Owing to the fact that three teams were tied for the trophy when Saratoga was reached, it was decided to re-start and to cover the original route until all but one team was eliminated. The Buffalo Automobile Club team was the only one to put in an appearance at the time the run-off was scheduled, and as it refused to start alone the trophy was not awarded for that year, but remained with the A. A. A.

In 1909 the trophy was awarded to the driver of a Pierce-Arrow after a 2,637 miles journey from Detroit down into Kansas, and the following year, 1910, the Chalmers Motor Co. received the trophy after considerable litigation with the Premier Motor Mfg. Co. regarding the eligibility of the

SCENE OF THE FATAL ACCIDENT TO CHAIRMAN BUTLER

Premier entry, which at first was awarded the prize. The tour was started in Cincinnati and finished at Chicago after covering a distance of 2,851 miles through Dallas, Texas, Oklahoma and Kansas to Omaha and then by way of Iowa and Illinois to Chicago.

Vogel Guessed Best for Schimpf Trophy.

Members of the Long Island Automobile Club who were loath to enter their cars in a sure enough reliability contest for the Schimpf trophy felt differently when the run was changed into a guessability contest pure and simple and a goodly number of them turned out on Saturday, 28th ult., to try for the prize under the altered conditions. The run really was a guessability contest in more than one sense. No specified route was laid down, the only conditions imposed being that the contestants check at Hempstead, Hicksville, East Norwich and Roslyn, N. Y. They were at liberty to guess the best routes to use to make connection with the checkers at those points. The secret time allowed each contestant was given him in a sealed envelope and he was required to mark his actual time on the outside for comparison. Louis A. Vogel, Jr., guessed nearest to his allotted time—he was just one minute and seven seconds out of the way—and was awarded the trophy. J. K. Fink, who guessed within one minute and 10 seconds of his time, was second, and W. H. Kouwenhoven was third. His error was two minutes and seven seconds.

End of Fairmount Park Road Race.

In all probability the Fairmount Park road race in Philadelphia has seen its end, the park commissioners having served formal notice on the Quaker City Motor Club that the continuance of the famous race is "inadvisable." The notice took the form of this resolution, which was adopted at the last meeting of the commissioners:

"Resolved, That in the opinion of the Fairmount Park commissioners it is inadvisable to continue the automobile races in the park in future years and that to avoid disappointment and misunderstanding this opinion be transmitted to the persons chiefly concerned and to make the same public."

Philadelphia Reliability Run Off.

There will be no reliability contest this fall in Philadelphia, Pa., under the auspices of the Quaker City Motor Club. Sanction had been obtained from the A. A. A. for a contest on November 2, 3 and 4, but lack of entries has caused the plan to be abandoned.

Motorists of Greensboro (Ala.) have formed the Hale County Good Roads Automobile Club, with William E. Yerby as president and Lee M. Oats, secretary. Vice-presidents will be appointed in each section of the county.

CHICAGO'S 1,400 MILES CONTEST

**Seventeen Start and All Still in the Run-
ning—Six Scores Spoiled—Excite-
ment in Kentucky.**

Seventeen motorists in two divisions—one for touring cars and the other for runabouts—started from Chicago on Friday, 27th ult., in one of the most pretentious reliability runs ever promoted by the Chicago Motor Club, which organization is sponsoring the affair. Before the motorists get back to the starting point they will have covered upward of 1,400 miles over a winding trail leading through sections of Illinois, Indiana, Kentucky and Michigan.

The tour, which is designated officially as a Grade 1 reliability contest, originally was scheduled to start some time early in October, but owing to the fact that Chicago's "open house" show week came about that time the new dates, October 27-November 3, were selected. To-morrow (Friday) will see such of the contestants as have been able to survive back in their home city, where the technical examination will be performed.

Of the 17 who started, the following are computing for the Chicago Motor Club's trophy in the touring car division: Neil Vandervoort, Moline; J. Salisbury, Moline; Will Jones, Case; George Daubner, Halladay; A. Davies, Halladay; C. Winter, Oldsmobile; A. M. Robbins, Abbott-Detroit; Gus Monckmeier, Staver-Chicago; Emery Knudson, Staver-Chicago. The competitors for the Van Sicklen cup in the runabout division are: J. A. Wicks, Moline; W. J. Boone, Moline; Howard Bauer, Oakland; J. H. Stickney, Velie; A. Gibbons, Velie; Adolph Monson, Bergdoll; Paul Strauss, National; E. H. Halbert, Grout. Other than these two trophies there is the Chicago Motor Club's team trophy and the Standard Oil fuel economy trophy.

For the first day's run Indianapolis, Ind., was the destination, and as weather conditions were very nearly perfect and roads were better than had been anticipated all of the contestants reached the noon control at Brook without penalization. During the luncheon stop the tourists were entertained at "Hazleton," the home of George Ade, the noted humorist. Humorously he invited the motorists, one and all, to "pick nuts from his willow trees," and before they left presented each with a package of apples "out of his own garden."

In reaching Indianapolis the scheduled length of the run was increased by a little over four miles, bringing the total for the day up to 221 miles. The increased mileage was necessitated by a detour which was decided on because some of the roads were in very bad state due to repairing operations. The change in the route sent the motorists over what is declared to be one

of the muddiest stretches of highway in northern Indiana, the road taking the procession into the Kankakee River swamp lands. Only one got into difficulties, however, and when the night control was reached 16 perfect scores still remained. The lone sufferer was Paul Strauss, whose National exhibited symptoms of carburettor trouble that necessitated a stop for which he was charged three points.

On Saturday, 28th ult., the run of 179 miles to Louisville was made and the motorists remained in the Kentucky town over Sunday. The roads through southern Indiana and northern Kentucky were in excellent shape, and when the cars were checked in 16 of them still retained their perfect scores. A streak of ill-luck pursued Strauss and his National, however, and 27 additional points were charged against him. Spark plug trouble was the cause and two new plugs had to be fitted, for which 14 points was charged, the remaining 13 being for lateness at control.

Confusion in the route at Greenwood, Ind., nearly caused other contestants to lose their cherished perfect scores. As part of the road was piled with broken stone in preparation for repair work, another detour had to be made. Several of the cars came to temporary grief on this bad section of the road, but the officials decided that the fault was not with the cars and scores were not affected.

After a quiet Sunday spent in Louisville, the procession started on Monday morning for Cincinnati by way of Lexington, the noon control. The day's run covered a distance of 200.8 miles and the entire trip was marked by thrills. The first of the thrills was caused by H. E. Halbert's Grout, which very nearly turned over on a bridge just outside of Prestonia, Ky. A burst tire and a broken spring were responsible for the near accident. Shortly afterward W. J. Boone, at the wheel of a Moline, was in collision with a carriage, and F. E. Edwards, the American Automobile Association representative, was trampled on by a horse which was frightened by the Velie car in which he had been riding. Gus Monckmeier in the Staver-Chicago was assessed 18 points because of a broken spring, and Halbert, whose Moline got into a tantrum, received 48 debits for the same reason.

On Tuesday morning, 31st ult., 14 out of the 17 starters checked out of Cincinnati with perfect scores and headed for Columbus, Ohio, a distance of 172 miles. Arrived there only 11 clean scores remained. Those who were penalized were: George Daubner, Halladay, 19 points, three of which were for cleaning the gasoline line and 16 for repairing broken fenders; A. Gibbons, Velie, one point for muffler cut-out trouble; H. E. Halbert, Grout, 344 for replacing broken spring; Charles Winter, Oldsmobile, 455 points for a damaged wheel and gasoline tank sustained when his car collided with a farm wagon.

Wednesday's run was to Detroit, Mich., 190 miles, with the noon control at Toledo, Ohio. Today's journey is between Detroit and Grand Rapids, Mich., 150 miles, the shortest run of the tour. For the last day a run of 218 miles is scheduled from Grand Rapids through Kalamazoo, Mich., and South Bend, Ind., into Chicago.

Taft Sets Date for A. C. A. Banquet.

While the dinners annually given by the Automobile Club of America always have proven events of more than ordinary importance and magnificence, the forthcoming annual banquet of this club promises to be one of the most notable affairs ever held in this country. No less a person than President Taft will be the guest of honor; indeed, it is stated that he himself selected the date, December 20th, when three representatives of the A. C. A. waited upon him and extended the invitation. In addition to the President, all the members of his cabinet and the diplomatic corps have been invited, and it is confidently expected that some of them will be able to be present at the banquet.

Leading statesmen, professional men and captains of industry throughout the country have been asked to participate, while bids to the feast have been sent to the presidents of all the clubs comprising the International Association of Recognized Automobile Clubs. Among the distinguished foreigners who are included in the list are: The Duke of Connaught, of the Royal Automobile Club of Great Britain; Baron De Zuylen de Nevelt, of the Automobile Club of France; Victor, Duke of Ratibor, of the Kaiserlicher Automobil Club of Germany; Baron Frederix, of the Imperial Club of Russia, and thirty others of hardly less international fame.

Schimpf Made A. A. A. Contest Chairman.

Following a conference on Wednesday, 1st inst., between President Robert P. Hooper of the American Automobile Association and Howard E. Coffin of the Manufacturers' Contest Association, William Schimpf was appointed to fill the unexpired portion of the late Samuel M. Butler's term as Chairman of the Contest Board of the A. A. A. Schimpf is president of the Long Island Automobile Club of Brooklyn, N. Y., and already was a member of the Contest Board.

Minneapolis Climb Again Postponed.

There was no hill climb in Minneapolis, Minn., last Thursday, 26th ult. The affair first was announced to occur October 21st, but was postponed until the later date, and meanwhile Dr. C. E. Dutton, local representative of the A. A. A., investigated matters which led him to advise the Minneapolis Motor Club to again postpone it, as the plans were not shaped to assure success. Accordingly announcement has been made that the climb will be held to-day (Thursday) on Columbia Heights hill.

NATIVE SON SHINES AT LOS ANGELES

Unusual Array of Racing Stars Fails to Dazzle Roscoe Anthony—Lee Oldfield Also a Contender.

"Stars" were so numerous and so luminous at the Los Angeles (Cal.) Motordrome October 21st-22d that it was difficult for the lesser lights and unknown to be seen. The racemeet was under the auspices of the Los Angeles Automobile Dealers' Association and rivaled in brilliance the road carnival at Santa Monica the preceding week. All who had participated in that event appeared on the Los Angeles local track, but not even that dazzling array served to prevent Roscoe Anthony, a local man who made his first appearance, from sharing the glory. At the wheel of a Regal he won the race for small cars without difficulty, and in the five-mile handicap with 45 seconds' start was a contender with Bert Dingley (Pope-Hartford), the scratch man, for first place. Dingley, however, won by a small margin.

Lee Oldfield, driving a Fiat, made his first appearance since the Syracuse (N. Y.) accident and succeeded in capturing one of the five-miles free-for-all events, but in a match with Teddy Tetzlaff (Fiat) at two miles in two heats he was not able to defeat the winner of the 1910 Santa Monica. Tetzlaff also won three other five-miles free-for-all races. Harvey Herrick, this year's hero of Santa Monica, was present, but did not compete. He contented himself by driving a two-miles exhibition in 1 minute 29.60 seconds and one mile in 44 $\frac{3}{4}$ seconds, while Louis Disbrow, piloting Bert Dingley's Pope-Hartford, whizzed a mile in 41.91 seconds. Hanshue (Mercer) took one of the 25 mile races for cars of 231-300 inches displacement and a 10-miles race in the same class on the first day. G. Shain (Schacht) captured both the 10-mile and 25-mile in the same class the second day. William Endicott (Inter-State) with 12 seconds, won a five-miles handicap with Bert Dingley (Pope-Hartford) second and William Carlson (Cole) third. The summary:

Saturday, October 21.

Five miles, Class C, 161-230 inches displacement—Won by Roscoe Anthony (Regal); second, Clarence Smith (Maxwell); third, William Endicott (Reo). Time, 4:39.20.

Ten miles, Class C, 231-300 inches displacement—Won by Harris Hanshue (Mercer); second, Rupert Jeffkins (Schacht); third, William Carlson (Cole). Time, 7:45.20.

One mile time trial—Harvey Herrick (National). Time, 0:44.60.

Five miles free-for-all—Won by Teddy Tetzlaff (Fiat); second, Bert Dingley (Pope-

Hartford); third, Dave Lewis (Stutz). Time, 3:29.60.

Twenty-five miles, Class C, 231-300 inches displacement—Won by Harris Hanshue (Mercer); second, William Carlson (Cole); third, Roscoe Anthony (Regal). Time, 20:59.20.

Five miles free-for-all handicap—Won by Bert Dingley (Pope-Hartford), scratch; second, Roscoe Anthony (Regal), 45 seconds; third, William Endicott (Reo), 50 seconds. Time, 3:48.20.

Five miles free-for-all—Won by Teddy Tetzlaff (Fiat); second, Bert Dingley (Pope-Hartford); third, William Endicott (Inter-State). Time, 3:33.20.

Sunday, October 22.

Five miles, Class C, under 500 inches displacement—Won by Bert Dingley (Pope-Hartford); second, William Endicott (Inter-State); third, Dave Lewis (Stutz). Time, 3:40.40.

Ten miles, Class C, 231-300 inches displacement—Won by G. Shain (Schacht); second, William Carlson (Cole); third, Roscoe Anthony (Regal). Time, 7:55.

Ten miles, Class C, 161-230 inches displacement—Won by Clarence Smith (Maxwell); second, Roscoe Anthony (Regal); third, William Endicott (Reo). Time, 8:42.41.

Five miles free-for-all—Won by Teddy Tetzlaff (Fiat); second, Lee Oldfield (Fiat); third, William Endicott (Inter-State). Time, 3:19.35.

Twenty-five miles, 231-300 inches displacement—Won by G. Shain (Schacht); second, William Carlson (Cole); third, Roscoe Anthony (Regal). Time, 19:48.77.

Five miles free-for-all—Won by Lee Oldfield (Fiat); second, Teddy Tetzlaff (Fiat); third, Bert Dingley (Pope-Hartford). Time, 3:20.33.

Five miles free-for-all handicap—Won by William Endicott (Inter-State), 13 seconds; second, Bert Dingley (Pope-Hartford), scratch; third, William Carlson (Cole), 43 seconds. Time, 4:02.98.

One mile time trial—Louis Disbrow (Pope-Hartford). Time, 0:41.91.

Two miles time trial—Harvey Herrick (National). Time, 1:29.60.

Two miles match, in heats—Teddy Tetzlaff (Fiat) vs. Lee Oldfield (Fiat). Both heats won by Tetzlaff. Time—first heat, 1:18.57; second heat, 1:17.90.

Kansas Motorists Must Pass Examination.

The new automobile ordinance passed by the city council of Wichita, Kansas, makes it compulsory on private owners, or heads of families owning motor cars, to take an examination for competency and pay a fee of \$1 for the certificate. Members of the same family, desiring to drive the car, also must submit to an examination and pay a fee of 25 cents. Professional chauffeurs will have to pay \$2 fee for a certificate. The same ordinance makes it compulsory for all cycles to carry lights.

STORY OF THE "STRENUOUS SEVEN"

They Went from San Francisco to Los Angeles and Return—Now Want Good Roads Club Denied Sanctions.

The hurry and bustle incident to the running of the annual Santa Monica road races was considerable. In fact, it almost was sufficient to overshadow every other sporting event that was held in the West at that time; which, perhaps, accounts for the small amount of attention that was attracted by the first reliability contest to be promoted by the Good Roads Club of Northern California, despite the fact that feeling over the decisions ran so high that there was talk of having the club denied future sanctions. It was started in San Francisco on the 11th ult., whence the trail led to Los Angeles and return, a total distance of 950 miles. Seven days were required to make the trip.

Though the affair was small if viewed solely from the point of number of entrants, it more than made up in strenuousity what it lacked in size. But seven cars were driven away from the starting point, and not one of the contestants was able to complete the journey without penalization.

It was in no way a "summer outing," and the pace set, combined with the rules of the A. A. A., which were observed closely, made it a real contest. This caused many who had intended entering in order to witness the Santa Monica races on the 14th to make up another party and go by easy stages to the scene of the races. Contrary to expectations, the roads through the lowlands were in very bad condition, and even before Paso Robles, the night control of the first day, was reached several penalties were imposed. The next day took the motorists over the treacherous San Juan grade and the hub-deep sand caused much delay. When Santa Barbara was reached more perfect scores had been lost. The third-day route into Los Angeles was much better, but not exactly boulevardlike.

Two days were spent in Los Angeles, the return trip being started Monday, 18th inst., with Bakersfield as the night control. The roads were found to be in better condition for the return journey, though they still were bad enough to cause nearly every one of the contestants to accumulate greater penalties. Also all of the cars received such hard knocks on the trip that all suffered on the final technical examination. The final scores were as follows:

Driver and Car	Penalties—		
	Road	Tech.	Total
William Parry, American..	64	23	87
C. Hobson, Warren-Detroit	326	161	487
Stanley Jonas, Flanders...	833	24	857
Stanley Gawne, American..	865	112	977
C. B. Matthews, S. G. V....	1091	104	1195
Ralph Collins, Cartecar....	1688	342	2030
W. Gillett, Flanders.....	1983	65	2048

VELIE TO BE STARTED WITH PURE AIR

**Its Self-Starter Differs from Other Types,
Employing Original Pump—Other
Features of the New Car.**

In adding the name Velie to the list of new cars equipped with self-starting devices, the Velie Motor Vehicle Co., of Moline, Ill., has not been content to adopt a stereotyped system, without adding to

It consists of a counter-bored body portion, cast with cooling ribs on the outside, inside of which is mounted a two-diameter piston. The lower and large diameter bore is connected directly with the cylinder interior. The upper chamber, which in reality constitutes a separate cylinder, is connected with the atmosphere by means of an automatic poppet inlet valve and with the tank pressure line by means of a ball check valve. The alternate rise and fall of pressure in the cylinder causes the pis-

are now of a single standard size and pattern moreover, which, in addition to doing away with troublesome flanged fittings and gaskets, affords a simple expanding-lock method of installation and adjustment.

Other changes in the construction of the motor include the redesigning of the crank case in such a way that by removing the oil-pan from the bottom it is made possible to remove the pistons and connecting rods without disturbing the cylinders. The oil reservoir is now fitted with an oil gauge,

VELIE FIVE-PASSENGER TOURING CAR AT \$2,100 AND THE \$2,000 "RACYTYPE" ROADSTER

its advantages. Hence, although the simple method of introducing pressure into the cylinders through a distributing valve, or "air-timer," is employed, it differs from a number of others of the same general class to the extent that pure air is used and not the waste gases from the engine. In addition to assisting the initial charging of the cylinders with a good working mixture, this is of advantage be-

ton to rise and fall in the cylinder, the lower section serving as a driver for the upper section, which follows the regular two-stroke compressor cycle. Apart from the compressor the system includes a starting valve, the timer, which serves to distribute the air charges to the cylinder in their proper firing order, and leads to the cylinders, properly safeguarded by means of check valves.

the valve stems are bushed in the cylinders and the valve actuating mechanism is now protected by a removable aluminum cover plate.

The three-ring type of plate clutch is retained, but the bearing surface has been increased materially, while by the adoption of a newly designed retaining ring it has been made possible to remove the clutch from the chassis in about one-tenth the

STANDARD FIVE-PASSENGER TOURING CAR AND THE "SPECIAL" MODEL L AT \$2,750

cause it permits the charge in the tank to be used for tire inflation purposes at any time, thus practically eliminating the need of any sort of pump about the engine.

By an ingenious adaptation of the differential piston the pressure variations in one of the cylinders are turned to good account in operating a very small compressor which is entirely automatic in action, and which is capable of raising the receiver pressure to 150 pounds. The device, which is hardly larger than the ordinary check valve such as frequently is used in gasoline pressure-feed systems, occupies the same relative position in the top of one of the cylinders.

In preparing the specifications of the new Velie line considerable pains have been taken to improve the mechanism in essential points without destroying the characteristics which have contributed to its success in the past. Thus the radiator has been increased two inches in height, the water circulating pump mounted on trunnions, making it self-aligning, and the water pipes have been increased to 1 3/8 inches diameter with the idea that the added sectional area will enable the system to act by natural, or thermo-syphon, circulation, in the event of possible failure of the pump. All connections to the motor

time formerly required. The clutch brake has been increased in size and the clutch-operating linkage has been altered in such a way as to increase the leverage, reducing the amount of pressure necessary to release the parts from engagement by fully one-half.

The rear system has been improved by the adoption of a heavy pressed-steel channel section torque arm in place of the tubular member formerly employed, likewise by the enlargement of the driving axles by one-eighth inch on the diameter. The brakes have been increased to 14 inches diameter, while the applying mech-

anism is now arranged inside the frame and operates through "eveners."

Further modifications in the chassis have resulted in an increase in wheel base from 115 to 118 inches on the four- and five-passenger bodies and to 121 inches on the six-passenger special. The race-type roadster and "doctor's special" torpedo roadster remain at 115-inch base, however. The frame now has a double drop, permitting the bodies to be designed with deep, straight lines through the entire effective length. The new bodies are formed of aluminum instead of wood and sheet metal. Tire sizes have been increased from 34x4 to 36x4 inches on the five-passenger cars and to 36x4½ inches on the six-passenger special. The wheel construction has been improved by the adoption of heavy brake drums bolted to the spokes, instead of the old-style drums, which were fitted to the hubs.

The new bodies, as a result of the amplification rendered possible by the enlarged wheel base, are properly commodious and have three inches more leg room than did the former types of corresponding purpose and capacity. The upholstery is of hand-buffed leather, instead of machine-buffed material, as formerly, and is stretched over 8½-inch tilted cushions. To add finish to the body the filled strip between the running board and frame is brought up flush with the frame and entirely conceals all irons. All door handles, hinges and top irons likewise are concealed, thus leaving the exterior free from unsightly and dust-catching protuberances. As a measure of precaution against distortion, the body and door sills are strongly reinforced with steel angles.

The engine dimensions remain the same as before, which is to say, 4½ x 5¼ inches bore and stroke, the horsepower thus being 32.4 by the S. A. E. rating. The cylinders are cast in pairs and are of L-head construction, the valves being mounted on the left side. As an instance of thoughtful design it may be added that in the mounting of the magneto an adjustable coupling has been provided which permits six degree variations in the angular position of the armature, thus allowing proper timing regulation to be accomplished without difficulty. Further summarizing the specifications of the chassis, the change gear mechanism is of Brown-Lipe make, and of liberal size and strength in every part, the propeller shaft is equipped with two Spicer universal joints, and the differential is of Brown-Lipe pattern. The axles, both front and rear, are mounted on Timken roller bearings.

In the matter of equipment considerable improvement has been made besides that incident to the installation of the self-starting system. Double ignition is still employed, Splitdorf magneto and Atwater-Kent spark generator being the equipment. The magneto has been shifted from the right rear side of the motor to the left

front side, where it is more accessibly placed, however, while the system has been further improved by the addition of a four-way switch. By means of this device it is possible to operate either of the two complete ignition systems separately or to employ them both simultaneously.

Electric lighting is now a standard feature, a large dynamo driven by silent chain transmission from the pump shaft serving

VELIE "40" CHASSIS

to charge a 100-ampere-hour storage battery from which the lamps are fed. The meters and switches are mounted on the dash, except the tail-light switch, which is placed on the rear of the car adjacent to the tail lamp. In addition to the starting and lighting systems, the standard equipment includes a mohair top, rain vision windshield, speedometer, demountable rims and the usual outfit of necessary tools and parts.

To Correct Sagging of Old Frames.

The frames of cars which have been in use for several seasons should be tested to ascertain whether or not they have sagged and taken a permanent set. This

is best done by placing a straight-edge along the under side of the frame. If they have sagged the motor and the gear case should be lined up anew by placing thin brass "liners" under them to raise them to the required height. Where two universal joints are used between the motor and the gear changing mechanism exact alignment is not absolutely necessary, but where only one or none at all is used the alignment must be perfect. When making the adjustment the car should be loaded with the weight that normally is carried. If no appreciable binding can be felt when the motor is "turned over" by hand with the pet cocks open and a full load in the car, it is reasonably certain that the alignment is correct.

In cases where the frame has sagged badly the better way to do is to affix trusses under the sides. Owing to the fact that the construction of cars differs greatly the exact method of applying the trusses will vary. Generally the truss rods should be from ¾ to ½ inch in diameter and the struts over which they are placed from four to six inches high. The truss rods should be attached in front of the front spring shackles and behind the rear ones and if possible very nearly over the axles. The struts should be spaced apart about one-third the distance between the ends of the rods and firmly riveted to the frame. The ends of the rods also should be riveted to the steel side members of the frame, turnbuckles in the center of each permitting the frame to be drawn up into its original shape.

Tobacco Smoke to Detect Leaks.

Often leaks in the joints of intake manifolds may be detected by resorting to the "smoke test" much used by plumbers in determining the tightness of pipe joints. Similarly, when the evidence that a leak obtains is not perfect the diagnosis may in the majority of cases be made with certainty only after such a test has been made. The simplest way to go about the work is to attach a short length of rubber hosing to the air intake of the carburettor and blow the ordinary home variety of tobacco smoke through it. If a leak exists it will be made plain by the issuance of smoke.

Three Miles in "Taxi" for 25 Cents.

Montclair, N. J., soon will be the Mecca of all who desire to ride in taxicabs without paying a week's wages for the experience, a company having been incorporated for the purpose of operating taxicabs in that hilly little town, and its franchise does not permit it to charge more than 25 cents to any part of the town below Watchung avenue, from 7 A. M. to 10 P. M., while the rate from 10 P. M. to 7 A. M. is to be 50 cents. These are the prevailing rates charged by hackmen from the station, and the distances covered by them average about three miles for each trip.

UNCLE SAM MAY BUY 1,200 WAGONS

Unexpected Disclosure of Unsuspected Intentions—One Manufacturer Submits Vehicle for Official Test.

Two months ago when it was given out that the Russian government was making ready to purchase 2,000 motor trucks for the use of its army the size of the prospective order caused even those closely identified with the automobile industry to gasp. That Uncle Sam himself had any very large intentions of the sort was not even suspected until last week, when the White Co., of Cleveland, O., made known

on November 1. The total distance over which the freight trucks will run is 138 miles, practically all of which is a desert country, as accessible but as difficult in winter as in summer. All the freight received by the merchants of Burns henceforth will be routed through the town of Bend, where it will be transshipped to the trucks and carried through the desert to Burns. The people of that district are said to have welcomed the first truck with as much enthusiasm as the first transcontinental railroad was greeted.

Co-operative Buying Hits Nebraska.

Located far from the beaten line of travel, S. R. Benton, of Cairo, Neb., apparently is not aware that there already are in exist-

WHITE ARMY ESCORT WAGON AS SUBMITTED FOR TEST

that the United States government has in view the purchase of no less than 1,200 escort wagons for the use of its soldiers.

At the Army building in New York they know nothing about the matter, but that the White people know whereof they speak is evidenced by the fact that they actually have built a wagon in accordance with official specifications and have submitted it for the official tests. It is shown by the accompanying illustration.

This "escort wagon" is built on the regular one and one-half ton White chassis, with the exception of the wheels, which are considerably larger and heavier than those on the standard chassis of this type. The body is a spacious affair built with two-foot sides and ends. On a hickory framework above is carried a heavy canvas tarpaulin. The sides are provided with large iron rings and straps for carrying tent poles.

Motor Freight Line in Oregon Desert.

An automobile freight line has been established between the cities of Portland and Burns, Ore., and as a result they are fully eight days nearer to each other than last month. The first of the trucks arrived last week and a regular schedule began

ence more than a sufficient number of so-called automobile owners or co-operative supply associations to meet all needs and that in many places they are not warmly welcomed. At any rate, he is deeply concerned in the organization of one which he states will have its headquarters in one of the larger cities in Nebraska. Benton is at present engaged in unfolding his plan and in endeavoring to secure prices from accessory manufacturers.

Jury Would Not Give His Money Back.

"You can't expect a \$600 car to climb steep hills" appeared to be the gist of the opinion held by the twelve jurors in the case of F. E. Saunders vs. the Cedar Rapids Auto & Supply Co., of Cedar Rapids, Ia. Saunders had purchased two runabouts from the company for the use of himself and his family on and about their farm near Garryowen, paying \$1,200 for the two. Coming home with the cars he found that the exceedingly steep hills near his home refused to be overcome by the low-powered cars, and he promptly sued the company for the return of the \$1,200. The jury, however, could not see it that way and found for the defendant.

PACIFIC COAST REQUIRES SERVICE

Henderson, Home from Wide Swing, Discusses Trade Conditions in States Along the Pacific.

Reviewing the results of observations made during an extensive trip which included the principal Northwestern and Pacific Coast cities, Charles P. Henderson, general manager of the Henderson Motor Sales Co., of Indianapolis, Ind., gives emphasis to the fact that while trade conditions on the Pacific Coast and in the Northwest show remarkable activity, the situation requires direct and intelligent handling. The Henderson Motor Sales Co. is the general sales agent for Cole 30-40 cars, and Henderson's trip, which was mixed with pleasure, had for one of its purposes the better distribution of the Cole product in the territory visited. He was accompanied by L. Carter, president of the company, together with Mrs. Henderson, Mrs. Carter and Miss Henderson. In telling of his trip Henderson said:

"In Winnipeg and Vancouver trade conditions are unusually good, despite the fact that the automobile business is new in these cities. At the other points visited trade conditions are only fair. The tendency toward cheaper cars is quite evident in the cities depending largely on agricultural territory for support, while in cities depending on more diversified interests the higher-priced cars are still in demand.

"In my opinion manufacturers will be forced to introduce service departments, to be handled direct by the manufacturer or through a capable distributor, as there is a demand for quicker and better service to the owners. The companies now giving such service are getting the lion's share of the business. Although the Cole was introduced to the Pacific Coast only a little over a year ago, we now have a sufficient number of cars to warrant our establishing adequate service departments throughout that territory.

"In Los Angeles, which seems to be the Mecca of motorists, there is a very active trade at this time. The delightful climate permits the use of cars the year 'round. One point that the owners are learning is that cars driven twelve months of the year without a rest should not be expected to wear quite so long as in localities where machines are laid up in storage for a good portion of the year.

"Another thing that impressed me was the knowledge of automobile construction that is shown by the Pacific Coast distributors and agents. They want the very best of equipment, including tops, windshields and the like. On the whole I think the Pacific Coast trade, as that of the South, is in its infancy, and with better roads will rapidly increase."

ASHEVILLE'S AUTOMOBILE HIGHWAY.

Private Enterprise Gives the North Carolina City a Remarkable Road—Wonderful Curves and Rare Scenery.

Asheville, N. C., has the distinction of being one of the few places that has an exclusive automobile road for the free enjoyment of its citizens. It leads from the end of Charlotte street, at the foot of Sun-

"SWITCHBACK CURVE" ON ASHEVILLE'S AUTOMOBILE ROAD

set Mountain, around the face of the mountain to its summit—a distance of five miles. At the summit of the mountain the road connects with the crest of the Blue Ridge highway, which at present is in course of construction. It was opened to the public by Dr. E. W. Growe, of Asheville.

The entire length of the road to its summit has been laid with macadam and rolled until its surface is as smooth as a floor. It is of sufficient width to allow motor cars to pass each other at any point, while all approaches to curves are fitted with signs "Blow Horn." Wherever the special road intersects the regular wagon road that also leads to the summit signs have been erected giving notices that carriages are not permitted on the automobile road. This carriage road also has signs advising the public that automobiles are not allowed to travel on it.

The scenery along this new road is of rare grandeur. At each turn and all along the mountainside are delightful vistas stretching away to the north and west, showing the beautiful valley of the French Broad river, or Tahkeestee (the Indian name for "racing river"). Reaching the summit, the tourist finds himself at an altitude of 3,119 feet above sea level and about 1,000 feet above the city of Asheville, which is plainly visible at the foot of the mountain, while fully a dozen mountains, ranging in height from 3,000 to 6,500

feet, pierce the sky at the western horizon and form a fit frame to the beautiful picture.

Divides New York Into Three Districts.

Carrying out his plan of facilitating the issuing of licenses to chauffeurs and the registration of motor vehicles, Secretary of State Lazansky has divided New York State into three districts, with bureaus in New York, Albany and Buffalo, respectively. Commensurate with the fact that

Richmond, Nassau, Suffolk, Westchester, Rockland and Putnam.

Albany—Albany, Broome, Chenango, Clinton, Columbia, Delaware, Dutchess, Essex, Franklin, Fulton, Greene, Hamilton, Herkimer, Jefferson, Lewis, Madison, Montgomery, Oneida, Orange, Oswego, Otsego, Rensselaer, St. Lawrence, Saratoga, Schenectady, Schoharie, Sullivan, Ulster, Warren and Washington.

Buffalo—Alleghany, Cattaraugus, Cayuga, Chautauqua, Chemung, Cortland, Erie, Genesee, Livingston, Monroe, Niagara, Onondaga, Ontario, Orleans, Schuyler, Seneca, Steuben, Tioga, Tompkins, Wayne, Wyoming and Yates.

No Prince Henry Tour Next Year.

Despite the fact that this year's tour for the Prince Henry Cup was such an unqualified success, there will be no repetition of the event next year. Adalbert Count Sierstorpff, vice-president of the Kaiserlicher Automobil Club, officially announced the abandonment of the European touring classic in a statement issued last week.

The cup, originally given by Prince Henry, was to be competed for three years in succession, at the end of which time it was to become the permanent property of the person or persons winning it in the third attempt. As, however, the cup went to the Royal Automobile Club of England this year, it became the property of the latter, Prince Henry disdaining to require a return of the trophy. It furthermore

WHERE THE AUTOMOBILE ROAD AND HORSE HIGHWAY MEET

more than 60 per cent. of all motor vehicles in the State are owned by residents of the metropolitan district, the bureau already existing in New York City will be so greatly enlarged that, while Albany will remain the secretary's headquarters, the bureau there will be reduced to small size and importance. The counties assigned to the three districts are as follows:

New York—New York, Kings, Queens,

has been decided to substitute a competitive reliability run with strict penalizations and speed tests instead of the social event it became this year. A new tour, under these changed conditions, will be held in 1913, at which time the run probably will be extended to cover portions of Austria, Italy and Hungary, and it is stated that several manufacturers intend building special cars for the run.

NEW ELECTRIC CAR FROM JACKSON

Standard's Production Proves an Attractive Creation—Ingenious Power Plant Construction and Body Arrangement.

For several years the idea has prevailed that electric vehicle construction had been standardized to a point that admitted of practically no further improvement—at least until science had provided new methods and materials. The fallacy of the notion was revealed last year when several novelties were introduced and again is being demonstrated with the advent of a number of entirely new productions at this

added vibrational stresses which may be imposed on the assemblage when fitted with solid, or semi-solid, equipment.

In general design the vehicle, which sells complete for \$1,850, is of the modernized coupe type and of effective design. Owing to the liberal length of the chassis it is possible to secure ample interior accommodation, in the way of foot-room, as well as seating accommodation, and at the same time to leave the two battery compartments entirely free from the body. The result is that the interior fittings and upholstery are entirely isolated from the acid fumes of the battery, while it also is possible to secure ample ventilation for the latter. Another point in favor of the arrangement is that it renders the battery accessi-

to be proportioned with due regard to charging economy, and at the same time without introducing an extravagant amount of weight. The two rear trays, already mentioned, are of nine-cell capacity, the front section of the battery being divided into two groups of six cells each.

Because of its relatively high efficiency under heavy load and also by reason of its light weight a high-speed motor has been selected for the work of propulsion. The

THE STANDARD ELECTRIC COUPE IN ELEVATION

time. The new Standard electric, which is just being placed on the market by the Standard Electric Car Co., of Jackson, Mich., affords further illustration of the point. While combining the many advantages of thoroughly established electrical practice, it also is built in accordance with the tenets of modern automobile practice, as distinguished from the combination of carriage work and ill-assorted mechanical equipment which distinguished many of the early electrics.

Indicative that it is an automobile and not an electric carriage, in the strictest interpretation of the terms, the new Standard car has a drop frame, 39-inch wheel base, semi-elliptic springs in front and three-quarter elliptics in the rear, double, internal-expanding rear wheel brakes, 32-inch wheels shod with No. 1 Universal demountable rims and pneumatic tires. The matter of tire equipment is left open to the option of the purchaser to a certain extent, however, as either solid or cushion tires may be obtained. The point is noteworthy in this connection, as revealing thoughtful design, because the strength of the chassis parts has been calculated with an eye to

ble at all times without need of entering the body interior. In consequence the body map remain locked at all times even when the mechanical parts are undergoing slight adjustment or repair.

The general equipment is of thoroughly approved pattern. The interior is illuminated by means of corner lights, which are held to be superior as throwing the light from behind the occupants, instead of directly over their heads and into their eyes. The external lighting equipment consists of the usual dash and tail lamps. The upholstery is of well-selected material, liberally cushioned and proportioned. The finish is commensurate with the mechanical qualifications of the machine.

In arranging the battery special provision has been made to secure ample clearance for the rear axle without elevating the chassis to the point of instability. The rear section of the battery is divided into two sections, which are separated by an open space of several inches, thus being protected from risk of injury due to the striking of the body against the axle. The standard equipment is 30-cell, 11-plate Ironclad Exide—a battery which is thought

STANDARD ELECTRIC'S CHASSIS

type employed is rated at 48 volts, 26 amperes and 1,650 revolutions per minute. The frame is made of a single steel casting, the armature and commutator being of small diameter and light weight, thus reducing their peripheral speed and inertia to a minimum. The bearings are provided with extra large lubricating reservoirs, which are protected in such a way as to prevent the escape of oil or the entrance of dirt and dust. Special pains have been taken in working out the design to render the motor sparkless at all speeds and to give it as high and uniform a degree of efficiency as possible together with low operating temperatures. These features, as well as the protection of the entire machine by the frame housing tend to render it long lived and free from troublesome tendencies.

The motor is rigidly connected with a propeller shaft which runs within an en-

SHOWING ARRANGEMENT OF CONTROLLER AND DISPOSITION OF STANDARD ELECTRIC'S BATTERY

closing torque tube with which the motor itself swings in accommodating the flexure of the rear springs. To this end the frame casting is encircled by a gimbal ring which is mounted in trunnions on either side, the latter being supported on a suitable cross frame member. The torque tube itself is stayed to the rear axle by means of diagonal braces which run to the outer ends of the axle, thereby rendering the entire mechanism essentially rigid. The reduction gearing is located entirely in the rear axle housing, and is of the double step-down type, embodying one pair of bevel gears and one pair of spur gears, the driven member of the latter being the axle driver, which is built integral with the floating member of the differential.

The axle is a trifle out of the ordinary, being what is termed the three-quarter floating type. In this form of construction, as distinguished from the full-floating axle, in which the wheels are mounted on the axle tube ends and are entirely independent of the driving mechanism as far as load-bearing is concerned, but one row of balls is employed in supporting each wheel. The

driving shaft in either end of the axle is rendered rigid with its wheel and floats in the differential bearing; it thus exerts a steadying influence on the wheel and preserves the alignment of the bearings.

STANDARD DRUM CONTROLLER

The front axle is unusual in its employment of the so-called reversed Elliott type of steering knuckle, which is to say that in which the knuckle proper is hooded over the end of the axle, the latter having merely an eye in its extremity, instead of the more common yoke. The axle is of I-beam section and dropped to lower the center of gravity of the car. The car is mounted on

ball bearings throughout, special dust-proofing provisions having been made in each mounting.

The control mechanism is of the standard pattern, having a continuous-torque type of drum controller, side-lever steering and double pedal mechanism for operating the brakes. This feature, together with the use of rear wheel brakes exclusively, is held to be advantageous, since it affords equal retarding facilities with both brakes and does not tend to strain the transmission unduly.

Computing Ratio of Revolutions.

Owing to the construction of differentials, one rear wheel will rotate at double normal speed if the other is held so that it cannot move. This should not be forgotten when it is desired to ascertain the ratio of engine revolutions to rear wheel revolutions. Both of the rear wheels should be jacked up when such an operation is undertaken. Also care should be taken to see that both wheels rotate with equal freedom—that they rotate in unison, in other words—for if the brake on one wheel drags the computation will be wrong.

THE STANDARD MOTOR

THE DOUBLE REDUCTION DRIVE

Clutch Brakes; Their Development and Purposes

Contrary to the general impression which seems to have gained much ground among persons who are not intimately connected with the automobile industry, the purpose of a clutch brake is not to assist in bringing a car to a stop. Just how the impression gained prevalence is not very difficult to understand. As far as the average owner is concerned, a brake is a brake, regardless of its position on the chassis and he cannot conceive of it being put to any other use than to stop the car. That ser-

ployed because of their professed familiarity with "everything pertaining to a car," show a surprising amount of ignorance when the subject of clutch brakes is mentioned.

Briefly, the purpose of a clutch brake is to prevent that part of the clutch which is connected to the change gear mechanism from "spinning" when the clutch is disengaged. That is its principal function. Also it is designed to prevent "dragging" which results when the clutch members do not

desire for a "talking point" rather than for reasons of increased efficiency or ease of control. This is best made plain, perhaps, by the fact that very heavy clutches often are without any means to prevent the excessive spinning which must take place. Light clutches, in which the inertia very quickly is dampened by the friction in the bearings, on the other hand, just as often are fitted with brakes, which, as suggested previously, are heavy and cumbersome out of all proportion to the work for which they are intended.

Not that manufacturers have an easy problem in designing and fitting an all around efficient clutch brake. Far from being simple, it is a great deal more difficult than might be supposed and entails considerable thought and experiment. For instance: The brake should be so arranged that in changing from a low gear to a higher one the clutch member attached to the change gear mechanism should be slowed down, but when the change from a high to a lower gear is made, spinning should be encouraged rather than stopped.

The reason for this becomes apparent after a little thought. When a car is driven on a low gear and a change to a higher gear is made, two gears rotating at different speeds have to be brought into engagement. The driving gear is rotating at clutch speed and the driven gear is rotating at a speed proportional to the speed of the rear wheels. Before the teeth on these two gears will engage, the gear wheels must rotate at a certain ratio of peripheral speed governed by the number of teeth in each. When the car is driven on high gear, the driving gear rotates slower than it does when the car is driven on low gear. Therefore when a change from low to a higher gear is made, the speed of the driving gear, which is attached to the clutch, must be decreased to prevent the teeth of the two gear wheels chattering over each other until their speeds have reached the proper ratio to permit the teeth to engage.

Similarly, when the car is driven on a low gear the driving gear rotates faster than it does when the car is driven on a high gear. From which it becomes plain that when a change from high to a lower gear is made, the rate of rotation of the driving gear should not be decreased, but rather it should be increased for the reason that has been pointed out. As it is impracticable at present to increase the speed of the driving gear when a change "down" is made, the next best thing to do is to let well enough alone, or, in other words, to allow the clutch to spin when changing to a lower gear.

FIG. 1—PIERCE-ARROW ARRANGEMENT OF TWIN CLUTCH BRAKES

vice or emergency brakes sometimes are placed on the propeller shaft undoubtedly is partly responsible for the wrong impression. Also the fact that in some makes of cars clutch brakes are of sufficient size and weight actually to stop a car suggests a possible reason for the prevailing misapprehension.

But the layman, the individual owner who interests himself chiefly with the steering of his car and has little time or inclination to delve into its innermost recesses and learn the why and wherefore of things in general, is not the only one to whom the purpose of a clutch brake and the functions of the device are a mystery. He scarcely can be blamed for his lack of understanding for the reason that in not a few cases the salesman who sold him the car did not even know of the existence of a clutch brake, much less the reason for its being there. Furthermore, it has been brought to light in not a few instances that even professional chauffeurs, em-

disengage fully and immediately when the clutch pedal is depressed.

The use of the clutch brake as regular equipment is a comparatively recent development. Up to a year or two ago they were almost as scarce as the proverbial hen's teeth. But at present they are used by a large number of manufacturers and their popularity undoubtedly is on the increase. As a matter of fact, clutch brakes are this year a feature of the products of several manufacturers who never before have so equipped their cars. Which goes far to prove that despite assertions to the contrary, the device really has merit, particularly in view of the fact that among the cars on which clutch brakes will be shown for the first time this season are some of the best known in this country.

But while there is a number of new clutch brake designs there is an equal number of old ones, and several of those that are in the latter category suggest that their presence is due in no small measure to the

Theoretically, a clutch brake never should be sufficiently powerful to stop a clutch immediately, though many of them do that very thing. Instead, it should merely slow the clutch down gradually. When the clutch is stopped while the car is running, practically the same conditions obtain as when the clutch is spinning. Which is to say that in the former case only one gear is rotating, the gear which is driven by the clutch being stationary. Therefore when the rotating gear and the stationary one are brought together a terrible din is produced by the teeth of the one chattering over the teeth of the other, in addition to which there is grave danger that the teeth of either may be chipped. The teeth of the two gear wheels slide, or rather bounce, over each other until the stationary gear has been set in motion and it and the clutch are rotating at the proper speed for the teeth to engage properly. From which it may be seen that the designing of a properly working clutch brake is by no means an easy task, for in addition to accomplishing the results set forth it must be as simple as possible and contain the minimum of moving parts. Also that portion of it where the necessary friction is obtained should be easily renewable at little expense.

The principal difficulty has been in arranging a clutch brake so that it will operate to slow down the clutch member when a change to a higher gear is to be made, but will permit the clutch to spin when a change down is made. While numerous devices, more or less complicated, have been used, nearly all of them have been relegated to the scrap heap. Practically the only remaining method embraces the manipulation of the clutch pedal, the clutch brake being interconnected with it in such a way that when the pedal is depressed to the limit the clutch brake becomes operative, but when it is only depressed part way the clutch is allowed to spin.

As efficient as this method is, and it is used by a number of manufacturers with excellent results, it is open to the objection that it requires a certain nicety in the use of the clutch pedal which not all drivers have the forethought or the inclination to use. As a matter of fact there are relatively few drivers who treat their cars with the consideration to which they are entitled, and it is likely that the disfavor into which clutch brakes have fallen with some is directly attributable to this. Incidentally it is genuinely astonishing that under the abuse to which some of these mechanisms are subjected they survive as long as they do. At the least it is a tribute to the excellence of modern materials and methods.

In general there are three types of clutch brakes which are used to any great extent. Perhaps the most familiar is that which embraces a cup and cone. In this case either the cup or the cone is arranged to be held stationary, while the other, usually

made of a different kind of metal and sometimes faced with leather or fiber, rotates with the clutch. When the clutch is disengaged the cup and cone are brought together, after the manner of the two parts of a cone clutch, and the resultant friction slows down the clutch member. This design lends itself well to interconnection with the clutch pedal, or that member of the clutch which is withdrawn from the other, but it has not attained to any very great amount of popularity for the reason that it is not as easy of adjustment as some other types, nor can its parts be replaced without dismantling a considerable portion of the clutch assembly. Obviously it is perfectly simple, but it is likely to be "fierce" and to grab unless either of its

er he desires to change to a higher or a lower gear.

The disks themselves are free to rotate and are faced with fiber. Also they are slightly offset so that when the clutch member is brought into contact with them they rotate and wear is minimized. At the same time the friction which is obtained is sufficient to accomplish the ends desired and instead of being worn into the grooves the fiber faces wear evenly. They may be replaced in a very short time when necessary and at a very slight cost.

Overland Model 61 cars are equipped with a very similar arrangement, the difference being that but one disk is used. The disk is mounted at one side on a bracket, which also serves to support one

FIG. 2—DETAILS OF PEDAL ACTUATED CHADWICK CLUTCH BRAKE

members is faced with leather or fiber, which is objectionable because of the difficulty of replacing the facing.

One of the latest types of clutch brake and one which is used this season for the first time by two of the more prominent manufacturers, embraces the use of a flat disk or disks which come in contact with the clutch when it is disengaged and prevent excessive spinning. The Pierce-Arrow arrangement of this general design is shown in Fig. 1.

As may be seen in the illustration, two disks, A and A', are mounted diametrically opposite to each other on supporting arms in such a way that when the female member of the cone clutch is fully withdrawn it presses against them and its motion is partly arrested. Of course when the female clutch member is not fully withdrawn it does not come in contact with the disks, the operation of the brake thus being subject to the will of the driver, who may use it or not, according to wheth-

end of the cross shaft which carries the clutch pedal. In the Overland construction, also, the disk is fiber-faced and is slightly offset so as to rotate when the clutch member is brought into contact with it. The disk is held in position by a spring, the tension of which is variable.

Chadwick practice, which is illustrated in Fig. 2, shows an entirely different arrangement. The clutch itself is of the internal expanding variety, and as it is of comparatively heavy construction there is need of a clutch brake that shall be positive in action. In the design that is used, the manufacturers have succeeded in getting a clutch brake that is "sweet" and uniform in action as well as being positive. The brake consists of two separate parts, the drum, A, which is bolted fast to the internal member of the clutch, and the shoe, B, which is attached to and actuated by the clutch pedal. The brake shoe is formed of an adjustable, flat, steel spring, the friction material being leather. The leather is riv-

eted to the end of the steel spring and may be renewed quite easily. One of the noteworthy features of the arrangement is that the brake shoe presses against the drum at an angle so that no matter how tightly it may be adjusted the clutch always may be fully disengaged.

A somewhat similar arrangement, illustrative of Corbin practice, is shown in Fig. 4. It differs from the other, however, in that the rim of the clutch itself takes the place of the drum which is used as shown in Fig. 2. The Corbin clutch is of the cone variety. Actually, the similarity concerns only the brake shoe; in method of attaching it is quite different. Whereas in the Chadwick design the brake shoe is attached to the clutch pedal and actuated by it, the Corbin brake shoe is attached to one of the cross shafts but does not move with it. It is brought into contact with the clutch, or rather the clutch is brought into contact with the brake shoe, when the

FIG. 3.—PACKARD CLUTCH AND BRAKE

male clutch member is withdrawn. The friction material is leather and its renewal does not require a great amount of either time or money.

Also in the general class of clutch brakes in which the brake shoe is moved into contact with the clutch by the movement of the clutch pedal, is the Packard mechanism, which is shown in Fig. 3. The whole arrangement is shown very clearly in the picture. A multiple disk clutch is used and the outer casing, A, serves as the drum for the clutch brake. Against this presses the brake shoe, B, which is faced with an asbestos material. The effective pressure which may be obtained between the two is governed by a spring and may be adjusted by means of the lock nut, C. The whole assembly is particularly simple and is attached directly to the clutch pedal. When the pedal is depressed to disengage the clutch, the whole mechanism is rocked forward and downward into contact with the outer casing of the clutch. In this instance, also, renewal of the friction material is a simple matter.

Lozier construction, illustrated in Fig. 8, shows still another form of clutch brake and one which seldom is used, probably because of the relatively high cost of manufacture. It is not unlike the cup and cone variety of brake, in action at least, though in this case both cup and cone are flattened out and form two plain disks, one of steel and the other of bronze. The steel disk is formed integral with the clutch shaft and is not shown in the picture. The bronze disk, A, remains stationary, or very nearly so, and is held in position by means of a cross frame member.

FIG. 4—SIMPLICITY OF CORBIN STOP

When the clutch, which is of the multiple disk variety, is disengaged, the bronze disk is moved through linkage connected to the clutch pedal a fraction of an inch and brought into contact with the rotating steel disk on the clutch shaft. The movement of the clutch pedal, however, only controls the pressure between the two disks within certain limits. The actual pressure obtained is controlled by the tension on the springs through which the clutch pedal movement is transmitted to the movable bronze disk. The tension on these springs may be varied through a wide range, permitting considerable compensation for wear before renewal of the bronze disk is necessary. The insertion of a new disk is a simple matter and should not require more than a few minutes.

Not all manufacturers incline to the use of the clutch brake, not merely because it entails added manufacturing cost but because of deep-rooted convictions that it is an unnecessary adjunct that increases the complexity of their products without material benefit. In some cases just plain prejudice against the device is largely responsible for its non-appearance on cars which manifestly would be improved by its addition, though it is only fair to say that in the majority of cases, manufacturers do not permit sentiment to govern their actions and are quick to adopt meritorious devices regardless of prejudices against them. Be that as it may, however, the fact remains

that there are on the market today several makes of cars in which a spinning or dragging clutch constitutes an abomination. One manufacturer has realized his deficiency, but rather than fit a clutch brake he relies on the friction in the bearing which supports the male portion of his clutch. Furthermore, he makes provision whereby the bearing may be tightened when it has worn so that the tendency for the clutch to spin is unchecked.

But as previously has been stated, such cases are rare and really are the exceptions which go to prove the rule that manufacturers on the whole are extremely liberal and their designers are not slow to realize that, literally, "it is the small things that count." Of course where a clutch is small and light a clutch brake really is unnecessary, but when a clutch is heavy and its inertia is considerable, a clutch brake is a necessity and cannot justly be classed as a luxury or a useless complication.

FIG. 5.—ILLUSTRATIVE OF LOZIER DESIGN

It is comforting to contemplate that such advances as have been made in the perfecting of cars as a whole have been due very largely to efforts on the part of designers to refine details and eliminate or simplify small parts. It is perfectly reasonable to expect, therefore, that in the not far distant future an even better solution of the clutch brake problem will be forthcoming.

Jones Produces a Hub Odometer.

Supplementing its regular line of speed and mileage recording instruments, the Jones Speedometer Co., New Rochelle, N. Y., just has placed on the market a new type of Jones odometer which is designed to be attached to one of the wheel hubs of vehicles. As its name suggests, the new instrument registers mileage only and is entirely automatic in operation. To discourage unauthorized persons from tampering with the device after it has been placed in position, it is sealed and cannot be disconnected, nor can the recorded mileage be altered without the owner's knowledge.

PULLMAN TO PRODUCE TAXICABS

Standard Touring Chassis Used, With High Class Body Work—Will Not Be Sold Through Dealers.

Taxicabs have been added to the line of cars produced by the Pullman Motor Car Co., of York Pa., and in connection with this approach to the borders of the commercial vehicle field the company announces that instead of marketing the machines through agents or by the roundabout method of subsidiary companies it will sell them direct from the factory to the purchaser. In accordance with the direct

which, therefore, affords unobstructed entrance to the vehicle and an unobscured view. The device is further noteworthy in that the top can be raised or lowered without the operator having to dismount, merely by swinging it to one side—as sometimes is done with spray hoods on motor boats—the bows being arranged to fold down against one of the side rails. The raising and lowering is assisted by a concealed spring and lever arrangement, while the employment of steel tubing exclusively for the framework is said to give unusual strength with a minimum of weight.

To Market the Levraut Tire Valve.

That rare article, a new tire valve, styled the Levraut, is about to be placed on the

CLUTCH TEST AS A TROUBLE FINDER

Walter White Tells of Its Application—Locates Proper Distribution of Load and Traction Power.

Though the average individual is likely to view a clutch test as a clutch test and nothing more, it really has much greater significance and under the observant eye of the expert reveals a number of things that scarcely would be suspected by persons not conversant with engineering practices. In remarking the fact and in commenting on the San Francisco Examiner's recent commercial vehicle contest, Walter White, of the White Co., brings to light an interesting circumstance which bears out the contention that in a way a clutch test is in reality a test of the whole vehicle. The particular feature which the clutch test makes plain involves the proper balancing of the vehicle and its load distribution.

"Pleased as we are about winning this economy contest," he said, "to my mind it is not the most striking feature of the event. Any truck might have been fortunate enough to win a two days' economy contest. It takes weeks and months of such performance actually to demonstrate real economy in operation, but the brake and clutch contest did prove some things for which we have been contending in truck construction.

"To my mind, the clutch contest was a whole commentary in itself upon the proper balancing of a motor truck. In this clutch contest the trucks were run upon a platform, near one end of which was an eight-inch block. The front wheels of each truck were placed against this block, the engine speeded up and the clutch engaged. Each truck was required to stall its engine or spin its rear wheels in order to make a perfect score.

"The White trucks contesting did not stall their engines nor spin their rear wheels; they simply climbed over the eight-inch obstruction—a demonstration of the engine's power perfectly applied to the rear wheels for traction.

"Eighty per cent. of the trucks entered in this contest either spun their rear wheels or stalled their engines on this test, showing proper and powerful clutch construction, but to our minds also showing that too large a percentage of the load is carried on the front wheels. As a result, when bad roads are encountered, the front wheels have a tendency to act just as they did against the eight-inch obstruction—that is, to stall the engine or spin the rear wheels instead of climbing over.

"It seems to us that the greatest lesson of this truck contest was taught by our trucks, which showed that a truck can be so balanced that the traction is almost perfect."

PULLMAN 30-HORSEPOWER \$1,500 TAXICAB

method of selling, the company has placed what it considers a low price, \$1,500 net, on the cab.

The chassis is the same as that of the 30-horsepower Pullman pleasure car, the motor being 4 1-16 by 5. Ample spring suspension is provided and a high quality of aluminum alloy is used in the crank and transmission cases in order that the car may be kept light and easy on the tires. In recognition of the needs of its service the vehicle has been built to afford easy turning and a handy getting in and out of traffic.

The body, which is equipped with deep upholstery, accommodates five passengers. Although the vehicle is constructed for commercial use, the finish is of a grade comporting with the reputation on which the company prides itself in connection with its bodies. The equipment includes 34 x 4 tires and demountable rims, gas headlights, gas tank, pedestal side lamps, oil tail lamp and the usual minor tools.

Making the Top More Convenient.

Reverting to the form of the one-time familiar canopy top, a British inventor just has perfected a new style "hood," which is supported at the front and rear only, and

market by the Central Machine Supplies Co., 96 Warren street, New York City. The device, which is made without springs or washers and has but five parts, including the outer shell and the hollow screw by which it is attached to the inner tube, is the invention of M. Levraut and was patented last August. Its principal features are a fine-bore tube, which replaces the stem of the standard valve, a short length of rubber tubing which surrounds its lower extension, an outer shell which is flanged at its lower end, and the hollow attaching screw. It has no external threads and is interchangeable with valves of other types. Inflating the tire lifts the rubber valve tube from the stem which it surrounds; when inflated the tube clings fast to the stem and closes the opening therein, forming a perfectly tight seal.

Why Inlet Valves Need Less Clearance.

Owing to the fact that cold gas continually is being drawn over inlet valves they never become as hot as do exhaust valves and, therefore, they expand less. For this reason the amount of clearance between the inlet valve stems and the push rods should be less than that which obtains in the case of exhaust valves.

PREMIER CARS IN DESERT SETTING

Indianapolis Company Stages Private
Automobile Show—Other Hoosier
Dealers to Follow Suit.

Cacti, sagebrush and plenty of sand, together with other stage effects calculated to give a vivid stage setting representative of the Great American Desert, formed the feature of the "fall opening" or fall automobile show given by the Premier Motor Manufacturing Co. in Indianapolis, its home city, during the week October 23d

Premier creations. The company's "fall show" was such a success that other manufacturers and dealers in Indianapolis have announced similar shows for presenting their 1912 offerings to the public; in fact, the local trade association has set one week of the present month for a general exhibition or "opening" of the sort.

Dealers Pay for Chauffeur's Guilt.

Shortly before a suit for \$20,000 damages filed by Miss Emma Horton, of Nashua, Ia., against the Morris Motor Car Co., of Waterloo, Ia., came up for trial, the defendant company last week settled it out of court by paying \$1,000 to the com-

IMPORTANCE OF CAPABLE DRIVERS

Stone Rates Them 80 Per Cent. of Truck's
Success—Teamsters and Professional
Chauffeurs Compared.

A number of automobile men were discussing the operation of motor trucks the other day, when one of them, who is a well-known commercial vehicle manufacturer, took occasion to recount a recent experience. Happening to see one of his trucks running along the street, he stopped it and climbing up beside the driver rode

DESERT SETTING FOR THE PREMIER "HOUSE SHOW" IN INDIANAPOLIS

to 28th. The show was in line with the growing popular conviction that the automobile is an all-the-year-round vehicle, and its purpose was to stimulate the fall and winter trade.

Being unhampered by any uniform scheme of decoration, such as obtains in the big national automobile shows, the Premier company was at liberty to indulge its own ideas. In taking advantage of this freedom it chose to represent a scene taken from the ocean-to-ocean tour of twelve Premier cars last summer when the 40 tourists in the party camped out in the desert en route from the Atlantic to the Pacific coast. This elaborate setting occupied about one-half of the space in the Premier salesrooms, the other half being taken up with series M models, the newest

plaintant. The case caused considerable interest in the Middle West, as it involved the question of responsibility of a dealer for the carelessness of one of his employees. In the bill of complaint filed by Miss Horton she alleges that in June, 1910, her father purchased an automobile from the Morris company and asked a representative of the company to drive him and his family home in it. On this trip the car turned turtle while going at a high rate of speed, and the occupants were thrown out, all receiving more or less serious injuries. Horton himself was so dangerously wounded that he died before reaching home. Enough witnesses were subpoenaed to convince the company that its chauffeur was responsible for the accident and it hastened to settle the claim out of court.

with him for some little distance in order to observe the working of the machine. The truck was a new one and the driver, as he recalled, a raw recruit from the ranks of the teamsters. The man obviously was of a cautious temperament and proud of his new job; furthermore, he handled the sturdy machine gingerly, as though he were momentarily expecting it to fall apart. Observing that he was careful to keep the speed below the limiting point of the speed regulator with which the machine is equipped, the manufacturer finally inquired, "Why don't you open her up and let the governor take care of the speed?"

"Oh, sure an' that would hur't the injun," was the reproachful answer.

Most motor truck authorities will agree that men of this type are the exceptions—

which prove the rule of incompetence. But that the best and most trustworthy drivers for commercial vehicles are drawn from the teamster class is now pretty generally agreed, and in seeking material for new drivers more attention constantly is being paid to this class. Nor is the difficulty of securing good drivers one to be minimized. In the opinion of Charles E. Stone, sales manager of the Alden Sampson Co., the value of the driver may be as high as 80 per cent. out of a possible 100 of perfect operation.

"I believe I am safe in saying that 80 per cent. of the successful operation of a truck rests alone in the driver's hands," to quote him exactly. The opinion was expressed at a meeting of the Motor Truck Club last week, in connection with a paper in which Stone thoroughly reviewed the driver situation.

"There can be no hard and fast rules or methods established for the employment of such men," said he, "and no one class from which to draw upon. Offhand it would seem as though the professional chauffeur represented the best available material, but, as a matter of fact, both the dealer and the purchaser cannot safely rely upon this source.

"The major portion of the so-called chauffeurs are unwilling to take up the commercial vehicle as a filler-in between seasons in the automobile business, and it has proved most unprofitable to employ men who have no serious intention of remaining. The speed mania in the majority of instances has claimed this class of labor and thereby unfitted them for the slower-going merchandise vehicle, and the rough, dirty work in connection with the truck is not attractive. I think that we must look more to the present drivers of the horse-drawn vehicles from whom to recruit our force.

"Prime requisites of the motor truck driver are a fair physique, ability to master certain fundamental principles of the vehicle, a cool head, sobriety, previous experience in driving (particularly in congested traffic), rules of the road and local automobile laws, a willingness and desire to absorb information as to the care and operation of the machines and, above all, an interest in the machine entrusted to his care and fidelity to the owner.

"Anyone agreeing to accept the responsibility and the care of operating and taking charge of a piece of machinery—locomotive, if you will—which may represent a value of as much as \$6,000 or \$7,000, certainly should not limit his interest to the mere driving of the vehicle, but this interest should be sufficient to see that the machine entrusted to his charge is in every way prepared to resume its operation the next day. Personal pride and the desire to establish a reputation and thereby increase his salary as a recognition for services rendered would, to my mind, be a matter of course. No employer will hesitate to com-

pensate and advance the man who economically and efficiently runs a truck entrusted to him, and machines are installed as a result of such economic performance. I have in mind one man in this city who drifted into the motor truck business as a driver from the ranks of motormen, and by application, study and a desire to advance is now in charge of one of the largest and most successful motor truck installations in this country, with a salary in proportion to the responsibility.

"Up to a few years ago, when self-propelled vehicles were pretty much of an experiment and the buying public skeptical, a universal sales argument was that machines were so simple in construction and operation that practically anyone could drive them. Naturally the purchases paid little or nothing in excess to the wages of the general teamster. The result has been, except in rare instances, disastrous; and, unfortunately, in place of blaming himself and the over-zealous salesman for the troubles, the machine alone bore the blame. The more extensive installation and general spread of knowledge, however, has created a change in this regard, and I believe the majority of the sales offices and agencies are taking pains to educate the buying public up to the necessity of employing experienced and qualified men. To my mind, the very wisest investment and the greatest economy connected with the introduction of a self-propelled business vehicle is brought about by paying more money to the competent man and thereby affecting a tremendous saving through the elimination of breakdown and excessive wear.

"As a general thing, I believe the most satisfactory results may be obtained by having the purchaser select from among his teamsters or employes familiar with his delivery, the man embracing the greatest number of qualifications, and either sending this man to the truck factory or to the service department of the dealer for as long a tuition as possible, at least a month.

"Inasmuch as the personal interest items of such importance, it seems to me that each of us engaged in marketing trucks should employ every means in our power to foster such interest and co-operate with the owner toward this end, either by arranging a bonus system for satisfactory service or a prize to be awarded at certain fixed intervals. A few merchants are resorting to such methods with pronounced success. Another scheme was started in Philadelphia whereby the owners paid their drivers \$3 a day for every day that the truck operated satisfactorily and \$2.50 a day when it was out of commission. This particular truck is the only one in the city of Philadelphia of the make of that year now in commission.

"The hours of operation should be carefully determined upon and every effort made to prevent the shipping department imposing upon the driver. It is not to be

expected that a man running a 5-ton truck can continue to satisfactorily perform his duties on more than a 10-hour schedule, particularly when he is called upon to load and unload. Assistance should be given to him and a reasonable amount of time each day allowed for the inspection and care of the truck. As an organization working to improve existing conditions and endeavoring to enlarge the scope of the motor truck, it is up to us to educate the owners to the necessity to paying salaries in proportion to ability and to stimulate the drivers to renewed effort and interest and make both the friend and booster of the self-propelled vehicle."

England to Subsidize Military Trucks.

Realizing the enormous importance of motor vehicles in case of war, and its own dilatoriness in equipping its army with the modern means of transportation, the British War Office has worked out a provisional scheme for the subsidizing of gasoline motor trucks or wagons, built after January, 1910, and owned by civilians. United States Consul-General John L. Griffiths, at London, England, reports that the scheme provides that the vehicles will only be purchased in event of national emergency and will not be enrolled for hire purpose or for maneuvers. "The War Department," he says, "is to have the right to purchase on fixed terms any enrolled vehicle when the War Minister certifies in writing under his hand that the country is in a state of national danger or if a proclamation be issued under the reserve forces act of 1882.

"The motor trucks which may be thus acquired are divided into two classes, (1) those capable of carrying a useful load of 3 tons (ton = 2,240 pounds) at 10 miles an hour, and (2) those capable of carrying a useful load of 30 hundredweight (hundredweight = 112 pounds) at 12 miles an hour. The wagons will be subsidized for two years, and the owners will receive an initial subsidy varying from \$39 to \$58 and an annual subsidy of \$73, payable half-yearly. A further \$48 will be paid if the wagons carry a second magneto."

Unique Wagon Coming from Columbus.

F. W. Dickinson, who several months since incorporated the Automotor Co., in Columbus, Ohio, with \$50,000 capital stock, has brought it into actual being by leasing a plant at 1181 Parsons avenue, in that city, and electing the following officers: F. W. Dickinson, president; William Caskey, vice-president; Frank Lodeman, treasurer; A. F. Dickinson, secretary. The company purposes manufacturing an extremely light delivery wagon which is wholly unlike any of those now in use. It really consists of a body suspended between two steel tube motorcycle frames and employs wire wheels and other motorcycle characteristics. It mounts a five horsepower motor and is rated at 1,000 pounds capacity.

Rambler

1912—Cross Country—\$1650

IT'S 38 horse-power, five-passenger, with 120-inch wheel base and 36 x 4-inch wheels and tires. *It's long, it's low, it's roomy.* Low, with drop frame—long, with front axle set forward and straight line torpedo body. Roomy, with 27 inches from front seat to dash and 30 inches from seat to seat in tonneau. No outside door latches. Enclosed ventilated front and hooded dash. A car of exceeding beauty, finished in English Purple Lake—it's a rare shade of deep maroon—trimmed in nickel. Radiator to conform to body lines, high and distinctive in appearance. Fenders with sweeping grace. Powerful brakes. To drive this car is exhilarating. It runs like a spirited horse. You touch the throttle and it's away. It's the Rambler Cross Country and the flag-bearer for 1912.

Equipment, Bosch magneto. Fine, large, black and nickel headlights with Prest-o-lite tank. Black and nickel side and tail oil lamps; large tool box; tool roll with complete tool outfit. Roomy, folding robe rail; foot rest, jack, pump and tire kit. Top, with envelope, \$80—wind shield \$35. Demountable Wheel, less tire, with brackets and tools, \$30. Eveready automatic engine starter \$175.

996,434. Engine. Charles H. Talley, Lincoln, Ill. Filed June 11, 1909. Serial No. 501,593.

In a gas engine, the combination with the crank shaft and casing, of a bearing sleeve bolted to the casing and having a portion of its outer end reduced in external diameter, the crank shaft bearing in said sleeve and projecting beyond the outer end thereof, a contact collar fixed on the inner end of the reduced portion of the sleeve, a fly wheel having a differential bore to fit on the reduced outer end of the sleeve and on the projecting end of the crank shaft, a rod movable radially on the fly wheel and having a contact piece engaging the collar, a spring for holding the contact piece normally in engagement with the collar, and a device for regulating the tension of the spring; together with an igniting device electrically connected to the contact collar and contact piece, respectively, substantially as shown and described.

996,435. Valve-Grinder. Elvin E. Townsend, Oakland, Cal. Filed Oct. 4, 1910. Serial No. 585,290.

1. A valve grinder comprising a frame, a sleeve journaled therein and provided with upper and lower cam grooves, means for oscillating said sleeve, a shaft longitudinally movable in said sleeve, a pin carried thereby for engaging the upper cam grooves, a collar on said shaft and provided with a lug for engaging the lower cam grooves, valve oscillating means carried by said shaft, and yieldable means opposing relative movement of said shaft and sleeve.

996,477. Rotary Engine. James Morris Foy, Palatka, Fla. Filed Mar. 12, 1910. Serial No. 548,764.

1. A rotary engine comprising a frame, a cylinder mounted to rotate upon said frame, a piston in said cylinder, said frame having means for reciprocating said piston, said cylinder having a controlling valve, a tripping device carried by said frame, for operating said valves, a governor mounted upon said frame, means whereby said cylinder actuates said governor, and a second tripping device carried by said frame, and independent of said first tripping device, said second tripping device serving to control said valve, said governor being operatively connected with said second tripping device and adapted to render the same operative and inoperative.

996,493. Vehicle Wheel. Robert B. Love, Antioch, Cal. Filed Sept. 3, 1910. Serial No. 580,329.

A rim, a tire carried thereby, a channel plate seated upon the rim, an adjusting screw passing through the rim and plate and terminating in a reduced end extension, semicircular bands seated in said plate and slidable therein, said bands being provided with slots that engage on the end extensions of said screws, springs interposed between said bands and the inner surface of the tire, and sleeves carried by one end of each band to slidably engage the end of the other band.

996,550. Roller Bearing. Oswald F. Zahn, Los Angeles, Cal., assignor to Zahn Self Righting Roller Bearing Company, Los

Angeles, Cal., a Corporation of Californint. Filed Oct. 7, 1907. Serial No. 396,279.

1. In a roller bearing comprising inner and outer bearing members, a set of bearing rollers at each end of the bearing, each set forming a circular series of rollers in close juxtaposition, each roller having a groove near that end which is most remote from the other set of rollers, abutment means at each end of the bearing on one bearing member engaging with the end of the rollers which are most remote from the other set of rollers, and an abutment means on the other bearing member extending into the recesses of the rollers and engaging with the walls in said recesses which are most remote from the other set of rollers.

996,572. Gear Shifting and Brake Applying Mechanism. Benjamin T. Epps, Athens, Ga. Filed Dec. 4, 1909. Serial No. 531,372.

1. In a motor vehicle, the combination with a rotatable shaft for controlling the high gear clutch, an arm on said shaft, a pair of pedal levers for controlling the low gear clutch and the brake mechanism respectively, and a link having one end connected with the arm on said shaft, and the other end adapted for engagement with said pedal levers during the movement of the latter in one direction, whereby the movement of one of said pedal levers in one direction will successively rotate said shaft to cause same to throw out the high gear clutch and then throw in the low gear clutch, and the movement of the other pedal lever in said direction will successively rotate said shaft to cause same to throw out the high gear clutch and then actuate the brake mechanism.

996,575. Wheel. John Berlin Frost, Jefferson, N. H., assignor, by mesne assignments, to Joseph H. Hardwick, Cleveland, Ohio. Filed June 24, 1908. Serial No. 440,197.

1. A vehicle wheel comprising a rim and a hub, said hub including an outer member to which the spokes are attached, and an inner member engaging the axle, said outer member having inwardly projecting spring supports, the face of the inner member having radial arms extending therefrom, a set of radially active springs interposed between the face of said inner member and the inwardly projecting spring supports of the outer member of the hub, a second set of radially active springs interposed between the outer ends of said radial arms, and the outer member of the hub, and circumferentially active springs located at a radial distance intermediate the set of radially active springs, said circumferentially active springs being substantially circumferentially aligned and each of said circumferentially active springs engaging at one end of the radial arms and at the other end engaging one of the inwardly projecting spring supports.

996,626. Internal Combustion Engine. William D. Edwards, Portland, Ore. Filed Apr. 2, 1910. Serial No. 553,006.

1. In an engine, a piston, means co-operating with the piston to form a combustion and expansion chamber adjacent to said piston and two compression chambers, means associated with the piston for compressing air in the first of said compression chambers upon the working stroke of the piston and for compressing air in the other compression chamber upon the return stroke of the piston, and means for placing both of said compression chambers in communication with said expansion chamber at the end of the working stroke

of the piston and for maintaining one of said compression chambers in communication with the said expansion chamber during the return stroke of the piston.

996,662. Lamp. Charles G. Myers, Cleveland, Ohio. Filed Apr. 22, 1910. Serial No. 556,932.

A lamp, comprising a casing closed at its rear and open at its front, a source of illumination, a hinged front provided with a projecting tube, a lens holder removably mounted at the rear of said projecting tube, a condensing lens carried by said holder, a lens tube mounted in said projecting tube, an objective-lens removably secured to the front end of said lens tube, and means for adjusting said lens tube in said projecting tube.

996,699. Automobile Heater. Leo A. Brigel, Cincinnati, Ohio. Filed Jan. 14, 1909. Serial No. 472,315.

1. In a mechanism of the character described, a motor, a main motor exhaust conduit adapted to permit a direct escape of the motor exhaust, a branch conduit leading from said main exhaust conduit adapted to direct the motor exhaust to heaters, a valve adapted to direct the motor exhaust to said main conduit or to said branch conduit wholly or in part, a plurality of heaters in position to impart heat to the car occupants, a valve in said branch conduit adapted to direct the motor exhaust wholly or in part to either heater, separate conduits leading from said last named valve to each of said heaters, and independent exit conduits to lead the motor exhaust from the respective heaters.

996,714. Automobile Agricultural Machine. David Henry Hatlee, Clifton Park, N. Y., assignor of one-fourth to Daniel P. McQueen, Saratoga Springs, N. Y. Filed May 16, 1910. Serial No. 561,634.

1. An automobile agricultural machine, comprising a main frame, a main or driving axle mounted in bearings therein and provided with a driving wheel, an engine or motor mounted on the main frame, a worm shaft driven thereby, connections between said worm shaft and the driving axle, an adjustable supporting wheel at the rear end of one side of the main frame, a pilot wheel at the front of the machine, a pivoted frame in which it is mounted, a shaft operatively connected with this frame, a hand wheel for operating the shaft, a frame arranged below the main frame and pivotally connected at its rear end therewith, means for raising and lowering this frame, a shoe to which the lower end of said frame is connected by which its lower end is supported and which is adapted to have connected with its parts an agricultural machine, and means carried by said frame and connected with the engine for operating the part attached to the shoe.

996,796. Protective Cover for Pneumatic Tubes. Fritz Rosdorff, Potsdam, Germany. Filed Dec. 3, 1910. Serial No. 595,472.

A protective envelope for the inner tube of vehicle tires comprising a sheet of fabric adapted to be wound around the tube, said sheet being of such a width that it will completely surround the enveloped tube a plurality of times, said sheet being provided with a plurality of rows of eyelets and a row of fastening cords, said rows being substantially parallel to one another, each row being spaced from the row next adjacent thereto a distance substantially equal to the circumference of the entire tube when enveloped.

Vol. XXIX.

New York, U. S. A., Thursday, November 9, 1911.

No. 8

SETTLING NEW YORK SHOW QUESTION

Addition to Grand Central Palace Will Afford All the Room Desired—Board of Trade Holds Lease.

So far as New York is concerned, there will be no so-called "show question" after the forthcoming exhibitions are out of the way. Madison Square Garden will be demolished in February next, but long before the automobile shows of 1913 are ready for the boards there will be upreared a building that will be big enough to house all the automobile exhibits which may be offered and the much-desired one-week-one-show will become not merely a possibility, but an extreme probability.

For be it known the new Grand Central Palace, which has but recently been completed, will be about doubled in size. The New York Central Railroad Co., which owns the Palace, has completed practically all of the preliminary arrangements necessary for the erection of a twin building—so far as the exterior is concerned—which will be directly connected with the present magnificent structure. It will occupy the site fronting on Lexington avenue from 47th to 48th street, adjoining the present Palace, which runs from 46th to 47th street. Unlike the latter, however, the exhibition hall of the new building will be devoid of columns and posts. It will more closely resemble the interior of Madison Square Garden in that it will have a huge arena overlooked by two balconies, thus providing a setting for a public show which at present only Madison Square Garden provides. It will afford 160,000 square feet of floor space, which, with the room afforded by the present Palace, will be sufficient for almost any automobile or other exhibition not of a sweepingly general nature.

Like the present structure, it will contain a number of offices and permanent show rooms, and will be operated by the Manufacturers and Merchants Exchange.

Of more direct concern to the automobile industry is the fact that for the purposes of automobile displays the present Palace and the addition that will be erected are under lease for a period of five years to the Automobile Board of Trade, which will have power to assign its lease if it so desires; in fact, so quietly did the Board of Trade go about it that only recently it leaked out that the National Association of Automobile Manufacturers' show which will occupy Grand Central Palace during January next will do so only by grace and assignment of the Board of Trade. The plans for the addition to the Palace are so well in hand that it can be authoritatively stated that the new building will be completed and ready for occupancy early next fall.

During the past week or so the New York papers have printed pretty pictures of another projected "show building," styled the Broadway Gardens, which it was stated might be erected on Broadway between 47th and 48th street, but it is extremely doubtful if the building ever will reach beyond the pretty picture stage.

Monnot Gets the Edison for Europe.

John F. Monnot, of Paris, France, who recently completed arrangements to handle Detroit electric cars and trucks in Europe, has also consummated the contract that was pending for the representation of the Edison Storage Battery Co. on the "other side." His territory includes all of Europe except Germany and Austria, which already are being taken care of by the Deutsche Edison Akkumulatoren Gesellschaft. Monnot has his plans so well in hand that already he has leased commodious quarters in London and Paris, where he will carry large stocks of both the Detroit vehicles and the Edison batteries, it being his intention to pursue a really aggressive campaign to popularize the electric vehicle abroad, where, strange to say, it has found but limited favor. Monnot is not only an American by birth, but for some time has done good work in introducing another American production, the Klaxon horn, of which he is the European distributor.

DID LOZIER AGREE TO SELL CONTROL?

Prospective Buyer and Broker Charge that He Did So Agree; He Denies It—Court Will Decide.

Whether or not, during the year 1909, Harry A. Lozier agreed to sell the controlling interest in the Lozier Motor Co., whose principal factory at that time was at Plattsburgh, N. Y., to Fletcher R. Williams, a resident of Hamilton County, Ohio, probably will be decided next week by Judge Seabury, sitting in Part I of the New York Supreme Court. That Lozier agreed so to do and then failed to carry out the agreement is the basis of a suit which Williams has filed in the New York court, claiming that Lozier's failure to consummate the transaction subjected him to a loss of \$500,000.

In another suit pending in the same court Joseph L. Rhinock, who acted as a broker in the matter, and who brought Lozier and Williams together, asks for \$150,000 for the service he performed, which sum he failed to secure because of the termination of the negotiations, through no fault on his part.

The case first came before Judge McCall on October 18th last, when that justice granted Lozier's demand that Williams be required to file a bill of particulars on or before November 6th. On November 6th it was adjourned until the 8th, when it was again put over until Monday next, 13th inst., at which time the points at issue probably will come to trial.

The institution of the two suits was the first general information that the Loziers had at any time contemplated the reorganization of the Lozier Motor Co. and relinquishing its control. That such a step was contemplated, however, Harry A. Lozier himself admits. In his answer to Williams's complaint he acknowledges that he entered into negotiations with the Ohio man, but states that they never reached a point approaching consummation.

In his bill of complaint Williams alleges that in March, 1909, he entered into negotiations with Lozier for the purpose of acquiring a majority or all of the stock or shares of the Lozier Motor Co. and that an agreement was reached whereby the company was to have been reorganized with \$3,000,000 capital, divided into \$1,000,000 first preferred, \$1,000,000 second preferred and \$1,000,000 common stock. Plaintiff was to have been allotted 3,000 shares of the first preferred stock at par, paying therefor \$300,000 and receiving a bonus of 3,000 shares of the common stock, while Harry A. Lozier and Edward R. Lozier were to have taken 2,000 shares of the first preferred stock, paying therefor \$200,000 and receiving 3,000 shares in common stock as a bonus.

Williams states that negotiations proceeded to the point where he tendered \$75,000 in cash to bind the bargain, but that Lozier then refused to proceed further or to reorganize the company and to let Williams purchase any shares. Instead, the complaint charges that Harry A. Lozier sold a majority or all of the stock in the company to citizens of Plattsburgh, at an average price of \$20 per share. Because of these alleged vacillating tactics Williams considers himself damaged to the extent of \$500,000.

In a voluminous answer to this complaint Harry A. Lozier denies that any binding agreement was entered into between himself and Williams. He admits that the latter came to Plattsburgh and spent several days in careful examination of the factory; that a large amount of correspondence passed between them regarding the proposed reorganization, but that he (Lozier) had not kept copies of all these letters; that Williams offered many suggestions as to the financing of the company, and that he was given an accurate statement of the company's affairs dated July 31, 1909. He, however, flatly denies that negotiations had been concluded or that Williams suffered any loss.

When, in response to Williams's complaint, Lozier asked that the plaintiff be required to file a bill of particulars, he requested, among other things, that the Ohio man be required to state when and where the \$75,000 was tendered and in what form; when and where the various compensations, negotiations and agreements referred to in the complaint took place, and when and wherein the plaintiff suffered damage to the extent of \$500,000.

Berlin and Paris Shows to Alternate.

The European show situation has taken an unexpected turn, a joint meeting of representatives of the French and German automobile manufacturers held last month having agreed to hold but one large "international" show each year on the continent of Europe, the show to alternate between Paris and Berlin. The 1912 show will be held in Paris, under the auspices of the

Chambre Syndicate des Constructeurs d'Automobiles, aided by the Automobile Club de France. This arrangement, of course, does not prevent the smaller countries from holding shows of their own whenever they please, the only parties to this agreement being France and Germany, on whom the burden of exhibiting in other countries chiefly falls.

New Company Gets the Lavinge Gear.

The Lavinge Mfg. Co., Detroit, has transferred the Lavinge steering gear to a new corporation, the Lavinge Gear Co., which has been organized for the purpose with \$100,000 capital stock, and which will maintain offices in Detroit and Milwaukee. In addition to the Detroit plant, it is stated that a larger plant which will produce the steering gear exclusively will be operated at Corliss, Wis., which is a suburb of Milwaukee. This new plant is 480x55 feet and has modern equipment that will permit of an annual output of from 35,000 to 50,000 complete steering gears. Joseph P. Lavinge, the inventor of the gear, will remain with the company as its chief engineer.

Huge Traffic Merger Formed in London.

According to press despatches, the London General Omnibus Co., the largest user of motor buses in the world, on November 1 was absorbed by a syndicate composed of the companies operating the electric, steam and underground railways of the English capital. The new corporation will have an absolute monopoly of motor traffic in the Metropolitan district. The capital of the companies involved in the merger amounts to \$165,000,000. The London General company operated 1,418 horse-drawn buses, all of which since May, 1905, have been replaced by motor-driven double-deckers, the last horse having been retired from service only last month.

Durant "Shapes Up" Two Companies.

The Little Motor Car Co., of Flint, Mich., which is W. C. Durant's newest enterprise, last week completed its organization by the election of these officers: Charles M. Begole, president; W. H. Little, vice-president; W. S. Ballinger, secretary and treasurer. The Little company, which is capitalized at \$1,200,000, has taken over the plant of the Flint Wagon Works, as was stated in last week's Motor World. Durant's other project, the Chevrolet Motor Co., of Detroit, also was incorporated last week with \$100,000 capital stock. Louis Chevrolet, William H. Little and Edwin R. Campbell figure as its incorporators.

Coates-Goshen Owes More Than \$38,000.

Schedules filed by the Coates-Goshen Mfg. Co., of Goshen, N. Y., which was thrown into bankruptcy several weeks ago, show liabilities of \$38,781, and actual assets of \$7,628, consisting of stock, \$1,800; machinery and fixtures, \$2,750; factory real estate, \$2,500; accounts, \$438, and cash,

\$140. Among the creditors are the National Bank of Orange County, \$5,800, secured; J. S. Coates, \$3,012, and Miller Cart Co., \$16,260, all of Goshen.

Whitesides Reorganized in Newcastle.

Following its removal from Franklin, Ind., to Newcastle, Ind., the Whitesides Commercial Car Co. has been reorganized with O. C. Saffell, of New Castle, as president. The other officers are F. N. Whitesides, of Franklin, vice-president; L. C. Boyd, of New Castle, secretary, and W. W. Prigg, of New Castle, treasurer and general manager. The company will build two trucks, one of 1,500 and the other of 2,000 pounds capacity.

Show Promoters Invade the South.

The South evidently is due to experience a great wave of "auto shows" this winter, George B. Bowling, F. B. Weeks and G. W. Buchanan, of Memphis, Tenn., having organized the American Auto Show Co., with that end in view. They already are said to have contracted to promote and manage a show in Houston, Tex., November 12-16, which, however, will be held in the name of the local club.

To Sell Mora Property at Auction.

The property of the defunct Mora Co., at Newark, Wayne County, N. Y., will be sold at auction on Tuesday and Wednesday next, 14th and 15th insts. The real estate comprises about five acres of ground and the other property includes a complete factory equipment, including machinery, patterns and jigs, a lot of parts and material and 50 finished automobiles.

Carter Seeking a Site in Pittsburg.

The Carter Motor Car Co., of Washington, D. C., makers of the Washington car, are seeking to obtain a site in Pittsburg, Pa. They are negotiating with the Pittsburg Industrial Commission and have let it be known that in addition to their present plant they have in view the establishment of a factory to supply the trade in the Middle West.

Changes Name and Adds Four Millions.

The Bishop & Babcock Co., of Cleveland, has filed notice of change of name to the Bishop-Babcock-Becker Co., and, concurrently, has increased its capital stock from \$4,500,000 to \$8,500,000. The company is a big one and is identified with the automobile industry because of its air compressors and tire pumps of various kinds.

Fisk Building Branch in San Francisco.

The Fisk Rubber Co. has placed contracts for the erection of a new building which will house its San Francisco branch. The structure will be a two-story and basement reinforced concrete building, and will be erected on the Fisk property at Van Ness avenue and Austin street at a cost of \$15,000.

NO LET-UP IN GROWTH OF EXPORTS

Canada Still Heaviest Buyer—Oceania Gains 300 Per Cent.—Totals Reach \$14,000,000 for Nine Months.

Exports of American-made automobiles continue to average away above the million-dollar mark, the figures for the month of September, 1911, being \$1,336,822, as compared with \$744,696 during the same month of last year. Of this amount \$1,121,544 represents the value of 1,159 complete cars, while \$215,278 worth of parts were exported, as against 502 complete cars valued at \$607,258 and parts valued at \$137,438 in the same month of 1910.

Despite a falling off in seven of the twelve divisions, the totals for the month are fully \$400,000 greater than they were at the same time of last year. The great losses in Asia (\$60,252), Mexico (\$33,239), and France (\$24,498) were far more than made up by the gains in the United Kingdom (\$206,912), South America (\$125,687) and British Oceania (\$127,927). The United Kingdom was the heaviest buyer, its quota reaching \$302,941, while Canada only took \$253,585 worth. British Oceania, with a purchase of \$199,654 in a single month, took third place. South America increased its purchases by over 800 per cent.

The figures for the nine months ending September, 1911, establish a new high record, no less than \$13,988,293 worth of cars and parts having been sent abroad during this time. Of this sum \$11,565,034 was represented by 11,244 complete cars, as against 6,472 cars valued at \$8,874,066 in the same period of the preceding year. The most significant increase is evidenced in British Oceania, where \$334,222 during the nine months' period of 1910 expanded into \$1,353,398 in 1911, a gain of 300 per cent. Canada, however, still is by far the biggest buyer of American cars, its purchases amounting to \$4,493,287; Great Britain, the next largest customer, took \$2,170,264 worth. The exports of parts during the nine months attained a value of \$2,423,259 as compared with \$1,545,933 in the same period of 1910. The report in detail:

	September—		—Nine months ending September—		
	1910	1911	1909	1910	1911
Automobiles and parts of—					
Automobiles	\$607,258	\$1,121,544	\$5,481,707	\$8,874,066	\$11,565,034
Parts of (except tires)	137,438	215,278	618,150	1,545,933	2,423,259
Exported to—

Total	\$744,696	\$1,336,822	\$6,099,857	\$10,419,999	\$13,988,293

"Rubberless Tires" at \$35,000,000.

In Atlantic City, N. J., where the waves and other things roll high, there are those who see almost uncountable millions in a so-called rubberless tire which has been invented by John Ingram, who is described as a former associate of Glenn Curtis, the aviator, the so-called rubberless tire being nothing more or less than one more adaptation of the 13,000 spring tires which have occupied the attention of the United States patent office. Despite the fact that none of the other 13,000 have reached far beyond the patent archives, it is stated that the Ingram Rubberless Tire Co. is to be organized and incorporated under the laws of New Jersey with a modest capitalization of \$35,000,000, and that "the promoters of the new company are preparing to enlarge their plant in Atlantic City and also to erect a factory at Egg Harbor City on a tract of 200 acres." However, inquiries addressed to P. E. Lathrop, of Atlantic City, whose name is mentioned in connection with the project, remain unanswered.

Imports Again Fell off in September.

Imports of foreign-made automobiles, which seemed to hold some slightly renewed promise to importers during August last, again dropped heavily during the month of September, 1911. While 86 cars valued at \$179,269 reached this country in September, 1910, this number fell to 62 cars, valued at \$137,253 in the same month of the present year. Parts to the value of \$10,042 were imported, as compared with \$34,175 worth in September of last year. For the nine months ending September, 1911, the figures show 670 complete cars valued at \$1,450,222, as against 809 cars valued at \$1,623,140 in 1910.

Tire Exports Near Two-Million Mark.

Tire exports continue to grow in importance. During the month of September, 1911, there were sent abroad \$226,451 worth of automobile tires, as compared with \$133,735 in the same month of the preceding year. During the nine months ending September, 1911, \$1,941,733 worth were sent abroad, but no comparison with last year is available, as the government did not list tires separately previously to July, 1910.

UNCLE SAM'S ORDER LONG WAY OFF

Size of Order, if Any, Depends on Year's Test of Two Wagons—Bidding May Be Open.

It will be some time before Uncle Sam places the order for those 1,200 motor-driven army escort wagons—probably more than twelve months hence, if, indeed, the order ever is placed. While there is no reason to doubt that the White Co., of Cleveland, possessed information or intimation justifying its statement of last week that the government had in view the purchase of 1,200 wagons of the sort, government officials who should have intimate knowledge on the subject discreetly dodge the question when it is put to them. They admit that the purchase of a number of army field wagons, as they style them, is contemplated, but they will not commit themselves to the statement that the order, if placed, will be for 12 wagons, much less 1,200. In other words, they will not deal with figures.

It transpires that the army wagon which the White Co. has built and delivered is one of two which the government ordered for test purposes. The other was produced by the Alden Sampson Mfg. Co., of Detroit, and both were constructed according to each manufacturer's stock specifications, slightly modified to meet the requirements of army service as nearly as they could be estimated.

In purchasing these two vehicles the army officials have in view tests which will determine whether the motor-driven vehicle can be depended on to operate not merely on the road, but off the road, under all conditions of country which now are negotiated by mules and wagons. Of the two machines selected one is chain-driven and the other shaft-driven, one of the fixed ideas being to determine by actual tests under service conditions which method of transmission is best suited for army purposes. These tests probably will occupy at least a year, and if they prove satisfactory detailed specifications for a wagon best suited for the service will be drawn up by government officials.

When Captain A. E. Williams, who is attached to the Quartermaster-General's office, was asked whether in the event that the tests prove satisfactory manufacturers of wagons other than the two which have been purchased by the government will be permitted to bid for the army order that is expected to result, he replied that in all probability all reliable truck builders will be given an opportunity to submit bids when the official specifications finally are drafted.

As to whether other wagons will be permitted to participate in the tests which are about to be undertaken, Captain Williams

did not desire to commit himself. In his opinion no additional machines will be purchased for the tests, but if other manufacturers desired to submit wagons he thinks it not unlikely that they will be allowed to participate.

Changes Among Prominent Tradesmen.

B. E. Snyder, chief accountant for the H. H. Franklin Mfg. Co., of Syracuse, N. Y., has been made comptroller of the company. He succeeds I. W. Reid, resigned.

W. J. Hoskins has been appointed production manager for the Oakland Motor Car Co., of Pontiac, Mich. Previously he was with the Cadillac Motor Car Co., of Detroit.

Hal Reifenberg, manager of the Warner Instrument Co.'s Kansas City branch, has been transferred to the management of the company's branch in Detroit. He succeeds A. S. Koto, resigned.

W. L. Penny has been appointed a district manager for the Ohio Motor Car Co., with headquarters in Peoria, Ill. Previously Penny was in the automobile business in Richmond, Va., for several years.

G. L. Wanes has been appointed director of agencies for the Haynes Auto Sales Co., of San Francisco, which controls the Haynes and Krit cars on the Pacific coast. Previously he was advertising manager for the company.

John C. Graham has been appointed assistant traffic manager for the Buick Motor Co., of Flint, Mich. He is an old railroad man who latterly has been serving as assistant transportation manager for the Detroit Board of Commerce.

Thomas J. Heller, formerly sales manager for the Standard Roller Bearing Co., has been appointed Eastern representative of the Warner Gear Co., of Muncie, Ind. He will make his headquarters at Glenwood avenue and Second street, Philadelphia.

J. R. Hall, for five years manager of the Eastern service department of the Lozier Motor Co. in New York City, has been transferred to Detroit, where he will fill a corresponding position in the Lozier factory. Hall has been identified with the Lozier interests for more than 20 years.

F. A. Rhodes, who previously was in the automobile business on his own account in New York, has been appointed general factory representative of the Alpena Motor Car Co., of Alpena, Mich., for the eastern half of the country. He will cover all of the Eastern and most of the Southern States.

Don C. McCord, who recently was chosen general manager of the Flanders Mfg. Co., of Pontiac, Mich., has been elected a director of the company. Clarence H. Booth, production manager of the Studebaker Corporation's E-M-F factory, also has become a director of the Flanders com-

pany. They succeed C. L. Palms and C. F. Splittdorf.

Frank L. Sessions has been appointed superintendent of the Standard Welding Co., of Cleveland, O., and F. H. Meyers, assistant superintendent. Sessions is a graduate of the Worcester Polytechnic Institute, 1899, and a member of the American Society of Mechanical Engineers and the American Institute of Electrical Engineers, and has had ripe experience in complicated manufacturing problems. Meyers has been connected with the Standard Welding Co. for many years.

Big Taxicab Company Admits Bankruptcy.

The big Cab & Taxi Co. of New York, of 254 West 40th street, has withdrawn its answer to the petition in bankruptcy filed against it on March 23 and consented to an adjudication.

The schedules filed show liabilities of \$3,073,964, of which \$2,500,000 are income bonds, \$95,170 first mortgage bonds, \$223,323 secured and \$223,134 unsecured claims, \$24,825 estimated liability on claims for damages aggregating \$218,050 and wages \$7,511 to about 900 employees. Nominal assets are \$583,429, consisting of 1,028 carriages and taxicabs, \$263,290; 305 horses, \$48,907; supplies, harness and uniforms, \$67,787; tools and machinery, \$11,625; accounts, \$122,698; shares of stock of the Moulton Stable Co. and Club Automobile Co., \$64,001; cash, \$2,828; insurance, \$2,356; notes, \$1,937, and claim on a contract, \$5,000.

Among the creditors and bondholders are the American Locomotive Co., \$94,282; Thomas Motor Car Co., \$19,429; Sultan Motor Car Co., \$14,658; West Side Bank, \$29,452; Bryant Park Bank, \$11,845; Colonial Bank, \$8,096; New York Livery & Auto Co., \$1,416,600; William H. Leach, \$128,000; Mary A. Moulton, \$60,000; H. W. Whipple, \$56,600, and the Standard Oil Co., \$18,927.

Big Plant for Champion Spark Plug.

The Champion Spark Plug Co., of Toledo, O., of which Robert A. and Frank D. Stranahan are the owners, has purchased a 1½-acre site in that city, at Upton and Avondale avenues, and has commenced the erection of a new plant which will have an annual capacity of from 1,500,000 to 2,000,000 spark plugs, with a reserve capacity of double that amount. The new building will be a modern brick and concrete structure, 102x72 feet.

Philadelphia to Repeat Double Bill.

Philadelphia again will be one of the few cities which will support a two weeks' show, the Philadelphia Automobile Trade Association having decided to repeat its usual "double bill" in January next, from the 13th to 27th, inclusive. As was the case last year, the First Regiment armory, uptown, and the Third Regiment armory, downtown, will be used for the purpose. During the first week both buildings will house gaso-

lene pleasure cars and accessories. During the second week the First Regiment armory will be devoted to electric vehicles and appurtenances, while the Third Regiment armory will be given over to commercial vehicles of all kinds.

More Room for Underslung American.

The American Motors Co., of Indianapolis, Ind., which set the fashion in underslung cars, has taken possession of its new buildings at Meridian street and the Belt Railroad, in that city, which will considerably relieve the congestion which has prevailed in the old plant. The new structure is a handsome brick and stone building, three stories and basement, the main building being 60x160 feet, with one wing 40x60 and another 30x145 feet. The additions also include four other buildings, varying from 100x150 feet to 70x75 feet.

One Show Follows Kansas City Peace.

Due to the fact that the rival trade associations in Kansas City have buried the hatchet and become one organization, that city will escape its usual infliction of two shows, as but one show will be held there during 1912, under the auspices of the Motor Car Trades Association. It will occur during the week of February 12th and will occupy Convention Hall, which is one of the largest buildings for exhibition purposes in the West.

Hyatt Branch Secures Larger Quarters.

The Detroit branch of the Hyatt Roller Bearing Co. has been removed from the Ford building to Woodward and Alexandrine avenues, where it occupies the entire second floor of the new building recently erected at that address. These quarters will afford the Hyatt sales and engineering departments much more elbow room and other facilities than they previously enjoyed.

Mercer Opens Branch in Philadelphia.

Having discontinued its agency arrangements in Philadelphia, the Mercer Automobile Co. has established a branch in that city at 620 North Broad street. It will be in charge of W. A. Smith, who previously was in the publishing business in New York.

Fisk to Open Four More Branches.

The Fisk Rubber Co. is preparing to establish branches in Brooklyn, N. Y.; Pittsburg, Pa.; Cincinnati, O., and Butte, Mont. When these places are opened the Fisk company will be operating 34 direct factory branches.

Providence Sets Date for Its Show.

The Rhode Island Licensed Automobile Dealers Association, Inc., has selected the dates January 22-27 for its show in the State Armory in Providence. It will be managed by Arthur S. Lee, manager of the association.

David Elg has broken ground for a new garage and repair shop at Twin Harbor, Mich.

A. C. Porter & Son is the style of a new firm which has opened a garage in Marshall, Minn. It is located on Main street.

W. N. Peck has opened salesrooms and a garage at 176 North Ionia street, Grand Rapids, Mich. He will handle the Packard line.

R. A. Amerman has broken ground for a three-story brick garage on Linden street, Scranton, Pa. It will cost \$24,000 when complete.

At a cost of \$35,000 Wilson & Beckwith have erected a garage at Tampa, Fla. It is located at the corner of Tampa and Madison streets.

Easley, S. C., soon will have its first garage. H. C. Hagood and C. W. Garrett are building it, with the intention of dealing in Maxwell cars.

W. G. Moore has opened a garage and repair shop in Grand Rapids, Mich. It is located in one of the Itasca Mercantile Co.'s buildings.

The Michigan Motor Car Co. has been formed in Saginaw, Mich., with headquarters at 222 North Franklin street. It will handle the Michigan car.

The Lozier Sales Co. has been formed in Washington, D. C., to distribute Lozier cars in the District of Columbia. It has located at 1315 H. street, N. W.

The old Francis Theatre, at Benton Harbor, Mich., has been turned into a garage and salesroom by George J. Haid. He will sell Warren-Detroit and Michigan cars.

The Grand Rapids Auto Supply Co. has been formed in the Michigan city of that name, with headquarters at 137 South Division street. E. W. Simpson is the owner.

L. V. Hanson and E. A. Levy have formed the Colonial Sales Co. in New York City, with headquarters in the Colonial building. They will distribute G. J. G. cars.

The Kingman Plow Co., dealer in agricultural implements in St. Louis, Mo., has taken on automobiles. It will handle the McIntyre car in Illinois, Missouri and Arkansas.

M. C. Willetts, who for some time has been operating a garage in Albion, Mich., has sold his interests to Richards & Noble, who conduct the Albion Garage at the same place.

The Commercial Car Sales & Service Co. has "opened up" at 918 Michigan avenue, Chicago, Ill., where it will handle

Autocars. Carl Holdredge is manager of the concern.

The Mack Bros. Motor Car Co., manufacturer of commercial motor vehicles, has opened a branch at 292 Central avenue, Albany, N. Y. W. R. Mason is the district manager.

W. R. Kneiss and L. H. Bovee have formed a partnership and opened salesrooms at 346 Golden Gate avenue, San Francisco, Cal. They will handle the Kelsey Motorette.

The West End Garage Co. has opened up at the corner of Fifteenth and Gordon streets, Allentown, Pa. William E. Bohlinger and Raymond Brey are the men behind the project.

A. E. Eddy, founder of the Eddy Electric Co., Hartford, Conn., has opened a garage and salesroom in the former livery stables of the Hotel Windsor. He will sell the Cartecar line.

Slootmaker Bros. is the style of a new concern which has "opened up" in Grand Rapids, Mich. It is located at Madison avenue and Crawford street, where Hudson cars will be shown.

Work has commenced on the new garage at 3431 Ludlow street, Philadelphia, Pa., which will be occupied by E. B. Price. It will be three stories high, of brick construction and will cost \$11,000.

George Sweat and J. G. Minter have purchased the interest of Louis Derango in the Beaumont Motor Car Co., in the Texas city of that name. They will continue the business under the same name.

First steps have been taken to dissolve the Alco Motor Sales Co., of Minneapolis, Minn., on the petition of R. J. Powell and H. W. Volk, stockholders. The court appointed Louis Andersch receiver.

The Hub City Garage, of Aberdeen, S. D., in the future will be conducted by George R. Summers, the partnership between Summers and R. Wheeler having been dissolved by mutual agreement.

A petition in voluntary bankruptcy has been filed by the Richard A. Crooker Co., 24-26 Columbus avenue, Boston, Mass. The liabilities of the concern are given as \$7,702.05, while its assets are \$3,788.18.

O. A. Repass, formerly of Des Moines, Ia., has opened a salesroom in Waterloo, the same State, where he will sell Ford cars. He will operate as the Repass Automobile Co., and is located at 706 Jefferson street.

The Fisher Motor Car Co., of Cincinnati, O., has opened a salesroom and service department at 804 Sycamore street.

Simultaneously with opening the larger quarters the company has inaugurated a motor truck renting service.

The Maxwell Sales Agency has been formed in Oakland, Cal., to take care of the distribution of Maxwell and Columbia cars in that territory. Its headquarters are at the corner of Twelfth and Madison streets, with A. C. Hull as manager.

David J. Fox and William T. Fox, of Birmingham, Ala., have formed a partnership under the style Fox Bros. and secured the distributing agency for Matheson cars. They will cover the States of Alabama and Mississippi and the eastern part of Tennessee.

Frank Staley, who for several years was with the Hearsey Vehicle Co., of Indianapolis, has returned to the automobile business in that city and opened salesrooms at 513 North Capital avenue. He will handle the R. C. H. car, as well as one of the higher-priced makes, which he has not yet decided on.

Francis J. Barfield has filed a petition in involuntary bankruptcy against the Birmingham Auto Co., of Birmingham, Ala., and asked for the appointment of a receiver. There are damage suits aggregating \$60,000 pending against the company, which offered no objection to the bankruptcy proceedings.

K. W. Brewer has taken over the interest of his partner, E. L. Baker, in the firm of Baker & Brewer, of Indianapolis, Indiana agents for Baker electrics, and will continue the business himself. Baker has joined the Hupp Corporation, of Detroit, where he will have charge of the sales of Hupp-Yeats electrics.

Albert J. Ditman, who for eight years was connected with the Studebaker sales department in New York, has acquired an interest in the Whiting Motor Co., 1802 Broadway, New York, and henceforth will play an active part in its affairs. The company handles the Cunningham and Mercer cars and the Sandusky truck.

Recent Losses by Fire.

Fredonia, N. Y.—Fredonia garage, Day street, damaged and contents burned.

Independence, Ia.—H. J. Wilson's garage destroyed; all the cars saved. Loss on building, \$2,800.

Pittsburg, Pa.—Buhl Regal Repair Co.'s garage, 220 South St. Clair street, and two cars destroyed. Loss, \$6,500.

Detroit, Mich.—Phipps-Grinnell Automobile Co.'s plant at 16 Water street damaged. Loss heavy, estimated at over \$12,000.

This simple device
places your car among
the safe percentage.

Skidding is responsible for 90 per cent. of automobile accidents. See that you do not risk the lives of your passengers on the greasy roads and pavements this Fall and Winter. Equip your automobile with

Pennsylvania Vacuum Cup Tires

The principle is simple, like all big ideas. On a tread of regular thickness is moulded a series of cup-shaped rubber knobs which exert a vacuum hold on wet and greasy pavements. Slipping in any direction is im-

possible. The rolling of the wheel releases each cup automatically by raising one side first, so that forward speed is not retarded.

In snow and mud the knobs sink in and provide a better hold and better "traction" than any other form of non-skid.

Longer Service is a strong feature of Pennsylvania Vacuum Cup Tires. Even when the rubber knobs wear down, the tire is still as good for service as a smooth tread tire of regular thickness.

You combine the essential qualities of Safety and Economy by using these non-skid and long wearing tires.

Should Be Addressed to P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, NOVEMBER 9, 1911.

Why Not Mark the Firing Point?

Despite the accuracy which is obtainable with modern methods and machinery, it is a well-known fact that no two cars which are turned out from the same factory, of the same materials and supposedly under identical conditions are exactly alike. They differ slightly and require to be adjusted, for which purpose a corps of trained mechanics is retained.

In the road test each car is required to attain a certain maximum speed before being turned over to be finished. It is the duty of the tester to obtain this speed or to say why it is not possible. To him falls the work of ascertaining the best possible position for the spark and throttle control levers for maximum power and efficiency. When he has found that particular position and the car performs to his satisfaction it is returned to the finishing shops and the tester is the only one who knows that if the spark is advanced one-sixteenth of an inch

or retarded as much the efficiency of the motor is increased or decreased accordingly.

After all the careful testing that has been carried on to discover the proper position of the spark advance lever for the greatest efficiency—the point at which the motor will deliver the greatest power—the car is shipped to the distributing agent with an instruction book that says "the best position for the spark advance lever for ordinary running is about the center of the quadrant," if, indeed, the book says anything at all about the subject.

As a matter of fact, it may not be "about the center of the quadrant" for that particular car, though the purchaser has no way of finding that out—at least, he has not the certain way that is at the command of the manufacturer. There is just one spot on the quadrant over which the lever should be placed for the greatest efficiency, and there is just one man who knows that spot—the tester. Also there is just one simple way of insuring that the salesman, or the demonstrator, or the purchaser may know that spot—let it be marked before the car leaves the factory, or rather before the car leaves the tester's hands. Apparently it is a trifling matter, but it is one of the many "trifles" that count.

Economics of Motor Haulage.

There is no better proof of the overpowering triumph that lies in store for the commercial vehicle of the future than the circumstance that men of strong inductive faculty and trained intelligence are studying its present operation with an eye to increasing its serviceability. Motor truck mechanism still is subject to improvement; its evolution is certain to continue, and with marked advantage. But where would be the incentive to betterment did the user fail to appreciate its shortcomings as well as its advantages? From this time on more will depend on the discriminating application of power vehicles than on the further development of their properties. Marketing problems now demand equal consideration with those of manufacture.

Furthermore, the investigation of operating problems now reveals as fertile possibilities and as many unexpected discoveries, encouraging and otherwise, as did the pursuit of pure invention a few years ago. The whole field of economics as applied to motor haulage demands critical attention and seldom fails to yield logical, if un-

expected, results. The coal merchant who resolved the balance in favor of adopting a certain style of truck into a question of the helper's wages is of a type utterly different from the customer of old. The old-time automobile salesman—and perhaps the old-time automobile manufacturer, too—would be at a loss in knowing how to deal with him; he subjects his transportation costs to the same sort of scrutiny that his purchases, his market, his other routine operations received. He himself is a new problem for the industry to solve. Incidentally, the outcome of the investigation referred to, as related in another column, is both diverting and startling—startling because it emphasizes the absolute necessity of facing the labor problem anew at every step in the world's progress.

An equally instructive illustration of the profitable outcome of close truck cost analysis is the experience of another large user of automobiles who has found his best economy in certain work with a very low-priced form of gasoline delivery wagon. In the face of the common belief in the electric car for short hauls, particularly under traffic restrictions, this is a most radical conclusion. Yet the logic of deduction is unimpeachable. Close city traffic imposes the necessity of slow average speeds. In the mind of the average man slow averages are compatible only with slow maximum speeds. But the investigator in question has discovered that the light gasoline car which he employs has a considerable advantage over the otherwise satisfactory electric due to its superior powers of acceleration.

Under certain special conditions which govern a portion of his haulage—and which might apply in no other case—the small, light vehicle is enabled to make frequent bursts of relatively high speed which enable it to work at lower cost, even though required to make three trips to one of a competing type in order to transport the same bulk of material. True, this is destructive operation; the light vehicles probably will prove short lived, but the operator has taken that into account in reckoning the cost. Even with a shorter life he can see how the little car will save money over the larger one, and the fact that he is so convinced after much study proves that he is a wise user—one of the type that is destined to assist the motor truck movement more than all the arts of manufacture and sale.

Chicago, Ill.—Ajax-Grieb Rubber Co., under New Jersey laws, with \$1,000,000 capital; to deal in rubber goods.

Detroit, Mich.—Mechanics Motor Car Co., under Michigan laws, with \$10,000 capital; to deal in automobiles and motor vehicles.

Seattle, Wash.—Stearns Auto Co., under Washington laws, with \$7,500 capital; to deal in automobiles and motor vehicles. Corporators—A. C. Stevens, F. A. Mitchell.

Hagerstown, Md.—The Antietam Garage Co., under Maryland laws, with \$5,000 capital; to deal in automobiles and maintain a garage. Corporators—Dr. I. M. Wertz, Ira R. Smith, Ernest Shockey.

Buffalo, N. Y.—Frontier Tire & Rubber Co., under New York laws, with \$250,000 capital; to manufacture pneumatic tires and rubber goods. Corporators—G. B. North, H. M. Gill, F. D. L. Stowe.

Chicago, Ill.—Motor Service Corporation, under Illinois laws, with \$10,000 capital; to operate an automobile express and delivery service. Corporators—R. O. Ehmgig, F. R. Buri, Frank P. Page.

Augusta, Maine.—Lakeaero Co., under Maine laws, with \$1,000,000 capital; to engage in automobile, airship, motor boat and other enterprises. Corporators—E. J. Pike, L. J. Coleman, Charles L. Andrews.

New York City, N. Y.—International Motor Co., under Delaware laws, with \$10,000,000 capital; to manufacture motor vehicles. Corporators—R. A. Aldrich, G. Foster, J. A. Bennett, all of New York City.

Boston, Mass.—Vera Motor Car Co., under Massachusetts laws, with \$60,000 capital; to deal in automobiles and motor vehicles. Corporators—G. M. Polian, Wakefield, Mass.; M. A. Sweeney, Cambridge, Mass.

New York City, N. Y.—Auto Sectional Leather Tire Co., under New York laws, with \$50,000 capital; to manufacture vehicle tires, rubber and leather goods. Corporators—H. L. Biener, I. Scherer, M. Scherer.

Indianapolis, Ind.—Indiana Motorcar Co., under Indiana laws, with \$10,000 capital; to deal in automobiles and motor vehicles. Corporators—W. C. Teasdale, W. K. Bromley, G. C. Simons, C. U. Nankival, L. E. Wilson.

Newcastle, Ind.—Whitesides Commercial Car Co., under Indiana laws, with \$31,500 capital; to manufacture commercial vehicles. Corporators—O. C. Saffell, F. M. Whitesides, L. C. Boyd, W. G. Hillock, T. B. Millikin.

New York City, N. Y.—G. & S. Accessory Co., under New York laws, with \$100,000 capital; to manufacture and deal in motor vehicle supplies. Corporators—W. Fischman, L. E. Z. Aaronson, G. Tumpson, all of New York City.

Chestertown, Md.—Chestertown Automobile and Garage Co., under Delaware laws, with \$25,000 capital; to deal in automobiles and maintain a garage. Corporators—H. B. Simmons, A. P. Rasin, L. B. Russell, all of Chestertown.

Dayton, Ohio.—Dayton and Troy Automobile Co., under Ohio laws, with \$10,000 capital; to deal in and operate automobiles and motor vehicles. Corporators—C. E. Emerick, S. S. Faulkner, S. B. Faulkner, W. J. Sherer, D. B. Sherer.

Memphis, Tenn.—Stewart Automobile Co., under Tennessee laws, with \$8,000 capital; to deal in automobiles, motor vehicles and accessories. Corporators—R. G. Stewart, E. F. Perry, L. Le May, Mrs. E. Stewart, Miss Nellie Blankership.

Fremont, Ohio.—Northern Ohio Punctureless Tire Co., under Ohio laws, with \$3,000 capital; to manufacture and deal in automobile and other tires. Corporators—Frank E. Wieset, Louis Wieset, John J. Wieset, L. P. Wieset, C. W. Bowler.

Bloomfield, N. J.—Torbensen Gear & Axle Co., under New Jersey laws, with \$300,000 capital; to manufacture gears, axles and other automobile parts. Corporators—J. O. Eaton, H. O. Tube, Montclair, N. J.; V. V. Torbensen, Bloomfield, N. J.

Wilmington, Del.—The Coleman Dupont Road, Inc., under Delaware laws, with \$200,000 capital; to construct automobile roads. Corporators—J. C. Dupont, L. L. Dunham, P. E. Wilson, all of Wilmington, Del.; F. M. Williams, Goshen, N. Y.; S. H. Henry, Cambridge, Md.

Cincinnati, Ohio.—Spring Hub Automobile Wheel Co., under Ohio laws, with \$10,000 capital; to manufacture automobile wheels. Corporators—James G. Blackburn, John H. Kruse, Henry H. Weild, James E. Earle, Henry W. Plump, Robert Freisens, Edward M. Wollen.

Wilmington, Del.—The Eastman Motor Truck Co., under Delaware laws, with \$25,000 capital; to deal in and operate motor vehicles. Corporators—J. H. Schields, Minneapolis, Minn.; C. E. Semmes, Washington, D. C.; B. R. Kenworthy, Philadelphia, Pa.; H. G. Eastburn, Wilmington, Del.; L. J. Eastman, Philadelphia, Pa.

Terre Haute, Ind.—Terre Haute Automobile Association, under Indiana laws. No capital. Fraternal. Corporators—S. F. Lane, Charles Patton, H. H. Dronberger, M. A. Steele, F. F. Blankerbaker, J. F. Lynch, H. E. Bindley, J. G. Elder, C. B. Goroy, G. R. Daniels, J. R. Yung, E. R. Baldrige, Carl Bauermeister, T. O. Beggs, C. J. Root.

November 9-12, San Antonio, Texas—Racemeet under auspices San Antonio Automobile Club.

November 13, Harrisburg, Pa.—Economy tests under auspices Motor Club of Harrisburg.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

January 13-27, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show in First and Third Regiment Armories.

January 15-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden. Commercial vehicles only.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-27, Providence, R. I.—Rhode Island Licensed Automobile Dealers' Association's show in the State Armory.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show at Wayne Garden.

January 27-February 3, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in the Coliseum and 7th Regiment Armory. Pleasure vehicles only.

February 5-10, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

February 17-24, Newark, N. J.—New Jersey Automobile Exhibition Co.'s annual show in First Regiment Armory.

March 2-9, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics' Hall. Pleasure vehicles only.

CHICAGO RUN PROVED STRENUOUS

**Mud, Snow and Ice-Laden Winds Marked
Closing Days—Fifteen Survivors—
Awards Well Distributed.**

The 17 motorists who so bravely started from Chicago on the 27th ult. in the Chicago Motor Club's 1,400 miles reliability run did not have such an easy time after they left Columbus on Tuesday, 31st ult. Eleven of the 17 reached that Ohio city with perfect scores, as told in The Motor World last week, but in the subsequent three days' run all but nine of them suffered penalization, and on the technical

Chicago Motor Club's team trophy; Salisbury and E. T. Knudson, who drove a Staver-Chicago, tied for the club trophy in the touring car division; J. A. Wicke, also a Moline pilot, won the trophy in the run-about division, and by a curious coincidence H. E. Halbert (Grout), who rolled up the greatest penalty to be meted out—499 points in all—won the Standard Oil trophy for economy in the consumption of gasoline.

Halbert's Grout covered the 1,355.7 miles on just 77 gallons of fuel. His percentage, according to the Chicago Motor Club's formula, in which the weight of the car fully loaded is divided by the number of ounces of gasoline consumed (128 ounces to the gallon), was .406, and as this was

of mud, Jack Frost took a personal interest in the tour and added to the hardships of the motorists. Owing to rain on the previous day, the roads were in bad shape and in some places the mud was hub deep. It was between Columbus and Toledo that the worst going was experienced. Toledo was the noon control, and when members of the Toledo Automobile Club announced that the roads on the route originally laid out were practically impassable Referee Beecroft acted on the suggestion of local motorists and mapped out a detour by way of Ypsilanti. But even then conditions were little better, and the time schedule had to be cut from 18 and 20 miles an hour for the two divisions to 13½ and 15 miles, respectively.

SNOW AND FROZEN RUTS ENCOUNTERED IN MICHIGAN BY THE CONTENDERS

examination that followed seven more clean slates went by the board, leaving F. G. Salisbury (Moline) and E. T. Knudson (Staver-Chicago) as the sole survivors with unblemished records. Two of the contestants, A. M. Robbins (Abbott-Detroit) and Paul Strauss (National), withdrew their cars before the completion of the run.

To F. G. Salisbury and C. H. Vandervoort, who both drove Molines, goes the

the highest to be recorded he was adjudged the winner. Salisbury and his Moline required only one-half gallon more, but as the car was 250 pounds lighter than the Grout the percentage dropped accordingly to .378. E. T. Knudson (Staver-Chicago) was third with a consumption of 82 gallons and a percentage of .371.

On the run from Columbus, O., to Detroit, 211 miles through the slimiest kind

But one bright ray of sunshine pierced the deepening gloom. None of the cars not previously debited forfeited its perfect score. Two of the contestants, C. R. Winters (Oldsmobile) and Gus Monckmeier (Staver-Chicago) got into difficulties, however, that added two points and five points, respectively, to their losses. When Winter's Oldsmobile collided with a wagon on the previous day and lost a few of its

fenders the remaining ones were thought to have been firmly fastened, but they were not. As a result, the Oldsmobile was driven into control lacking another fender and consequently was penalized. Meanwhile Monckmeier had been having trouble with his transmission case. The car had been running finely through the deep sand and mud, but latterly showed signs of bearing trouble. It was deemed necessary to make

alike were benumbed by the intense cold. For a while the mud disappeared and instead the motorists bucked sand and more sand until some of the drivers managed to get warmed up wrenching their steering wheels from one side to the other and back again.

Outside of South Bend the procession caught up with the tail end of a snow-storm, and before long had reached its

Detroit was withdrawn near Niles, Mich. Halbert's Grout received 30 more points for lateness at control, and Winter's Oldsmobile had six more points added to its score for work done on the old offending fender.

The cars that were penalized on the technical examination, the reasons therefor and the penalties were as follows: 1-Moline, radiator support boss loose, 4; 3-Case, lost grease cup, 2, broken spring leaf, 5, loose tie rod yoke, 15, total 22; 5-Halladay, loose steering connection, 15, loose torsion rod end, 1, total 16; 6-Halladay, broken fender iron, 6, lost fender bolt, 2, total 8; 7-Oldsmobile, broken muffler, 5, broken fenders and running board, 11, lost fender and two broken bolts, 20, total 36; 9-Staver-Chicago, broken spring leaf, 35; 100-Moline, leaky radiator pipe, 4; 101-Moline, broken starting crank bracket, 50, radiator support boss loose, 4, total 54; 102-Oakland, broken spring and loose fender, 7; 103-Velie, broken spring leaves and loose fender, 17; 104-Velie, broken fender iron, loose operating brake service, two spring leaves broken, 53; 105-Bergdoll, lost grease cup, broken spring leaf, 7; 107-Grout, leaky gasoline connection, broken spring leaf, loose fender, 8.

Building an American Racer for Burman.

When Robert Burman returns from Germany with his 300-horsepower Benz it

THE STAVIER PILOTS, E. T. KNUDSON AND GUS MONCKMEIER

adjustments, and five points were charged for the privilege. Paul Strauss stayed out all night in his National and withdrew in the morning.

From Detroit to Grand Rapids, over the route traveled by the tourists, it is only 150 miles, the shortest day's run of them all. But the roads still were far from perfect and despite the short run several drivers were compelled to see additional figures marked down on their score cards. After what was considered to be a remarkable showing A. M. Robbin's Abbott-Detroit picked up a "jinx" and could not throw it off. Up to that time the car had retained a perfect score, but the "jinx" manifested itself just out of Detroit and a broken spring brought 45 black marks. Repairing the gasoline line cost 25 more and an additional 48 were charged for lateness at control. John Hansen, driver of No. 3 Case, in attempting to dodge a woman who walked in front of the machine, stalled his motor and saw four points debited as a result. H. E. Halbert's Grout had 53 points more added to its score when its clutch became deranged; 50 of them were for time lost and the other three for the actual work of adjustment.

Prognostications to the effect that the last day's run of 218 miles into Chicago by way of South Bend and Kalamazoo would be the worst of the lot were very nearly correct. South Bend was the noon control, but long before that interesting Indiana city was reached drivers and passengers

C. H. VANDERVOORT AND F. G. SALISBURY—VICTORIOUS MOLINE DRIVERS

middle and were bucking snow drifts instead of sand. After Kalamazoo had been passed the pilots had a real battle with the snow drifts to keep from skidding off the roads; at Dowagiac the snow was 18 inches deep.

But though the conditions were hard only three penalizations resulted, and in no case was a perfect score blemished. After a series of mishaps that culminated in a broken frame, A. M. Bobbins's Abbott-

transpires that he will not devote all of his time and skill to the exploitation of its lightning speed, for, according to advices from the Ohio Motor Car Co., of Cincinnati, that company has nearly completed an Ohio racer designed specially for Burman's use. It is of a special type and will permit the Ohio car to enter events above the 300 cubic inch class, and it is stated that Burman will put it to the speed test on the Daytona (Fla.) beach.

27 PERFECT IN NEWARK'S NON-STOP

Two Others, Penalized for Unusual Causes,
Enter Protests—Trucks Try to Follow
Touring Car Schedule.

Twenty-seven perfect scores and two protests marked the finish of the non-stop endurance contest promoted by the Newark (N. J.) Star and conducted by the Newark Motor Club on the 3d inst., and which included both pleasure cars and commercial vehicles. It was a one-day affair, the course following a circuitous route extending into northern New Jersey and including a steep climb over the winding road up Schooley's

kept "on the go" to preserve their perfect scores.

M. F. O'Neill, owner and driver of a Paterson car, was one of those who entered a protest after the completion of the run. O'Neill got within sight of the checking-out point eight minutes ahead of schedule and loafed in; it cost him eight points and his perfect score. He protested on the ground that he had not actually crossed the finish line ahead of time. The other protest originated with J. M. Gray, who piloted a Schacht. He claimed that someone other than himself or his passengers pulled out his battery plug while in front of the gasoline supply station at Hackettstown and caused his motor to stop. The stoppage of the motor resulted in a penalization

man Valley water-bar too forcibly and another in the mud at Devil's Hole. When he checked in he ventured the opinion that no motor truck could cover the course in the time prescribed, which, it may be added, no truck in practical service ever will be called on to do. All the truck drivers were non-contestants.

Of the 27 who finished with perfect scores nearly all were local tradesmen; very few private owners participated. Following is the list of contestants who finished without penalization: J. D. Nichol, Jackson; Clifford B. Wyckoff, Ford; Guy M. Reynolds, Pennsylvania; E. G. B. Riley, Correja; C. R. Schuyler, Haynes; George F. Eveland, Stevens-Duryea; Walter Davenport, Buick; Clarence E. Fisher, Cadillac; Ray Magruder,

WHERE THE GOING WAS GOOD AND THE SCENERY PICTURESQUE ON NEWARK'S NON-STOP RUN

mountain. Seven hours were allowed for the trip of 146 miles, and to obtain perfect scores the contestants were required to check in on time—not ahead of schedule nor behind it—and to keep their motors running the whole time except when at an arbitrary gasoline supply station at Hackettstown.

Mayor Jacob Haussling was the dignitary in charge of the start, and promptly at seven o'clock in the morning he gave the sign to George F. Eveland, who headed the procession and who was officially designated as the pathfinder. The other 37 cars, including four loaded trucks, followed at one-minute intervals. The roads were found to be in excellent condition except near Newton, where a bridge was being repaired and a detour had to be made. At this point a man was stationed who not only instructed the motorists as to the proper course, but handed out sandwiches and other refreshments, for no stop was scheduled for lunch and the cars had to be

which he hopes to have removed and his score card wiped clean.

Though the route as originally laid out covered 127 miles, W. J. McAvoy in the Packard pilot car found it necessary to increase this distance by 19 miles because of two bridges which were undergoing repairs, and the confetti was strewn accordingly. As a further guide to the following procession flagmen were stationed at sharp corners to prevent accidents and set stragglers on their way.

One of the non-contestants got into really serious difficulty. A Johnson three-ton truck loaded with 3,200 pounds of coal and driven by V. Richardson slid off the road just out of Petersburg, and it took the crew of four men close to five hours to extricate it. It covered the remainder of the course without further mishap, though it was late into control, of course. J. H. Robertson, who drove a Mais truck, was late, too. He lost two hours in repairing damages sustained when he struck a Ger-

American Tourist; J. J. Mayer, Auburn; R. B. Mann, Hudson; P. Haycock, Reo; F. L. Apgar, Lion; M. F. Apgar, Lion; J. W. Mason, Maxwell; L. F. Pfeiffer, E-M-F.; R. E. Gillan, Ford; M. H. Jolly, Flanders; H. C. De Rai-mes, National; John B. Wallace, Cole; Herman Peterson, Premier; Thomas Buckner, Oakland; F. J. Rodel, Correja; H. O. Carter, Washington; R. C. Clements, Lion; Casper J. Maier, Oakland; Louis J. Blanchard, Herreshoff.

The penalized contestants were as follows: Thomas McGuire, McFarland, 1; W. H. Samuel, Metz, 4; M. F. O'Neill, Paterson, 8; Frank L. Kramer, Cutting, 1; J. R. Mann, Auburn, 2; F. F. Briggs, Maxwell, 1; J. M. Gray, Schacht, 2. Those who started as non-contestants, including the four commercial vehicles, were as follows: C. L. Fitzgerald, Packard; Geo. D. Smith, Peerless; Walter H. Ellis, Pierce-Arrow; F. Marwin, Maxwell truck; V. Richardson, Johnson truck; C. Robinson, Mais truck; W. Wakefield, Commer truck.

HERRICK LEADS ACROSS THE DESERT

Californian Again Wins Strenuous and Spectacular Western Race—Tetzlaff and Others Wrecked on the Way.

Harvey Herrick, piloting the National which he drove to victory in the big road race at Santa Monica, Cal., October 14th, added to his fame by again winning the famous "desert race" on Monday last, 6th inst. He covered the heart-breaking course of 542 miles from Los Angeles to Phoenix, Ariz., in 20 hours and 22 minutes running time. Two hours later Ralph Hamlin, driving a Franklin, checked in at the fair grounds, having covered the course in 22 hours, 54 minutes and 53 seconds running time. Frank Siefert, at the wheel of a Midland, was third. His running time was 24 hours, 21 minutes and 24 seconds. W. E. Ferguson (Buick) was fourth, it having taken him 26 hours, 26 minutes and 35 seconds running time to make the trip.

The race was run under the auspices of the Maricopa Automobile Club, of Phoenix, the start from Los Angeles being made at 10.45 p. m. Saturday. There were 16 starters, who at five-minute intervals left in the following order: Clarence Smith (Maxwell), W. D. Tremaine (Pope-Hartford), William Bramlette (Cadillac), William La Casse (E-M-F), George Soules (Flanders), Harris Hanshue (Mercer), Johnny Jenkins (Cole), W. B. Brong (Case), Harvey Herrick (National), Louis Nikrent (Buick), Teddy Tetzlaff (Fiat), Frank Siefert (Midland), Charles Bigelow (Lexington), W. E. Ferguson (Buick).

The course, which is 100 miles longer than last year, when Herrick (then driving a Kissel car) first flashed into prominence, lay south from Los Angeles to San Diego and thence eastward through some of the worst roads that are to be found in northern Mexico. Through Steele Canyon near the border line the going was such that it was almost impossible for the cars to pass each other, and at Devil's Canyon, Copopah and from Andrade to Yuma there are few miles of good road. Where there are no rocks there is sand—desert sand—and often there are both rocks and sand, while human beings and human habitations are few and far between.

The cars suffered all kinds of trouble, and as the result of a collision with a telegraph pole after leaving San Diego, Teddy Tetzlaff and his mechanic are in a hospital at La Mesa. Neither was seriously injured, although their Fiat car was wrecked.

Clarence Smith (Maxwell) was not so fortunate. After being delayed an hour near El Centro repairing a broken spring, his car skidded and turned over at nearly the same place Tetzlaff met with the accident. Smith and his mechanic, Earl Francis, were thrown from the car and

badly injured, the latter sustaining two broken ribs. Both were taken to the La Mesa hospital. Harris Hanshue (Mercer), after a series of mishaps, also abandoned the race, and William Bramlette (Cadillac) was delayed several hours at Santa Ana on account of a broken gasoline line.

When George Purdy Bullard planned the route he determined to make it a severe test on both cars and drivers, although special provision was made for passage through Mexico, where passports and clearance papers were necessary. To facilitate checking William Wallace, at Mexicali, went on the bonds for the cars, and as each reached the station the name of the car and number was inserted. These papers the drivers turned in at Andrade. From there to the Colorado river the route was through sand hills, and at the river the cars were ferried across to Yuma, the control, Sunday night. Herrick was the first to reach Yuma, and therefore was the first to get away from there Monday morning at six o'clock, the others following in the order in which they arrived.

Rader Climbs Fastest at Minneapolis.

Facing a cold, raw wind in the presence of 500 spectators, W. C. Rader, at the wheel of a National, captured two prizes and otherwise covered himself with glory Thursday last, 2d inst., at Columbia Heights Park, Minneapolis, Minn. The occasion was the twice postponed and much dampened hill climb under the auspices of the Minneapolis Motor Club. The hill is 1,308 feet long, with an average grade of 6.63 per cent. Much trouble was experienced with the timing apparatus, and as a result stop-watches were used. According to these Rader hung up a record for the hill of 20.04 seconds and won the trophy in his class. He also took the free-for-all, negotiating the hill in 20.20 seconds. John McDowell (Ford) won the trophy in the 161-230 inches displacement class by topping the hill in 21.73 seconds, and in the division for large cars the prize went to Abe Prescott (Peerless), who made the ascent in 27.20.

Much Mixed Sport at Sioux Falls.

Sioux Falls, which, needless to say, is in South Dakota, has had its first taste of automobile racing, but before another meeting is held some course other than a dirt track which is used to exercise thoroughbred horses will have to be provided. The meet was held Saturday, 4th inst., on Clark Coats' private track, and but three events were decided: During the first one Art Berry, driving an E. M. F., skidded on the turn and was crashed into by G. M. Gilbert (Chalmers). Both cars were wrecked, and although the drivers were thrown out neither was injured. The race was declared off. A match race for Velie cars between Knapp Brown and Roger Dennis, at five miles, was won by Brown in 7 minutes and 39¼ seconds.

McNAY THE STAR AT COLUMBIA MEET

Only One Event Escapes Him—Lundgren Leads Small Car Racers—Jagersberger Spills and Crushes a Leg.

Jay McNay, driving a Case, was almost the "whole thing" at the two days' race-meet which marked the close of the South Carolina State Fair, at Columbia, Friday and Saturday, 3d and 4th inst., taking five of the six events he entered. Joe Jagersberger, who probably would have given him a run for the money, was disabled during a practice test prior to the first race on the opening day. While driving a new Case, Jagersberger threw a tire while going better than 60 miles an hour. The car turned over and he was buried beneath. His right leg was crushed below the knee and he was otherwise injured. The Automobile Club of Columbia, under whose auspices the races were held, rushed Jagersberger to the Knowlton Infirmary, where it is thought that the leg may have to be amputated. The summary:

Friday, November 3d.

One mile time trials—Won by Jay McNay (Case), time 0:56.40; second, B. McFadden (Maxwell), time 1:11.20; third, Francis Lundgren (Flanders), time 1:14.50; fourth, Odom (E-M-F), time 1:16.20; fifth, Cohen (E-M-F), time 1:20.

Five miles, Class C, under 230 inches displacement—Won by Francis Lundgren (Flanders); second, Odom (E-M-F). Time, 6:21.50.

Ten miles, Class C, 231-300 inches displacement—Won by Jay McNay (Case); second, B. McFadden (Maxwell). Time, 11:09.80.

Twenty-five miles, free-for-all—Won by Jay McNay (Case); second, Clarence Rawls (Jackson); third, Francis Lundgren (Flanders). Time, 25:32.

Saturday, November 4th.

Five miles time trial—Jay McNay (Case). Time, 4:46.60.

Fifteen miles, Class E, under 230 inches displacement—Won by Francis Lundgren (Flanders); second, B. McFadden (Maxwell); third, Odom (E-M-F). Time, 19:20. Lundgren disqualified.

Ten miles, Class C, 231-300 inches displacement—Won by Jay McNay (Case); second, J. F. Maxwell (Case). Time, 12:03.

Twenty-five miles, free-for-all—Won by Jay McNay (Case); second, J. F. Maxwell (Case); third, Francis Lundgren (Flanders). Time, 26:36.

Five miles, free-for-all handicap—Won by Odom (E-M-F), 105 seconds; second, Jay McNay (Case), scratch; third, J. F. Maxwell (Case), 35 seconds; fourth, Francis Lundgren (Flanders), 75 seconds. Time, 5:05.

SMALL CARS RULE AT BERLIN SHOW

**"Baby" Sizes and Fours Predominate—
Development of "Stream Line" Bodies
—A Center Steered Limousine.**

Although the exhibit of automobiles at Berlin, which held the attention of the German public during the ten days October 12-22, was styled an "international show" it was less deserving of the title than any of

exhibited three models. Four hundred German accessory makers elbowed the scant dozen "foreigners" in this department into the corners. As an international show, therefore, the exhibit was a disappointment, but as an indication of the present stand of the automobile industry in Germany and the popularity of the small car it was a revelation. The 1911 Berlin show was pre-eminently a "small car show."

Germany for years has been the land of the small car. But even people familiar

made by Brunau, Weidmann & Co., of Zurich, Switzerland, which follows the Knight idea, but in all other respects the improvements of a mechanical nature were mere matters of detailed refinement. Valves in nearly all cases are enclosed, the general tendency, amounting almost to a slogan, being "noiseless, but not valveless," and in several of the latest examples of enclosed valve motors the noise is eliminated to an extent which would have been considered unattainable a few years ago.

In body construction, too, there was little of a revolutionary nature. The "stream

THE DELMENHORSTER "CAR OF THE FUTURE"

DELMENHORSTER REAR ELEVATION

the previous shows held in the German capital. As a matter of fact, the show was distinctly and predominately a national exhibit—the product of German manufacturers completely smothering the combined

with the prevailing tendency for low horsepowers hardly were prepared for the veritable "babies" shown during the recent exhibit. Chief among these was the six-cylinder Loreley, exhibited by Rudolf Ley, Maschinenfabrik - Aktiengesellschaft, Arnstadt-Thuringen. This, the smallest six-cylinder stock car in the world, develops only six horsepower according to the official German rating, or 20 horsepower at

line" body is gaining ground and the general tendency is toward longer wheelbase, larger tires, wider and flatter spring suspension, and toward bodies with rear-end compartments for tools and spare tires.

The chief novelty in the line of bodywork was a so-called "car of the future," which was exhibited by the Delmenhorster Body Factory, and which is shown by the accompanying illustration. This is an ex-

"JBE" EMERGENCY WHEEL

THE WINDHOFF LIMOUSINE WITH CENTER STEERING WHEEL

products of the English, French, Italian, Austrian, American and Swiss makers.

Forty-three German manufacturers showed 165 complete cars and 28 chassis, while the international contingent consisted of seven French, two American, one Italian, one Swiss, one English and two Austrian manufacturers. The United States' representatives were the Mitchell-Lewis Motor Co. and the Ford Motor Co., each of which

the brake. No less than 30 other small cars, ranging from five to 10 horsepower, all of four-cylinder construction, are shown. Practically all of the small motors, even those of six-cylinder construction, are cast en bloc.

Mechanically there was very little that can be called radical in either motor or transmission construction. True, there was one new sleeve-valve system, the Fischer,

treme example of the "stream line" effect, the footboards having been entirely eliminated and the step enclosed within the body, thus obtaining a perfectly smooth exterior and yet permitting of exceedingly generous storing space for handbags, spare tubes, baskets and similar requisites for long-distance touring. The air resistance which this car meets is said to be almost one-fourth less than that of the ordinary

torpedo model, while the difficulties of swirling air currents alongside and in the rear of the car are claimed to be completely overcome by this style of construction.

Among the standard limousines and laudaulets crowding the various spaces there was one which at first glance did not appear to be much different from the rest, and yet which probably showed the most revolutionary step yet taken in the arrangement of the steering column and the location of the driver's seat. In this limousine the manufacturer, Gebrueder Windhoff, Rheine i. W., has placed the chauffeur's seat and the steering wheel and column fairly and squarely in the center. The body of the car tapers gradually toward the hood, leaving a seat of single width in front of which the steering column is mounted. It is claimed that this arrangement renders steering and supervision of the road easier, while at the same time tending to balance the load more correctly and to give the passengers a more open view ahead.

In the line of accessories a number of novelties were shown, chief of which was the "JBE" emergency wheel, shown by the accompanying illustration, which is designed to be secured to the hub in the event of the breakage of the regular wheel. Signs familiar to the American motorist met the eye on every side, as Bosch, Klaxon, Mea, Jones, Michelin, Continental, F. & S., U. & H., Eiseman, Oildag and Gredag were among the names emblazoned.

As usual with industrial exhibitions in Germany, a lottery was run in connection with the show, the management having purchased 35 of the cars on view, ranging from a seven-passenger limousine listed at \$6,000 to a runabout, and put them up as prizes.

Making High Powered Cars Prohibitive.

The Austrian parliament at present has under consideration a new automobile law, which boosts the prices for licenses two and three-fold, especially in the case of high powered cars owned by foreign tourists.

According to the new regulations, which are said to be certain of adoption, automobiles of less than six horsepower will have to pay \$17; from 6 to 10 horsepower, \$20; from 11 to 25 horsepower, \$40; from 26 to 35 horsepower, \$75; from 36 to 45 horsepower, \$120; from 46 to 50 horsepower, \$210; from 51 to 60 horsepower, \$240; from 61 to 70 horsepower, \$270. Foreign tourists, who only intend to remain a few days—up to ten days, inclusively—must pay one-tenth of the annual fee; if they desire to stay two months, one-fourth; three months, one-half; four months, full fee.

How high these fees are is clearly shown when compared with the registration fees current in Germany. Here the amounts range from \$7 to \$80, while the tourists pay \$0.75 for one day's stay; \$2 for two to five days; \$3.75 for 6 to 15 days; \$6.25 for 16 to 25 days; \$10 for 31 to 60 days, and \$12.50 for 61 to 90 days.

RECKONING THE INDUSTRY'S FUTURE

Willys Points Out Statistics on Which Big Manufacturers Pin Faith—Large Possibilities Yet Untouched.

While it is easy to account for the figures which stock jobbers and company promoters call to their aid and with which they seek to bedazzle a credulous public, there are those who often have expressed amazement at the courage displayed by large and well-established automobile manufacturers in constantly adding to their already enormous investments in brick and mortar and machinery. They are prone to wonder upon what these manufacturers base their reckonings and estimates of the future of the automobile business. The answer is not always easy, but it never was better given than by John N. Willys, president of the Willys-Overland Co., of Toledo, O., in his address at the banquet tendered him last week by the business men of his old home town, Elmira, N. Y. Discussing the future of the automobile industry, Willys said:

"I once heard the story of a man who went hopelessly insane through frantic speculation as to what becomes of all the pins. He would argue by the hour that there were millions of pins made every day—that nobody wasted them—that nobody eats them. What becomes of them all?

"A question of much more importance—and seemingly as hard for a lot of people to solve now—is 'What becomes of all the automobiles?' Why, bless you, the manufacturer sells them to the dealer and the dealer sells them to the banker, the lawyer, the doctor, the merchant, the farmer, the butcher, the baker and the candlestick maker.

"Nineteen hundred and twelve will be the banner year in the automobile industry. Never were the cars so good—never so low in price or the output so big.

"Big quantity production, complete standardization of parts, thorough design, the best workmanship and materials enable the automobile manufacturers of America to eclipse the world in furnishing the best for the least money, which, after all, is the meat of the cocoanut in a nutshell.

"The bromides may be heard on every hand mouthing that old one, in effect, that there are thousands of people running automobiles who cannot afford them. I have made a little personal investigation along this line and I have the figures to prove that there is nothing in that 'old chestnut.'

"There are now registered in the United States 405,000 automobiles. There are approximately 50,000 in the States where no registration is required. We boast of a total population of ninety million people, thus up to date only one in every 200 owns an automobile.

"Take, for a good example, the city of

Toledo. We have a population of about 200,000 people. There are 2,200 automobiles—of all kinds—owned there. I happen to know, personally, a great many of the people who own these automobiles, and I have taken pains to investigate a great many of the others, and I can say, without hesitation, that all of them, at least with a very small percentage of exceptions, can well afford to own an automobile, or two of them if they feel like it. An examination of the tax duplicates will show that there are in the city of Toledo probably 15,000 who can afford to buy an automobile.

"Now, it is a fact that any man who has an income of even \$1,800 or \$2,000 a year can afford to own a small automobile; and as a matter of fact will find a small automobile not a luxury but an economical convenience. I have had an opportunity to make some comparisons and I know for a fact that a man can operate one of the small cars at a cost for repairs, up-keep, tires, gasoline and oil—all not to exceed \$25 a month; providing, of course, he drives the car and handles it as it should be handled.

"Statistics show the country now has a population of approximately ninety million people; to quote official statistics, by families, there are in the United States 18,890,000; 1,786,000 families have an income of between \$1,200 and \$1,800 a year; 1,446,000 families have an income of \$1,800 to \$3,000 per year; 704,000 families have an income of from \$3,000 to \$6,000 per year; 220,000 families have an income of from \$6,000 to \$15,000 per year; 43,000 families have an income of from \$15,000 to \$60,000 a year; 7,000 families have an income exceeding \$60,000—thus there are 4,208,000 families, at least, who can afford to own some kind of an automobile—price from \$1,000 up. There are now in use in the country—as before stated—but 455,000 cars; thus there still remain 3,753,000 families who can afford to own automobiles and who probably will when the factories get time to make enough to go around.

"There are on the farms of America 891,000 families who have incomes of from \$900 to \$1,200 per year; 286,000 who have incomes of from \$1,200 to \$1,800 per year; 172,000 families who have incomes of from \$3,000 to \$6,000 per year; thus there are 1,349,000 families on the farms who can and should own automobiles.

"Last year (1910) 25,000 automobiles were sold to the farmers of America. There are now, approximately, 50,000 cars on the farms, so that this leaves us 1,299,000 families in the rural districts still to be supplied with automobiles.

The above figures show, of course, the outlet for automobiles by families only and does not take into account the unmarried of our population, the cars exported nor commercial cars. And the export of automobiles has increased from less than \$1,000,000 in 1901 to almost \$20,000,000 in 1911."

SELDEN CARS ON SINGLE CHASSIS

But Five Styles of Body Afford Plenty of Variety—Rear Axle and Other Points of Improvement.

In exploiting a single chassis which, in addition to incorporating many of the sterling features that marked the three chassis which last year made up the line, also embodies a number of new ones, the Selden

drums is prevented in a novel and efficacious manner. Sleeves in the wheel hubs lead any oil which may work out along the drive shafts into annular recesses in the brake flanges, from where it is drained out on to the road. The brakes themselves remain practically unchanged, both sets being of the internal expanding type on the rear wheels with bands $1\frac{3}{4}$ inches in width and 14 inches in diameter.

Having produced a motor which has proven perfectly satisfactory for a number

high-tension magneto connected to one set of plugs and an independent battery system operating through separate plugs. A four-unit coil with master vibrator is used, and the timer, which is mounted on a vertical shaft between the cylinders, is of the roller type. Current for the independent system is supplied by a battery of six dry cells carried in a box on the running board.

The cone clutch which has served in the past has been replaced by one of the multiple disk variety in which there are 13 disks.

THE SELDEN LIMOUSINE WHICH LISTS AT \$3,750, AND THE \$2,600 TOURING CAR

Motor Vehicle Corporation, Rochester, N. Y., still has left little to be desired by the intending purchaser in the matter of variety of body styles. For the ensuing year the Selden line permits a choice of four open bodies and a limousine, all of which are mounted on the one chassis.

One of the more notable changes which have been made in the chassis concerns the rear axle. As heretofore, it is of the full floating type, but is of a new and improved design calculated to increase simplicity and to make more accessible the differential

of seasons, alterations have been deemed unnecessary and it remains unchanged except in minor details, of which the housing of the valve mechanism with an aluminum cover plate is the most noticeable. The four cylinders are cast in pairs and measure $4\frac{3}{4}$ inches bore by 5 inches stroke. All the valves are arranged on one side of the motor and are interchangeable; their diameter is $2\frac{1}{4}$ inches. Particular emphasis is laid on the fact that six gears in the motor comprise the total. All of them are of the spiral type, a detail of construction

It is enclosed in a housing bolted to the flywheel and is arranged to run dry, the driving disks being faced with an asbestos material riveted in place and the driven disks being plain. Providing an easy method of adjustment without the necessity of removing the housing or dismantling the clutch mechanism in any way, the studs on which the spiral clutch springs are mounted extend through the housing. To increase the "sweetness" of action of the clutch, a clutch brake is fitted.

The three-speed selectively operated

THE NEW SELDEN MULTIPLE DISK CLUTCH AND REAR AXLE CONSTRUCTION

mechanism, the bearings and the axle shafts. Differing from usual practice in full floating axle construction, the axle shafts carry driving flanges through which the hub bolts pass. Thus the possibility of lost motion at these points is eliminated while at the same time the hub caps are relieved of one of their duties in holding the shafts in place. A liberal sized cover plate in the axle housing permits of easy adjustment of the differential or the removal of the whole mechanism intact.

Indicative of the attention which has been given small and more or less obscure details, the leakage of oil into the brake

which contributes materially to the silent operation of the power plant. Circulation of the cooling water is effected by means of a centrifugal pump and lubrication is made certain and positive by a combination splash and constant level system in which a gear-driven paddle pump serves to maintain a constant level in the oil wells under the connecting rod big ends. An easily discernible gauge is provided to indicate the oil level in the reservoir in the crankcase.

The ignition system remains the same as has been used with considerable success for the past four years and embraces a Bosch

change gear set has been retained practically without change; high speed is direct drive. All of the shafts are carried on Timken conical roller bearings and one of the noteworthy features of the construction is that adjustment for wear may be made from the outside without disassembling any part of the system. As heretofore, motor, clutch and change gear mechanism are carried on a sub-frame.

Very little change in body styles has been made; in general the lines remain practically the same, except that the open bodies have acquired even smoother and more pleasing exteriors. The price of the

model 40-T five-passenger touring car (now styled Model 47) has been advanced to \$2,500, which price includes as standard equipment such items as top complete with side curtains and dust envelope, windshield, Prest-O-Lite tank, combination oil and electric side and tail lamps, horn, foot rail, robe rail, tire irons and a complete set of tools. The same equipment is included with all the open bodies, and all bodies are equipped with front doors.

Other than the five-passenger touring car there is a seven-passenger touring car which lists at \$2,600, a four-passenger torpedo model and a two-passenger roadster with rumble seat, both listing at \$2,500, and the limousine at \$3,750 which makes its first appearance this season. The limousine

HAS NOT HURT RAILWAY EARNINGS

Popular Notion That Automobile Has Reduced Railway Travel Disproved by Statistics—"Travel Makes Travel."

Periodically the automobile is held responsible for about every crime on the calendar and almost every business disturbance that ever has found its way into print. Among the many things, it often has been charged with eating into the earnings of the railway companies' passenger departments, and on the face of things no charge appeared more easily believable. But the Railway Age-Gazette has brought

tween the two is deepened by the fact that during the last decade there have been some special and familiar forces operating adversely to passenger traffic. During that period the long-distance telephone has come in more and more as a commercial and industrial coefficient. It has reduced what but for it would obviously have been a large volume of railway travel. Is it to be added the automobile, likewise affecting a wealthy group of habitual travelers; and finally there has been the extension of competing street railways, using the term to include cross-country and long-distance lines.

The long-distance telephone has had hardly a perceptible qualifying feature. Now and then it may enable Brown to

RIGHT AND LEFT SIDES OF SELDEN MOTOR, SHOWING VALVE ENCLOSURE

body is of aluminum and accommodates five passengers in the rear compartment. Standard equipment includes curtains, extra swing seats, foot and robe rails, dome light, umbrella holder and toilet case. Inside, the body is finished luxuriously in broadcloth or whipcord in colors which harmonize with the outside paintwork.

The wheelbase of all models is the same—125 inches—and all are fitted with 36x4-inch tires mounted on Firestone quick detachable and demountable rims; the road clearance is 10 inches. Springs of the three-quarter elliptic variety are used in the rear as heretofore, and the front of the cars is supported on semi-elliptic springs.

New South Wales Has 3,500 Automobiles.

According to the report of Consul-General John P. Bray, at Sydney, N. S. W., there are 3,500 cars in use in that colony alone, no less than 2,000 of which have been purchased during the past eight months—January to August, 1911. The number of licensed drivers far exceeds this number, there being fully 4,500 registered in the State.

to bear statistics which serve to put even that popular notion to rout. The figures indicate that despite the free and increased and enormously increasing use of automobiles for both long distance and short distance travel, the railways' passenger traffic greatly has increased; their losses have occurred in the freight business.

The records of railroad traffic show in passenger miles a mile an increase since 1901 of 54 per cent., as compared with 43 per cent. in freight ton miles a mile; and even during the panic period, 1907-8, they increased about 5 per cent., while freight business decreased nearly 8 per cent., says the Railway Age-Gazette in dealing with the subject. Hard times in business admittedly hit the freight business first, particularly that branch of it that covers factory products; passenger traffic is affected later and often only after a considerable interval. Yet on the theory that business travel should go with business itself, one would think that the upward and downward curves of freight and passenger traffic should correspond pretty closely.

The seeming anomaly of a disparity be-

notify Smith to make a railway journey, but in the vast majority of cases it is a preventive. Not so, however, with the parallel street railway. At first an active and serious rival of the steam line, it has now, apparently, taking the country as a whole, become, in its secondary stage, a feeder. A small rival still between near together stations of the steam line, it has grown more and more to be a feeder from farther points. Its rivalry has been sunk in its character as a subsidiary, saying nothing of the larger values of the electric line as a direct lateral and its facilities for focusing travel at the urban station.

The automobile has the same duplex character of feeder and rival. It competes with the steam line at many points and often on long distances, but it also brings the home, the shop and the store in closer touch with the station. The rural home of wealth, formerly remote, is now hardly, by figure of speech, by automobile, across the street from the steam railway. The maxim that "travel makes travel" may prove as true in the relations of the automobile to railroads as in the case of the trolley.

BIG BROTHER OF BERGDOLL "30"

Employs Real Long Stroke Motor But Bears Family Resemblance—Has Self-Starter and Four-Speed Gear.

Having acquired a reputation with its 30-horsepower car, the Louis J. Bergdoll Motor Co., Philadelphia, Pa., has enlarged its line by adding a 40-horsepower chassis that is a fit compeer to the older model. The manufacture of the "30," which was brought out last year, will be continued, but with a number of mechanical changes and refinements that bid fair to make its reputation for general merit even more enviable.

In bringing out the new model it has been the aim of the manufacturers to fill the demand of that part of its clientele

have multiple disk clutches in which the alternate disks are faced with Raybestos.

Ignition on both cars is effected by means of a Bosch "easy starting" magneto; no batteries are used. The Atwater-Kent system, which was a feature of the "30" last season, has been discarded, though provision is made for it on both cars and it will be supplied if desired by the purchaser. It is not regular equipment, however. Lubrication is carried on in both engines in the same way, a constant oil level in wells beneath the connecting rod big ends being maintained by a plunger pump. A sight-feed glass on the dash serves to indicate that the system is in operation.

A full floating type of rear axle is used on both cars, the axle on the smaller model having undergone several minor changes making for greater simplicity and accessibility. Also both sets of brakes on both models are located on the rear wheels. The

BERGDOLL "40" WHICH MOUNTS A LONG STROKE MOTOR

which desires a car of greater power, but in which the principal features of the smaller model are retained. To this end the "40" is practically a reproduction of the "30," except as regards the motor and change gear mechanism. Like its predecessor, the new motor has its four cylinders cast in a single block with the exhaust valves at one side and the intake valves overhead. The stroke, however, is six inches as against 4½ inches in the smaller model, and inasmuch as the bore is four inches, the motor properly belongs in the long-stroke class. The bore of the "30" also is four inches. The Ever-Ready self-starter, which is a spring device that attaches in place of the starting crank, is supplied only on the larger model.

In adopting for the new car a four-speed selectively operated change gear set in which the third speed is direct drive and the fourth is an overstep, the manufacturers have placed themselves in the field occupied by but a very few other manufacturers of medium-priced cars who feature this construction. Usually it is found only on the higher-priced cars, and its presence on the Bergdoll speaks well for the initiative of the car's producers. The three-speed selective gear set on the "300" has been retained, and both this car and the new one

construction of the "30" in this respect differs from last last season's models in that heretofore only the emergency brakes have been on the rear wheels, the service brake being on the propeller shaft. The wheelbase of both cars is the same—125 inches. Thirty-four by 3½ inch tires all around are supplied on the "30" and those on the larger model are 36x4 both front and rear. Quick detachable-demountable rims are standard equipment.

Two open bodies and four closed bodies are regularly supplied on the 40-horsepower chassis as follows: Four-passenger torpedo, seven-passenger closed front touring, seven-passenger limousine, coupe, Colonial coupe and landaulet. The prices with either of the open bodies is \$1,900 and the limousine lists at \$3,000. Standard equipment includes mohair Cape Cart top, folding glass windshield, tire irons, tools and horn. Practically the same equipment is included in the price of the three body styles in which the 30-horsepower car is marketed. The "Louis J," which is a speedy-looking roadster with closed-in driving compartment, lists at \$1,500, which price also applies to the small tonneau car and to the standard closed-front touring car.

BUILDING UP ELECTRIC BUSINESS

Some of the Things That Must Be Considered—Scope of the "Transportation Engineer"—Schools Desirable.

It is beyond question that no more thorough and comprehensive methods of increasing the use and broadening the application of motor vehicles ever have been employed than those which are now being brought to bear on the distribution of electric vehicles. Just how this movement is being carried out through the co-operation of electric vehicle manufacturers and the central station people, whose interests are centered in the spread of electric vehicle transportation, is expressed briefly in the gist of a paper read before the recent meeting of the Electric Vehicle Association of America, and of which R. L. Lloyd and John Meyer were the authors. The keynote of the movement is the function of the none-to-well-known "transportation engineer," but the suggestion of a school for electric chauffeurs is the most striking thought that is evolved.

"The term 'transportation engineer,'" say the authors of the paper in question, "has been recently coined to apply to the technical manager of that branch which would take cognizance of all those demands of a business relating to the delivery of goods. The decision to discard the present transportation system and to install an electric vehicle system is based upon the same fundamental facts that decide the substitution of electric motors for other forms of power. However, in cases where the number of vehicles used or the character of the business does not justify the employment of a transportation engineer, then the central station salesman should act in this capacity in the interest of the prospective purchaser. The present stable practice must be studied, the facilities for loading at the store, the routing, the capacity carried, and in addition thereto, the disadvantages of the present system compared with the advantages of the proposed system. It is now pretty generally acknowledged that the department should retain the services of what is negatively termed a 'trouble man,' to respond to any call for trouble, diagnose the case, and either correct the deficiency or else give positive information as to the nature of the trouble.

"When automobiles became so numerous a few years ago, schools were started where men were educated to become chauffeurs. It seems to us that it would be proper that such schools should be started for electric vehicles. There certainly will come a day when the central stations will rebel against furnishing all the brains and labor necessary to take care of electric vehicles. While the industry is in its in-

fancy, they are, of course, willing and anxious to do some things for the promotion of the cause which they could not be reasonably expected to keep up indefinitely.

"One of the first requisites for the building of an electric vehicle business in any city is the establishment of properly equipped garages. Garages improperly or poorly equipped, or in charge of inefficient or careless attendants, act as a decided setback to progress. It is naturally difficult to get anyone to open such an establishment before there is a demand for it. The expense of maintaining an independent garage is considerable, and inasmuch as the growth of the use of electric vehicles is very problematical when the campaign is first inaugurated, the capital may be tied up for a term of years. In several of our cities the central station has made the investment in a large, well-equipped garage,

GREAT WESTERN'S DETACHABILITY

It's in the Front Door But the Idea is Ingeniously Carried Out—Some Other Notable Features.

With the laudable intention of increasing the comfort of passengers, while at the same time enhancing the pleasing appearance of its product in general, the Great Western Automobile Co., Peru, Ind., has placed on the market a new touring body in which a little more than the usual amount of attention has been paid to details, the body being regularly supplied on the standard 40 horsepower Great Western chassis, to the manufacture of which the company devotes its entire attention.

The principal feature of the new design

Obviating the necessity for disturbing the occupants of the rear seats, the compartment beneath these seats may be reached through a door at the back of the body. The door swings on piano hinges and is provided with a lock and key to keep out prying hands.

The outside of the body has been kept clear of projections, door hinges being concealed and the control levers placed inside close to the driver's right hand. Particular attention has been given the necessity for ample leg room. The paintwork is in holly green with door panels in cream striped with black; the body mouldings and dash are of black walnut. To further carry out the idea of conservative coloring, the lamp equipment is finished in black enamel and embraces Solar electric headlights operated from a 120-ampere hour Elba storage battery and oil side and tail lamps.

GREAT WESTERN "40," SHOWING NEW BODY AND THE CLEANLY DETACHABLE FRONT DOOR

and after a few years it has become a paying investment.

"If one could judge from the attitude the automobile dealer generally assumes when discussing matters with the central station man, we would all be led to believe that a low rate for electricity is the one object that stands in the way of the immediate universal adoption of electric vehicles.

"However, do not misunderstand this paper to be a plea for high rates for electricity. Its object is to assure the vehicle man that the central station is seeking to do the very thing they are asking for, viz., the establishment of lower rates, but at the same time to request them to not become impatient with the apparent tardiness—to try and see the problem through other eyes and to give credit for already making some progress where credit is due."

New Jersey Stage Line Expanding.

The Passaic Valley Transportation Co., which has been operating an automobile stage line between New Providence and Summit, N. J., has increased its capital stock to \$2,000. The capital stock is nominal, as the company already had acquired ground for a garage and will add a new motor bus to its equipment.

is the construction of the front doors, which are arranged so that they may be easily and quickly detached. Of course, detachable doors no longer are novel, but whereas the term usually signifies exactly what it means, that the doors along may be removed, detachable in the Great Western sense means quite a little bit more. For not only may the doors be taken off, but when they are removed, door-jamb, posts, mouldings and all come away with them, leaving an open front touring car that suggests not a whit the closed front car from which it was converted. Just how the transformation may be made is illustrated in the accompanying pictures, which show the car with the front doors in place, and one of the doors removed, together with its posts and moulding.

In presenting the new body, the manufacturers have been at considerable pains to make of it a sort of body de luxe throughout, and just as careful attention has been given other details of construction. Thus the leather work is hand buffed and is fitted over curled hair and springs. Arm straps are fitted for the convenience of tonneau passengers and a compartment between the front seats is provided for the reception of route books or memoranda.

The price of the new car is \$1,750, such items of equipment as a mohair top and side curtains to match, rubber dust hood, brass bound folding windshield and model 26 Stewart speedometer being furnished ready fitted to the car at an extra cost of \$100.

"Coupes" to Be Made Smokable.

The Miller-McKee Cigar Co., of Indianapolis, has been incorporated in Indiana for the purpose of distributing a brand of cigars to be known as the Cole cigar, which will be manufactured by the Santa Clara Cigar Mfg. Co., of Brunswick, Ga., of which L. Carter, president of the Henderson Motor Sales Co., also is president. Associated with C. D. F. Miller, president of the distributing company, as directors in the cigar venture, are J. J. Cole, of the Cole Motor Car Co., H. P. and C. P. Henderson of the Henderson Motor Sales Co., and Homer McKee. The company will turn out a high grade Havana cigar in seven styles, each of which will take the designation of a particular model of Cole car, which means that a man with 10 cents soon will be able to smoke a "Cole Coupe" or London limousine even if he cannot afford to ride in one.

Fans as Factors; Methods of Mounting and Driving

Though automobiles have been brought to a state of perfection that is well-nigh unassailable, one of the curious inconsistencies is that with the advent of cold weather almost nine cars out of the proverbial ten blossom out with various contrivances placed in front of their radiators to reduce the amount of cold air that is drawn in by the fan. Of course, the reason for such screens is perfectly plain—without them the cooling apparatus maintains the

For the remedy there are just two alternatives—either a series of variable speed pulleys must be provided or the fan blades must be so mounted that their pitch may be changed to suit the altering temperature conditions. The first method scarcely is possible for the reason that too much space would be required for a number of pulleys if the ordinary type of flat belt were used. A round belt might be used and a series of pulleys then could be made to occupy a

been understood and maintained in proper adjustment.

In view of the tendency toward simplicity and the efforts to make everything possible "adjustmentless," it is not unlikely that the necessity for occasional adjustment of the blades of such fans has deterred more manufacturers from adopting them. Naturally a motor cannot be expected to operate efficiently too hot any more than it can too cold, and for this reason the average

FIGS. 1, 2 AND 3—REPRESENTATIVE TYPES OF BELT DRIVEN FANS—STODDARD-DAYTON, VELIE AND RUTENBER

motor at a temperature too low for efficiency. To allow the motor to retain some of its heat and therefore operate to deliver its rated power on the proper number of pints of gasoline per hour, it is necessary to shut off part of the draft of cool air that is drawn through the radiator.

There is no doubt but that the screens really perform their work. That is not the question. Rather the question is, Why should not the fan itself govern the amount of air that is drawn in, instead of uselessly "flapping the wind" behind a screen and wasting power. For it most assuredly does require power—a greater amount than generally is supposed—to drive a heavy fan at from twice to three times crankshaft speed, which is close to the rate at which the average fan runs.

very small space. There is an objection to round belts, however, in that it is difficult to devise a method of joining the ends of the belt so that they will not come apart at inopportune moments. Add to which, round belts are not as durable as flat ones and wear or pulleys centers have to be adjusted for stretch more often than is the case when flat belts are used.

From which it becomes apparent that the only practicable way out of the difficulty is to provide means whereby the fan-blade pitch may be increased during hot weather when the maximum draft is required and decreased in winter when very little cold air is needed. As a matter of fact, fans of this variety have appeared on several cars of foreign manufacture and have proven successful wherever they have

manufacturer prefers to endeavor to strike a happy medium rather than to go to the expense of equipping his product with more complicated parts and at the same time risk his reputation at the hands of novices who know little or nothing concerning the proper temperature at which a motor operates most efficiently.

Also it is an open question whether the ordinary four- or six-bladed fan really is necessary. To obtain the greatest thrust, or, in other words, to displace the greatest volume of air at a given number of revolutions per minute, aeroplane propellers, which operate on exactly the same principle, though the application is slightly different, have only two blades. The percentage of efficiency of an aeroplane propeller is higher than is that of an automobile

fan, it is true, but only because the design of the aeroplane propeller has been more carefully and painstakingly worked out. If the same amount of thought and attention was given the fan in an automobile it is reasonably certain that very much greater efficiency and quietness could be expected at the least.

A two-bladed fan can be made that will perform the work of any of the four- or six-bladed ones that are used at present and should appeal to manufacturers if for no other reason than that it could be produced more cheaply than the other forms. Incidentally, it would allow of a more accessible engine which is a valuable feature in itself.

In some cars no fan is used, the spokes of the flywheel being formed like propeller blades so that they act as an exhaust fan to suck the air from the engine compart-

FIG. 4—AMERICAN BEL DRIVE

ment, cold air rushing in through the radiator to take the place of the hot air which is expelled. This system, of course, can be used only where the engine hood is tight and a long underpan is used. Opinions differ as to whether as high a degree of efficiency can be obtained by this method as can be obtained when a fan proper is used, though there are any number of cars in service in which this system is used that bear mute testimony to its efficiency. The majority of manufacturers continue to use fans, however, and each one has his own particular method of mounting and driving them.

Because of the speed at which fans normally run they always should be mounted in ball or roller bearings, and provision should be made for constant lubrication. Generally ball bearings are used and are packed in grease, which need not be replenished except at long intervals. When fans are so mounted they seldom give trouble, but if they are mounted in plain bearings and no provision for constant

lubrication is made, wear is rapid owing to the abrasive action of the dirt and dust that is drawn in through the radiator and they soon rattle and become a nuisance. If not taken in time there is grave danger that the bearings may become so worn as to let the fan sag sufficiently to touch and damage the radiator.

Assuming that the normal speed of an engine is 1,000 revolutions a minute, which is not too high, then a fan must run approximately twice this speed. At 2,000 revolutions a minute, the centrifugal force

FIG. 5—MAXWELL CONSTRUCTION

generated in a fan is considerable and it must be so designed as to resist it and not fly apart under such conditions or when the motor is speeded up still more. Several cases have been known where fans have shed a blade or blades because they were not strongly enough made, but such occurrences are the least of the troubles that manifest themselves.

Perhaps the most common trouble is the breaking of belts. As light as fans are as a general rule, the sudden way in which they are started when the motor commences to fire places a tremendous strain on the belt until the fan has been accelerated to normal speed. Once it has reached normal speed, the strain is continuous and even and the chance of breakage is remote unless the motor is alternately slowed down and accelerated suddenly. For this reason, nearly all fans have their belts so adjusted that when the motor is started the belt slips slightly until the fan gets up to speed. This is a point which should not be overlooked when it becomes necessary to tighten a belt. It should not be made so tight that there is no slippage. If it is there is danger that the belt will break when least expected, in addition to which an unnecessary strain will be placed on the bearings and the fan supports.

With the present types of large flat belts very little stretching takes place and

they seldom require to be adjusted except at long intervals. Nevertheless, some method of easily and quickly lengthening pulley centers should be provided to obviate the necessity for removing the belt and shortening it. Usually provision for adjustment is made, though some manufacturers have overlooked this necessary feature.

But even in some cases where elaborate provision for adjustment has been made, it apparently has not entered the manufacturer's mind that belts do not last forever and require to be replaced at stated times. There are several cars on the market at present in which the replacement of a fan belt is an extremely laborious and dirty undertaking, owing to the location of the driving pulley. In one car it is impossible to replace the fan belt without splicing it to the old belt and drawing it over the

FIG. 4—AMERICAN BELT DRIVE

driving pulley in that way. If the old belt has come away from the driving pulley, nothing remains except to "fish" with a curved wire or to remove the radiator, the latter method usually requiring less time and expenditure of effort. Such construction is not as uncommon as might be thought, either, though it seldom is noticed until it becomes necessary to put on a new belt. The redeeming feature is that belts generally last a season at the least, and a new one can be put on easily when the motor is taken down for the annual overhaul.

At present the belt remains the favorite method of driving fans, though it would be hard to find any two manufacturers who employ the same system of "hook up." Generally a flat belt is used, the driving pulley being attached directly to the end of the crankshaft outside the crankcase, on the extension to which the starting handle is attached. This method is used on the Stoddard-Dayton-Knight engine, shown in Fig. 1, and also on the Velie engine, illus-

trated in Fig. 2, and the Rutenber engine in Fig. 3.

Stoddard-Dayton construction embraces the use of an aluminum fan in which the blades are cast integral with the hub and pulley. The fan is supported by a bracket which is bolted to the crankcase, provision for adjustment of the belt being made by arranging the pulley center so that it can be moved eccentrically within an outer ring formed with the bracket. This method of adjustment is shown more clearly in Fig. 2, and though the general arrangement is different, the principle is the same.

The outer ring encloses an inner member on which the pulley center is mounted near one edge. When the belt is placed in position it is laced to the proper tension when the pulley center is at the lowest point. Therefore, when the belt becomes worn or stretched it is a simple matter to loosen the inner member and move the pulley center eccentrically until the belt again is at the proper tension. In the Velie fan (Fig. 2) the hub and pulley are cast integral of aluminum and the fan blades afterward are riveted in place.

Rutenber construction in the method of mounting the fan for belt adjustment is very similar. The bracket, itself, however, is entirely different and is formed of an extension of the housing which encloses the vertical shaft from which the magneto is driven by means of skew gearing. The belt is not shown, though the two pulleys over which it runs are visible.

Though the majority of manufacturers prefer to place the belt in front of the fan and run it over a driving pulley attached to the crankshaft, there is a considerable number who place the belt behind the fan, the driving pulley being actuated by the shaft which operates either the magneto or the circulation pump or both, somewhat after the manner shown in Fig. 4, which is illustrative of American practice. With this arrangement it is a comparatively simple matter to replace the belt, in addition to which there is no danger of the fan sagging and rubbing against the belt, which occasionally happens when the fan and belt are placed closer together. The fan itself also is slightly different and is of a design which is used to a considerable extent. By the use of a strengthening ring soldered or riveted in place, the blades can be made very much lighter, and it is practically impossible for them to come loose, due to the action of centrifugal force.

The Maxwell fan, which is illustrated in Fig. 5, is mounted not on the engine itself but on the water outlet pipe leading to the radiator. The method used to permit the belt to be tightened is unique and is clearly discernible in the picture. The bracket which supports the fan is attached at its center and is in effect a lever which is held in place by means of adjustable screws at each end. When it is desired to tighten the belt it is merely necessary to tighten one screw and loosen the other, which

causes the whole bracket to rock and increase or decrease the distance between pulley centers. As the belt used is a round one and the pulleys are comparatively large in cross section it is not necessary that they be perfectly parallel, which makes possible the use of this simple system. Obviously this arrangement could not be used with a flat belt for the reason that immediately the adjustment was changed the pulley faces would lose their parallelism.

By eliminating the belt and still retaining the fan, a number of manufacturers have attempted to further simplify their products. Lozier practice, illustrated in Fig. 6, embraces the use of a vertical shaft, driven from the timing gear train, enclosed in a housing which also serves as a support for the fan. As already has been pointed

FIG. 7--WINTON GEAR DRIVING

out, it is necessary that when the motor is started there be some slippage between the driving and driven members of the fan in order to prevent breakage of the fan belt, or in this case, fracture of the shaft or injury to the gears by which the fan is driven. This has been done in Lozier construction by interposing a miniature friction clutch between the driving and driven members. The clutch is automatic in action and is so adjusted that when an unusual strain is placed on the bevel gears that drive the fan, it slips, but when the fan has attained to normal speed and the drive is steady, no slippage occurs.

Fig. 7 shows the method used in driving the Winton fan in detail. As may be seen, the fan is driven directly from the timing gear train by means of an additional pair of spiral gears. The clutch mechanism, by means of which a certain amount of slippage is allowed for, is plainly visible, and operates much after the manner of the ordinary multiple disk clutch, except that there are but two disks or plates. One of the plates is attached to the driving gear

and the other is formed integral with the fan. They are held in contact by the spider-like spring, which in turn is held at any desired tension by the castellated nut and cotter pin. Adjustment is quite simple and merely requires that the nut which holds the spring be tightened or loosened, as the case may be.

As varied as are the methods of mounting and driving cooling fans, there still is room for considerable improvement, and not the least of it may well be in the shape and number of the blades and their pitch. With the advent of the silent types of engines, redesigning of the cooling fan becomes more than ever a necessity, for the reason that there are remarkably few fans in use today that are really silent in operation. Of course, it is to be expected that a fan rotating at 1,500 to 2,000 revolutions a minute shall emit a certain amount of noise, but the amount of noise that the average fan really does produce is out of all proportion to the work done.

It is to obtaining the proper pitch of the blades that the greatest amount of attention should be paid. Once this factor is established it will be found that the number of blades can be reduced, which in turn will reduce the production cost and the noise. The shape of the blades also should undergo change if efficiency and silence of operation are to be gained. Incidentally, the outer band which serves to assist in holding the blades of some fans in place might well be omitted, for it serves merely as a baffle plate and causes the blades to churn the air rather than to throw it out clearly and quickly.

"Extras" Cause Taxicab Strike in London.

Temporarily London is practically without taxicabs. On Thursday last, 2d inst., a general strike of taxicab drivers was declared and 6,000 of the 7,000 regularly employed chauffeurs quit work; they have refused to return until ordered to do so by their union. The deduction by a taxicab owner of six cents from the wages of one of his drivers is said to be the direct cause of the walk-out, though trouble has been brewing for some time regarding the disposition of "extras" charged for carrying extra passengers and luggage. The men claim that such "extras" are perquisites and have refused to turn them in to their employers, who state that without them their margin of profit is so low that they cannot do business. Recently "spotters" were employed and the first driver who was detected in receiving an "extra" and not turning it in to his employers was suspended. Following his suspension the other drivers walked out in sympathy. Due to the efficiency of the underground railways and bus lines, the shortage of taxicabs has caused little discomfort and public sentiment is said to be almost unanimously against the striking drivers because of the reckless way in which the cabs have been handled in the past.

THE "CONQUERING HEROES" RETURN

**Home-coming of Victorious Maxwell Team
Made Memorable—Gold Coin, Watches
and Medals Dispensed.**

Although corporations are supposed to have no souls and though the United States Motor Co. quite naturally made the most of the victory of the Maxwell cars in the Glidden tour, that big corporation did not forget the men who made the victory possible. When the men returned to New York from Jacksonville they were met at the pier by a

driver a chamois bag containing \$100 in gold, which was separate and apart from the cash prizes they won in the tour.

Watches were given to Harry E. Walls, of Philadelphia; E. G. Gager, of Pittsburg, and Thomas Costello, of New York, the drivers of the Maxwell team, and to M. C. Reeves, the contest manager of the company, who had the team in charge, while to the mechanics on the cars and to the company's representatives who were on the tour were awarded gold medal watch charms properly engraved. The latter included Elery Wright, O. Riley, D. O. Fair, Warren Merman, Walter Stone, W. McK. White, Berry Rockwell and M. H. Newton.

baud (Marion); time 1:23.50; fifth, Mulhall (Abbott-Detroit), time 1:26.20.

Five miles, Class C—Won by Mulhall (Abbott-Detroit); second, Thebaud (Marion). Time, 7:40.

Ten miles, free-for-all—Won by F. Monroe (Mercer); second, Costello (Maxwell); third, Thebaud (Marion). Time, 13:10.50.

\$50,000 Purse for Indianapolis Race.

Apparently the 500 miles International Sweepstakes on the Indianapolis Speedway is to be an annual affair after all. Following a mail vote by manufacturers throughout the country, which was discussed at the last directors' meeting of the Speed-

UNITED STATES MOTOR CO.'S GATHERING TO WELCOME THE VICTORIOUS MAXWELL TEAM

brass band and an escort of Maxwell forces and, seated in state in touring cars, they were paraded from the pier to the United States Motor Co.'s headquarters at 61st street and Broadway, where they received the first fruits of their victory in the form of gold stop-watches and gold coin.

Upon reaching headquarters the drivers and all those involved in the success of the tour were taken to the executive offices, which include a two-story amphitheater on the top of the big United States Motor Co. building, and in which the entire office force turned out to welcome the "conquering heroes."

Benjamin Briscoe, president of the company, made the presentation address, giving each driver of the Glidden tour team, and also to the driver of Governor Hoke Smith's perfect-score car that won the Anderson trophy, a gold Tiffany stop-watch on behalf of the company; and, in addition, as a personal recognition, giving to each

The company also has sent a special gold medal souvenir to Miss Birdie Marks, who was the only woman driver on the tour, and who finished with a perfect score in her Columbia car.

Unsanctioned Meet at White Plains.

Despite the fact that sanction had been refused because of the perils of half-mile tracks, the meet on the White Plains (N. Y.) course was run off on Election Day, 7th inst., and did not lack men who cared naught for their necks or for the suspension that will be meted out. The sport was passably interesting. The summary:

Ten miles, Class C—Won by Thomas Costello (Maxwell); second, P. G. Thebaud, Jr. (Marion); third, Carlisle Mulhall (Abbott-Detroit). Time, 13:50.40.

One mile speed trials for track record—Won by Belzhover (Mercer), time 1:19; second, Munroe (Mercer), time 1:21; third, Costello (Maxwell), time 1:22; fourth, The-

way management, it has been decided to hold the second 500-miles race under very nearly the same conditions as was the first, on May 30th next. When Ray Harroun won the race with his Marmon last Decoration Day the purse was \$25,000, the richest ever competed for up to that time; but for the next race it is to be double that amount. The purse will be divided into twelve prizes, as follows: First, \$20,000; second, \$10,000; third, \$5,000; fourth, \$3,000; fifth, \$2,500; sixth, \$2,000; seventh, \$1,500; eighth, \$1,400; ninth, \$1,300; tenth, \$1,200; eleventh, \$1,100; twelfth, \$1,000. For the 1911 race there were only 10 prizes. The 1912 race will be a class E event open to cars of under 600 cubic inches piston displacement and of a minimum weight of 2,000 pounds; as was the case for the first race, they must be capable of at least 75 miles an hour to be eligible. The better to safeguard contestants, the field of starters has been limited to 30.

NOVEL BUS FOR CHICAGO COMPANY

Has Two Doors and Will Be Managed by One Man—Electric Heaters and Fans for Passengers' Comfort.

Chicago, reveling in the patronage of its first motor bus line, likewise has the distinction of testing the first of a new type of vehicle. For public service purposes under the peculiar operating conditions which govern in large American cities this type is thought to be superior to all others, particularly to those which have been developed in accordance with the regulations of foreign cities. The new Chicago bus system, as was disclosed some weeks ago, is being inaugurated by the Chicago Motor Transportation Co., a concern which is

are in mode of propulsion. The seats are richly upholstered in grain leather, the interiors are lighted by electricity and electric fans are provided for ventilation in summer. For winter use a heating system has been installed in which both the jacket water from the engine and exhaust gas are employed. The bodies have been built by H. McFarlane & Co., of Chicago, and are fitted on the regular White one and one-half ton chassis.

The initial equipment of four buses, which is to be increased by 12 more which already have been ordered, is being operated between the Chicago and Northwestern passenger station, at Madison and State street, and the State street retail district. The running time for one round trip is 35 minutes and the fare 10 cents per passenger, as against 50 cents charged by the operators of the old busses. The four vehicles in use are able to transport with

FINE POINTS OF WHEEL BINDING

Schwartz Discloses Some Little Known Considerations—Wherein Automobile and Carriage Wheels Differ.

It is a curious fact that while other points of automobile construction have enjoyed thorough study and discussion at the hands of manufacturers and motorists alike, the wheels for the most part have been neglected. Bad wheels, as a rule, have been distinguished from good wheels only when they broke down, while opportunities to improve wheel manufacture have been oddly neglected, save by the restricted and often secretive cult of the wheel-makers themselves. It is significant, however, that of late the subject of motor-car wheels has

THE CHICAGO MOTOR TRANSPORTATION CO.'S FLEET OF WHITE PUBLIC SERVICE BUSES

heavily reinforced financially, and which is under control of experienced interests which long have been familiar with Chicago traffic through participation in the affairs of the Parmelee Transfer Co.

In developing a new type of bus body for use in the congested loop district of the Windy City two essential requirements have been kept in mind. First, the need of rendering the vehicle thoroughly accessible from the curb, and second, the economy of rendering it operable with one man. In order to give free entrance and egress two doors are used, one in the rear and one on the right side. The latter is placed well forward, however, whereby it is made to serve as the sole entrance to the vehicle, and hence to serve the purposes of the pay-as-you-enter plan. The cars, which are illustrated in the accompanying picture, will accommodate 18 passengers in addition to the driver, and cover the same route as the old two-horse buses which have been in operation since the early '70's.

In interior arrangement they are as far in advance of the old equipment as they

more comfort and greater despatch the traffic formerly handled by eight horsed buses and five "carryettes," and with the expected increase in equipment, enabling better headway to be made, it is anticipated that the earnings of the new enterprise will increase proportionately.

Hoosier Dealers Seek to Curb Evils.

In its efforts to mitigate the evils of the local trade—which, however, are by no means confined to Indiana—the Indianapolis Automobile Trade Association last week legislated against at least two of them. It passed resolutions decreeing that hereafter before being acceded to all requests for the free use of cars for charitable purposes or for the use of "distinguished visitors," etc., first must be sanctioned by the association, and that all applications for money contributions and for advertisements in programs or other indiscriminate publications not connected with the automobile business be referred to the secretary of the association, who will select the worthy applications from the unworthy ones.

been receiving more general attention, and it is equally significant of the advanced thought which prevails in the more highly developed portions of the industry that in not a few instances wheel builders of long standing have proved willing to come to the rescue with helpful information.

Thus at the August meeting of the Philadelphia branch of the Society of Automobile Engineers Charles L. Schwartz, of the Schwartz Wheel Co., of Philadelphia, presented a paper on artillery wheels, in which several of the more salient points of a well-built wheel were emphasized.

"To make good artillery wheels it is just as important to use thoroughly dried wood as it is to use good quality," he said. "The least shrinkage will cause the wheels to become loose. For pleasure cars the wheels are generally made of hickory. There is a vast difference of quality in all wood used for wheels.

"Carriage and wagon wheels are graded according to quality of wood used; the price of the best is about four times that of the lower quality. The hubs and spokes

on these wheels are of uniform dimensions for each size. When the spokes are turned they are divided into different grades. The best grade is all white and heavy wood, and the annual layer has to run across the spoke. Those with the annual layer running from front to back of spoke are termed bastard.

"On automobile wheels these methods are not followed. Most automobile manufacturers have their special design, which the spokes have to be turned to suit. If by chance the spokes are the same, there is likely to be a difference in the hub diameters. Consequently all spokes not considered good are thrown out and are an entire loss.

"On account of it being necessary to fill out the circle of the hub with the width of 10 or 12 spokes, large pieces of wood are required to make them. The spokes are generally turned regardless of which way the annual layer runs. If the wood is not thoroughly dry the spokes turned the regular way are more apt to become loose on account of more shrinkage, which is three times as much with the circumference of the annual layer as against the diameter of the wood. Only straight fiber and heavy spokes should be used, regardless of color. The red wood is equally as strong as the white. The spokes should fit as well where they meet at the hub, fitting tight to the hub barrel, as at the shoulder inside of the wood rim. The tenon should be half the diameter of the spoke and should be the full length of the depth of the rim, and rest on the metal rim or tire. Where this is not the case the shoulder of the spoke resting on the wood rim only, at the weakest point, causes the rim to shatter under the spoke.

"The annual layer of the wood rim properly bent should run with the depth of the rim, although on account of the width of rims many are bent bastard and used. If they are not thoroughly dry the larger percentage of shrinkage will cause them to split at the tenon holes, principally if the spoke should be drier than the rim or if in the same condition the annular layer of the spoke tenon runs the proper way across the spoke. If dished wheels are used the points of the axles should be turned under at least the same number of degrees, allowing the spoke to be in vertical position below the hub.

"Where spokes are bolted to brake drums the flat fitting to the drum should be the widest part of the spoke. If the spokes are rounded toward the drum, space hard to clean out will be left. Spokes tapered in width from the rim towards the hub make the best-appearing wheels. When it is required the spokes can be turned with tapering depth and width in opposite directions with one operation. In conformity with higher power and speed most automobile manufacturers are now using wheels with deeper spokes. The severest strain on wheels is sidewise from skidding.

"With the use of new machines wheel-makers now produce better shape, finish and quality of wheels than heretofore."

In the discussion which followed the reading of the paper it was brought out that the effects of overloading a wheel first are indicated in the loosening of the spoke at the felloe, and, furthermore, that owing to the variation in the quality of wood it is almost impossible to calculate with any degree of accuracy the exact load which a wheel will bear with safety. Urged to state a definite figure, however, Schwartz stated that with first-growth hickory the factor of 1,000 pounds per square inch of spoke load could be carried with safety, though sometimes the figure would rise as high as 5,000 pounds. As only half the spokes carry the load at any one time, this really amounts to 2,000 pounds per square inch.

"The main thing in making automobile wheels," he added, "is the depth of the spokes; for instance, for high-speed cars weighing 4,000 pounds the spokes should be two inches deep. Skidding is the hardest strain on any wheel."

As almost invariably happens where wheels are under discussion, the advantages of wire construction were brought into question at the engineers' meeting. The prevalence of this type abroad was argued to be due to the scarcity of good wood, and, on the other hand, to be the result of careful tests which have shown it to be the superior of the wood wheel in the matter of strength. In concluding the discussion one speaker expressed what is probably the consensus of opinion in the United States at the present time, when he said: "The principal arguments against the wire wheel are looks and cleaning."

Labor Unions Complicate Motor Hauling.

Apparently justifying the apprehension that unionism is destined to have a decided influence on motor truck operation, one prospective purchaser has been discovered who has been forced to "ask permission" of his employees' union before adopting a certain class of equipment which he desires to use. The situation was disclosed by a well-known truck manufacturer in the course of a rambling discussion which concluded the regular monthly meeting of the metropolitan section of the Society of Automobile engineers at the society's New York headquarters last Thursday evening.

The customer whose purchase has been delayed by what is thought to be an unprecedented situation is a large wholesale and retail coal merchant, and already a considerable user of motor trucks. The only motor vehicles employed hitherto, however, have been of large capacity and have been operated exclusively with crews consisting of a driver and helper. For certain classes of duty it is now desired to introduce trucks of smaller capacity, and with that object in view a careful study of conditions affecting the cost has been made with the result that a very small margin of

advantage for the motor, as compared with the horse-drawn conveyance, was found to exist.

As a matter of fact, it was discovered that the probable working profit of the intended equipment hinged about the wages of the helper. If the trucks could be sent out with only the driver it would pay to operate them. If not, the additional cost of the helper would render the cost of operation greater with motor trucks than with horses.

This altered the situation inasmuch as the union has placed a limit on the size of load which one man is permitted to handle. So the question has been put to the powers that be as to whether, under the specially advantageous conditions of motor haulage, it will sanction the use of only one man per truck in the present instance. Pending the decision, of course, the manufacturer who related the incident is very much in doubt as to whether or not he will be able to make the sale.

American Cars Gaining in South Africa.

"It is gratifying to see that at last American-made motor cars are getting a foothold in this market," reports the American consul at Cape Town, South Africa. "The imports not only increased 94 per cent. as compared with the previous year, but the percentage increased from 9.6 per cent. in 1909 to 11.2 per cent. in 1910. Some of the American manufacturers of automobiles have established good selling connections in this country with energetic firms which are not afraid to advertise the merits of the American cars in competition with other makes. The tendency in South Africa is to buy lower-priced cars than formerly, although they may not wear so long. Other advantages outweigh that of superior durability."

Indianapolis Tradesmen Form a Club.

The Hoosier Motor Club, which has been in process of formation in Indianapolis for several weeks, finally has completed its organization by electing the following officers: Charles A. Bookwalter, president; C. L. Diers, H. H. Rice and C. A. Kenyon, vice-presidents; P. P. Willis, secretary, and Joseph Selvage, treasurer. Will H. Brown, chairman; C. A. Bookwalter and C. L. Diers will compose the executive committee. The club is composed almost wholly of Indianapolis automobile tradespeople and will maintain centrally located rooms in the Claypool Hotel. President Bookwalter is a former mayor of Indianapolis and until a few months ago was the head of the Mais Motor Truck Co.

Canadian Northwest Has Many Cars.

Despite the fact that Saskatchewan is not popularly supposed to be much of a stamping ground for automobiles, there are upwards of 2,000 cars registered in that rather remote Canadian province. A year ago there were but 652.

Influence of Details; Room for Improvement

If it had been customary to make road testing and repair shop experience a standard qualification for the automobile draughtsman, it is likely that the breed of modern cars would have improved far more rapidly than has been the case. As it is, many of the faults which are discoverable in the average machine may be charged either to ignorance of governing conditions or to carelessness in the arrangement of small parts, such parts as ordinarily are abandoned to the tender mercies of his subordinates by the designer-in-chief. In enlarging upon the point, L. A. Legros, the well known English engineer, has found sufficient material to form the subject of a lengthy address, which was delivered before the Institution of Automobile Engineers on the 11th ult. His discussion on "The Influence of Detail on the Development of the Automobile," mounts to a careful criticism of the minor faults of present construction, for as he observes:

"To examine this subject systematically, we shall find that most detail has its origin in design, but that the design is frequently marred in execution, and that the executed work is subjected to abuse by the user and to wear by the conditions under which it works, and it is from the latter end of the story that the cycle of design must recommence, since it must take account of the possibilities involved in use and abuse, and of the certainties involved by wear and tear.

"To take the first example that comes to hand, that of the steering gear, it is well known that the ordinary Ackermann axle affords a fair compromise for obtaining the intersection of the axis of the front wheels at a point on the axis of the back wheels.

"This gear as usually made is fitted with a number of pin points, all of which are liable to wear, and as wear proceeds, the two front wheels of the vehicle when it is traveling in an approximately straight line, which, after all, represents by far the greater portion of the distance it runs, will, whether the steering bar be in front of or behind the front axle, take up positions such that the horizontal diameters of the steering wheels would intersect behind the car. After a certain stage of wear has taken place, it is thought necessary to put the wheels in gauge again, and most mechanics, if left to themselves, would set the wheels properly and truly parallel. At this point we should ask ourselves whether this is the right thing to do; whether making things 'exactly right' is after all the proper course to adopt, and whether the present

example is not an illustration of a distinct advantage to be gained by making adjustments incorrectly in the first instance. If the limit for error in parallelism, determined by experience based on the wear of tires, is half a degree (or, in the language of the shops, the wheels should not be more than one quarter of an inch out of parallel in a length equal to their diameter), and if, when this error has been reached, it is time to put them right, then why not set them half a degree (or a quarter of an inch) inwards to start with, so that they will start with a negative error no greater than the positive error permissible, and thus double the life will be given to the steering before it becomes necessary to take it up, assuming the want of parallelism is the only reason for the taking up.

"Take another case: the bearings of an engine are made and fitted so that there is no shake or knock when the engine is turned round without the ordinary amount of lubricant. Such an engine will run very stiffly until its bearings have become sufficiently worn to admit of the proper thickness of oil film for supporting the load. Under present conditions, with the limit gauges and more accurate machine tools available, some of these factors are being incorporated in the design, as recorded by the drawings, but there are many factors which still escape and are not recorded, and it is left to the shops to do as their unwritten experience suggests to them may be right. The tendency in the bigger factories is to diminish the amount of responsibility left to the individual worker in respect to the employment of what, for want of a better term, may be called 'shop knowledge,' and the reason may be found in the fact that whereas in the earlier days of engineering the same man both constructed and repaired, now, under modern conditions of output, the man who constructs is of a quite different class from the one who repairs, and the two classes are rapidly becoming almost out of touch with each other. Consequently that form of shop knowledge which was of such use to the mechanic of some years ago and which enabled him to put through work on the imperfect instructions of not very definite drawings, must today be replaced by positive information supplied by the designer and embodied in the detail drawings, figured with limiting dimensions and supplemented by specifications.

"In the broad and general consideration of detail, the first and most important point to be dealt with is that of standardization, and, consequently, interchangeability. In

spite of all the efforts of Whitworth and others creating standards of size and form for screw threads and for other details, there are still numbers of manufacturers in the country who work almost as though such standards had never existed. That is to say, there are firms who will make 1/2-in. bolts 1/64-in. or 1/32-in. large because the user will get a stronger bolt, although he is buying the same size. The fit of screws between proper limits is quite as important as the accuracy of pitch and of shape of thread. A loosely fitting screw in machinery subjected to so much vibration as is common with automobile vehicles will ultimately cause waste of time and trouble to the user, if not damage to other parts of the machine, whereas the too tightly fitting screw has its obvious disadvantages.

"Standardization is looked after by committees who formulate very excellent rules which should be followed by the manufacturer, but in many cases there is a want of uniformity in the resulting product which calls for better inspection at the start of operations and for the checking of the gauges to which the work is made. The admirable work now being done by the National Physical Laboratory in connection with all classes of standardization cannot be overrated; but the importance of the independent checking of commercial standards by such an impartial central authority is not so fully appreciated by manufacturers as it might be.

"Again, to take an example, the ordinary pneumatic tire is supposed to be interchangeable, that is to say, the same rims will do for any of the tires made by the leading makers. The same pump connection serves for pumping up the inner tube, but it will be found that the same uniformity does not apply to the other details which go to make up the complete tire on its rim. Security bolts, for instance, have various threads, causing the expenditure of much bad language on the road. The diameters of covers are not always in agreement with the rims within the usual limits, with the result that a cover may prove to be tight on the rim and may give considerable trouble in getting it into place. The checking of any of these dimensions is beyond the ordinary purchaser or consumer besides being outside his province, and the trouble caused by too great deviation from the standard dimensions is only discovered at a time when it gives great inconvenience. The question again is one of the various limiting dimensions of the rim and of the limits permissible in the cover under normal conditions.

"In the wheels of pleasure vehicles ball bearings have been used for some years with increasing success, but their application was delayed through failures, in some cases due to overloading, and in many others through imperfect provision being made in the casing of the bearing against the entry of water and mud. In fact a considerable period of time elapsed before the various causes which contributed to the failure of ball bearings in road wheels were appreciated at their proper values. . . .

This matter of wheel bearings is essentially one of design, because the ball bearing when worn is, in general, beyond repair, so that the question of prolongation of the life of the ball bearings is one which can only be referred back through the repair departments, who effect the renewal, to the designer. The presence of moisture, which has resulted in the failure of ball bearings in the road wheels, has also been found to affect those ball bearings which have been fitted to the crankshafts of some engines, and it has been found that a small amount of water in the lubricating oil will cause a sufficient pitting of the surface of the ball races and of the balls to result in premature failure.

"In the engine many improvements in detail have been made, resulting in an enormous advance in respect to silence, speed of revolution, and power for piston area. Apart from such questions as multiplication of the number of cylinders, these improvements, however, have been confined to reduction in the weights of reciprocating parts, alteration of the arrangement and types of valves, modification of the shape of cams and of the size of the cam rollers, care in the selection of the materials and teeth of the gears used for driving the camshafts, the replacement of low tension by high tension magneto ignition, and in general by improvements of detail.

"It is, however, in the carburetter that the main problem of advance in the internal combustion engine appears at present to lie. Carburetters have been made giving over fifty ton miles per gallon on ordinary touring cars when running at speeds up to forty miles per hour, and there appears to be no reason why such results should not be easily and regularly obtainable when the carburetter has attained a development as far advanced as that of the high tension magneto. At present the tuning up of the carburetter is still frequently effected by the expensive method of running the car on the road, involving a considerable expenditure of the time of a skilled tester, the wear and tear of the whole machinery of the car, and the wear and tear of the tires, which, even if only old tires are used, must be added to the other costs. It is true that on the road the conditions under which the carburetter is working are quite different from those of the testing bench. The forward movement of the car may give increased air pressure at the intake

of the carburetter; the vibration of the car may appreciably alter the mean level in the float chamber and the amount of petrol which flows through the nipple. Usually these matters are adjusted by the tester by varying the size of the orifice in the nipple, but from an examination of the conditions which lead to the necessity for this adjustment, it would appear that frequently it is the level in the petrol chamber which requires adjusting quite as much as does the size of the orifice, and in but few carburetters is any provision made whereby the tester can set the level of the petrol to the desired height otherwise than by filing down the nipple or adding solder to the float. . . .

"In the clutch there is less complaint than was formerly common, in fact the peculiarities of leather, cone and disk clutches have become sufficiently well understood by designers to render this detail one of those which now cause but little difficulty; in the case of metal disk clutches, the difficulties first met with in their use were mainly due to the imperfect knowledge on the part of the user of the proper conditions under which to work them, and, in this case, it is the improvement in the mechanical education of the user that has permitted their continued employment.

"In the last few years the question of the reduction of the noise on motor vehicles has been almost entirely dealt with in the engine and gear box, apart from the change from chain drives to live axles. In the gear box noise was found to be produced by errors in the shape of gear teeth, which caused irregularity in the velocity of the driven shaft accompanied by separation of the driving surfaces at speeds beyond a certain minimum. The improvements in gears have entirely been improvements in detail; the involute form of tooth has been retained and the angle of inclination to the tangent of the path of the point of contact has seldom been varied; on the other hand, not only have the cutters been made of greater accuracy than those employed for the construction of other classes of such as those for developing gears by hobbing, which of themselves produce an approximation to the true form of tooth much more accurate than was obtainable by older methods. Again, the distortion of the gear wheels which may occur in cementing and in case-hardening has been more thoroughly appreciated, and precautions have been taken by manufacturers which have resulted in a much smaller error in the finished product. In the back axle a source of noise has remained in the bevel gears, which even though made on developing machines, are liable to the introduction of more error than is the case with spur gears. . . .

"In the ordinary touring car there is still one detail which looks as though it should be altered before long, and that is the want of alignment between the propeller-shafts and the shafts in the gear box when the

car is under its normal load. It would appear that a simple modification should be possible by which the whole length of the shaft would be in alignment from the front of the engine to the center of the back axle when under normal load. At present the chief difficulty appears to lie in the lubrication arrangement for the engine. Now the angle of inclination of the shafting, if it be made lineable, is but small, and is in fact much less than that of any of the gradients up which the engine is required to work at full load. If the uniform lubrication of the engine were assured for a larger range of angle, covering the total inclination of the engine to the frame added to that of the maximum gradient to be ascended, this difficulty would disappear. . . .

"In the case of public service vehicles, the improvements made in detail are immediately noticeable on the London streets, where some of the earliest taxicabs are still running side by side with the latest types. In motor omnibuses the contrast is still more marked between the old pattern with the chain gear and the new pattern with the bevel drive, and here we have a paradox, for some of the more silent omnibuses, though they have no chains in the transmission from the gear box to the back axle, yet have a greater number of chains running at much higher speeds continuously within the gear box itself. The chain itself, therefore, should not be held to blame for the noise, but the cause should be attributed to the faulty method of application of the chain. . . .

"Experience has now determined the amount which should be provided for wear in the brakes, brake surfaces have been increased, and provision has been made for an ample range of adjustment in the brake gear. In the earlier designs of automobiles, the designer seldom compared the new or maximum form of the brake shoes or drums with the worn-out or minimum thickness, with the result that frequently it was necessary, when adjusting the brakes, to cut the rods for length and re-thread the ends, or to set the levers in order that the necessary adjustment could be effected. . . .

"Accessibility is a question which has had a great influence on the design of the automobile, and in some instances may have determined the type which has set the fashion, and fashion in the automobile vehicle plays a more important part than it does in any other class of machinery within my experience. The necessity for frequent access to the engine, to its ignition gear, to its carburetter, and to its valves, has ensured the placing of the engine in the front of the car, where it could be quickly and most easily reached with the minimum of disturbance to the main portions of the vehicle. This fashion in position of the engine is likely to die very hard, so accustomed have we become to giving up the front of the car for the ac-

commodation of the propelling power.

"Accessibility may be divided into two main heads: First, accessibility to those parts which frequently require adjustment requiring no special skill, such as the adjustment of the brakes, of the strength of the clutch spring, of the spark of the ignition devices, and the like, most of which have already been dealt with by the designer in arranging them; and, second, accessibility to details requiring skilled attention. In the latter class come the overhauls of engines, gear boxes, axles, etc., and the influence of commercial and public service vehicles on this branch of the subject is only now commencing to make itself felt. The importance of being able to remove parts of a car, unit by unit—that is, engine, gear box, back axle, etc.—has now become recognized by those responsible for the vehicles of public services, such as those of the motor omnibus and cab companies, since the conditions of working such services are much more closely allied to those of the railway and the tramway than are the conditions of the private car or the commercial vehicle. The easy removal of these units complete, and their interchangeability with other similar units on the same class of vehicle, is a large factor in economically and continuously keeping a fleet of public service vehicles upon the road.

"Apart from the two broad questions just mentioned, a third and very important factor is that of accessibility to the various parts by those tools used in making the adjustments. . . . If these features were considered in design, bolts would often be substituted for studs, long bosses would be cast on parts to enable the nuts or bolt heads to be reached, channels would be milled across faces into which bolt heads could fit to prevent them from turning, and such parts as guardings and covers would be so made that their detachment would be dependent on very few devices, and those of kinds easily secured and readily locked."

"Regarding fuel as a storage of energy, we have in petrol nearly 50 per cent. more energy per unit weight than is stored in coal, and, moreover, we have it in a more convenient form, owing to the advantage which a liquid possesses over a solid. Among so-called improvements may be cited solidified petrol, but it is difficult to imagine what possible advantage a solid which is troublesome to handle can have over a liquid which can be readily led from its reservoir to its destination through a pipe by gravity, or by pressure if gravity will not suffice.

"In the desire to reduce the weight of the transmission gear the diameter of shafts in the early vehicles was reduced to the minimum, and, in order to obtain the requisite area of bearing for carrying the load the bearings in the gear box were of necessity made long. The spring of the shafts under the heavy loads to which they were sub-

jected resulted in bending to such an extent as to reduce the thickness of the oil film locally below that necessary for efficient lubrication, with the result that in many of these earlier cars difficulties arose in maintaining the bearings in efficient order. This difficulty has been largely overcome by the use of the ball bearing, which, as it takes up less length of the shaft, reduces the effective span between the supports and diminishes the spring. But this is not the only advantage given by the ball bearing; still more important is the fact that it is capable of working satisfactorily with a greater error of alignment than is possible with a plain bearing. In fact, in the gear box ball bearings generally give less trouble than on other portions of the car.

"Although the ball bearing has such marked advantages when treated in a suitable manner, yet, under conditions less favorable, such as those of the road wheels, where a bearing may be called upon to stand excessive and obliquely applied loads, failure is much more easily produced, especially if accelerated by the penetration of water, even without dirt, into the bearings. The effect of water in destroying the smoothness of the surface leads to rapid disintegration, and once the ball bearing has begun to fail, either by the breakage of the balls or of the race, its end occurs more rapidly than is the case with the plain bearing.

"The improvements in the efficiency of motors have been almost inseparably linked with improvements in carburetters. Nevertheless, improvements in the motor itself have to no small degree contributed to the advance in the amount of power obtainable per unit of weight of motor, and in the efficiency of the motor itself is a thermodynamic machine. The consumption of fuel per brake horsepower hour in the petrol motor has now been reduced to 0.63 pound. Allied to the question of efficiency is the question of obtaining small commercial motors capable of working with a less highly inflammable fuel, such as ordinary paraffin oil."

Four New "Valveless" Engines Appear.

That not all foreign manufacturers are willing to dissipate part of their profits in producing the Knight sleeve valve engine under royalty, or believe that in that type of engine is perfection attained, is evidenced by the fact that no less than four new "valveless" engines of different types have made their appearance abroad within a comparatively short time. Scotland, France, Italy and Switzerland are represented in the new products, and Germany as well is preparing to enter the ring with still another type. Two of the new engines, those produced by Darracq & Co., of France, and the Itala factory in Italy, belong in the rotary valve class, the Darracq engine being built on the Henriod principle and the Itala engine being of a new construction peculiar to the Italian plant. In it a

single rotary valve serves for both the admission and exhaust of gases from each pair of cylinders. The other two, one from the works of Argyll, Ltd., Alexandria, Scotland, and the other from the Swiss plant of Brunau, Weidman & Co., follow the Knight idea in that they embody sleeve valves. In the Argyll engine a single sleeve is used and arranged concentrically with the cylinder, as are the Knight sleeves. Unlike the Knight sleeves, however, the single Argyll sleeve moves circumferentially a short distance each way in addition to moving upward and downward, so that each spot on the sleeve describes an ellipse during two revolutions of the crank-shaft. The Adlerwerke, the big Frankfort makers of automobiles and cycles, also are hinting at something new in valve development.

When Throttle Does Not Increase Power.

An engine's inability to show any difference in power when the throttle is half and is full open is an indication that improved running would probably result if the jet were enlarged. If this is done, says the Motor News, it may be necessary to provide means for introducing an extra supply of air into the induction pipe; otherwise the enlargement of the jet might be accompanied by a considerable increase in petrol consumption. It is erroneous to suppose that gasoline consumption must appreciably increase when the jet is enlarged, or that a reduction in the jet leads to tangible results. A small jet and a constricted choke tube can supply a properly proportioned mixture as well as a large jet and generous air orifice; but it is calculated to reduce the maximum amount of mixture needed for fast going, particularly on inclines. We once improved the range of flexibility of a car we possessed by slightly increasing the jet orifice and by fitting a Bowden extra air valve. This we did without any noticeable increase in gasoline consumption. Theoretically it probably was greater, but, if so, only to a negligible degree.

Why Too Many Cells Cause Damage.

While it generally is known that the spark which can be obtained from a coil with eight dry cells is better than one which can be obtained with a battery of six cells, changes of this kind should not be made indiscriminately. Most coils are made to be operated on six dry cells, and when an eight-cell is used the platinum points burn away rapidly. Similarly, other coils that are designed to be used on a four-cell circuit never should be connected to a six-cell battery for the same reason. As a general rule, coils which are intended to be used with a four-cell battery will give the best results with a battery of that size, and if they do not it is likely that the trouble is with the battery and not with the coil. The same rule holds good in the case of coils which are intended for six and eight cells, respectively.

CANNOT LIMIT TOURIST MONEY

Unusual Suit Decided Against Railroad Company—Must Make Good Tourist's Funds Lost in Wreck.

That a tourist or intending tourist may carry as much as \$1,800 without incurring the charge of being unreasonable or careless is the opinion of a majority of the justices of the Appellate Division of the New York Supreme Court. The case which last week called forth this divided opinion was that of Joseph A. Knieriem vs. New York Central Railroad. The evidence presented in the trial court showed that Knieriem had sold his restaurant business in Jersey City for \$8,000 and had drawn \$1,800 from the bank and gone to Amenia, N. Y., to meet his wife, previous to starting on a four months' automobile tour through the South. On the way back the train he was on met with an accident and in the confusion following the wreck the money and a large amount of jewelry belonging to his wife disappeared. The New York Central Railroad refused to make good the lost money, although it did settle for the lost jewelry and for the three broken ribs suffered by Mrs. Knieriem. When Knieriem sued the railroad the jury in a lower court rendered a verdict in his favor.

The railroad company having appealed from this decision, the case came before the Appellate Division, which, as stated, sustained the verdict by a majority opinion written by Justice Clark. In this opinion the justice declares that the jury's verdict of \$2,246 should be sustained, because it was for the jury to say whether \$1,800 was a proper amount for a couple to have who were starting on a four months' tour of the South, even though the long trip had not actually begun at the time the accident occurred.

Presiding Justice Ingraham, writing the dissenting opinion, in which Justice Mc-

Laughlin concurred, held that it was against the weight of the evidence for the jury to think that \$1,800 was a reasonable sum for the Knieriems to have, since they were taking only a short journey at the time.

The case is of unusual interest because of the custom of many tourists to carry considerable amounts of ready cash when starting on protracted trips through districts where they are unknown and unacquainted.

Motorphobe Too Slow on the Trigger.

Because he allowed his motorphobia to get the best of him, to the extent of drawing a pistol on a passing car, Sam Whither, a wealthy young Cleveland county (N. C.) farmer, lost his life last Sunday, the 29th ult. Facing the drawn weapon in Whither's hand, Lucius Randall, a business man of Gaffney, S. C., thought himself attacked by a lunatic and shot Whither twice, killing him instantly. The meeting took place on a public road near Charlotte, N. C., on which Whither was driving in a buggy. At the approach of Randall, the automobile hater got off his buggy and, with sundry insulting remarks about motorists in general and Randall in particular, drew his pistol and announced his intention of killing Randall then and there. Randall pleaded with him ineffectually and finally, drawing his own weapon, shot his opponent. Neither man knew the other by name or sight. Randall surrendered to the sheriff on his arrival in Charlotte.

Extent of Child's Negligence.

While contributory negligence always has been considered sufficient to prevent the victim of an accident from obtaining damages, the term has not been so generally extended as to cover the acts of small children. Usually it was taken for granted that such children could not act with the understanding and experience of adults. This idea, however, was upset by the Appellate Division of the New York Supreme Court, on Friday last, 20th inst., in the case of Mrs. Antonio Marius, of

New York City, whose eight-year old son Clarence had been run over by an automobile belonging to the Motor Delivery Co., also of New York, and who sued the latter company.

It was brought out in the trial before a jury in the Supreme Court, that the boy at the time of the accident was playing ball, and Judge Bijur instructed the jury in his charge that it was the duty of the plaintiff to show that the defendant was negligent and that the boy was free from "contributory negligence." The judge, however, failed to give the jury any instructions as to what constituted negligence or to define a rule by which the jurors could test the conduct of the boy in order to determine whether or not he was guilty of contributory negligence. They returned a verdict of \$5,000 for the plaintiff.

The defendants appealed from this decision, and the Appellate Division, in setting it aside, criticized the charge of Judge Bijur and stated that, although the court was right in telling the jury that the boy could not be held accountable as strictly as a grown person, he should have impressed upon the jury that the boy should have acted "as a reasonable and prudent boy of his age and understanding would have conducted himself under like circumstances." Failure to enlighten the jury in this respect resulted in the setting aside of the verdict.

What Touring Brings to Hotel Tills.

What automobile touring means to the hotels in the summer resort regions, even those located off a main line of travel, is well instanced by the two hostleries amid the ruggedness of the White Mountains at Bretton Woods, N. H. When it closed its doors for the season the Mount Washington had recorded a total of 6,291 arrivals, of which 4,793, or 76 per cent., came to the hotel in 1,202 automobiles. The Mount Pleasant hotel registered 5,155 guests, 2,173, or 42 per cent., arriving in 502 motor cars of various brands.

AS USUAL DREADNOUGHT *Moline* "THIRTY-FIVE" WINS AGAIN

5 Passenger Self-starting Touring Model

1911 Chicago Reliability Run

**Four Entries—Four Winners
Four Perfect Road Scores**

Once more the DREADNOUGHT MOLINE has swept its field of competitors aside and covered itself with glory—this time even more decisively than ever before—winning three out of the four Trophies offered in the Chicago Reliability just finished and standing second for the fourth—the Economy Cup.

Here is the result in a nutshell of the 1911 CHICAGO RELIABILITY RUN just ended, Friday, Nov. 3rd, passing through five States and covering nearly 1,400 miles in seven days' running.

Four Trophies were offered—a Touring Trophy—a Roadster Trophy—a Team Trophy for the best two cars of same make—and a Fuel Economy Trophy.

Four Moline were entered—two Touring Cars—two Roadsters. These four cars covered the entire run of 1,356 miles, plowing through 18 inches of snow and mud on the last day, yet finishing with perfect road scores. Think of that!

In addition two of them won the TEAM TROPHY—another won the Van SICKLEN ROADSTER CUP (won also by a Moline last year)—another tied with a competitor for the TOURING TROPHY, and one stood second for the FUEL ECONOMY CUP with a record of 17½ miles to the gallon of gasoline for the entire run.

In short, the Moline practically cleaned up everything worth while in the run. And here is the reason in six short words—its invincible

4 x 6 L O N G S T R O K E M O T O R

The motor "par excellence" of today—the motor unapproached for dependability, roadability, fuel economy, in fact, every motor qualification—the motor that has made the Moline the undisputed "KING OF THE ROAD."

WINNER FOUR CONSECUTIVE NATIONAL CONTESTS

Winner 1911 Chicago Reliability Run

Winner 1910 Chicago Reliability Run

Winner 1911 Annual Fuel Economy Run

Winner 1910 Annual Gilded Run Chicago Trophy

MOLINE AUTOMOBILE CO., 61 Keokuk St., East Moline, Ill.

DEALERS—Write for Our Special Proposition on "The Car That Always Wins."

996,745. Headlight. Robert A. Bell and James B. McKiel, Marshall, Tex., assignors of one-fourth to James Fink and one-fourth to Harry E. Reinheimer, Marshall, Tex. Filed Feb. 26, 1910. Serial No. 546,080.

1. In a device of the class described, a vehicle frame having a movable axle end; means for shifting the axle end; a lamp pivotally supported upon the frame; and a connection between the shifting means and the lamp, for turning the lamp; the connection being arranged to reciprocate longitudinally upon and transversely of said shifting means.

996,798. Packing Ring for Axle Box Bearings. Jakob Schmid-Roost, Oerlikon, near Zurich, Switzerland. Filed May 5, 1910. Serial No. 559,507.

1. In an axle box bearing, a metallic packing, comprising two parallel abutting rings, each consisting of a plurality of segments, the joints of the one ring being covered by the other ring; and an endless spring wound sinuously around the assembled segments and holding the latter together both in radial and axial direction; substantially as described.

996,800. Muffler. John O. Schmitt, Cleveland, Ohio. Filed Aug. 2, 1909. Serial No. 510,706.

1. In a muffler, in combination, a casing having one open end and closed at its other end by an integral fixed head, a removable head adapted to be secured to the casing at said open end, and a plurality of muffler tubes secured to and supported at one end by said removable head and provided at their respective opposite ends with perforations arranged in a manner to baffle the exhaust in its passage through the muffler.

996,831. Vehicle Wheel. Nestor Braibant, Brussels, Belgium. Filed Dec. 17, 1908. Serial No. 468,053.

1. A vehicle wheel comprising in combination with the hub, rigid spokes and rim therefor, of a plurality of flat leaf springs spaced apart from each other circumferentially on said rim, each spring comprising a central or base portion curved to conform to the curvature of said rim and lying flat thereon and rigidly secured thereto, and having its ends bent outwardly radially spirally inwardly toward each other in opposite directions, a tread portion located radially outwardly from the ends of said springs and from said rim and having radially inwardly projecting extensions spaced apart from each other and disposed abreast of the sides thereof and below said rim, adjustable anti-friction means on said rim engaging said extensions to prevent lateral movement of said tread portion with respect to said rim, and means non-rotatively secured in the ends of said springs for connecting said tread portion therewith.

996,835. Vehicle Wheel. William C. Cole, Locust Hill, Mo. Filed Apr. 25, 1910. Serial No. 557,462.

A vehicle wheel comprising a hollow hub formed with a plurality of radial cavities and having its periphery provided with a plurality of circumferentially disposed

slots each of which open into a respective cavity, a bridge connecting opposite sides of each cavity and provided with a circumferential slot in radial alignment with a circumferential slot in the periphery of the hub, a spoke passing through each slot in the periphery of the hub and the radially aligned slot in the bridge disposed within the cavity, a cross arm mounted on each spoke between the periphery of the hub and the bridge within the cavity, a spring surrounding each spoke and having one end in engagement with the upper side of said cross arm and the other end in engagement with the periphery of the hub, a second spring having one end in engagement with the lower side of said cross arm and its other end with the bridge connecting opposite walls of the cavity, and springs disposed between each end of said cross arm and the adjacent wall of the cavity.

996,838. Resilient Wheel. Alfred A. Curry, Bridgeport, Conn., assignor of one-half to Edwin B. Knowles and one-twentieth to Charles S. Canfield, Bridgeport, Conn. Filed Sept. 29, 1910. Serial No. 584,477.

1. A resilient wheel comprising a relatively fixed inner rim, a series of U-shaped springs alternately inverted resting thereon, an outer rim resting on the arches of alternate springs, side plates secured to the outer rim and pivoted dogs secured to the side plates, and means for holding said dogs yieldingly in engagement with the inner rim whereby oscillation of the outer rim is permitted when the springs yield.

996,945. Pressed Steel Wheel. Justice W. Sharick, Frankfort, Ind. Filed Apr. 21, 1910. Serial No. 556,844.

A wheel consisting of two metal plates spaced apart to define a chamber about the axis of the wheel, the plates being inclined toward each other from the axis of the

wheel toward the periphery thereof, the peripheries to the plate being bulged in opposite directions to bring their edges into abutment and to define a chamber in the wheel rim, communicating with the central chamber of the wheel; both plates, at spaced points adjacent the rim of the wheel, being struck inwardly to form terminally abutting lugs, and to form recesses in the outer faces of the plates, the lugs constituting the sole points of contact in the plates between the rim and the axis of the wheel; and retaining elements extended through the lugs, the retaining elements having heads located in the recesses between the planes of the outer faces of the plates.

The Atwater Kent System

COMBINES the good features of all other ignition devices with several that are peculiar to it alone. It is the only system that produces a hot, dynamic spark of absolute uniformity, no matter whether the engine is turning a hundred or a thousand revolutions per minute.

The man who drives an Atwater Kent equipped car is pretty sure to be an Atwater Kent enthusiast.

No. 3

WANTS \$150,000 FOR INFRINGEMENT

Rose Files Chain of Suits Born of Lamp and Tag Bracket Patent—Many Jobbers Made Defendants.

Claiming cash damages in each case, the Rose Mfg. Co., of Philadelphia, Pa., is sweeping the country with a lengthening string of suits based on alleged infringement of the several patents covering the Neverout combination lamp and license tag bracket, and also infringement of the Neverout number plate bracket for attachment to automobile radiators. To date the suits which the Rose people have filed claim damages to the amount of \$150,000.

The most recent actions instituted are those against the Eberhardt Mfg. Co., the Pennsylvania Rubber & Supply Co., the M. & M. Co., of Cleveland, and the Perkins-Campbell Co., of Cincinnati, which have been filed in the United States Circuit Court for the Ohio district.

There are also now pending similar suits against the E. A. Whitehouse Mfg. Co. and Le Compte Mfg. Co., in the District of New Jersey; against Motor Car Supply Co., James H. Lallou, Hugh A. Glackin, William G. Anderson, Frank M. Bell and James L. Gibney & Bro., in the Eastern District of Pennsylvania; against Cox Brass Mfg. Co. and Lowe Motor Supplies Co., Thomas Harper and American Auto Supply Co., in the Southern District of New York.

The patents involved are No. 883,973, April 7, 1908; No. 962,219, June 21, 1910; No. 962,220, June 21, 1910; No. 962,221, June 21, 1910; No. 978,023, December 6, 1910; No. 41,388, May 16, 1911; No. 41,389, May 16, 1911; No. 41,609, July 26, 1911; No. 41,637, August 1, 1911.

Williams-Lozier Suit Goes Over.

Trial of the suit for \$500,000 damages which Fletcher R. Williams has filed against the Lozier Motor Co., as told in last week's Motor World, and which was to have taken

place last Monday before Judge Seabury in the New York Supreme Court, was postponed by agreement to the 20th inst. The correlate suit of Joseph L. Rhinock against Lozier also went over to the same date. Fletcher seeks to recover for the failure of H. A. Lozier to sell to him the controlling interest in the Lozier Motor Co., as per an alleged agreement, and Rhinock wants \$150,000 as a brokerage fee for bringing Williams and Lozier together.

Packard Votes \$3,000,000 Note Issue.

Partly in the nature of casting an anchor to windward and thereby safeguarding itself against the effects of business depressions or political agitations and partly to retire bank loans, the Packard Motor Car Co., of Detroit, has formulated a note issue of \$3,000,000 five per cent. four year notes, \$2,000,000 of which were promptly taken by W. A. Read & Co., the New York bankers, who at once found a market for them at 5.35 per cent. After retiring the bank loans, the sale will provide about \$700,000 for additional working capital for the Packard company, with \$1,000,000 of the notes remaining in the treasury for future use, if required. The notes will mature in December, 1916, the company reserving the right to take them up before maturity at a premium. They will constitute a first lien on the Packard property, taking precedent on the stock issue of \$5,000,000 seven per cent. preferred and \$5,000,000 common, and also, by express stipulation, on any bond issue which may be made.

Remys to Re-enter Automobile Industry.

Frank Remy and B. P. Remy, who founded the Remy Electric Co., at Anderson, Ind. and who sold it for a handsome sum less than a year since, are reported to be on the point of re-entering the automobile industry. It is stated, however, that their new inventions which they purpose to manufacture will not conflict with the productions of the Remy company. Exactly what they are preparing to turn out has not been divulged as yet.

OFFERS TRUCK SHARES TO PUBLIC

International Places \$1,185,000 Preferred Stock on Market—Also Discloses Details of Its Organization Plan.

Having perfected the merger of the Saurer Motor Co., of Plainfield, N. J., and the Mack Bros. Motor Car Co., of Allentown, Pa., and entered into actual control of its property, the International Motor Co., of New York, is offering for public subscription 18,500 shares of its 7 per cent. cumulative stock at 97½. At this price the stock will yield 7.17 per cent.

The public offer of this stock discloses some hitherto undisclosed details of the big company's plan of organization and operation. It makes known that of the \$4,000,000 authorized preferred stock \$2,815,000 has been issued and that it is the remainder, \$1,185,000, that has been placed on the market. This preferred stock is followed by \$5,165,625 of common stock. The preferred has preference over the common in the event of liquidation or dissolution, the control of the stock being vested in a board of voting trustees consisting of C. P. Coleman, former president of the Saurer company, J. W. Mack, former president of the Mack company, and H. K. Pomroy, of the New York Stock Exchange firm Pomroy Bros., which trusteeship will continue until October 14, 1916.

There are no prior liens on the International property except \$155,000 bonds and mortgages of the subsidiary companies for the retirement of which provision already has been made, and according to the voting trustees' agreement no mortgage or other fixed obligation constituting a lien upon the property may be created or placed ahead of the preferred without consent of the holders of 75 per cent. of the preferred stock at that time outstanding. The dividends are cumulative, and if not paid in any one year, remain an obligation to be met before any dividend can be paid on

the common; also, if no dividend is paid in any period of twelve months holders of preferred stock have sole voting power while such default continues.

After December 31, 1914, the company is required to set aside 20 per cent. of the net earnings remaining after the preferred dividend, as a reserve fund for buying in the preferred stock at not more than \$120 a share before any dividend is paid on the common. If the stock cannot be acquired at or below that price the fund may be used for acquisition of property or equipment or held as a cash reserve part of the surplus fund. After payments into the reserve fund have aggregated \$500,000 further payments are not required. Provision is made that no dividend shall be paid on the common stock in 1912 unless the company shall have set aside \$210,000 surplus. No dividend is to be paid on the common in 1913 unless the surplus shall have been increased to \$400,000. In 1914 and thereafter the surplus fund must be not less than \$500,000 and no dividends may be paid on the common stock after that time when the surplus fund is below \$500,000.

It is announced that the Mack company is now producing at the rate of 1,200 trucks per year, and that the Saurer plant will be in full operation in the near future and thus provide for an output during the coming fiscal year of 2,000 trucks.

It is also disclosed by the report of the accountants who reported upon the properties and earnings of the two companies that on net sales of \$1,200,000 during the six months ending August 31st the Mack company earned a net profit of over \$250,000, or on a basis of more than \$500,000 per annum. Based on these figures, the stock prospectus directs attention to the fact that the dividend on the outstanding preferred stock, calling for \$197,050 per annum, is being earned more than two and a half times by the Mack plant alone and without regard to the logical increase which will come with the full operation of the Saurer factory.

Streator Settlement Finally Accepted.

Due to the action of a majority of its creditors, the Streator Motor Car Co., of Streator, Ill., makers of the Halladay car, will be able to rise superior to its embarrassment. After several meetings, 83 per cent. of the creditors voted to accept the proposition offered by J. C. Barlow and Paul R. Chubbuck, respectively president and vice-president of the company, and in due course, it will be freed from the bankruptcy court to which it voluntarily applied on September 23rd last for a measure of relief and in order to forestall unfavorable action by several dissenting creditors. The Barlow-Chubbuck settlement which finally has been accepted, will entail their turning over to a trustee about \$1,200,000 of their personal property as security for a loan of \$425,000, and the issuance of bonds to the creditors, who thus will receive 100 cents

on the dollar. The settlement was offered to the larger creditors before the crisis was reached but was refused by several of them. It was then that the Streator company filed a petition in bankruptcy, not seeking to be adjudicated a bankrupt but taking advantage of a new provision of law which forces minority creditors to accept a settlement approved by the majority.

Stearns Takes Royal Tourist Factory.

Further evidence that the adoption of the Knight engine has "made business" for the F. B. Stearns Co. was given last week when that company leased outright the near-by plant of the Royal Tourist Motor Car Co. in Cleveland, the Royal establishment having been at a standstill for months. Once possessed of the property, the Stearns people quickly removed their body building, upholstering, painting, road testing, final assembly and finished test departments to the Royal plant, thus giving much more room in the main factory on Euclid avenue, which will be continued in full operation with its entire facilities concentrated on the manufacture of the chassis. As fast as completed, chassis are run under their own power to the Royal factory—now styled Stearns plant No. 3—where they are tested out and the complete cars finished. Shipments are made from the Royal plant, and owing to the exceptional railway facilities offered the work of the shipping department will be greatly facilitated. Meanwhile work on an addition to the Stearns factory is in progress, and it is expected that it will be completed early in January next. The new building will be devoted wholly to machining operations and will materially assist in doubling the Stearns output, which is in view.

Wants Rice to Pay \$3,214 for Tires.

A suit for \$3,214.25 has been filed in the New York Supreme Court by the Thermoid Rubber Co., of Trenton, N. J., against the Mohawk Rubber Co., of Utica, N. Y., and its president and treasurer, Clarence B. Rice. The bill of complaint alleges that during the interval between May 10, 1911, and July 29, 1911, the plaintiff sold and delivered "at the express request and promise to pay of the defendant" to the latter goods and articles valued at \$8,597.45, but that the latter only accounted for, in cash and returned goods, \$5,383.20; the balance of \$3,214.25 remaining unpaid.

Sue for Return of Deposit Money.

Alleging a breach of contract, Badgley & Reichert, dealers in automobiles at Cedar Rapids, Iowa, have filed suit for \$1,052.79 against the Campbell Motor Car Co., Overland distributors for the State of Iowa. In their complaint the dealers claim that in August they entered into a contract with the Campbell company, under which the latter were to furnish them 50 Overland automobiles, and that they

deposited with the latter the sum of \$1,500. This sum the defendants were to hold until the termination of the contract, when the deposit was to be returned to the plaintiffs. It is now claimed that the Campbell company elected to terminate this contract on July 11 last, and that it did not return the deposit made according to agreement. In the interval Badgley & Reichert purchased from the defendants \$447.21 worth of supplies, which are deducted from the \$1,500 claim.

Hayes Not to Abandon Detroit Plant.

Because the Hayes Mfg. Co., of Detroit, has in view the establishment of a branch factory in Indianapolis, the report has gone abroad that the company purposed abandoning its Detroit plant and concentrating at Indianapolis. That such is far from the truth, however, is indicated by Secretary Carrow, of the Hayes company, who states that the mere fact that they are at the present time expending more than \$100,000 in the construction of additional buildings at Detroit should be sufficient to give the rumor its quietus. Detroit, he adds, will continue to be the Hayes headquarters, and even if a plant is established in Indianapolis the greater part of the Hayes output of sheet metal parts and forgings will continue to be made in the Michigan city.

Best Year in Solar Lamp History.

Despite the great competition that has developed since the Badger Brass Manufacturing Co., of Kenosha, Wis., first began the production of acetylene gas lamps, that pioneer company has been able to more than hold its own. At its annual meeting, which was held last week, the official report showed that the past year had proved the best in the history of the company. It had not only done more business than ever before but it has on hand orders for more than a million dollars worth of Solar lamps for future delivery. Also not one cent of money is owed to any one; not even a bank loan is outstanding.

Work Started on Chevrolet Factory.

The first steps towards the construction of a factory for W. C. Durant's new enterprise, the Chevrolet Motor Car Co., of Detroit, which now is occupying temporary quarters in that city, were taken last week, when the work of clearing the recently purchased site at Woodward avenue and Hamilton Boulevard was commenced. The site has a frontage of 700 feet on Woodward avenue. The factory which will be erected will be a five story structure about 600 feet long.

Pierce-Arrow to Build Truck Plant.

The Pierce-Arrow Motor Car Co. is preparing to build a separate truck factory on a 35 acre plot in Buffalo, which is bounded by New York Central tracks, Hertel avenue, Colvin and Fairfield streets. The price paid for the site alone was \$165,000.

INDUSTRY'S OUTPUT, \$249,202,000**Supplementary Census Statistics Give Production of Both Cars and Parts—Instructive Averages Afforded.**

If anything has afforded more room for speculation than the number and value of the automobiles produced in this country, it has been the extent and value of parts production. It was possible to make at least a long-distance and partly satisfactory estimate of the number of cars manufactured, but all figures affecting the parts trade were at best little more than wild guesses. In April last when the preliminary report of the 1909 census was made public, the exact status and the exact output of cars was disclosed, and if press agents can blush those statistics caused more than one press agent to blush. When the truth came out via the census office it was shown that there were 316 manufacturers who had produced a total of 127,289 complete cars, and this week the same source made public that in 1909 there were 427 producers of bodies and parts whose combined outputs attained a value of \$84,986,000.

One of the most significant facts made public by the census figures is the average price of the automobiles manufactured during 1909, which amounted to \$1,297, as compared with \$1,079, which was the average price obtained in 1904. The profits gained in making the 127,289 complete cars figured up to \$38,611,000, or 22.21 per cent. on the \$173,837,000 capital invested.

The summary shows increases in all the items of the census of 1909 as compared with that for 1904.

The number of establishments increased 317 per cent.; capital invested, 653 per cent.; the gross value of products, 730 per cent.; cost of materials, 901 per cent.; value added by manufacture, 596 per cent.; average number of wage earners employed during the year, 528 per cent.; amount paid for wages, 580 per cent.; number of salaried officials and clerks, 682 per cent.; amount paid in salaries, 654 per cent.; miscellaneous expenses, 389 per cent.; primary horsepower, 647 per cent.

There were 743 establishments in 1909 and 178 in 1904, an increase of 317 per cent.

The capital invested as reported in 1909 was \$173,837,000, a gain of \$150,753,000, or 653 per cent., over \$23,084,000 in 1904. The average capital per establishment was approximately \$234,000 in 1909 and \$130,000 in 1904.

The value of products was \$249,202,000 in 1909 and \$30,034,000 in 1904, an increase of \$219,168,000, or 730 per cent. The average per establishment was approximately \$335,000 in 1909 and \$169,000 in 1904.

The cost of materials used was \$131,646,000 in 1909, as against \$13,151,000 in 1904.

**AUTOMOBILES, BODIES AND PARTS—GENERAL SUMMARY:
1909 AND 1904.**

	Census		Per cent. of increase, 1904-1909
	1909	1904	
Number of establishments.....	743	178	317
Capital	\$173,837,000	\$23,084,000	653
Cost of materials used.....	\$131,646,000	\$13,151,000	901
Salaries and wages.....	\$58,173,000	\$8,416,000	591
Salaries	\$9,479,000	\$1,257,000	654
Wages	\$48,694,000	\$7,159,000	580
Miscellaneous expenses	\$20,872,000	\$4,266,000	389
Value of automobiles made*.....	\$164,216,000	\$23,751,000	591
All other products†.....	\$84,986,000	\$6,283,000	1,253
Value of products.....	\$249,202,000	\$30,034,000	730
Value added by manufacture (products less cost of materials).....	\$117,556,000	\$16,883,000	596
Employees:			
Number of salaried officials and clerks	9,233	1,181	682
Average number of wage earners employed during the year.....	75,721	12,049	528
Primary horsepower	75,550	10,109	647

* In addition, in 1909, 719 automobiles, valued at \$899,000, and in 1904, 1,138, valued at \$379,000, were made by establishments engaged primarily in the manufacture of other products.

† In addition, in 1909, bodies and parts to the value of \$4,484,000 were made by establishments engaged primarily in the manufacture of other products.

**NUMBER AND VALUE OF MACHINES BY KIND OF POWER,
AND PER CENT. OF INCREASE: 1909 AND 1904.**

Kind of Machines			Per Cent. of increase
	1909	1904	
Number	127,289	22,830	458

an increase of \$118,495,000, or 901 per cent. In addition to the component materials which enter into the products of the establishment for the census year there are included fuel, rent of power and heat, and mill supplies.

The value added by manufacture was \$117,556,000 in 1909 and \$16,883,000 in 1904, an increase of \$100,673,000, or 596 per cent. This item formed 47 per cent. of the total value of products in 1909 and 56 per cent in 1904. The value added by manufacture represents the difference between the cost of materials used and the value of products after the manufacturing processes have been expended upon them. It is the best measure of the relative importance of industries.

The miscellaneous expenses amounted to \$20,872,000 in 1909 and \$4,266,000 in 1904, an increase of \$16,606,000, or 389 per cent. Miscellaneous expenses include rent of factory or works, taxes, and amount paid for contract work, as well as such office and other expenses as can not be elsewhere classified.

The salaries and wages amounted to \$58,173,000 in 1909 and \$8,416,000 in 1904, an increase of \$49,757,000, or nearly 591 per cent.

The number of salaried officials and clerks was 9,233 in 1909 and 1,181 in 1904, an increase of 682 per cent.; their salaries increased from \$1,257,000 to \$9,479,000, or 654 per cent.

The average number of wage earners employed during the year was 75,721 in 1909 and 12,049 in 1904, an increase of 528 per cent.; their wages increased from \$7,159,000 to \$48,694,000, or 582 per cent.

The salaries and wages paid out during 1909 went to 9,233 salaried officials and clerks, whose average salary therefore was \$1,026, and to 75,521 wage-earners, who received on an average \$644 each during the year. In 1904 the earning capacity was slightly greater in the case of salaried officials and clerks, who got on an average \$1,069 each, while wage-earners received but \$594 each.

The primary horsepower was 75,550 in 1909 and 10,109 in 1904, an increase of 647 per cent.

The average horsepower per establishment, considering all establishments, was approximately 102 horsepower in 1909 and 57 in 1904.

The summary of number and value of machines by kind of power includes all the machines made either as a chief or minor product, whether by establishments classified as "Automobiles, including bodies and parts," or under other designations in accordance with their chief products. There was a total of 316 establishments making one or more machines in 1909, and 168 in 1904, an increase of 88 per cent. The number of machines increased from 22,830 to 127,289, or 458 per cent. Of these, gasoline increased from 19,837 to 121,274, or 511 per cent.; electric, from 1,425 to 3,639,

or 155 per cent.; and steam, from 1,568 to 2,376, or 52 per cent.

Of the total number of machines, 122,505, or 96 per cent., were pleasure and family vehicles; 1,428, or 1 per cent., public conveyances; 68 were for government and municipal purposes; and 3,288, or 3 per cent., were business vehicles.

The largest number of machines, 51,457, or 40 per cent., were rated at 30 but less than 50 horsepower; those rated at 20 but less than 30 numbered 35,380, or 28 per cent.; those at 10 but less than 20, 29,657, or 23 per cent.; and those at 50 but less than 90, 3,224, or 3 per cent. There were 7,542 less than 10 horsepower and only 29 rated at 90 or more.

If the automobiles and bodies and parts made in the 245 establishments engaged primarily in the manufacture of other products be added to the figures in the general summary, the total value of products in 1909 becomes \$254,585,000. In 1904 the by-products reported make the total value \$30,913,000.

Although in the table 743 establishments are numbered as engaged in automobile manufacture, only 316 of these, as stated, actually manufactured complete cars, the remaining 427 being makers of parts.

Of the accompanying table only the first section, dealing with the production of automobiles, bodies and parts, is new, the other two sections having been included in the preliminary census report, issued in April last, and published in the Motor World on April 27.

Changes Among Prominent Tradesmen.

R. T. Wingo, recently of the Cadillac staff and previously for some twenty-two years with the Brown & Sharpe Mfg. Co., has been appointed production manager for The Hupp Corporation, of Detroit.

W. J. Clements, former sales manager of the Krit Motor Sales Co., of Detroit, has been appointed manager of the Krit Motor Car Co.'s Buffalo branch. He will direct the distribution of Krit cars in that territory.

Edwin A. Walton, previously assistant advertising manager of the Burroughs Adding Machine Co., has been appointed advertising manager for the Timken Roller Bearing Co. and the Timken Detroit Axle Co. He will be located at the office of the latter company in Detroit.

A. D. McLachlan has been appointed sales manager of the Sanford-Herbert Co., of Syracuse, which is building a light delivery wagon and which is preparing to expand. McLachlan was for ten years connected with the Royal Tourist Motor Car Co., of Cleveland, as a member of the selling staff.

J. A. Jones has been appointed manager of the Diamond Rubber Co.'s retail branch at Golden Gate and Van Ness avenues, in San Francisco. He succeeds J. Ingersoll, who resigned to assume the management

of the Keaton Vulcanizing Works, of San Francisco, distributors of the Swinehart tires.

Roy Watts, former power apparatus manager and engineer of the Western Electric Co., has been added to the staff of the Remy Electric Co. as special traveling representative. He will devote most of his time to visiting electrical supply dealers as well as gas and gasoline engine manufacturers.

Thomas Marshall has been appointed manager of the Indianapolis branch of the United States Motor Co. He succeeds John Hayden, who resigned because of ill health. Marshall has been connected with the Maxwell factory and other branches of the United States Motor Co. for several years.

A. M. Welch, who for about eight years was identified with the Studebaker interests and who for the past year has been manager of the commercial vehicle department of the H. H. Franklin Mfg. Co., has engaged with the Stevens-Duryea Co., of Chicopee Falls, Mass. He will take up territorial work.

F. R. Bump, who has had ripe experience in the sales departments of the Franklin and Reo companies, and who latterly has been sales manager of the Universal Motor Truck Co., of Detroit, has been appointed assistant sales manager of The Hupp Corporation in that city, and will have charge of the sales, advertising and service departments.

Henry G. McComb, former chief engineer of the E. R. Thomas Motor Co., and latterly assistant general manager of the Louis J. Bergdoll Motor Co., of Philadelphia, has resigned the latter office to become manager of the commercial engineering department of Wyckoff, Church & Partridge, Inc. He will be located in New York City and not at the Wyckoff factory in Kingston, N. Y.

Holbrook-Armstrong Not to Make Cars.

Reports that the Holbrook-Armstrong Co., of Racine, Wis., a \$300,000 concern, was preparing to engage in the manufacture of automobiles have been authoritatively denied. The company has been manufacturing automobile engines for some time and the reports, apparently, grew out of the fact that it had taken a contract and completed three runabout chassis for a Chicago concern.

Twiford Transmission for Texas Truck.

The Commercial Motor Vehicle Co., of San Antonio, Tex., has secured the right to operate under the Twiford four-wheel drive patent. In return for the right R. E. Twiford and the other owners of the patent are given 25 per cent. of the capital stock of the Commercial company and 6 per cent. royalty on the trucks which it may produce.

H. M. Widrig has opened a garage and salesroom in Mt. Clemens, Mich. He will sell Hupmobiles.

A new garage is in course of erection on Washington avenue, Racine, Wis. A. Anderson is building it.

Robert F. Payne has broken ground for a new garage at 204 Rutger street, Utica, N. Y. It will cost \$4,500.

G. L. Hudkins, who sold Ford cars in Cawker City, Kan., has transferred his business to Salina, Kan. He will continue to handle the same make.

The Mitchell Motor Co., of Omaha, Neb., has found its old quarters too cramped and has moved into more commodious salesrooms at 2050 Farnam street.

George Rodemann is building a two-story brick garage at the corner of Atlantic and New York avenues, Brooklyn, N. Y. It will cost, when complete, \$8,000.

F. R. Gamble has bought out his partner, E. W. Gamble, in the firm F. R. Gamble & Co., of Columbia, Tenn. He will drop the "Co." and continue the business in his own name.

The Cartercar Iowa Automobile Co. has been formed to succeed Cruzan & Co., former Cartercar agents in Des Moines, Ia. Charles M. Friedberg is manager of the new concern.

W. V. Carringer and Henry Barrett have purchased an interest in the Model Auto Co., of Clinton, Ia. The company will be incorporated with these two and F. E. Lowell as directors.

The firm of Russell & Walker, which operated a garage at Devil's Lake, N. D., has been dissolved, Walker retiring. Russell will continue the business under the style Devil's Lake Garage.

The Goodyear Tire & Rubber Co. has inaugurated its new branch store at 1562 Broadway, Denver, Colo. It is reputed to be the handsomest establishment of the sort west of the Mississippi.

The Bolmer Motor Car Co., Bound Brook, N. J., is building a two-story reinforced concrete and steel structure on East Main street, to be used as a garage. The building will be 100 x 49 feet.

George W. Garland, Jr., has purchased the interest of his partners, George and Edward Strobel, in the Garland Automobile Co., of New York City. The company distributes Velie and Speedwell cars.

The Warren Texas Motor Car Co. has opened salesrooms at 2014 Commerce street, Dallas, Tex. W. C. Boren and E. C. Dodson are managers of the concern, which of course, will handle Warren-Detroit cars.

The Michelin Tire Co. has opened a branch in Los Angeles at 749 South San Pedro street. It is in charge of J. R. Wells, who previously was connected with the Michelin company's San Francisco depot.

The Serage Automobile Co., of Joplin Mo., one of the oldest concerns in the State, has found its quarters too cramped and moved into a new building at 1602 Main street. The company handles the Studebaker, E-M-F, Garford, and Flanders cars.

Carlson Brothers, who are the proprie-

PENCE AUTOMOBILE CO.'S NEW STORE IN MINNEAPOLIS

tors of the Metropolitan Carriage Co., have added automobiles to their other interests. For this purpose they are building a cement garage on Grand street, Bridgeport, Conn., which will be 50 x 150 feet and of fireproof construction.

Under the style Hughes & Dalley-Baker Electrics, a new company has been organized at Minneapolis, Minn., with headquarters at Tenth street and First avenue, to handle Baker electrics in the Flour City. H. L. Hughes and H. C. L. Dalley comprise the partnership.

The partnership of Myers & McGillivray, owners of a garage in Fenton, Mich., has been dissolved. Dr. A. M. Switzer, of the same town, has bought an interest in the garage and will continue it with Myers under the style Fenton City Garage. The firm will handle the Hupmobile.

Mason Towle and A. B. Towle have purchased a controlling interest in the business of the Steinhart-Jensen Automobile Co., of Joliet, Ill., and changed its name to Towle Automobile Co. Simultaneously with changing the name, the capital stock of the company has been raised from \$5,000 to \$10,000.

Following its recent policy of establishing factory subsidiaries in all the larger cities, the Packard Motor Co., of Detroit, Mich., has taken over the business of the Welch Bros. Motor Car Co., of Milwaukee, Wis., Packard agents for the State of Wisconsin. O. G. Heffinger will be general manager, and R. C. Chidester, sales manager.

A petition in voluntary bankruptcy has been filed by the Baldwin Mfg. Co., dealer in automobile supplies and specialties, at 143 Federal street, Boston, Mass. Its liabilities are fixed at \$9,617.90, of which \$7,614.62 is unsecured; assets amount to \$4,506.62. The company is incorporated under Maine laws. A receiver has been appointed.

The garage and showroom formerly occupied by the Electric Carriage & Battery Co., on Harmon place, Minneapolis, Minn., has been taken over by the Rauch & Lang Electric Car Co., which will operate the establishment as a factory branch. The officers of the Minneapolis branch are: President, Charles Rauch; vice-president, H. E. Fletcher; secretary, treasurer and manager, J. G. McClurg.

Emil Hauck has been appointed receiver for the Hayes & Havens Auto Livery Co., 5 West Canal street, Cincinnati, O. The appointment was the result of a petition filed by Gus L. Hayes against his partners, Charles F. Havens, Leo R. Wise and Max Wise, charging them with attempting to oust him from the company. It is claimed that the company is solvent, but that its affairs are in a tangled state owing to the dissension among the partners.

Recent Losses by Fire.

Lafayette, Ind.—Star City Garage and the Jamison Garage wrecked by tornado.

Lynn, Mass.—Charles E. Whitten's garage, rear of 38 Central avenue, and two cars destroyed. Loss, \$9,000.

Kansas City, Mo.—Peck Auto Co.'s garage at 1424 McGee street and contents damaged. One automobile destroyed. Loss estimated at over \$10,000.

Washington, D. C.—Buick Motor Co.'s branch at 1139-1141 Seventeenth street Northwest, and 24 cars destroyed. Loss estimated at over \$35,900.

This simple device
places your car among
the safe percentage.

Skidding is responsible for 90 per cent. of automobile accidents. See that you do not risk the lives of your passengers on the greasy roads and pavements this Fall and Winter. Equip your automobile with

Pennsylvania Vacuum Cup Tires

The principle is simple, like all big ideas. On a tread of regular thickness is moulded a series of cup-shaped rubber knobs which exert a vacuum hold on wet and greasy pavements. Slipping in any direction is im-

possible. The rolling of the wheel releases each cup automatically by raising one side first, so that forward speed is not retarded.

In snow and mud the knobs sink in and provide a better hold and better "traction" than any other form of non-skid.

Longer Service is a strong feature of Pennsylvania Vacuum Cup Tires. Even when the rubber knobs wear down, the tire is still as good for service as a smooth tread tire of regular thickness.

You combine the essential qualities of Safety and Economy by using these non-skid and long wearing tires.

About Electric Vehicle Schools.

At this time the establishment of electric vehicle schools, the suggestion of which recently was let fall, scarcely is feasible. Certainly they could not be profitably maintained as separate institutions, but the suggestion is such a good one that it would appear that the more enterprising of the many so-called "automobile schools" should make haste to add a course of electric vehicle instruction to their curriculum.

While there is not nearly so much that is complex or mysterious about electrics as there is about gasoline cars, there prevails a surprising amount of ignorance regarding the comparatively little there is to be learned. Without much outlay, the existing schools easily may impart such instruction to their pupils, and it is of such a nature that most of the "graduates" will be more truly competent to handle and care for electrics than is the case with men who become "gas car experts" as the result

of six weeks' tuition in one of these schools.

There is no question that the electric vehicle now is "looking up" as it never has "looked up" and that it affords opportunities which are not to be denied and which will be immensely enlarged the very day that any manufacturer summons the necessary courage and capital to produce electric cars in sufficient quantities to permit of the establishment of what may be termed a truly popular price.

While it is wholly unlikely that the electric ever will seriously threaten the gasoline car, there is small room for doubt that a popular price instantly will be followed by a tripling or quadrupling of its sales. The garage problem and the chauffeur problem—the latter of which is akin to the servant girl question—have left many owners of gasoline cars in a frame of mind which inclines them toward the electric, and in a number of known instances already has resulted in their purchase of electric cars, which minimize if they do not entirely solve the problems.

The Way to Stop Joy Riding.

According to the last report of the secretary of the so-called National Highways Protective Society—which report, as usual, was rendered to the newspapers—89 persons were killed and 855 injured on the streets of Greater New York during the first 10 months of the current year. The number of casualties due to other vehicles is not given. In rendering his report the secretary, who practically is the whole society, rates "the 'joy rider' and the 'night-hawk' cabman as the most dangerous factors to life and limb in the city," to which the activities of the society, despite its formidable title, are almost wholly confined.

Notwithstanding the manifest desire of the secretary to make undue capital of automobile accidents, and despite his admission, once made to a Motor World representative, that he "played up" such accidents because that policy brought the most contributions to his till, the work of the society is not to be despised; it has exerted a good influence, if nothing more, and its conclusion that the "joy rider" and the "nighthawk" cabman are the chief perils of the highway is well within reason. Perhaps those evils always will be with us in greater or less degree, for certainly the law aimed at the "joy rider" and which makes his crime a felony has failed woefully as

a means of greatly reducing the offense.

"Joy riding" continues to flourish to an extent almost beyond belief and fully known only to garagemen and chauffeurs. The garage which does not house at least one chauffeur given to nightly theft of his employer's car probably is the exception and not the rule; most of them house more than one such culprit. There are garages which are perfect hotbeds of "joy riding," but for some reason the average garageman and the average chauffeur consider themselves interdependent. They protect each other, so to speak, from the car owner who pays both for honest service. The protection is carried to great extremes.

In one recent instance the garageman, who himself had a car for rent, wailed continually because a chauffeur on his premises was "hacking" his employer's car at less rates than the garageman considered fair competition. But despite his knowledge the garageman failed to notify the car owner of the almost nightly theft and misuse of his property. It continued until finally the crook lost his job, and even then he was permitted to hang around the garage until the garage owner was given a stern choice by another patron of his establishment who had discovered that his own car was being similarly misused.

This may be an extreme case, but the fact remains that "joy riding" cannot long continue without the knowledge of the garage owner and his night superintendent. They can come pretty close to stopping it whenever they will and whenever they cease to seek subterfuges and begin giving the car owner a square deal and the protection for which he pays well. Since it is apparent, however, that many garagemen will not apply the remedy that is within their own hands, the A. A. A., the Highways Protective Society or some other body should induce the Legislature to apply the remedy. For joy riding can be stopped, and quickly. Simply so amend the anti-joy-riding law that the garage owner or the garage superintendent, or both, shall be made accessories to the crime committed by the chauffeur. Such a law instantly will not merely clarify the garage atmosphere, but it will make the highways safer and save many lives and many limbs, all of which are objects well worth serving. When everything else failed to stop racetrack gambling, a law of the sort which made the track owners and directors personally culpable stopped it instantly and effectively.

Detroit, Mich.—Cass Automobile and Repair Co., under Michigan laws, with \$10,000 capital; to deal in automobiles.

Chicago, Ill.—National Spring Tire Co., under Illinois laws, with \$125,000 capital. Corporators—Charles H. Sigman, Jr.; Louis Valance, Charles H. Jackson.

Rochester, N. Y.—Plymouth Garage Co., under New York laws; to maintain garages. Corporators—C. Burton Nye, C. Eugene Barker, Charles E. Maselli.

Tulsa, Okla.—Southwestern Auto Co., under Oklahoma laws, with \$1,000 capital; to deal in automobiles. Corporators—J. D. Gibby, Carl C. Magee, Hull Hancock.

Evansville, Ind.—F. W. McNeely & Co., under Indiana laws, with \$25,000 capital; to deal in automobiles. Corporators—Chester Ranking, F. W. McNeely, Alice McNeely.

Dallas, Texas—Indiana Motor Car Co. of Indianapolis, Ind., under Texas laws, with \$10,000 capital; to deal in automobiles and motor vehicles in the State of Texas.

Columbia, S. C.—Etheredge Motor Co., under South Carolina laws, with \$10,000 capital; to deal in automobiles and motor vehicles. Corporators—E. J. Etheredge, Robert L. Mitchell.

Marion, Ind.—Auto Machine Co., under Indiana laws, with \$10,000 capital; to deal in automobiles, motor vehicles and supplies. Corporators—G. D. Lindsay, B. A. Tong, R. E. Breed, Sr.

New Haven, Conn.—Pyramid Automobile Co., under Connecticut laws, with \$5,000 capital; to deal in automobiles and motor vehicles. Corporators—Walter H. Goodrich, Henry P. Johnson.

Chicago, Ill.—Federal Motor Car Co., under Illinois laws, with \$10,000 capital; to deal in automobiles and motor trucks. Corporators—Carey W. Rhodes, David F. Rosenthal, Leo S. Kositchek.

Seattle, Wash.—The Arcticmobile Co. of Seattle, under Washington laws, with \$1,000,000 capital; to manufacture and deal in automobiles. Corporators—Sam B. McCrea, F. G. Horner, and others.

St. Louis, Mo.—Mack Motor Truck Co. of St. Louis, under Missouri laws, with \$25,000 capital; to deal in motor vehicles. Corporators—Frank J. Buch, Knox Tausig, T. S. McPheeters, William A. Thomas.

Detroit, Mich.—Chevrolet Motor Co., under Michigan laws, with \$100,000 capital; to manufacture and deal in automobiles and motors. Corporators—Louis Chevrolet, Edwin R. Campbell, William H. Little.

Flint, Mich.—Little Motor Car Co., under Michigan laws, with \$1,200,000 capital; to manufacture automobiles and motor ve-

hicles. Corporators—W. H. Little, Detroit, Mich.; C. M. Begole, W. S. Ballinger, Flint, Mich.

Cincinnati, Ohio—Muhle Motor Car Co., under Ohio laws, with \$20,000 capital; to deal in automobiles and motor vehicles. Corporators—Henry M. Muhle, John C. Miller, Ida A. Muhle, Mary Smith, Elizabeth Muhle.

Chicago, Ill.—General Auto and Repair Co., under Illinois laws, with \$25,000 capital; to deal in automobiles, operate taxicabs and maintain a garage. Corporators—W. R. Potter, George H. Davis, Jr., Frank H. T. Potter.

New York City, N. Y.—Benford Manufacturing Co., under New York laws, to manufacture and deal in motor vehicles. Corporators—G. Brauburger, Elizabeth, N. J.; E. I. Kleinfeld, M. Klein, both of New York City.

Conneaut, Ohio—Trio Horn Manufacturing Co., under Ohio laws, with \$25,000 capital; to manufacture warning signals for automobiles and motor vehicles. Corporators—Ire E. Stump, B. E. Gordon, F. B. Kavanaugh, George Collings.

Brooklyn, N. Y.—Bedford-Bergen Auto Exchange, under New York laws, with \$25,000 capital; to manufacture automobiles, machinery and motor supplies. Corporators—M. Keve, R. Brown, Brooklyn, N. Y.; C. Goldstein, New York City.

Indianapolis, Ind.—The Hoosier Motor Club, under Indiana laws, to promote good roads. No capital. Corporators—Charles A. Bookwalter, H. C. Smith, J. W. Selvage, C. W. Sedwick, H. H. Price, C. L. Diers, Homer McKee, Bert A. Boyd.

Portsmouth, Ohio—Portsmouth Automobile and Machine Co., under Ohio laws, with \$10,000 capital; to manufacture and deal in automobiles. Corporators—Lincoln Poole, Walter O. Ruhlman, Roy A. Oakes, Filmore Musser, Edward C. Riegel.

St. Louis, Mo.—Schelp-Budke Tire and Rubber Co., under Missouri laws, with \$10,000 capital; to manufacture and deal in automobile tires and rubber goods. Corporators—Conrad Budke, C. M. Schelp, W. F. Schelp, George H. Schelp, H. A.

Bradford, Pa.—Bradford Auto Exchange, under Pennsylvania laws, with \$30,000 capital; to manufacture and deal in automobiles. Corporators—F. H. Head, L. I. Holmes, F. H. Logan, all of Bradford, Pa.; S. L. Libbits, Custer City, Pa.; F. L. Gallup, Smithport, Pa.

Increases of Capital.

Buffalo, N. Y.—Thomas Motor Co., from \$50,000 to \$100,000.

Birmingham, Ala.—Highland Garage Co., from \$5,000 to \$25,000.

Minneapolis, Minn.—The Thomas Motor Cab Co., from \$50,000 to \$100,000.

Milwaukee, Wis.—The Waverley Manufacturing Co., from \$25,000 to \$50,000.

November 20-25, Indianapolis, Ind.—Indianapolis Automobile Trade Association's fall opening.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

November 30, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

November 30, Los Angeles, Cal.—Race-meet at Los Angeles Motordrome.

December 25-26, Los Angeles, Cal.—Race-meet at Los Angeles Motordrome.

January 2-10, New York City, N. Y.—Importers' salon at Hotel Astor.

January 6-13, New York City—Automobile Board of Trade's 12th annual show in Madison Square Garden. Pleasure vehicles only.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual national show in New Grand Central palace. Pleasure and commercial vehicles.

January 13-19, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's annual show in Auditorium.

January 13-27, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show in First and Third Regiment Armories.

January 15-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden. Commercial vehicles only.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-27, Providence, R. I.—Rhode Island Licensed Automobile Dealers' Association's show in the State Armory.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show at Wayne Garden.

January 27-February 3, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in the Coliseum and 7th Regiment Armory. Pleasure vehicles only.

February 5-10, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

February 17-24, Newark, N. J.—New Jersey Automobile Exhibition Co.'s annual show in First Regiment Armory.

March 2-9, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics' Hall. Pleasure vehicles only.

HOFFMAN USED THE LEAST GASOLENE

And Therefore Earned Chief Honors in Harrisburg's Chilly Economy Contest—Averages 20 Miles per Gallon.

Seventeen Pennsylvanians partook of the doubtful joys of near-winter touring on Monday last, 13th inst., when they covered 104.5 miles in the course of an economy contest under the auspices of the Harrisburg Motor Club. The route was from Harrisburg to York, Pa., over fairly good roads, and all save two of the starters survived. Roy Hoffman, driving a 1912 self-starting Hudson belonging to J. W. Dill, carried off the honors by consuming but five gallons and one-eighth of a pint of gasoline for the entire trip. Murray Dick, also driving a Hudson, and C. C. Crispen, at the wheel of a Cadillac, were close runners-up.

The day was too cold for pleasure and the contestants ran ahead of schedule, but as the time did not figure in the awards the speeding made no difference in the results. The two sufferers of the contest were George G. McFarland, driving a Reo, who skidded and broke the rear axle, and D. Menker, who was compelled to withdraw on account of leaks in the water and gasoline connections of his Kline.

The contestants and their records were as follows:

Driver and car.	Gals.	Qts.	Pts.
Roy Hoffman, Hudson	5	0	$\frac{1}{8}$
Murray Dick, Hudson	5	1	1
C. C. Crispen, Cadillac	5	1	$1\frac{3}{4}$
J. W. Dill, Inter-State	5	2	$1\frac{3}{4}$
H. D. Delmott, Cadillac	5	3	$\frac{1}{2}$
J. C. Crispen, Cadillac	6	0	$1\frac{1}{4}$
W. P. Starkey, Cadillac	6	1	0
R. L. Morton, Chalmers	6	1	$\frac{1}{2}$
E. L. Craft, Flanders	6	3	$1\frac{1}{2}$
C. E. Covert, Cadillac	7	2	$\frac{1}{2}$
G. C. Furl, Everitt	7	2	1
John Gallagher, Chalmers	7	2	$1\frac{1}{2}$
J. L. Craft, E-M-F	7	3	$1\frac{1}{8}$
J. H. Banfer, Hudson	8	3	0
J. A. Kline, Kline	8	3	$1\frac{1}{2}$
D. Menker, Kline	Withdrawn		
G. G. McFarland, Reo	Withdrawn		

Witt and Evans Break Small Car Records.

When they decided to test the speed of the two Flanders cars which have been entered in the Savannah (Ga.) road races the Studebaker Corporation killed two birds with one stone. The cars were not only tested to the fullest satisfaction, but official records were established at the same time. A. A. A. sanction having been secured. The tests were made on the Indianapolis (Ind.) Speedway Monday last, 13th inst., and new marks hung up were for cars of less than 160 inches displacement at one, five, 10, 15 and 20 miles. Chairman F. E. Edwards of the A. A. A. technical committee was in charge, assisted by C. W. Sedwick, Indiana representative of the A. A. A. C. H. Warner was the official timer. No attempt was made to break records for more than 20 miles, as both Frank Witt

and Robert Evans, who piloted the cars, suffered from the cold. The times were:

Frank Witt, Class B, stock chassis—One mile, 0:56.80; five miles, 4:22.98; 10 miles, 9:27.49; 15 miles, 14:13.26; 20 miles, 19:00.87.

Robert Evans, Class C, non-stock—Five miles, 4:26.10; 10 miles, 8:53.95; 15 miles, 13:24; 20 miles, 17:54.70.

Savannah Profits to Go to Militia.

All of the net profits of the Grand Prize, the Vanderbilt Cup and the light car races to be held at Savannah on November 27th and 30th will go to the military companies of that Georgia city, which will again guard the course. The Savannah militia, which is composed of commands having a long and proud history, six of the 14 companies being more than 100 years old, has always co-operated actively with the officials of the Savannah Automobile Club in promoting past events. To their efficiency in guarding the course in the previous Grand Prize races is attributable the securing of that race and the acquisition of the Vanderbilt Cup race this year. In none of the three big races held in Savannah has there ever been an injury to a spectator, except to one man who received the point of a bayonet in his side when he insisted on attempting to cross the course during the progress of the first Grand Prize race. During the forthcoming races and as heretofore no one will be allowed on or close to the course who is not armed with a pass signed by Mayor Tiedeman and countersigned by Colonel O'Leary, commanding the volunteer militia.

French Grand Prix to Go 1,200 Miles.

The French Grand Prix for 1912 will be a two-days affair, according to the decision just reached by the Sport Commission of the Automobile Club de France, under the auspices of which the race will be held. The rules provide for the negotiating of 1,000 kilometers, or about 600 miles, on the first day, and the same distance on the second day. The times for the two sections to be added and the winner determined by the combined time. The race is free-for-all, regardless of cylinder dimensions, horsepower or weight. For light cars a like event is carded covering the same distance concurrently with the big car race. A prize of \$5,000 will go to the winner, while a number of bonuses and smaller prizes will go to swell this amount considerably. The race will take place early in July, 1912.

Chicago "Insurgents" Want Kelly.

Similar to their action last year the "insurgents" in the Chicago Motor Club have started a movement to put another ticket in the field for the annual election of officers which takes place December 5. When the nominating committee of the club announced that Charles E. Gregory, the present treasurer, would head the ticket to succeed David Beecroft, the "insurgents" at once started a boom for John H. Kelly.

BERT DINGLEY IN FRONT AT PHOENIX

Survivors of Desert Race Meet on Track—Dingley There Beats Herrick But Herrick's Car Scores a Win.

Although out of the running in the Los Angeles-Phoenix road race, Bert Dingley, at the wheel of a Pope-Hartford, easily captured the lion's share of the spoils at the race meet held in Phoenix, Ariz., Thursday last, November 9th. The meet was held under the auspices of the Maricopa Automobile Club and constituted one of the attractions of the State fair then in progress. It was unusual in that all the cars that competed were the same that had crossed the great American desert in competition a few days previously. Some of the contenders who piloted those cars during the 542 miles from Los Angeles, Cal., did not appear on the track, however, electing to trust their cars to other drivers. This was true even in the race at 10 miles for the first four cars that finished the big race, as Swanson, who won, was at the wheel of Herrick's National, while Beaudet drove Bramlette's Cadillac and Guy Irwin steered Ralph Hamlin's Franklin into second and third places, respectively.

In the 25 miles event Bert Dingley gave an exhibition of the speed which enabled him to reach Phoenix a few minutes after Harvey Herrick on the preceding Monday. Dingley swung the Pope-Hartford 25 times around the mile course in 23 minutes and 52.96 seconds, with Herrick a close second. In the Los Angeles-Phoenix race Dingley was the second to check in at the finish, but in order to do so on account of accidents on the road he had to travel all night. This kept him out of the prize money, because in calculating the running time his car was near the bottom of the list. He, however, attached himself to three purses at the track meet, which in a manner helped to relieve his disappointment. Dingley also established a new track record for the mile course of 52.75 seconds and won the free-for-all at 10 miles.

Probably the most interesting contest was the 10 miles free-for-all handicap which was won by Swanson (National), who started from scratch. This was the last event of the day. For nine miles Swanson was hard pressed by Harris Hanshue (Mercer), who had 15 seconds start and appeared to be the winner. In endeavoring to forge ahead on the final turn the Mercer's wheel struck a post and the car swerved into the fence. Hanshue was thrown out and so badly injured that he was taken to a local hospital. In the 10 miles race for small cars Hanshue won easily. He was also third in both the 25 miles free-for-all and the 10 miles free-for-all.

The 10 miles race for cars over 301 inches

displacement was won by Frank Seifert, driving a National. There was some changing of the lead until near the finish, when Seifert put several lengths between the National and Louis Nikrent (Buick) and Guy Irwin (Franklin), who finished in the order named. Fred Fuller, driving a Mercer, skidded into the fence during the ninth mile, badly damaging the car, but escaping personal injury by good luck.

The summary:

One-mile trials—Won by Bert Dingley (Pope-Hartford), time 0:52.75; second, Frank Seifert (National), time 0:53.81; third, Purdy (Midland), time 1:05.56; fourth, W. E. Ferguson (Buick), time 1:05.67.

Fifteen miles for cars which participated in the Los Angeles-Phoenix race, over 301 inches displacement—Won by Frank Seifert (National); second, Louis Nikrent (Buick); third, Guy Irwin (Franklin); fourth, Tom Carrigan (Midland). Time, 13:37.67.

Ten miles for cars which participated in the Los Angeles-Phoenix race, under 300 inches displacement—Won by Harris Hanshue (Mercer); second, William Bramlette (Cadillac); third, William La Casse (E-M-F); fourth, W. B. Brong (Case). Time, 10:34.05.

Twenty-five miles, free-for-all cars in the Los Angeles-Phoenix race—Won by Bert Dingley (Pope-Hartford); second, Harvey Herrick (National); third, Harris Hanshue (Mercer); fourth, Frank Seifert (National). Time, 23:52.96.

Ten miles for the first four cars to finish the Los Angeles-Phoenix race—Won by Swanson (National); second, Beaudet (Cadillac); third, Guy Irwin (Franklin). Time, 10:16.36.

Ten miles, free-for-all—Won by Bert Dingley (Pope-Hartford); second, Swanson (National); third, Harris Hanshue (Mercer); fourth, Johnny Jenkins (Cole). Time, 9:13.36.

Ten miles, free-for-all handicap—Won by Swanson (National), scratch; Ralph Hamlin (Franklin), 15 seconds. Time, 12:07.69.

Considers Northern Route Infeasible.

B. O. Tilden, the New York "sanitation expert," who several months ago started on a transcontinental trip in a Stoddard-Dayton touring car, during which he visited about 40 States and covered 26,000 miles, and who visited Vancouver, B. C., via the Southern route and along the Pacific coast, reached New York on the return trip on November 6th. According to his statement the southern route will be the only feasible one for continental touring, as the hardships met with on the northern route are too great at present to find favor with the average motorist. The return trip from Vancouver led through Washington, Idaho, Montana, and it was while crossing the Cascade, Coeur d'Alene and Rocky mountains that he encountered the worst road conditions, including deep snowdrifts and blizzards.

"EXHIBITIONS" ON A BAD TRACK

Unusual Racing at San Antonio When Real Competition is Forbidden—Fire Marks the Regular Program.

Confronted by the dangerous condition of the Fair Grounds track in San Antonio, Tex., Thursday last, 9th inst., the officials of the San Antonio Automobile Club were compelled to declare all the races off for the day. But, strange to say, races were run, nevertheless. They truly were "exhibition races," which usually are fake races, but on this occasion they lacked their sting. There was a good crowd present, and in order not to wholly disappoint the drivers, after being told that no purses would be awarded, agreed to give as much of the regular program as possible and "not run any faster than the condition of the course would allow them to do safely." Despite these novel conditions the speed was fast enough to make the dust fly on the three-quarters of a mile course, which was very rough. John Raimey, driving a Cino, was more than half the show, as he won all of the "exhibition races" in which he started and did the same thing on Saturday, when the regular program was taken up. A four-mile match between George Clark (Cutting) and M. A. Holmes (Jackson) on each day was won by Holmes. On Saturday a four-hour race was stopped because of an accident to a Flanders driven by John L. Potter. It caught fire, Potter being singed and his mechanic, Walter Regan, seriously burned. At the time the race was stopped Charles Thatcher (Ohio) and C. K. Sutherland (National) were a lap in advance. The accident occurred when the tank was being replenished with gasoline, a spark from the exhaust setting the fuel afire. The car was badly damaged. The spectators showed symptoms of panic and the officials deemed it wise to stop the race. The summary:

Thursday, November 9th.

Twelve miles, Class C, 231-300 inches displacement—Won by John Raimey (Cino); second, William Dunne (Pope-Hartford); third, Joe Nikrent (Staver-Chicago). Time, 19:29.

Four miles, match—George Clark (Cutting) vs. M. A. Holmes (Jackson). Won by Holmes. Time, 6:08.

Twenty-one miles free-for-all—Won by John Raimey (Cino); second, M. A. Holmes (Jackson); third, Charles Thatcher (Ohio). Time, 31:06.

Saturday, November 11th.

Twelve miles, Class C, 231-300 inches displacement—Won by John Raimey (Cino); second, Gus Monckmeier (Staver-Chicago); third, Carl Reeves (E-M-F). Time, 15:49.

Four miles, scratch—George Clark (Cutting) vs. M. A. Holmes (Jackson). Won by Holmes. Time, 4:22.

Twenty-one miles, free-for-all—Won by John Raimey (Cino); second, M. A. Holmes (Jackson); third, Gus Monckmeier (Staver-Chicago). Time, 24:29.

Where Royal Family Is Punished.

In Germany, at least, members of the royal family are not exempt from arrest for violating the speed laws, as was proven recently when the Emperor's third son, Prince August Wilhelm of Prussia, and his chauffeur were haled before a Berlin magistrate and fined \$3.75 and costs for exceeding the speed limit. In court the chauffeur assumed responsibility and the fine was assessed against him, but it was paid by his royal employer. However, although the Prince's personal dignity was saved by the chauffeur in court, the legal scion of the Hohenzollerns will have more difficulty with his father, since the Emperor, displeased with the number of automobile accidents in which members of his family figured, some time ago gave notice that an offending Prince (or Princess) might have the machine confiscated. Before this mandate was issued the Crown Prince, Crown Princess and Prince August Wilhelm had figured in accidents. The latter met with a mishap near Berlin, but his adjutant by personal appeal to proprietors of Berlin newspapers and foreign correspondents succeeded in keeping the incident from His Majesty's eyes. Whether he will be equally successful with the court records remains to be seen, for the Kaiser is not a person to take liberties with.

Clubs and Club Elections.

Motorists of Dakota City, Neb., have organized the Dakota County Good Roads Association with the following officers: President, Ed. T. Kearney; vice-president, Roy Armour; treasurer, John L. Hazlegrove; secretary, O. W. Fisher. The new body will become affiliated with the A. A. A.

The Furnas County Automobile Association was formed last week at Arapahoe, Neb., and will affiliate with the A. A. A. State association. The officers are: President, Dr. J. M. Prime, Oxford; vice-president, T. M. Davis, Bever City; secretary-treasurer, C. D. Blauvelt, Arapahoe.

Under the title of Dothan Automobile Association motorists of Dothan, Ala., have formed a club with the following officers: Chairman, C. J. Faulk; secretary-treasurer, R. W. Lisenby; governors, the officers, D. C. Carmichael, E. R. Porter, W. C. Howell, J. N. Street.

Under the name the Holt County Automobile Club motorists of Holt County, Neb., have formed an association in O'Neill, Neb., with these officers: President, Judge Harrington; secretary-treasurer, Frank Campbell, Jr.

LITTLE NEW AT LONDON

Three New "Poppetless" Engines the Chief Startlers—Worm Drive Makes Great Gains—Small Cars With Small Motors Conspicuous—Few New Bodies.

The annual Olympia show—the Mecca of the British and foreign motorist—which each year is held in London, is over. The doors were closed on the 11th inst., and for the tenth successive year foreign automobile practice was exhibited and admired and criticized during eight whole days and half of as many nights. To the casual visitor who just "dropped in" or the experienced owner—and most of the visitors belonged in the latter classification, for the British motorist takes his motor cars seri-

ously—and at a very much decreased maintenance cost, and this is probably the real reason for their popularity.

Though very nearly every known make of British and other foreign car was exhibited, American products were not overshadowed and loomed large, particularly in view of the fact that their merits are coming to be more and more appreciated by those who a few years ago laughed at what they styled the "American invasion." No less than 15 brands of American cars were on view, including the Overland, Hupmobile, Mitchell, Ford, Regal, Flanders, Maxwell, Krit, E-M-F, White, Stoddard-Dayton, Hudson and Cadillac.

Block construction continues to be the favorite method of forming the cylinders and is particularly applicable to the small, light engines. The tendency, at one time pronounced, toward coring intake and exhaust passages has not been developed to any great extent. Those manufacturers who last year featured this construction

thy of note because of the almost minute size of their cylinders. The first of these is the Delahaye, in which the cylinders measure 75 x 120 mm., or approximately 2 15/16 x 4 23/32 inches. This engine, it may be remembered, created quite a sensation at the last exhibition by reason of the fact that its cylinders are cast en bloc and arranged in V form. The other is the Delage, and in it was revealed the smallest six cylinder engine at the show. Its cylinders measure 65 x 126 mm.—2 9/16 x 5 inches.

The tendency toward long strokes is more in evidence than ever, not a few engines having strokes of twice their bores. As a general rule, however, the usual stroke-bore ratio is one and one-half to one, or in other words, a stroke that is half as long again as the bore. The "square" engine has almost entirely disappeared and with a single exception every new engine that has been brought out is of the long stroke variety. Reciprocating parts have been lightened, pressed steel pistons are gaining in favor and connecting rods have been lightened in several instances by drilling them out, while in one case tubular connecting rods are used.

Of the exponents of the Knight type of sliding sleeve engine, the Daimler, of course, heads the list and the engine remains practically the same except for the addition of what is styled a periodicity damper. In construction the damper is really a miniature multiple disk clutch by means of which the fan driving pulley is actuated; the pulley is attached to the end of the crankshaft. Periodic torsional strains in the crankshaft, which manifest themselves as vibrations at critical engine speeds are damped by the revolving mass of the outer casing, which is really the fan pulley, through its frictional contact with the crankshaft through the disks. The Minerva engine also is equipped with this damper but otherwise remains unchanged. Messrs. Panhard and Levassor have brought out a diminutive Knight engine with its 80 x 130 mm. cylinders cast in pairs. Other Knight engines which were shown were the Deasy and the B. S. A. One of the recent additions to the Knight engine ranks is the Rover, which appeared in single and twin cylinder form, the engines themselves retaining all of the original Knight features without alteration.

Other types of sleeve and rotary valve engines, too, have received a big boost in the past and no less than three new types were shown in addition to the Hewitt piston valve engine which now has been on the market for some time but which has made little headway in public esteem. Of these new engines, the Argyll is the only one in which sleeve valves are used, and it is similar to the Knight except that but one sleeve is used in each cylinder, the sleeve rotating circumferentially backward and forward as it reciprocates. The other two are rotary valve motors, the Darracq

OUTRE COACHWORK—A "PARK ROYAL LANDAU"

ously—a great deal more seriously and with a great deal more of delving into details than does his American cousin—there was much to wonder at even though there was little that was startlingly new. Rather, the show was another exhibit of the traditional conservatism of the populace "overseas."

Fulfilling the promise of last year's show and following the well defined tendency which has been apparent for a number of years, the principal feature was the almost overwhelming number of small cars—two and four seaters, as they are styled "at home," with tiny motors that belie their looks when it comes to a showdown and real power and reliability are required. In a way, however, there is nothing remarkable in this increase in small cars. It is simply the outcome of popular demand. Gasolene costs nearly twice as much abroad as it does in America, and to offset this disadvantage it is necessary that a greater number of miles per gallon be obtained. Another reason is that taxation is extremely high. Also British roads generally are good and it has been demonstrated that light cars with diminutive motors can cover the ground as well as their larger

adhere to it, though the majority prefer to stick to the older method of leaving the manifolds out in the open.

One of the notable variances in the practice of enclosing everything possible is evident in the new Sizaire engine which is shown for the first time. Not only are the intake and exhaust passages enclosed—cored in the casting—but the magneto and carburetter as well are mounted within the crankcase housing, giving to the engine the appearance of a rectangular box, with nothing outside except very small intake and exhaust manifolds. Carburetter and magneto are made instantly accessible by the removal of an aluminum plate which also serves to cover the intake valve mechanism; the exhaust valves are located on the opposite side and are similarly enclosed by means of a removable plate.

Six cylinder engines, of course, are very much in evidence, though the number of manufacturers who list them for the first time shows no remarkable increase. Among the more noted of the six cylinder exponents are such stable products as the Napier, Sheffield-Simplex, Wolseley, Arrol-Johnston, Renault, Belsize, Talbot and Vulcan. Two others are particularly wor-

operating on the Henriad principle and the Itala embracing a single rotary valve for exhaust and intake for each pair of cylinders.

One of the significant features which everywhere was noticeable was the great increase in the number of silent chain cam shaft drives. The movement in favor of this method of construction almost has attained to the proportions of a landslide. The strife for quietness is largely responsible for the movement and manufacturers have not been slow to appreciate the merits of the silent chain in this respect in its application to that part of the engine. Benz, Crossley, Sunbeam, Standard and Singer are among the more prominent engines which are so equipped, the Singer being one of the latest converts. The methods of application differ widely, though practically all manufacturers make provision for adjustment of the chains. In the Crossley, there is an ingenious method for timing the magneto as well as provision for lengthening the chain wheel centers.

Ignition is largely by magneto with variable spark timing. There are quite a few cars in which the spark timing is fixed, and in not a few others automatically controlled advance and retard are provided. Carburation methods show very little difference, the single jet carburetter still being in greater favor, though double and triple jets slowly are becoming more popular. Similarly, thermo-siphon cooling is used mostly but is not confined so strictly to small engines as was the case a year ago. Several manufacturers of larger engines have been converted by the simplicity of the system and have come out strongly in favor of it.

The immensely increased popularity of the worm drive really was one of the greatest features of the show. As the original exponent of the overhead worm, the Dennis heads the list, and the manufacturers of Standard cars as well have adopted the same style for some models, though on others the bevel drive is maintained. Lanchester cars, of course, are worm driven, the worm being below the worm wheel and the Straker-Squire car also embodies the same type of drive, this being the first time that these cars have been so equipped. Minerva cars now may be had with either worm or bevel gear, but as indicating that not all manufacturers believe in the efficiency of the worm drive, it is recommended that the standard type of bevel drive be specified for open cars. As a still further indication of the same nature, Sunbeam cars no longer are worm driven, the manufacturers after having experimented with it for a year having returned to the bevel drive. In spite of these instances, however, the increase in the number of worm driven cars was nothing short of remarkable, and insofar as can be judged by present indications, the increase will be still greater in the future.

Another of last year's tendencies which it was expected would have shown considerable development concerns self-starters. As a matter of fact, the increase in the number of cars equipped with self-starters scarcely is noticeable. Those that have made their appearance are mostly of the compressed air type, and of these the equipment on Adams and Scat cars caused the greatest comment. In both air is compressed by means of a plunger pump run by the engine and stored in a steel cylinder. A button on the dash serves to liberate the air which is led to the cylinders and distributed by means of a rotary valve much after the manner made familiar in America by the Winton Motor Carriage Co. and others. In both, the air also is used for inflating tires, and with the Adams a pneumatic jack for raising the car is included.

As marked as was the tendency toward four speed change gear mechanisms last year, it is even more marked this year, and

usual way by means of spur gears, it being impracticable to employ a chain for this purpose.

As was predicted, the adoption of Knight engines and worm-driven rear axles abroad has resulted in a stimulation of the efforts of manufacturers to quiet other parts of their cars which previously had received little attention of the sort calculated to reduce slight noises. One of the more noticeable attempts of this kind which recently came to light is the adoption by the manufacturers of the Rover car of a silencer attached to the carburetter air intake pipe. As is generally known, all carburetters emit a hissing sound due to the suction of the engine, and this varies in intensity according to individual construction. The silencer is quite similar to the ordinary form of muffler such as is used to silence the exhaust, except that it is minus the customary baffle plates. It is cylindrical in shape, about three inches in length and approximately twice the diam-

ONE OF MULLINER & CO.'S LIMOUSINE BODIES—THE "CLERESTORY"

it almost might be said that nine cars out of the proverbial ten are so equipped. As a general rule they are of the sliding gear type with gate change and are mounted centrally on the chassis. Rear axle mounted gear boxes are not very much in favor, though the manufacturers of the Sheffield-Simplex cars have been more than ordinarily successful with this arrangement.

Though it was hinted during the last Olympia show that the coming season would show a considerable increase in the number of cars equipped with silent chain "gear" boxes, the forecast was premature. Only one chain driven change gear mechanism made its appearance and it was in a Maudsley car. The principle of the mechanism is fairly well known, of course, because of its continued use with such marked success by the London General Omnibus Co. In the Maudsley box, however, four speeds ahead and reverse are provided, instead of the three and reverse obtainable with the other. Also the Maudsley mechanism differs from the other in that there is no direct drive, all four speeds being obtained through the medium of the chains. Reverse is obtained in the

eter of the intake pipe to which it is attached. Air is admitted through a number of small round holes in the "barrel" of the device, and it is claimed that the hissing is effectually silenced without impairing the efficiency of the carburetter.

Wire wheels continue to enjoy the favor which steadily has been increasing, and still are one of the distinguishing marks by which a foreign car can be "spotted" immediately. Though front wheel brakes still are used on a number of cars, manufacturers have not been falling over themselves in efforts to adopt them and no new applications have made their appearance. As a matter of fact, one manufacturer has discarded his front wheel brakes and returned to the older method of locating all brakes on the rear wheels.

Regarding body styles, there is no doubt but that the influence of the torpedo and high closed front effects is being felt to a greater extent now than ever before. Owing to the diminutive engines that are used to a great extent it is not always possible easily to reconcile the apparently large and heavy bodies and the small engine hoods. Consequently tapered hoods and long

skuttles are the rule, and by judiciously proportioning fenders and running boards pleasing exteriors have been evolved, though many of the cars still retain the unmistakably British "dumpy" appearance.

Inside the cars greater attention has been given the comfort of passengers; seats are better proportioned and are lower than heretofore. The angle at which the seats are set also has been modified in the majority of cases so as to permit of an easier, lounging position. It is in the closed cars that the greatest amount of improvement is noticeable, however. They are better proportioned throughout and the appearance which some of them presented or having been merely "slapped on" to any old chassis has been lost to a considerable degree.

Of freak bodies there were few, the one which attracted the most attention being shown by Brown, Hughes & Strachan. It is styled a "Park Royal Landau" and resembled nothing ever before turned out by

COFFIN TALKS ON "CLEAN DESIGN"

At London Session American Engineer Tells British Brethren What It Implies—An Epochal Occasion.

It is not often that the "high point" of an undertaking is reached almost before it has commenced. In this respect the visit of the Society of Automobile Engineers to London, which in itself is epochal, was unusual. The Americans landed in London on the 7th inst., and the very next day they reached the "high point" of their visit—the joint technical meeting with the Institute of Automobile Engineers.

There may be individuals who consider that the Olympia show, or the banquet tendered by the Institute on the 9th, were higher points, but when a representative number of a representative engineering and

poraneous and general in character, and knowingly or unknowingly it struck the Britishers where they are weak. They love "fixings" and lots of them, and they appear to love ponderosity, and when they combine both they seem to imagine that money can buy no more.

When Coffin took as his text "Clean Design" he therefore struck at cherished traditions. For "clean design," he told his hearers, meant simplicity, the elimination of every unnecessary part in every feature of the chassis. Mr. Coffin stated that "clean designs"—cars free of rods and clattering of iron and steel—were an absolute certainty within the next few years, according to the trend of the principles of engineering practice. He expressed the belief that this constantly increasing simplicity would make the automobile more easily understandable to men not of a mechanical turn of mind and render it possible for women to drive the gasoline car, and that "clean design," like the elimination of

STANDARD ROLLS-ROYCE LIMOUSINE AND AN ENCLOSED DRIVE "TWO SEATER"

an automobile manufacturer. In appearance it is an old-style park landau of the early Victorian period, the rear part of the body containing two pairs of seats arranged so that the occupants face each other. This portion of the body is equipped with a special sort of double landaulet top which when raised completely encloses the rear seats.

As usual, inside driven coupes occupied a prominent place in the show though there was little of novelty apparent in any of them. Limousines, too, were well represented, and one by Mulliner & Co., styled a "Sociable Limousine," possessed a number of unusual features. As its name suggests, all the seats are enclosed, though the body differs from the usual enclosed limousine in that there is no partition between the driver's compartment and that reserved for the other passengers. The skuttle dash is exceptionally deep and the glass front is V-shaped to reduce wind resistance. But two doors are provided, one on each side, and either gives access to all of the seats, three of which are of the swiveling armchair variety. The driver's seat also is an armchair and it is adjustable so that the easiest driving position can be obtained.

industrial organization crosses the sea not merely to exchange courtesies but at a joint session to exchange ideas with the trained representatives of a similar body representing another nation—when this occurs, it is in the nature of an occurrence so rare that banquets, visits to public exhibitions or private factories appear commonplace by comparison. And at the joint session in London on the 8th it was an address by a member and a former president of the American Society of Engineers, Howard E. Coffin, president of the Hudson Motor Car Co., of Detroit, that constituted the feature of the occasion.

It is a habit of most Englishment to believe that most of the world's best thought and best productions are confined to their "tight little isle." But somehow the members of the Institute of Automobile Engineers had permitted themselves to at least fancy that while in all else that pertains to automobiles England leads the world, the Americans really knew more than a thing or two about chassis design. Accordingly they suggested that a member of the S. A. E. address them on that subject, and Howard E. Coffin, who really knows a thing or three about it, was delegated to deliver the address. It was largely extem-

poraneous and general in character, and knowingly or unknowingly it struck the Britishers where they are weak. They love "fixings" and lots of them, and they appear to love ponderosity, and when they combine both they seem to imagine that money can buy no more.

When Coffin took as his text "Clean Design" he therefore struck at cherished traditions. For "clean design," he told his hearers, meant simplicity, the elimination of every unnecessary part in every feature of the chassis. Mr. Coffin stated that "clean designs"—cars free of rods and clattering of iron and steel—were an absolute certainty within the next few years, according to the trend of the principles of engineering practice. He expressed the belief that this constantly increasing simplicity would make the automobile more easily understandable to men not of a mechanical turn of mind and render it possible for women to drive the gasoline car, and that "clean design," like the elimination of

the useless scaffolding of a building, meant the decrease of difficulty that some who might own cars fear they will encounter. The fact that this trend toward simplicity also must decrease the upkeep cost of the automobile also augurs for an enlarged field of usefulness. Mr. Coffin remarked that in the greatest car he himself had built he had found upkeep cost greatly decreased by the elimination of a thousand parts. He said that the big item in motor car building is labor, and with the elimination of rods and other features that could be dispensed with it was possible to triple the quality of parts that are used.

He said this would insure an immense saving and he evidenced his statements by recounting his experience building his latest automobile, in which nearly a thousand dollars a car was saved the ultimate purchaser by "clean design."

However, the greatest item, in his opinion, is the saving in upkeep cost and the ease of making adjustments because "clean design" places each part within ready reach of the owner, thus doing away with the task of tearing down a car for the purpose of adjusting or replacing some part of its mechanism.

ACCESSORIES AT THE LONDON SHOW

Influx of Electric Lighting Systems the Chief Feature—Real Novelties, However, Were Few and Far Between.

In the line of accessories the Olympia show offered little that could be styled new or novel. It is true there were a number of "novelties" on view, but on closer examination these resolved themselves into mere minor improvements of well-established principles.

Especially was this notable in the various "new" carbureters. The Welsh carbureter, for instance, was fitted with a neat device, which permitted of the throttle being moved past its closed position, thereby admitting pure air to the cylinders, when coasting down hills. Another system, called the T. & M. multiple jet, is fitted with a narrow by-pass so that the engine does not stop, even if the throttle is fully closed and the car standing still. None of the other carburation devices exhibited strayed from the beaten path of former years.

That there would be a flood of dynamo lighting systems on view was a foregone conclusion after the great strides made in this line during the past year. No less than seven manufacturers showed systems of electric lighting outfits, but none of them brought out any idea or arrangement that could be considered novel. In the matter of headlight installation, however, one manufacturer, Longstreths, Ltd., has hit upon the happy idea of providing long and short focus lights by mounting two bulbs side by side in the same headlight, one of them being suited for long distance, the other spreading the rays to the sides of the road.

It is the little "kink" in the most insignificant place that sometimes proves of real value to the man driving his own car. Such a happy idea is the Rotax pressure pump, which is swiveled at the bottom, and which turns itself off when set upright in its clip on the dash. Another small but important improvement is made in the Ashcroft valve-grinder, in which the direction of rotation is reversed at each revolution, but which nevertheless makes slow positive progress in clockwise rotation, in order to prevent scoring through working continuously on one spot.

To use a windshield for other purposes when the car is standing still is the rather freakish idea of Auster, Ltd., which firm offers a hinged shield that can be so manipulated as to form a very substantial table for the people in the rear compartment of the car. Another windshield, manufactured by Russell & Co., Ltd., is operated by a single worm and wheel and can be worked by the driver's left hand.

What is called a "two ignitions" plug is offered by Lodge Bros. & Co. It really

consists of two sparking plugs in one, the central portion containing two separate electrodes, each of which terminates in a nickel ring. The outer casing is fitted with a sparking point opposite each ring. The plug is used for combined magneto and battery ignition. In this section belongs the new Bosch magneto, which is entirely enclosed and has its working parts protected from dust and damp by felt washers where the casings join. Two special points are the design of the equipment on the control coupling and the serrated poles that give easy starting. Brooks & Co., Ltd., also are offering a new magneto, which is constructed on the basic principle of the well-known Mea. In this magneto the pole pieces rotate with the advance and retard of the contact breaker, causing the break always to occur when the current is at its maximum intensity. Other features in its construction are the absence of gearing in the two-to-one reduction drive for the distributor and the detachability of the contact breaker without the removal of any nuts. The High Tension Co. shows its C. J. L. mica magnetolite, which has permanent magnets. The fixed capacity of these magnets limits the output at high speeds, owing to the natural demagnetizing effect of the armature reaction.

In the line of demountable rims J. Liveridge & Son, Ltd., offer a new segmental rim which may be carried in the tool box. It is made in four segments, so that covers may be fitted over it without straining the bead of the tire.

The gyroscopic Non-Skid, which was described in *The Motor World* a few months ago, made its first appearance at any show. It is a gyroscopic flywheel mounted in front of the engine and driven by a belt from the fan pulley. It was shown by Vieo, Ltd., alongside of a resilient wheel, which was claimed to have been run on a heavy car for two years.

Of accessories made in the United States, the following were shown at Olympia: Klaxon horns, Rushmore lamps, Simms magnetos and dynamo-lighting outfits, Stewart & Clark speedometers, Gleason-Peters pumps, and Goodrich tires.

To Produce \$650 Union at Columbus.

With the object of manufacturing a small touring car of 25 horsepower to sell at \$650, the Union Sales Co. has been formed at Columbus, Ohio, with headquarters at 61 East Spring street. Several of these cars already are on the streets, while 25 more will be ready for delivery early in December, according to the statement of J. W. O'Brien, the general manager. The car, which is styled the Union "25," has a four-cylinder motor, $3\frac{3}{4} \times 4$, cylinders cast in pairs; Bosch magneto; Schebler carburetter; three speed selective sliding gear with center control; pressed steel channel frame; 100 inch wheelbase; multiple disk clutch, running in oil; semi-floating rear axle, and 30 x 3 inch tires.

AMERICAN CARS FOR AUSTRALIANS

Why They Are Preferred by Residents of the Antipodes—Fast Crowding Out Even British Productions.

Some of the reasons for the ever-increasing popularity of the American motor car on the island continent are very aptly outlined in a letter from an Australian owner of an American car, to an English paper. In his commendation or criticism of motor cars in general, and American cars in particular, the correspondent calls attention to the rate at which American cars arrive in Sydney and says that unless English manufacturers get busy at once there soon will be more Yankee cars in the Commonwealth than there are British.

"Now, what are the reasons for this state of affairs?" he asks, and proceeds to answer the question himself. "In the first place, the agents get a much quicker return for their money by handling a Yankee car than an English one. Incidentally it may be mentioned that the general opinion seems to be that the American cars are packed for shipment much better. Again, a purchaser can generally rely on getting immediate delivery of an American car, whereas if he wants a certain home make he may have to wait three months or longer. The American ports are much nearer Australia than the English ports are and Sydney is the first port of call of the American boats; hence the fact that there are many more American cars in New South Wales than in Victoria.

"The fact that some of the roads in the United States are as bad as those in Australia suggests that American cars should be suitably sprung for these roads, and it seems to me that here we have one of the chief reasons for the American car's popularity. An intending purchaser who knows nothing about motor cars is first taken for a run over a bad road on an English or Continental car, and then goes over the same road on an American car. Now, unless the European car is an exception to the rule, or the American car is, the former will be purgatory and the latter bearable." He adds that the only car he feels comfortable in is an American one.

California Stock at \$1 Per Share.

The California Motor Car Co., which was recently organized in Oakland, Cal., and which purposes manufacturing the Pacific Special touring car, has "gone the limit" in offering its shares to the public. The company is capitalized at \$250,000, in \$1 shares, which are offered at par value in blocks of 25 shares and upward. In advertising them the company makes use of the "60 to 1300 per cent. dividends" catchline used by many promoters located nearer to the Atlantic than the Pacific.

ELIMINATING THE POPPET VALVE

Details of New Foreign Engines in Which the Elimination has been Effected—
Wide Range of Ingenuity.

Prognostications, made at the time of the adoption of the Knight sleeve valve engine by the English Daimler company, to the effect that before long other types of "poppet-valveless" motors equally as efficient and reliable would be numerous, have been fulfilled in a measure. Within a very short time no less than three new engines employing valves of other than the poppet variety have made their appearance on Continental markets, and thus part of the prophecy, at least, has been realized. As

ARGYLL SLIDING SLEEVE

to whether they will prove as good or better than their forerunner of the so-called "valveless" type remains to be demonstrated. In the meantime three big European manufacturers are devoting considerable of their time to the production of these three different types of engines, and they are Messrs. Argyll, Ltd., of Scotland, Darracq & Co., of France, and the Itala factory in Turin, Italy, which with the older Hewitt piston valve engine, constituted the most radical motors in evidence at the Olympia show.

Two of the engines, the Argyll and the Itala, are new, the former being somewhat like the Knight engine and the latter being peculiar to the Itala factory in its employment of a single rotary valve for each pair of cylinders. Though the Darracq is not exactly new inasmuch as it operates on the Henriod principle, this is the first time that an engine of this type has been regularly

supplied as a stock model, and for this reason it is of interest.

It has been known for some time that the Argyll factory was actively engaged in the perfection of the new engine, but only recently has its development reached the stage where the engine has become marketable or did it become known that licenses to build engines under the Argyll patents had been granted to Piccard-Pictet, of Geneva, Switzerland, and to the Canadian

ARGYLL ENGINE SECTIONED

Fairbanks-Morse Co., of Toronto. It also is stated that negotiations are under way for the production of the engine in the United States.

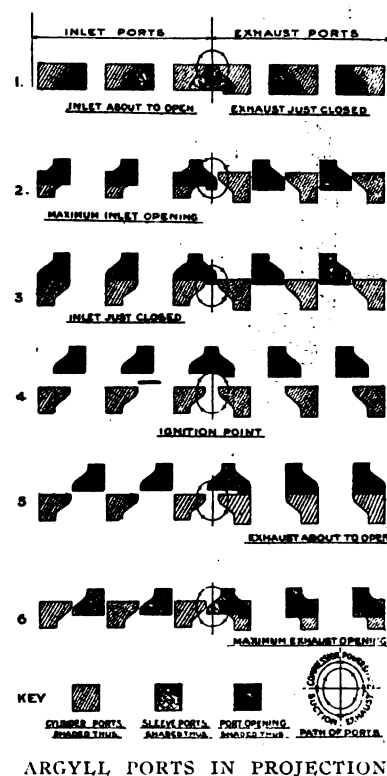

The principal point of difference between the Argyll sleeve valve engine and the Knight engine is that the former employs a single sleeve to do the work for which two are required in the Knight engine. As in the Knight engine, the sleeve serves as a liner to the cylinder and on it the piston slides. But instead of a straight up-and-down movement of the sleeve, such as is used in the Knight engine, the sleeve turns on its axis, as well, with a sort of corkscrew movement backward and forward; which is to say that as the sleeve ascends it turns to the right and as it descends it rotates to the left, so that any point on the sleeve describes an ellipse during two revolutions of the crankshaft.

The four sleeves in a four-cylinder engine are actuated by skew gearing from a ball-bearing-mounted shaft which extends the length of the engine and occupies much the same position as the cam shaft in the ordinary type of poppet valve engine. The shaft is driven at crankshaft speed by means of a silent chain, the necessary reduction in the speed of the sleeves being made in the skew gearing by which they are actuated. In addition to acting as gears, these parts also serve as crank disks and impart the rotative motion to the sleeves, the method of connection being shown in the accompanying illustration.

Instead of the single intake and exhaust port common to the Knight type of engine, the Argyll has three of each, which are arranged in the same horizontal plane, the combined area of the three being equal to

a single large port; all three intake ports open simultaneously, as do the exhaust ports. In the sleeve there are but five ports, the center port being of a slightly different shape than the others and serving for both intake and exhaust.

It is in the shape of the ports that a great deal of the ingenuity of the engine lies, and to assist in making an explanation of the functioning of the valves more clear the shape of the sleeve ports and those in the cylinder are reproduced in projection in the accompanying diagram. At the commencement of the inspiration stroke, when the piston is nearly at top dead center, the sleeve is at its lowest point. As the piston descends the sleeve rises, and at the same time is rotated until its ports register with those in the cylinder. On the com-

ARGYLL PORTS IN PROJECTION

pression stroke the sleeve continues to rise, until, when the charge in the cylinders is fired, its ports are sealed behind two rings in the cylinder head, which take the place of the "junk" ring in the Knight engine. The ports are thus protected during the greatest heat of the explosion and compression loss is prevented by the sealing of the sleeve ports.

As the piston descends under the action of the exploded charge the sleeve also descends in its spiral path until the piston has reached the lower extremity of its stroke and has started to ascend, when the exhaust ports in the sleeve and cylinder register. One of the peculiar points of the valve action is that, as is common with reciprocating movements, the speed of the parts is not constant at all times, but varies according to the position of the reciprocating crank. The ports therefore open and close quickly, but during the time of their

greatest opening and when they are closed there is an appreciable lag, permitting maximum inspiration with quick closing of the intake ports and quick opening of the exhaust ports after the explosion, with a slight halt during combustion.

Contrary to what might easily be expected, little difficulty is experienced in lubricating the sleeves and cylinders, this being due to the elliptical motion of the sleeves, which tends to distribute a thin film of oil over their whole surfaces. By means of a pump actuated from the same shaft as the sleeves, oil is forced under pressure to the main engine bearings and to the sleeves, other parts of the engine's internal economy being lubricated by splash. The thermo-siphon method of cooling is used, and though it might appear that there would be difficulty in maintaining the engine at a sufficiently low tem-

perature it is no greater than in the case of the Knight engine. Rather it is less because of the presence of only the one sleeve instead of the two which are used in the Knight engine.

In place of the usual poppet valves, the Darracq motor employs a long cylindrical member carried horizontally within the cylinder casting, the cylinders being cast en bloc. This valve or distributor is actuated by means of enclosed gearing from the end of the crankshaft. The distributor is a single casting carried on ball bearings, and is annular in shape except opposite the port openings, where its section resembles a D. When the distributor is rotated the D sections register with the intake and exhaust ports alternately, permitting the same functions common to the ordinary four-cycle engine.

One of the important features in connection with the construction of the engine is that when the explosion takes place the distributor is completely isolated from the combustion chamber and the force of the explosion cannot react on the valve. This has been achieved by placing the distributor some distance from the top of the cylinders, so that the piston does not uncover the ports until it has completed approximately one-sixth of its downward travel. Though this location of the distributor results in a

portion of the burnt and burning gases being retained in the combustion space slightly longer than is usual with other types of engines it is claimed that this actually has a beneficial effect on the running of the engine and that fuel economy is increased thereby.

Lubrication is effected by means of an ordinary constant level pump-over splash system. Collector rings on the crankshaft distribute the oil to the main engine bearings. In this engine, too, thermo-siphon cooling is used, and in this respect it is a departure from former Darracq practice.

In the new Itala engine, which is rated

ITALA ROTARY VALVE

DARRACQ-HENRIOD ENGINE

at 35 horsepower, the cylinders are arranged in pairs, and for each pair a single vertical rotary valve serves for both intake and exhaust. The valve for each pair of cylinders is arranged between them in what to all intents and purposes is another cylinder cast integral. This cylindrical valve chamber is approximately four inches in diameter, and in its sides there are two narrow slits, each communicating directly with the combustion chamber to which it is adjacent. The intake pipe leads from the bottom of the valve chamber and the exhaust from the top.

Located in the valve chamber is the valve proper, which is in the form of a close-fitting piston which rotates in constant contact with the valve chamber wall. In the valve there are four slots, two of them communicating with the intake opening in the bottom of the valve chamber and serving as intake valves, and the other two

communicating with the exhaust opening at the top. The construction of the rotating valve is such that the two intake ports are separate from each other, as are the two exhaust ports.

The reason for the two intake and two exhaust ports in each rotary valve is that the valve is operated at one-quarter engine speed and on one occasion one intake port and one exhaust port serve both cylinders, one after the other, and on the next occasion the other intake and exhaust ports serve. In this way the speed of the rotating valve is kept low, while at the same time alternating the openings through which the gases pass gives the valve greater time to cool and keeps temperature down. There is only one port in each cylinder, and this serves alternately for intake and exhaust, the rotating valve only having a multiplicity of ports.

The rotating valves are provided at their

HEWITT PISTON VALVES

tops and bottoms with piston rings to prevent the leakage of gases and are driven by vertical spindles through skew gearing. The actuating shaft also serves to drive the magneto and water pump, and in turn is driven by means of a silent chain. Owing to the large area of the valve and its slow speed lubrication is rendered easy and is carried on principally by splash.

Regarding the effect of side pressure on the rotary valve, this trouble having been the bugaboo of practically all other such mechanisms, an ingenious method of eliminating trouble is revealed. Through the valve a small hole is drilled, and in the valve chamber wall behind the hole there is a recess so that the force of the explosion is balanced.

The novelty of the Hewitt piston valve engine has worn off during the two years it has been in service, and it has settled down into an accepted type. It is used in Crowdy cars and in principle it is exactly the same as a poppet valve engine except that the poppet valves are replaced by miniature pistons, one serving to uncover the intake ports and the other opening the exhaust ports. The pistons are actuated by means of cranks from a shaft which occupies much the same position as the camshaft in the ordinary type of poppet valve engine and is driven by a silent chain.

OFFERS CHAINS OR SHAFT DRIVE

**Simplex Adheres to Its Former Practice—
Few Changes Found Possible—Make-
up of the Line.**

Though most manufacturers prefer to devote their entire attention to either shaft or chain driven models, the Simplex Automobile Co., New York City, remains in the ranks of those whose cars may be had with both styles of final drive. The 38 horsepower shaft driven chassis which made its debut last year and which since then has more than lived up to the Simplex reputation, will be continued for the coming sea-

It differs from the other Simplex models in that it is shaft driven, of course. Also it embodies a long stroke motor, the dimensions of which permit of no quibble as to the propriety of the designation; it measures $4\frac{7}{8}$ inches bore and $6\frac{1}{2}$ inches stroke. Conforming to the general Simplex design, the four cylinders are cast in pairs with the valves on opposite sides and interchangeable. In the design of the motor particular care has been taken to insure the exclusion of dust and dirt from the bearings, which are so constructed that the exudation of oil is practically impossible. Simplicity is the keynote of the design; plenty of room under the bonnet, widely separated auxiliary apparatus and a general air of extreme accessibility are the most

hubs steel castings. Liberal sized D. W. F. ball bearings are used in both sets of wheels. In the arrangement of the springs, the manufacturers have adhered to general practice in the use of semi-elliptic members in front and three-quarter in the rear, it having been found by experience that this construction permits the greatest resiliency without promoting the faults which arise when other arrangements are used.

Both sets of brakes are located on the rear wheels, and in this respect the shaft-driven chassis differs materially from the older models. They are lined with an asbestos composition and provision is made for easy and quick adjustment. The service brakes are of the external contracting variety operating on drums $14\frac{3}{4}$ inches in diameter and $2\frac{3}{4}$ inches wide, and the emergency brakes are internal expanding of practically the same dimensions. The weight of the chassis on the tires is 2,700 pounds.

In all, six styles of body are regularly supplied, the wheelbase being the same in each case—127 inches. These six types embrace a two-passenger roadster, four-, five- and seven-passenger touring cars, a landaulet and a limousine, the prices of the two latter cars complete being \$5,800, and of the other four, \$4,850; the price of the chassis with tires and demountable rims is \$4,000.

As has been previously intimated, the 50 horsepower chassis and the 90 remain practically unaltered and are familiar to the motoring public by reason of their years of enduring service. The "50" is regularly supplied in two chassis lengths—124 inches wheelbase and 129—to accommodate the five-passenger touring car, small tonneau and small enclosed bodies, and seven-passenger and large enclosed bodies, respectively. In general design the "50" and "90" chassis are quite similar to the newer shaft driven model, the principal differences in construction being the use of double differential service brakes located on either side of the transmission case and operating on the cross shaft which mounts the driving sprockets, and motors of different dimensions.

The cylinders of the 50 horsepower motor measure $5\frac{3}{4}$ inches square, the valves being on opposite sides and the cylinders cast in pairs. In profile and construction the larger motor is exactly like its smaller brother, practically the only difference being in the cylinder measurements, which are $6\frac{1}{10}$ inches bore and $5\frac{3}{4}$ inches stroke. The construction throughout the rest of the chassis is identical, though the one mounting the larger motor is slightly heavier, of course. In both, ignition is effected by means of Bosch high tension magnetos, instead of the Mea which is used on the smaller chassis; otherwise these two motors conform in detail and appointments to that used in the 38 horsepower car.

The 50 horsepower chassis, with de-

THE SIMPLEX 38 HORSEPOWER, SHAFT-DRIVEN MODEL.

son, as will the 50 and 90 horsepower chassis, both of which are chain driven models.

Having passed through its novitiate, though the past year scarcely warrants the term, inasmuch as the marketing of the car was preceded by several years of careful study and experimenting, the shaft-driven model remains unchanged in a fuller sense of the word than generally is understood. A slight alteration in the pitch of the timing and transmission gears, by which they are rendered more quiet, is the only change that has been made. In the 50 and 90 horsepower chassis even less change has been made.

Naturally, considerable interest attaches to the two larger chassis as being of the few remaining exponents of chain driving. Principal interest, however, centers in the newer model which was at the time of its inception a radical departure from previous Simplex practice. Though it is distinctly a new model, embracing a number of features not found in either of the others, it still retains all the Simplex earmarks of quality and in it is reflected the same careful attention to details.

noticeable features, barring the solid and substantial construction which everywhere is visible.

Ignition is effected by means of a Mea high-tension magneto with advance and retard control lever within easy reach of the driver's fingers on the steering wheel. The cooling apparatus embraces a centrifugal pump, actuated from the timing gear train, and a honeycomb radiator, the fly-wheel spokes being cast in the form of fan blades, thus eliminating the necessity for any other cooling adjunct. Lubrication is by a direct-driven mechanical oiler which forces the oil to all main and minor bearings.

The change gear mechanism operates selectively and permits of four speeds forward and reverse, the fourth speed being direct drive. Interconnecting it with the drive shaft, the clutch is of the multiple disk variety, having 34 hardened and ground saw-steel disks. The drive axle is semi-floating and mounts wheels which carry 36 x 5 inch tires; front tires are 36 x 4. Particular attention is directed to the construction of the wheels themselves, the hub flanges being drop-forgings and the

mountable rims and tires, lists at \$4,500. The prices of the four-passenger small tonneau, five-passenger touring, seven-passenger touring, limousine and landaulet are \$5,499, \$5,500, \$5,700 and \$6,400, respectively; two-passenger roadster bodies are supplied at from \$600 upwards, according to the requirements of the purchaser. The price of the 90 horsepower chassis with tires and demountable rims is \$5,350, roadster bodies being fitted at prices that range upward from \$600. The four-passenger small tonneau touring car and the five-passenger standard touring cars are priced \$6,250 and \$6,450, respectively.

Orders Distinctive Colors for Taxicabs.

In order to facilitate the identification of taxicabs from town cars and private landaulets, especially at a distance, the Berlin Commissioner of Police has issued an order directing that henceforth all public taxicabs must be painted in certain colors. These colors are:

Gasolene cabs—dark brown with narrow bright-red striping around doors, wheel rims and spokes.

Electric cabs—ivory white, with narrow black stripes.

All cabs, regardless of motive power, must be fitted with clear beveled glass windows; no "frosted" or colored panes are permitted.

The order of the police commissioner was somewhat influenced by the flowers, grapes, arabesques and landscapes painted upon many of the cabs by their respective owners—which fantastic paintings, while enlivening the traffic picture, did not tend to raise the Berlin taxicab in the estimation of visiting foreigners. The latter's sarcastic and flippant remarks in the columns of the foreign press finally "got on the commissioner's nerves" and the order for distinctive color work went forth. What caused the order for "clear" glass panes must be plain to anyone familiar with metropolitan "night life."

Best Proof of Ignition Improvement.

"If anyone desires to discover how great is the part played by ignition systems in the success of a motor car, and how greatly such systems have been improved during recent years, he has but to apply a modern coil or a modern magneto to almost any of the old cars which are still running around," was the remark of Howard Carter, of the Carter Motor Car Corporation, Washington, D. C., who was in New York during last week. "Of course, engines have been improved," he admitted, "but the principle has remained the same and the improvement has not been sweeping. It was the ignition systems that caused most of the trouble in the old days, and the best proof of it is the number of old corks using old engines which have been revolutionized, or regalanized, so to speak, simply by fitting them with modern ignition systems."

BLACKBOARD TO CHECK PRODUCTION

How School Adjunct Helps to Solve Various Factory Problems—Places Blame Where It Belongs.

Those who have particularly good memories will have little difficulty in harking back a few years to the days when they attended school and the favorite method of expounding difficult problems was by means of the blackboard. Also it was common practice, and is yet, to post on the blackboard a schedule of the work to be done during stated periods, together with a resume of the materials and books necessary. Thus could earnest pupils, and those who were not so earnest, know at all times what was expected of them during certain working periods, and those who fell behind these expectations were held to an accounting.

But the sphere of usefulness of the blackboard is not confined to the school-room. It has become very much more commercialized within the past few years and many erstwhile schoolboys would be surprised to discover it occupying a very important position in the important industry of automobile manufacture. But though it has been advanced several rungs up the social ladder, so to speak, it still occupies much the same position in the automobile factory that it did, and still does, in the school-room, except that it has become more than ever a tell-tale of the amount of work to be done and that which has been accomplished.

Although many persons engaged in the industry do not know it, in many of the larger automobile factories there is not only one blackboard—there are a number of them. They are scattered throughout the length and breadth of the factories and are consulted continually, for on them appears a record of the amount of work that has been done during stated periods in the particular departments in which they appear. It is one of the duties of the foreman, or department head in charge, to post the daily output of his department; a glance suffices to tell the "man higher up" the progress of the work, and whether the output is up to the required schedule. In other words, the blackboards "keep tabs" on every step in production operations.

Though this blackboard system is in use in a number of factories and its merits are realized and it is coming into greater use almost daily, it is doubtful if it has been more developed than in the factories of the Studebaker Corporation in Detroit. Every department has its blackboard. Illustrative of the modus operandi of the system, the blackboard in the chassis assembling department at one time indicated that the scheduled output of 40 finished

machines a day had not been maintained by five cars.

Tracing the reason for the discrepancy, it developed that it was due to a shortage of five differentials. This shortage appeared on the blackboard in the differential assembling department and was explained by the foreman, who claimed a lack of differential pinions. The deficiency showed successively on the blackboards in the gear hardening department, the gear cutting department, and the turning department. The foreman of the turning department placed the blame with the drop forge shop in failing to supply a sufficient number of gear blanks and the trouble finally was located there. The die used in forming the gear blanks had been damaged and the reserve die was not performing satisfactorily. Thus, through the blackboards, the source of the trouble was traced quickly, without the necessity for entering into lengthy explanations, and the production manager was enabled to get up the necessary "steam" to remedy the fault in the minimum of time. Incidentally the mental equilibrium of the various workmen concerned was undisturbed and no ill-feeling for misplaced blame was engendered.

In the designing room, too, the blackboard very often is a valuable adjunct. Preliminary sketches can be made rapidly and, if necessary, altered endlessly with the least expenditure of effort and time; elusive ideas which likely would vanish during the ordinary process of construction in the drafting room, can be jotted down instantly for future reference—and obliterated with a wipe of a cloth. Of course, for the instruction of department heads or ordinary mechanics, the blackboard is the method par excellence, for the assimilation of knowledge through pictures still is easiest. It is in the other field, however—that devoted to the recording of work done and to be done—that the blackboard is most useful, and there is no other system as simple and as efficient or so available.

Extent of Platinum's Preciousness.

In Berlin, Germany, which is one of the centers of the platinum trade, the price of that precious metal stands at about \$650 per pound. It is undoubtedly the most expensive material which enters into the make-up or operation of a motor car. Unceasing efforts are being made to find a substitute, and practically all of the magneto manufacturers each week are prevailed upon to put one or more of such substitutes to the test, but it has been invariably found that no "just-as-good" will serve the purpose for magneto usage. At the price quoted, platinum, of course, runs quickly into money, as H. E. Krause, superintendent of the production department of the Remy Electric Co., remarked only a few days ago when there were received at the Remy factory two packages as large as a man's two fists, which represented a cost of close to \$5,000.

DUAL TIRES MADE DEMOUNTABLE

Big Company Devises a Rim That Solves Several Difficulties—Split Wedges Play Important Part.

Supplementing its regular line of pleasure and commercial vehicle tires, the United States Tire Co. has placed on the market a new type of demountable solid tire that

therefore, dual solid tires may be replaced in considerably under half the time required by the old method which necessitated the removal of the wheel and the temporary disablement of the vehicle.

The tire itself is made exactly the same as the Continental solid motor tire which is made in Hanover, Germany, and which has attained a reputation for durability and resiliency. Between the soft rubber tread and the steel band on which the tire

greater than the outside diameter of the felloe band on the wheel, over which it fits. Taking the standard 36-inch tire, for example, the outside diameter of the felloe band is 30 inches, and as the inside diameter of the band on which the new tire is built is 30 $\frac{3}{4}$ inches, there is thus ample clearance and no possibility of the rims rusting or freezing together.

Into this open space between the felloe and the tire band wedges are forced which

REMOVING BOLTS WITH SOCKET WRENCH

DETACHING THE SPLIT OUTER FLANGE

SHOWING REMOVAL OF SPLIT CENTER FLANGE

ALL THERE IS TO IT—BOTH TIRES DEMOUNTED

cannot well fail to have an important bearing on the truck industry. Though there are several demountable solid tires on the market in which a single solid tire may be taken off a wheel without the necessity for removing the wheel from the vehicle, this is the first one to make its appearance which permits the removal of dual tires quickly and easily while the wheel is in place on the truck. Under the new method,

is mounted there is a layer of hard-vulcanized rubber which is forced into serrations in the steel band. After the hard rubber foundation is in place the soft rubber tread is vulcanized to it, making a solid mass from the tread to the base. The tire is built in accordance with the size adopted as standard by the S. A. E.

The inside diameter of the band on which the tire is built is three-eighths of an inch

are part of the flanges; the wedges are pulled in tight by means of the bolts running through the felloe. The wedges are so designed as to remove all strain from the bolts and are of a 20-degree angle at the top and flat on the bottom. The top of the wedges comes into contact with a corresponding bevel on the under side of the tire band, giving a metal-to-metal seat of about three-quarters of an inch. The

action of the weight of the vehicle on the tire is to press the flange wedges directly onto the wheel band, and as they seat flat there is no tendency towards spreading the flanges.

All the wedges are split, which allows them to be pulled up tight and permits of a greater variation in the circumference of the wheel. The holes through the flanges for the bolts are elliptical and the difference between the outer and inner edge flange lies in the fact that the inner flange has oblong, square-cornered bolt holes and the outer flange has round-cornered, elliptical bolt holes. The holes in the inside flange are square so as to hold the square shank of the bolt, and in this way prevent its turning.

The equipment for a single tire is an outer flange wedge, an inner flange wedge and nine, 12 or 15 bolts and nuts, depending upon the diameter. The equipment for a dual wheel is the same except that it has a center wedge in addition to the flange wedges.

Oil Tank Removal Arouses Portland.

An ordinance pending in the Portland (Ore.) city council, requiring the removal of all oil tanks from the city proper, aroused the most violent opposition when none was expected. The dealers in automobiles, motorboats and motorcycles rose en masse, and announced their intention of fighting the measure with all means at their command. The city fathers were so surprised at the hurricane which struck them that they postponed discussion of the ordinance for the time being. It developed at the dealers' indignation meeting that the Standard Oil Co. and the Union Oil Co., the companies immediately concerned in the tank removal, had served notice that if they were forced to remove their tanks, the price of gasoline would be raised at least five cents per gallon, and that of all other kinds of oil in proportion. Opposed to the wishes of the dealers and automobile owners there was a strong faction of taxpayers who urged that the tanks be removed from the city for the greater safety of their property, claiming that the oil companies could install pipe lines for proper distribution to branch houses. Similar ordinances, it is stated, will be introduced in various other cities along the Pacific coast, where the fear of explosions appears to be greater than in the East.

Old Cotter Pins Not Worth Keeping.

Despite the small economy which may be practiced in straightening bent cotter pins and using them over again the better way is to throw out the old ones and insert new pins. Cotter pins that have been bent and straightened never are as strong as new ones, and as great dependence often is placed on these seemingly minor adjuncts it really is no saving to chance a straightened pin giving way at a critical moment.

THE MOTOR WORLD

HOW THE INDUSTRIES COMPARE

Census Report Discloses Condition of Carriage Trade—Wonderful Gains in Automobile Manufacture.

Whenever a Getrichquick Wallingford seeks to invade the automobile industry he is not thoroughly wide awake if he fails to bait his hook with a comparison of the horse vehicle and motor vehicle trades. With so many millions of horses and carriages and wagons to be replaced by so many millions of automobiles, how can you lose? is the favorite bait which Wallingford dangles temptingly before the hungry "lamb."

Quite apart from the use to which it is put by the Wallingfords, however, the statistics of the horse vehicle industry are full of food for those who have to do with automobiles, and the fact that the automobile trade made its biggest strides since the Federal census of 1904 was taken makes the statistics of the 1909 census of uncommon interest. In a measure they indicate the extent to which the newer industry has affected the older one, which is a favorite subject for speculation. And according to these official figures the output of horse vehicles has decreased from 2,355,065 in 1904 to exactly 2,106,923 in 1909, a loss of over 10 per cent. In the same time the number of automobiles increased from 22,830 to 127,289, a gain of 458 per cent. Especially was the loss evident in the class of horse-drawn pleasure vehicles which decreased by 109,000, or almost exactly the number of automobiles manufactured in 1909 over 1904. The value added by manufacture (product less cost of materials) of the horse-drawn conveyances dropped from \$78,341,000 to \$77,942,000, while the corresponding figures in the automobile trade show a gain from \$16,883,000 to \$117,556,000, or nearly 600 per cent.

In 1909 there were 5,492 establishments manufacturing carriages and 5,588 in 1904, a decrease of 2 per cent. But these numbers are still very large when compared with the number of automobile factories in 1909, which only amounted to 316, but which represented a gain of 88 per cent. over the 168 establishments of 1904. In addition there were 427 establishments in 1909 making bodies and other parts for automobiles.

The capital invested in 1909 in the two industries is almost exactly the same, \$173,837,000 being invested in the manufacture of motor cars, while \$175,474,000 took care of the carriage making. Compared, however, with 1904 the aspect of the two industries changes considerably, for in that year only \$23,084,000 were invested in motor cars and \$152,345,000 in the making of horse-drawn rigs. The five-year interval thus showed a gain of 653 per cent. for the

automobile industry, and one of 15 per cent. for the carriage industry.

The sums paid out in the carriage industry as salaries and wages amounted to \$45,555,000 in 1909 (\$44,944,000 in 1904), while the automobile industry paid to its employees \$58,173,000 in 1909 (\$8,416,000 in 1904), a gain of 591 per cent. One of the interesting items disclosed by the census report is the fact that but 544 automobiles were manufactured in carriage factories during 1909, as compared with 199 in 1904, but exactly what are denominated carriage factories the report fails to make clear.

How Testing Trip Became a "Tour."

To take a bath is a luxury—and to enjoy a luxury while on a "testing" trip with an automobile, is to convert the testing trip into a pleasure trip: ergo, if a dealer makes a testing trip with a new unregistered car and gets so dusty that he has to take a bath to be half-way presentable, he becomes a "tourist" and has to get a license for the car. Such is the law in Germany! The case has set the German public a-laughing and there seems no doubt but that the Reichsgericht, before which the matter will soon be brought on appeal, will reverse the odd judgment as it has done in several similar cases.

The verdict grew out of the case of a certain dealer in Cologne, who had received a new car from the factory, and who tried it out on a short trip to a neighboring town which boasted of a fine public bathing establishment. The roads were exceedingly dusty and Mr. Dealer was so covered with grime that he decided to take a bath then and there. A few days later he was informed that he had to pay a regular tourist's license fee for the particular car in which he took the trip, and even the appellate division of the State court found against him, ruling that a bath was not a legitimate part of the try-out. He, however, again appealed, and the case probably will come before the Reichsgericht for final decision.

Life Insurance Money for Motor Cars.

In a recent speech John I. Willys, president of the Willys-Overland Co., undertook to answer the question as to what becomes of all the cars manufactured. The Wall Street Journal, on the other hand, essays to show where the money comes from to pay for all these thousands of automobiles. According to the Oracle of the Financial District there is no doubt but that a large percentage of the money to pay for motor cars comes from the life insurance companies, which have disbursed to policyholders some \$360,000,000 during 1909, and as much or more in 1910. "To the beneficiary of such a policy," says the Journal, "and also to the payee of one of those 20-year endowment policies, the sum received is like 'round money,' and, according to the old adage, 'Easy come, easy go,' an automobile is the usual purchase made."

POPULAR-PRICING THE "SIXES"

Palmer & Singer Make Another Move in That Direction—Bring Out a \$2,000 Model Bristling With Value.

When, some three weeks ago, the Palmer & Singer Mfg. Co., of Long Island City, N. Y., announced reductions in the price of its standard four- and six-cylinder models, bringing the prices down from \$3,900 and \$4,200 for the seven-passenger cars to \$3,000 and \$3,200, respectively, it looked like remarkable value for the money. But when late last week the company launched a 40-horsepower "little six" cylinder touring car at \$2,000 it added, if anything, even more remarkable value. The car, which is styled the "Brighton six," is an addition to the line and is undoubtedly one of the "best buys" of the season.

NEW PALMER & SINGER \$2,000 "BRIGHTON SIX"

It is a real high-class automobile, too—the reputation of the manufacturers insures that—and, what is more to the point, nothing about the car has been skimmed. Everywhere the liberality of the manufacturers is evident, and one of the particular points indicative of this is that in common with other cars which list at more than double the price the comforts incidental to the use of 10-inch upholstery are one of the noteworthy features.

The whole car throughout is distinctly a new model, though many of the features that helped make the older P. & S. cars popular are incorporated in the new one. Thus the well-known T-head motor is used, though its six cylinders are cast in two blocks instead of in three as in the other six-cylinder model; the cylinder measurements are four inches bore and five inches stroke. Lubrication is effected by means of splash and a self-contained oil tank in the crankcase from which a constant level in the crankcase compartments is maintained by pump.

In the matter of carburation particular attention has been given the necessity for rapid acceleration, and to this end the intake manifold has been made more than ordinarily short so that the carburetter is

as close to the intake ports as possible. Following the general design of the other P. & S. models, fuel is supplied under pressure from a tank hung behind the rear axle. Pressure is obtained in the orthodox manner by means of an exhaust check valve with hand pump and pressure gauge located on the dash.

Two separate and individual ignition systems are provided, a Bosch high tension magneto with variable spark control serving to operate one set of plugs and a battery system with Splitdorf timer and single unit dash coil operating another set. The timer is located at the top of a vertical shaft at the rear of the engine, and is easily accessible for inspection or the adjustment of wires. For the cooling system a Mercedes type honeycomb radiator and centrifugal pump are used in conjunction with a particularly light and easy-running fan.

The frame of the car is of five-inch channel section pressed steel and is mounted in

front on semi-elliptic springs and in the rear on three-quarter elliptic members. Conforming to the tendency toward rear axle located change gear mechanism, this part of the transmission is enclosed in an extension of the differential housing. Three speeds forward and reverse are provided and are obtained selectively, gear shift and emergency brake control levers being at the right of the driver. Power is transmitted through an enclosed propeller shaft by means of a multiple disk clutch; the rear axle is semi-floating. Both sets of brakes, which are of unusually large area, are located on the rear wheels, and both are of the internal expanding variety.

But one type of body is supplied on the chassis, which is of 127 inches wheelbase. The body itself is of the modified torpedo type, in which a fairly short skuttle dash and straight line sides are the principal features. The leg room which is provided is exceptional, and this is particularly noticeable in the driver's compartment, where there is plenty of room to "stretch." In the rear seat provision for three passengers is made, though owing to its wideness it is probable that four would have little difficulty in squeezing in if necessary.

Firestone quick-detachable and demount-

able rims are items of standard equipment, wheel sizes being the same for both front and rear, viz., 34 x 4 inches. Completing the regular equipment, a full set of lamps, Prest-O-Lite tank, tools, pump and jack are furnished.

Regarding the other three cars in the line very little need be said, as they remain without change except in the case of the six-cylinder 60-horsepower model. In this car a dry multiple disk clutch has been substituted for the one which last year operated in an oil bath. Both the four-cylinder 40-horsepower model and the "6-40" will be continued practically without change except as regards minor details. The four-cylinder 30-horsepower model, however, has been dropped, which, with the addition of the new "Brighton six," leaves the line the same in the matter of numerical strength of models as heretofore. Both of the larger models are regularly supplied with five- and seven-passenger touring, limousine, landaulet and runabout bodies. The older "6-40" is supplied only in five-passenger and runabout form.

Edison "Boosting" Battery Not Ready.

Though it is fairly well known that the Edison Storage Battery Co., Orange, N. J., is actively engaged in perfecting a new type of storage battery, "it has not yet been worked out to a commercial basis," according to officers of the company, and orders for it cannot be entertained for the present, at least. The new battery is known as the thin plate type of Edison storage battery and is further styled a "boosting battery" by reason of a particular virtue which allows of short charges at considerably greater than normal strength. A ten minute "boost," or charge at a high rate, it is said, will permit the battery to accumulate sufficient "juice" to operate a vehicle for one hour.

"Six" Added to the Garford Line.

After some three years' experimentation, the Garford Co., of Elyria, Ohio, has ready for the market a six cylinder car which, like the other Garford productions, will be marketed through the Willys-Overland Sales Co. The Garford "six" has a bore of 4½ inches and a stroke of 5¼ inches, and develops 50 horsepower. It employs four speed selective transmission, Bosch dual ignition, full floating rear axle, shaft drive and ball bearings. The wheelbase is 135 inches and the tires 36 x 4½.

Big Trucking Company Formed in Toledo.

To engage in the general haulage business on the contract system, the Mallory Transportation & Storage Co., of Toledo, O., has been incorporated with \$150,000 capital stock, a number of the most prominent business men in Toledo being interested in the enterprise, among them John N. Willys, of the Willys-Overland Co., and Isaac Kinsey, of the Kinsey Mfg. Co. The company will maintain a fleet of 28 trucks.

Truck Problems; the Angle of the Steering Post

To those who have had opportunity to ride beside the operator of a motor truck in which the steering gear is of the reversible order the action of the steering wheel in the hands of the driver when the vehicle is driven over other than the smoothest of roads well may furnish food for thought. If the road is rough enough it is likely that the steering wheel will be wrenched first one way and then the other through the driver's hands, and unless he is watchful there is danger that before any great amount of time has elapsed his hands will have become painfully bruised.

that no other part of a freight-carrying vehicle is more deserving of careful re-designing than the steering mechanism.

This was most forcibly brought to mind by a recent fatal accident to one of the London Omnibus Co.'s motor buses in Regent street, London. The bus was proceeding at a moderate rate when for some unaccountable reason it swerved and one wheel came in collision with a tram-car. The result of the coroner's inquest was that "the steering wheel was knocked out of the driver's hand, he thereby losing control." Immediately following the inquiry

In the first place, the ordinary type of pleasure car is designed for very much higher speeds than ever are obtained with motor buses, and as the average motor bus is almost identical with other commercial vehicles of the heavy, slow-moving variety, considerations in the design of each are quite similar. In order to steer any moving vehicle it is necessary that the driver be able to move the steering wheels the required distance in the time available. If the vehicle is moving very rapidly the time available is appreciably shorter, and consequently for pleasure cars it is necessary

FIGS. 1, 2 AND 3—STEERING COLUMN ANGLES AS EXEMPLIFIED BY KISSEL, B. O. E. AND LAMBERT

While the comfort of the truck driver may be deemed a minor consideration, eventually it must be given just as much thought as is given the mechanism of his vehicle, for it is acknowledged that the operation of commercial vehicles in general on a paying basis depends largely on the driver. There is another factor which also is needful of attention. It is the factor of safety, and there is no point in the design of a motor truck upon which the safety of the vehicle, its load of human and inanimate freight and other vehicles and pedestrians depends to a greater extent than the steering mechanism.

It is quite true that practically the same desideratum—of a steering mechanism as nearly perfect as possible—is just as necessary in a pleasure vehicle, but in the designing of a steering gear for a pleasure car and a commercial vehicle there is a vast amount of difference. Pleasure car practice profitably may be copied to a large extent in the construction of other portions of commercial vehicles, but it is probable

into the cause of the accident the various public prints were deluged with letters suggesting methods whereby such occurrences might be rendered impossible in the future. Some of the letters were from eminent automobile engineers and others were from persons not even remotely connected with the automobile industry, and the consensus of opinion seemed to be that if the steering gear of the bus in question had more closely followed the general lines of that used on pleasure cars there would have been less likelihood of the accident, at least.

The accident was blamed on all manner of things—as accidents usually are. It was suggested that if the angle of the steering column had been greater, so as to incline the steering wheel, too, at a greater angle toward the driver, better control would have been possible. But the fallacy of this contention becomes apparent after a little thought; a short resume of the conditions to be met in the designing of a pleasure car steering gear may assist in making it clear.

that the gear ratio between the steering wheel and the front road wheels be considerably higher than is necessary for commercial vehicles, the speed of which is comparatively slow.

Another consideration is that the pleasure vehicle is light as compared with a commercial vehicle and less effort is required to move the steering road wheels. If the same comparatively high gear ratio between the steering wheel and the road wheels as is used on pleasure cars were used on commercial vehicles it is likely that the driver would find it well-nigh impossible to steer such a vehicle at all, much less alter its direction quickly enough to keep the car out of danger.

In the design of a pleasure car wind resistance is a big factor. In order to reduce the surface exposed to the wind as much as possible it is necessary to keep the seats low, which briefly explains the reason for excessively raked steering columns. Incidentally, the raked steering column permits the larger steering wheels which the higher

gear ratio makes necessary to be handled more easily.

In the designing of the steering gear for a commercial vehicle, on the other hand, the conditions to be met are almost entirely different. In the first place, the vehicle is heavy, which makes necessary the use of a low gear ratio between the steering wheel and the front road wheels. Inasmuch as the speed of the vehicle is low, a higher gear ratio is not necessary, and, as has been pointed out, very likely could not be used because of the physical exertion which would be needed to turn the wheels.

As the exact angle of the steering column presents no particular difficulty in design and entails no additional manufacturing cost, almost any angle can be used from these two points of view. Also, as the wind resistance offered by commercial vehicles is of little moment, owing to their slow speed, this factor, as well, may be disregarded and the designing of the wheel and the angle at which it shall set resolves itself principally into a problem concerning the best position for easy and quick control.

In the ordinary type of pleasure car with excessively raked steering column reliance is placed largely in the strength of the wrists of the driver, and this is sufficient because less effort is required to steer a pleasure car. But with a heavy commercial vehicle, unless the gear ratio between steering wheel and road wheels is extremely low—almost too low to be practicable—the average driver has not strength in his wrists sufficient to manipulate the steering wheel. For smooth roads he may have, but on rough roads greater strength is required, and it cannot be applied if the steering column is raked beyond a certain limit. For this reason a straight up-and-down column, or one with a slight rake, is necessary, for the driver then can exert a straight push with one arm and a pull with the other, bringing into play the muscles of his body as well as those in his arms and wrists.

In actual practice opinions differ as to just what angle may be used to obtain the best results, though most manufacturers prefer a vertical column or one that has but a slight rake. Some idea of the various angles that are used by representative builders may be gained from Figs. 1, 2 and 3, in which the Kissel, B. O. E. and Lambert trucks are shown, respectively. In the first the angle is very slight—just sufficient to permit the column to be placed far enough forward so as not to interfere with the driver's leg space and still have the steering wheel within easy reach of the driver.

The B. O. E. wheel, illustrated in Fig. 2, is set at a still greater angle, though it is well within the limit prescribed for ease of action; at the same time the base of the column is so far forward that the pedals may be operated without interference. Lambert construction, illustrated in Fig. 3, embraces the use of a steering column

angle that more nearly approaches that used in pleasure cars. Inasmuch as the truck is lighter in construction than either of the other two and is designed for lighter loads, a greater angle is permissible without danger of reducing the efficiency of the apparatus.

But for the heavier class of vehicles, designed for the conveyance of upward of five tons of merchandise, the column that is vertical or has but a slight rake is the best. The ease of operation which the vertical column permits is shown graphically in

that any old wheel be used. Primarily the wheel must have the requisite strength to withstand the constant shock incidental to the passage of the car over rough roads. Little need be said in this respect, however, as the construction of a strong wheel presents little difficulty. The diameter of the wheel is the next consideration, and on this point few manufacturers agree. Naturally, the construction of the rest of the mechanism controls the size of the wheel to some degree, for a high gear ratio necessitates a larger wheel than does a low one.

FIG. 4—EASE OF CONTROL AFFORDED BY VERTICAL COLUMN

Fig. 4, in which a Speedwell three-ton truck is illustrated. Also it may be seen that on occasion the driver can exert a great deal more strength with this arrangement than he can when the column is raked in accordance with the general practice in pleasure car design.

Of course, in the design of light delivery wagons very nearly the same conditions have to be met as when pleasure cars are designed, and for this reason little difference in the construction or position of the component parts of the steering gear need be made except as regards the factor of necessary strength. A great many of the delivery cars in the lighter class, of which the Johnson, illustrated in Fig. 5, is one, approximate very closely pleasure car practice, and this arrangement gives universal satisfaction.

In the design of the steering wheel itself much more thought must be given than generally is supposed; it is not sufficient

and vice versa. But there are cases where this rule is overlooked, and cars with high gear ratios are equipped with steering wheels that are so small as to require an inordinately great amount of strength to turn the road wheels. But these are merely the exceptions that prove the rule, and in the majority of cases the diameter of the wheel has been determined only after study and experiment.

The distance between the average man's arms stretched parallel in front of his body varies approximately from 16 to 20 inches. To provide a perfectly natural position for the driver's arms, therefore, it is advisable to keep the wheel within these limits, and it has been demonstrated that these figures are very nearly correct. Averaging the two, 18 inches is the best diameter, and this is the size that is most used.

Regarding the position of the control levers on the average commercial vehicle, and particularly the emergency brake lever,

there is much to be desired. It has on more than one occasion been pointed out that the emergency brake lever is the most important thing on a car—in an emergency. And if this is so with pleasure cars in which a real emergency seldom arises, it is doubly so with commercial vehicles, for the reason that in the majority of cases their most useful field of endeavor is in traffic-congested areas where emergency stops continually are necessary.

Though the majority of manufacturers appreciate this fact and place their levers within easy reach accordingly, there is a sufficient number who overlook it to cause comment. It is not uncommon to see an emergency brake lever so placed that almost superhuman efforts on the part of the

complaint. There is no reason, legitimate or otherwise, for placing the levers so that they scarcely can be reached, nor does it entail added manufacturing cost to place them properly. In view of these facts it is reasonable to expect that perfection will be more nearly approached in the future than it has been in the past.

Disco Starter Makes Noted Converts.

What was in view when the Ignition Starter Co. recently removed from Grand Rapids to Detroit, Mich., now has been made plain. It carried with it immediate and real expansion, the manufacture of 300 Disco starters per day and the adoption of a truly aggressive policy at the auspicious moment when self-starting devices, no

on the engine starts itself, and so efficient has the method proven that in 98 cases out of every 100, engines have been started easily and instantly, without the slightest further trouble.

The component parts of the system embrace a number of engine valves, equal to the number of cylinders, which are inserted in place of the ordinary pet-cocks, the main distributor valve to which the starting handle is connected and which is mounted behind the dashboard, and a two-way valve to replace the ordinary one-way acetylene valve on the gas tank. From the distributor valve four tiny pipes are led to the four engine valves in an engine having that number of cylinders; a fifth pipe is led from the distributor valve to the ordinary acetylene gas tank. The action of the distributor valve is to control the quantity of acetylene that is admitted to the cylinders through the separate engine valves, and as more than a minute quantity cannot be admitted with one revolution of the handle there is no danger that an explosion of too heavy a nature can take place. As a matter of fact the amount of gas required is so small that sufficient is contained in the ordinary gas tank to insure no less than 3,000 positive starts.

Avery Brings Out "Enriched Gasolene."

Claiming to have discovered a means by which commercial gasoline is enriched and its explosive power increased, P. C. Avery, of the Avery Portable Lighting Co., Milwaukee, Wis., has brought out a mixture of gasoline with acetylene gas, which he calls Acetrol. Gasoline is capable of absorbing several times its own volume of acetylene gas, and Avery states that his mixture of gasoline vapor and acetylene gas will exert a pressure of 207 pounds per square inch when exploded in the cylinder, thus affording more power. He also claims that combustion of this mixture is so much faster than that of the ordinary gasoline-air mixture, that an advanced spark is unnecessary. "The difference between my enriched gasoline and plain gasoline is about the same as the difference between the old fashioned black gunpowder and the latest development in nitro smokeless powder," is the way Avery sums up the virtues of his discovery.

Tobacco Pipe Saves Gasolene Line.

A resourceful motorist who always has made it a practice to care for his own car recently gave an example of ingenuity that might well be copied by others who find themselves in the same predicament. His gasoline pipe broke on the road, and, being without the "ordinary kitchen soap and piece of rag," or even a piece of adhesive tire tape, he simply removed the stem from his favorite tobacco pipe, and, pointing it at each end, used it as a temporary union to join the broken fuel pipe. Afterward he bound the spot with a piece of twine and it held until he reached home.

FIG. 5—RAKED STEERING COLUMN AS USED ON JOHNSON

driver are necessary for him to reach it. In case of an emergency even the foot brake cannot properly be applied when the emergency brake lever is so situated because in the position in which it can be reached the driver cannot brace himself. He very likely is balanced on the edge of his seat with his chest or chin jammed against the steering wheel, in which position it is impossible for him to do anything other than to look happy, or scared, as the case may be.

Gear shift levers very nearly always are placed correctly, because they must be used continually and must be reached with the minimum expenditure of time and effort. On some cars, however, they occupy positions calculated to make the most ardent churchgoer "cuss," and it really is no wonder that mechanisms are strained and motors overworked because of the disinclination of drivers to stretch arms nearly out of sockets hundreds of times a day when the car "will do it on high if she must."

Manufacturers have been educated up to placing the control levers properly on pleasure cars, and until they devote the same amount of attention to their commercial vehicles there always will be cause for

longer to be denied, began to sweep the industry like an epidemic. The Disco people had not been long in Detroit before they made a noted convert—the Metzger Motor Car Co., which had practically decided to employ on its Everitt cars an engine starter operated by exhaust gas. Then the merit of the Disco was made apparent and it has been adopted as standard equipment for the Everitt line. On the Hudson car and on the Westcott it also will be part of the equipment, and several other "catches" are in prospect. But the Disco is applicable to old cars or trucks as well as to new ones, and it is stated can be installed by any man of average ability in about two hours without making changes of any sort in the engine. The device contains but 12 parts—none of them moving parts—and weighs but four pounds.

In operation it is delightfully simple, a single turn of a small handle conveniently located on the dash being all that is necessary beyond a switching on of the ignition. This single turn of the handle, be it added, serves to insure the introduction into each cylinder of an almost minute quantity of acetylene gas from the ordinary compressed gas tank. Then when the spark is turned

ELECTRIC CARS FOR SMALL TOWNS

Rockford, Ill., Cited as a Good Example of Possibilities Afforded—Service That Brought Profitable Results.

Illustrating how with proper assistance from the right sources the cost of electric vehicle transportation may be reduced to astonishingly low figures, F. H. Golding, of Rockford, Ill., described the situation in that city in a paper read before the Electric Vehicle Association at its annual meeting recently held in New York City. Despite the fact that the annual cost of charging has been reduced to between \$60 and \$71 per vehicle, the yearly revenue from sales of charging current for the 185 cars at present in service amounts to about \$11,100. Considering that this is "off-peak" business, that sum constitutes a very desirable "plum" for the central stations, which thus obtain a revenue at times when their plants and employees would be practically idle.

"The introduction of electric vehicles in smaller cities has not progressed to a marked degree, and the lack of progress can undoubtedly be attributed to three causes," in Golding's opinion, "to wit:

"1. The central station does not appreciate the value of vehicle-charging as a source of revenue.

"2. The central station operator feels that because of some peculiar local conditions, such as grades, paving, or character of community, the introduction of electrics into his city cannot be successfully accomplished.

"3. A desultory, hit-or-miss campaign has resulted in a few vehicles, but failure to properly instruct vehicle purchasers, and to oversee operation, has caused the vehicle to fail to give satisfaction to the user.

"Probably the best argument with which to meet the foregoing reasons for non-development as a statement of development of the electric-vehicle business in Rockford, Ill., which presents a very good example of what can be accomplished in a medium-sized city. The census of 1910 gave Rockford a population of 45,501, and as a result of a consistent campaign and careful supervision of vehicles in use, it has now more than 185 electric pleasure vehicles in use, with some 80 private charging equipments for electric machines.

"The city is located on the rolling prairie of Northern Illinois, and is consequently only fairly level, and is fairly well paved, but the owners of electrics do not hesitate to drive out over hilly country roads, and a trip of 35 or 40 miles over average country roads is not infrequently taken. One might say that the hills in Rockford are not as great as those in some other city, but when one sees electric vehicles successfully climbing the hilly streets of

Scranton, Pa., and considers that an electric made an excellent showing in the famous Algonquin hill climb some two or three years ago, it must be conceded that the city whose grades operate against the electric vehicle must be a very hilly city indeed.

"The success of electrically driven vehicles in Rockford is in a large measure due to the fact that the electric company, from the beginning, employed a capable battery and motor man for the purpose of instructing owners in the care and operation of batteries and vehicles. The importance of 'gasing' the batteries at frequent intervals, keeping the water level up and checking charging by gravity tests rather than by volt-ampere input was impressed upon owners, and, as a result, unusual battery life it attained, same ranging from two to three years.

"An interesting feature of Rockford's vehicle development is the unique private garages, many of which are built in basements of houses, under porches, etc. About 140 electrics are housed in these private garages, and 95 or 100 are regularly charged with private equipment. The seeming inconsistency between this figure and the number of private charging equipments noted in a preceding paragraph is explained by the fact that quite a few owners have two electrics and some even three.

"The extreme simplicity of operation and the cleanliness of the electric car makes it especially adapted to the use of ladies as well as to that of business and professional men where the frequent stops make the cranking of a gasoline car a great deal of trouble.

"There has been as yet no commercial truck business developed, and the chief obstacle appears to be the first cost of the electric truck as compared with gasoline. This is particularly true of the lighter vehicles for groceries, etc., as a gasoline machine of this character can be purchased for less than \$1,000. Up to this time the electrics have not competed with gasoline cars to any great extent, as each type of car has had its own particular field, and, as a matter of fact, many Rockford people have both types of car. The development of higher-capacity batteries, making possible a run of upwards of 100 miles on a single charge, is opening up another phase of the situation, and the writer ventures to express the belief that within a few years the electric will be a formidable competitor of the gas car.

"The central station at Rockford makes an 'off-peak' charging rate of six cents net per kilowatt, with a minimum charge of one dollar per month, the 'off-peak' period covering from 4 P. M. to 9 P. M. from November to February, inclusive. For public garages, of which one handles electrics exclusively and two handle both electric and gasoline cars, an 'off-peak' rate of four cents net is made, the contract con-

taining the same 'off-peak' stipulation that contracts with private individuals contain, and a further proviso fixing the price at which the garage must resell charging current to car owners at six cents. It will be apparent that the latter clause is intended to insure the vehicle owner that the cost of operating his car will be no greater if he chooses to have it cared for in a public garage than if he installs his own charging equipment or charges at the company's depot.

"The enforcement of an 'off-peak' charging rule requires little attention, as the electric automobile is naturally used in the afternoon and the evening, so that the very nature of the vehicle makes it essentially an 'off-peak' proposition. In Rockford the electric company impresses the vehicle owner with the fact that slow charging, at a low ampere rate, is preferable to spasmodic charging at a high ampere rate, and this has tended to encourage all-night charging, so that fully 75 per cent. of it is done between 9 and 10 P. M. and morning.

"The annual revenue from vehicle charging is about \$11,100, the revenue from private garages averaging \$60 per car per year and that from public garages \$71 per car per year. The better showing of public garages is due to the fact that a number of the cars kept in private garages are frequently charged at public stations, and to current used while batteries are being repaired. The average annual cost of operating an electric in Rockford is estimated as follows:

Current for charging.....	\$60
Battery maintenance	30
Tire maintenance	40
Vehicle maintenance	50

Total\$180

"The vehicle maintenance cost covers repainting and overhauling the machine each year."

Lighter Oil that Prevents Stiffness.

The periodic tendency toward stiffness which some motors exhibit with the advent of cold weather generally is due to the fact that the oil used is too heavy. It would be remembered that when any grade of lubricating oil is chilled its viscosity is raised, or in other words it becomes "stickier." Consequently it offers greater resistance to the moving parts and the stiffness results. Though the oil reservoir in most motors is so situated that the oil is maintained at an even temperature at all times, others in which external oiling devices are used should be supplied with a lighter grade of oil during cold weather. When no mention is made by the manufacturer to the effect that a change is necessary it is best to use one grade the year around, as no harm can result provided a sufficient supply of lubricant is maintained in the reservoir. At any rate, it is well to consult with the manufacturer before making a change.

HERE'S A LAMP THAT LIGHTS ITSELF

Employs Phosphide of Hydrogen in Causing Spontaneous Combustion—How the System Works.

Employing one of the more or less well known laws of chemistry which ensures spontaneous combustion when certain gases are mixed, a British inventor with a penchant for such things, has perfected and placed on the market a radically new type of acetylene lamp lighter which, it is claimed, is infallible as well as entirely automatic in action. It is styled the Low Automatic Lamplighter, and though in its present form it is applicable only when acetylene generators are used, there are abundant possibilities for its use in connection with the more numerous and popular gas tanks.

Aside from the necessity for carrying a supply of a chemical other than the calcium carbide which is used in making acetylene, but which it is claimed can be purchased almost anywhere, "twopennyworth sufficing for about 200 lights," the device really has merit in that none of the mechanical aids, such as wires, spark coils or other contrivances, which generally are a part of such systems, are used. Instead, the whole apparatus, which is quite simple, is enclosed in the acetylene generator itself, or rather in a miniature generator of very much the same type, which is attached to the top of the other.

The upper portion of this secondary generator contains water and the lower portion, or container, serves as a reservoir for the calcium phosphide, from which the gas is made on which the action of the system depends. Inside a central tube in the generator there is a plunger, held in place by means of a spring, which is hollowed out at its lower extremity so as to contain a small quantity of water, which is admitted to the hollow space through two small holes in the tube. When the plunger is depressed this small quantity of water is carried down and issues through another hole to reach the calcium phosphide, after first having passed over a distributing ring.

The gas which is liberated is phosphide of hydrogen, and in its pure state would ignite spontaneously immediately it came in contact with the ordinary atmosphere. It is in controlling this tendency to spontaneous combustion that the ingenious part of the apparatus is revealed. Mixed with the calcium phosphide there is another chemical or "neutralizing agent," the name of which is a dire secret. Its action is such that the phosphide of hydrogen is rendered impossible of spontaneous combustion unless mixed with acetylene gas as well as air.

To put the apparatus in action it is mere-

ly necessary to open the valve in the acetylene line leading to the lamps, and after sufficient time has elapsed for the acetylene to generate and the air to be expelled from the line, depress the plunger in the auxiliary generator once. This causes phosphide of hydrogen "and another gas" to be generated and these two are introduced directly into the acetylene line by means of a T joint. When the mixture reaches the air spontaneous combustion takes place and the lamps light.

When the lamps are first lighted, it is explained, they burn with a slightly yellow tinge until the compound gases given off by the lighter are exhausted. Providing a supplementary use for the compound (calcium phosphide and the "neutralizing agent") it is stated that a small quantity added to the calcium carbide in the ordinary type of acetylene generator causes the lights to burn with a yellowish tinge, which color is much esteemed by Britishers for driving in the foggy atmosphere for which parts of England are famed.

Places "Warning Pictures" in Schools.

Realizing that the best way to warn children of the dangers they run when dodging in and out of traffic, and especially when hanging to the rear end of wagons, is to give ocular demonstrations and instructions, the Education Committee of the city of Hull, England, has caused to be hung in 186 departments of the municipal schools two pictures illustrating in a striking and vivid way these dangers. One of the canvases shows three children hanging onto a wagon in a crowded street—it is labeled "A Dangerous Game." The second picture shows one of the two boys run over by an automobile while the other boy and girl shield their eyes in terror—it is called "A Sad Result."

Four Year Old Boy "Took a Chance."

If one cares to believe a story which comes from Connersville, Ind., it is safe to lie in the road and to allow a motor car to run over you—provided you take care to lie lengthwise and keep still. A Connersville lad of the ripe age of four years is said to have tried the experiment and to have come through unscathed. As the tale comes from the Hoosier town, William Morler had heard that one could be run over without getting hurt, and he wanted to find out whether it could be done. So one day last week he lay down in front of R. M. King's automobile, and after the car had passed over him jumped up in high glee, exclaiming, "I done it, didn't I?"

Avery Treasurer of Milwaukee Club.

Percy C. Avery will look after the financial end of the Automobile Club of Milwaukee, Wis., until the next annual election of officers. He has been made treasurer to succeed Charles S. Drake, who resigned to devote his time to good roads work.

HOW SANDS REACHED HAZELTON

The Story of His Herculean Task of Blazing a Trail Through Virgin Country—Luck Assists Pluck.

For heart-breaking toil and privation, and at the same time astonishing good fortune, the trail-blazing run of P. E. Sands in the Flanders Pacific Highway pathfinder recently completed from Seattle to Hazelton, B. C., is unique in the annals of motordom.

Leading for nearly three weeks the primitive life of uncivilized men, with no roof over their heads and the mud for their beds at night with a simple diet of bacon, beans and bannock frying-pan bread (concocted "sour-dough" fashion), with an occasional variety of grouse shot by members of the party, they struggled through rainstorms, deep mud, across swift-flowing mountain streams and up and down and around the steep-sloping sides of precipitous hills and through forests in which it was necessary for axemen actually to hack the way.

And withal, good fortune seemed always at their elbows to give encouragement to the three men who constituted the party just as hope was at its lowest ebb. When they struck into the wilds of northern central British Columbia, where no other motor car or even a lumber wagon ever had gone, they discovered that, should any part of the car no matter how small fail them, it would require two months' time to get a new part. The imminence of an occurrence of this kind, which would have meant catastrophe to the enterprise, perhaps wore down their nerve more than the grinding labor they were compelled to endure. Such an accident would have meant that they must lay in whatever part of the wilds it happened for two months or else abandon the car.

The mental attitude of three plucky fellows may well be imagined when, at one point between Fraser Lake and Burns Lake, the dry cells of the battery gave out. They had no extra cells in the kit of equipments. Then, as in a hundred other instances, luck came to the aid of pluck. They found, a few miles distant, a settler who had just purchased four dry cells to install a telephone line to the next neighbor. The cells were purchased and the trip resumed with only a short delay.

Through that stretch, a distance of about 100 miles, they traveled at an average rate of about 10 miles a day, but there were many days when only one or two miles were covered. This required much work on the low gear and the consequent consumption of gasoline was far greater than had been anticipated.

They had taken on an extra supply of gasoline at Ashcroft, which they figured would supply them the remainder of the

journey, but when they reached Fraser Lake they found it would not carry more than half the distance to Burns Lake. But it was learned that gasoline lights were in use at Aldermere, 150 miles ahead. They wired to Aldermere and a supply of the fuel was sent down the trail on pack horses, meeting them before they reached Burns Lake.

Accidents were to be expected, and while the Flanders party was not disappointed in this respect, none of them proved serious. Once on a side hill so steep the car could not maintain a balance it toppled over, catching Driver Sands at the wheel. One of the axemen in the crew employed to slash the way for the machine rushed to the rescue and nearly demolished the car body, dragging Sands out to find that he had sustained only a badly lacerated hand and bruised leg.

Another accident before they had reached the worst part of the trail was narrowly avoided. It would have cost them the loss of the car and possibly the loss of Sands's life. They had just ferried across the Fraser River at Quesnel, leaving the beaten road and entering the uncharted region, when the ferryman neglected to secure his scow firmly to the river bank. At that point the river is swift and deep and the landing shot straight up from the water's edge at a precipitous angle. Sands backed to the farther end of the scow to get a running start, not knowing the scow was loose. The pull of the car as it raced for the shore drew the scow away from the bank. When the front wheel crossed the boat's edge it was six inches from the bank, and as soon as the rear wheels went over it was 18 inches from the shore. Sands did not know that he had been in peril until he reached the top of the bank, though the other members of the crew had seen it and watched in white-faced expectation to see car and man disappear in the stream.

Another prank of Fortune: Had it rained after they left Fraser Lake the car never could have gone through. At least, such is the opinion of Sands, and he ought to know. Though there were a few flurries of snow, no downpours came. But when they finally reached their destination they discovered that unless torrential rain came they could not get home again, as boats can reach the town only during high water.

They arrived at Hazelton at 9.40 o'clock Wednesday night, October 1st, and had their first sleep in a bed in three weeks. When they awoke next morning they gazed out on a flooding rainstorm. Three days later, after feasting and congratulations of the enthusiastic townsmen had reached the climax, they departed. Had they been a few days later the car, at least, would have remained at Hazelton until next spring.

There were scores of incidents of this nature that would require a huge volume in the telling. One other deserves mention. En route homeward they changed boats at Prince Rupert, B. C., and had ar-

ranged to take passage on the ill-fated Princess Beatrice, which went on the rocks on that same trip out of Prince Rupert. The plans were changed to save a couple of hours' time and they took a later boat, while the Princess Beatrice piled up on the rocky shore shortly after leaving port.

Though the run from Seattle to Hazelton showed only 1,281 miles by the speedometer, an idea of its severity on both car and crew may be gained from the fact that 10 tire casings were worn out. An idea of the hill climbing endured may be imparted by the fact that three sets of internal brake shoes were worn out. A set of these shoes in a hilly city like Seattle lasts at least a year, and three sets ordinarily will wear for about five years.

Sands estimates that of the 1,281 miles covered not more than 350 were traversed on the high gear, about 381 on the intermediate and 550 on the low gear.

When the car left Ashcroft, in southern British Columbia, it weighed 3,050 pounds, or an overweight of 650 pounds. When it reached Fraser Lake Sands found it necessary to remove the extra weight. En route from Ashcroft they had been forced to purchase a camping outfit, though this was meager because of the added weight it gave. At Fraser Lake two white men were employed as axemen and an Indian native was added to the crew as guide over the 'Telegraph trail'. A pack train of ten horses, for which they had to send 30 miles into the woods, was also added to the outfit to carry the supplies, the equipment removed from the car and the axemen and guide.

Thus equipped, the party fought its way through nearly 110 miles of wilderness to Aldermere, at the end of the road leading into Hazelton. They found the trail fairly well cleared, and were not compelled to do as much wood chopping as had been expected. The hills were not as large as had been anticipated, either, but their slopes, though short, were precipitous and so closely were they set to one another that the car frequently formed a bridge across the gullies between them.

Sands says there is little doubt that an excellent highway may be constructed through the region at nominal cost.

Hazelton, a town of probably 1,200 inhabitants at the head of navigation on the Skeena River, lies at the edge of North America's last great western frontier, where already a vast mining section has been discovered, and with the advent of practical transportation facilities is certain to experience a "boom" that will make it a great commercial center. It also is near a large area of farming land, as yet virgin, which awaits the wagon and railroad to become an important agricultural region.

The people of Hazelton, to whom the coming of the pathfinding car meant the certainty of a permanent highway and the opening of a new epoch in the history of the town and entire country, were wild with enthusiasm when the little machine

and its party finally rolled up in front of the town's biggest hotel.

At the time of the party's departure from Seattle—and, in fact, until the car was within 100 miles from its destination—odds of 10 to 1 were offered in Hazelton that it would never get through, and no one had faith enough in the attempt to take the wagers. Word had been sent out that the final 100 miles could be easily covered, over a highway traversed at regular intervals by an automobile stage. The pathfinders learned that this was a hoax. Only freighting wagons, drawn by 10- and 12-horse teams, carrying supplies out to the construction camp on the Grand Trunk Pacific Railway right-of-way, ever passed over the route, and the road for 100 miles was a succession of great ruts ranging from one to three feet in depth.

When they finally drew up in front of the Hazelton Hotel they looked up over their heads and saw, in the light of an arc lamp, a big white canvas stretched across the front of the balcony, on which was painted in huge letters the word "Bravo!" When word of their coming was received at Hazelton on the morning of that day the only automobile in town was dragged out and prepared to go out and meet them.

This car, a vehicle of mysterious vintage, had not been on the road for years. After several hours of tinkering and coaxing it picked up courage and made a dash of about 20 feet, then quit cold and firmly repulsed all further efforts to make it run.

Because the pathfinders did not show up before dark half the population of the town went to bed, thinking the party would not drive in until next morning.

The other half gathered in front of the hotel and cheered wildly when they heard in the distance the faint rattle of the Flanders "20's" exhaust. From the moment of the crew's arrival until their departure three days later their money was "no good." They were not permitted to buy anything, though they were urged to take anything the town possessed that they desired.

The banquet in their honor on the following evening, October 5, was the greatest event of its kind in the little city's history. Sixty men sat down to the spread, given under the auspices of the Business Men's Association, and before the meal's conclusion 173 bottles of champagne, which in that country costs \$5 a pint, were consumed. The menu consisted entirely of viands produced in that region, and the pathfinders declare that for quality it was unsurpassed by anything they had ever tasted in the United States.

Prest-O-Lite Plant for St. Louis.

The Prest-O-Lite Co. of Indianapolis has leased a plot in St. Louis, 475x180 feet, on Duncan avenue between Sarah street and Vandeventer avenue, on which will be erected a charging and repair plant. The lease covers a term of 15 years.

STORING A CAR DURING SNOW TIME

One Motorist Who Dodges Advice and "Camphor Treatment"—Also Cancels Insurance and Saves Money.

"When, at this time of year, I read the columns of advice on how best to store a motor car during the winter, I usually indulge in a quiet smile in my sleeve," remarked a man who does not lack experience. "If, when storing my car, I did half the things that the wise men advise should be done I fear that I would be gray haired before I got through doing half of them. I don't mean to say that the advice is not good advice, and that a car stored according to such directions may not be at least one per cent. better than cars which are not so treated, but I do know that I never have followed any of the voluminous suggestions or instructions and I cannot discover that my car is any the worse for it.

"Perhaps I am inclined to be careless, and perhaps if I had a garage of my own I might do otherwise, but as it is it does not take me very long to get my car ready for its winter sleep. Instead of practically dissembling it and applying vaseline or cold cream to each separate part and packing them in camphor, so to speak, about all I ever have done has been to remove all of the easily stolen accessories, drain the radiator absolutely dry, jack up the four wheels from the floor, let about three-quarters of the air out of the tires, and then cover the entire car with a heavy night-gown, so to speak.

"I have owned motors for all of ten years, and though each year they have been stored during all of the winter months I never have gone to more trouble than I have stated, and I have yet to find that my car is the worse for it.

"Last year, however, I learned a new trick affecting winter storage that is worth knowing, and which very much more than paid the cost of several years' storage. When I put up my car I canceled all of the insurance which I carried, not only collision and personal liability insurance but fire insurance as well, which brought me a drawback or rebate from the insurance company of more than \$50. Also I did not store my car in a public garage. I discovered that there were several high-class storage warehouses which were bidding for automobile storage and that the charge of several of them was just about half of the amount exacted by the garages. I gave my garage man a chance to meet the storage warehouse prices, but he preferred to turn away the easy money.

"When I say that I canceled my fire insurance policy, perhaps I should explain that I took out another one covering the car while it was in the warehouse; and you can believe me or not, as you please, but it

is a fact that the difference in the price of the insurance between the garage and a warehouse of the sort is more than half the price for the winter's storage in the latter place. In the spring, of course, when the car is put into commission again, I renew all of the policies, canceling the warehouse fire insurance, which cancelation brings another small rebate or drawback. I find that comparatively few motorists who carry the several forms of insurance which every wise man should carry are aware of the fact that by canceling their policies before their cars are put away for the cold months they can save a pretty penny."

For the Easy Removal of Carbon.

With the laudable intention of simplifying the removal of carbon deposits from cylinders and piston heads, a British inventor has patented a method of construc-

HOW HEAD "PLUGS" CYLINDERS

tion which should make this otherwise more or less egregious task seem almost as easy as rolling off the proverbial log. As may be seen in the accompanying illustration, the end, is achieved by the simple expedient of equipping each cylinder with a removable plug, and though the idea is not entirely new, this is the first time it has been deemed of sufficient merit to warrant its being patented. W. C. Head is the patentee, and he contemplates the accumulation of royalties.

Level with the top of the piston, when it is at top dead center, a rectangular port, A, is provided. Into this port there fits a plug, D, which is made integral with the face-plate, C. The plug is held in place by means of four short cap screws and a ground joint between the face-plate and the cylinder insures the maintenance of compression. The removal of carbon merely necessitates that the plug be taken out and a suitably shaped scraper inserted in the opening, when both the top of the cylinder and the top of the piston may be cleaned. Inspection is simplified by the removal of a valve cap and the insertion of an electric lamp.

PEDESTRIANS HAVE NOT IMPROVED

Massachusetts Highway Commission Again Charges Them With Carelessness—What Its Report Shows.

The Massachusetts Highway Commission, which for several years has furnished the most reliable and accurate statistics regarding accidents occurring on highways and city streets, in its report issued on November 1, calls attention to the lamentable increase of motor car accidents in that State. In discussing the causes for this increase, however, the Commission repeats a previous assertion that pedestrians are responsible for by far the greatest number of the accidents in which they are concerned. Children, in particular, are a source of much trouble, by running into the streets and standing in front of approaching cars until they are almost upon them.

Classifying the accidents from December 1, 1910, to October 1, 1911, the Commission finds that in these ten months there occurred 83 deaths in highway accidents, 50 of which were pedestrians, 26 occupants of motor vehicles, five bicycle riders and two occupants of carriages.

For the year from December 1, 1909, to December 1, 1910, there were 77 deaths, of which 44 were pedestrians, 25 occupants of motor vehicles, four bicycle riders, three occupants of carriages and one street car passenger.

The number of injured up to the first of last month was 994, of whom 395 were pedestrians, 419 occupants of motor vehicles, 116 occupants of carriages, 55 bicycle riders and nine street car passengers. In the previous year there were 993 injured, 406 being pedestrians, 378 occupants of motor vehicles, 111 occupants of carriages, 64 bicycle riders and four street car passengers.

The total number of collisions in the 10 months ending the 1st of October was 1229, distributed as follows: With pedestrians 445, with other motor vehicles 153, with carriages, carts, etc., 190, with bicycles 65, with trolley cars 100, with poles, trees, posts, etc., 266 and with trains 10. The corresponding figures for the previous year were 1182 accidents, of which 447 were with pedestrians, 103 with other vehicles, 174 with carriages, carts, etc., 74 with bicycles, 90 with trolley cars, 288 with poles, trees, posts, etc., and six with trains.

The number of accidents in the daytime during the 10 months of this year compared with the 12 previous months was 897, against 867; after dark, 332, against 315; on country roads, 233, against 22; in city or town streets, 996, against 960. In the past month there were 10 people killed and 101 injured in 128 accidents, making the total number of killed that has been reported 93, and that of injured 1,095, in 1,357 accidents.

996,839. Resilient Tire. Alfred A. Curry, Bridgeport, Conn., assignor of one-half to Edwin B. Knowles and one-twentieth to Charles S. Canfield, Bridgeport, Conn. Filed Jan. 19, 1911. Serial No. 603,485.

1. A resilient tire comprising an inner rim, a series of disconnected nested complementary U-shaped springs alternately inverted and resting on said inner rim, an outer rim resting on and supported by said springs, means carried by the outer rim for detachably engaging the inner rim to secure the outer rim and permit oscillation thereof relative to the inner rim, said means being located to one side of said springs.

996,870. Automobile Rim Holding and Tire Pumping Device. Edward Charles McCullough, Greenwich, Conn. Filed Sept. 30, 1910. Serial No. 584,714.

A supporting stud, a frame mounted for rotation upon said stud, a plurality of radially arranged rods movably connected to said frame, each of said rods being provided with a transverse extension having a hook at one end and a threaded stud at the other, a cone collar upon each of said threaded studs, and a nut carried by each of the threaded studs and bearing against said collars, whereby clamping means are provided for supporting a wheel-rim upon the rods.

996,871. Vehicle Brake. John A. McGrath, St. Louis, Mo. Original application filed July 20, 1910. Serial No. 572,798. Divided and this application filed Oct. 29, 1910. Serial No. 589,679.

1. In a vehicle brake, the combination with a vehicle body and wheels, of a support adjacent to the wheels, a brake shoe, a pair of rollers carried by one of said latter named parts and a pair of inclined bearings carried by the other of said parts and co-operating with said rollers, and means for moving said brake shoe bodily around the wheel to cause said rollers and bearings to co-operate and apply the shoe.

996,882. Automobile Tire Pump. John J. Reddy, Jersey City, N. J. Filed Aug. 30, 1910. Serial No. 579,667.

1. In an air pump the mechanism for operating the same with foot power, similar to walking, comprising two pedal levers, each with vertical members and a horizontal member, a pair of A standards between and upon which said levers are fulcrumed, link bars pivoted in pairs to the short member of each lever, and also to the cross head of each pump, strengthening rods, pivoted to horizontal members and also to the short members of said lever, means for connecting the cross heads of said pumps.

996,883. Dynamo Electric Machine. Henry G. Reist, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Mar. 1, 1905. Serial No. 247,849.

1. In a revolving field structure, polar portions, windings surrounding said polar portions, and a brace engaging the adjacent sides of the windings surrounding adjacent polar portions, said brace having

a portion extending between the tips of the corresponding polar portions which serves as a barrier to limit the axial flow of air in the space between said polar portions.

996,897. Carburetter. Thomas A. Swartz, Columbus, Ohio. Filed May 19, 1910. Serial No. 562,195.

In a carburetter, the combination with a carburetting chamber having a valve controlled gasoline discharge nozzle therein, and means for conducting gasoline thereto, of an air inlet casing communicating with said carburetting chamber, a valve casing in said air inlet casing, a valve in said casing, a ring about said valve casing, said ring having a plurality of openings, and ball valves normally closing said openings.

996,922. Lubricator for Engines. Ulysses S. Greer, Greensboro, N. C., assignor of one-half to Proximity Manufacturing Company, Greensboro, N. C. Filed July 25, 1910. Serial No. 573,806.

1. A lubricator comprising an oil distributor, and a feed member provided with an internal automatically operated valve and adapted to enter one end of the distributor and discharge its contents therein by impact of said valve at the opposite end of the distributor.

996,925. Fluid Clutch. Augustine F. Hall and George Cuthbert, Philadelphia, Pa. Filed Apr. 18, 1910. Serial No. 556,010.

1. In a fluid clutch, a crank casing, a crank shaft working therein, pressure pistons connected with the crank shaft, valve cylinders, piston cylinders for the pistons in communication with the valve cylinders, valves in the valve cylinders controlling the movement of fluid between the two cylinders, means for operating the valves in unison, and a diaphragm plate on the crank casing adapted to expand under the influence of heat generated therein.

996,962. Nut Lock. John G. Baling, Baltimore, Md. Filed Feb. 24, 1911. Serial No. 610,651.

1. The combination with a bolt, or a nut having a portion of one of the threads thereof extended outwardly beyond the adjacent face of the nut and split for engagement with the treads on the bolt.

996,969. Acetylene Gas Package. Henry H. Buckman, Jr., Indianapolis, Ind., assignor of one-third to William J. Richards and one-third to Harmon H. Fulton, Indianapolis, Ind. Filed Dec. 1, 1910. Serial No. 595,139.

1. In an acetylene gas package, the combination of acetylene gas, benzophenone and a liquid absorbent for the acetylene gas.

996,981. Carburetter. Frederick G. Folberth, Cleveland, Ohio. Filed June 13, 1910. Serial No. 566,677.

1. In a carburetter, the combination with a casing having an air intake and a float chamber, of an automatically controlled valve for said intake, a fuel valve, a bodily adjustable lever connected to said air valve for controlling said fuel valve, and a support for said lever slidably mounted on said float chamber.

996,985. Retainer for Ball and Roller Bearings. Fritz Henzelman, Chicago, Ill., assignor, by direct and mesne assignments, to German American Ball Bearing Mfg. Co., Chicago, Ill., a Corporation. Filed Aug. 16, 1910. Serial No. 577,464.

A retainer for ball and roller bearings, comprising a pair of rings having a plurality of registering apertures therein, a plurality of pairs of spacer plates between said rings, and the plates of each pair having their corners turned oppositely, and lugs on the ends of said plates adapted to be secured in said apertures.

996,997. Spring Mounting for Vehicles. George W. Morris, Racine, Wis. Filed Jan. 20, 1910. Serial No. 539,150.

1. The combination with a vehicle body, a cylinder open at its lower end secured thereon, a hollow plunger open at its upper end adapted to slide and to rotate freely in

The Atwater Kent System

COMBINES the good features of all other ignition devices with several that are peculiar to it alone. It is the only system that produces a hot, dynamic spark of absolute uniformity, no matter whether the engine is turning a hundred or a thousand revolutions per minute.

The man who drives an Atwater Kent equipped car is pretty sure to be an Atwater Kent enthusiast.

Write for detailed information.

Atwater Kent Mfg. Works

PHILADELPHIA, PA.
42-50 North Sixth Street

said cylinder, a coiled spring inclosed within said cylinder and plunger and tending to prevent movement of said plunger into said cylinder, and anti-friction devices interposed between one end of said spring and its bearing whereby the rotation of said plunger relative to said cylinder may not cause said coiled spring to unwind, of a link connected with said plunger, a spring connected with said link and bearing on said cylinder and tending to prevent movement of said plunger out of said cylinder, and an axle connected with said plunger.

997,105. Engine Valve Mechanism. Oscar Treier, New York, N. Y. Filed July 12, 1910. Serial No. 571,594.

1. A valve mechanism for engines, comprising a hollow valve for the passage of the motive agent, a yielding mounted cap for engagement by the said valve to close one end thereof, and means for imparting movement to the said valve.

997,133. Lifting Jack. Charles E. Hylander and George F. Freed, Pittsburg, Pa., assignors to The Duff Manufacturing Co., Pittsburg, Pa., a Corporation of Pennsylvania. Filed Oct. 8, 1909. Serial No. 521,763.

1. In a lifting jack, a jack frame, a lifting ram movable therein, and an endwise removable pin seated transversely in the frame and having a guiding and holding engagement with the lifting ram, substantially as described.

997,159. Motor. Richard Star, New York, N. Y., Filed Dec. 6, 1909, Serial No. 531,600. Renewed Dec. 16, 1910. Serial No. 597,721.

1. In a motor, the combination of a casing, one part of which is provided with a series of inlet and outlet ports, abutting partitions dividing said casing into two substantially equal chambers, a shaft passing through said chambers and said partition, said shaft being provided in each chamber with a circular enlarged portion, having a slot therein, and a piston having movable ends arranged to slide in the slot in said shaft in each chamber, said pistons being arranged at right angles to each other, substantially as described.

997,161. Indicating Device for Vehicles. Herman J. Suelzen, Chicago, Ill. Filed June 8, 1910. Serial No. 565,746.

1. In a device of the class described, the combination of a casing; a clock mechanism; a record-strip mounted in said casing adapted to be fed therethrough; means for feeding said strip, said means being adapted upon the subjection of the device to vibration to feed said strip at the greater rate of speed than when the device is not subjected to vibrations; recording means adapted to act upon said strip; and an operative connection between said recording means and said clock mechanism, substantially as described.

NO-LEAK for Mohair Tops

Absolutely guaranteed to stop all leaks. Your money back if not satisfied. Full directions with each package, sufficient for one top, \$1.00.

WANTS AND FOR SALE

15 cents per line of seven words, cash with order.
In capitals, 25 cents per line.

REBUILT THOMAS CARS—One year's work usually tells the story of the difference in construction between a high grade, high priced and high powered car and those built to sell at a low first cost. The strain of gear shifting, the jar of road shocks, and the stress of brake work begin to tell on the cheaper cars. Therefore the logical deduction is that for the man who wants a thoroughly dependable car at a moderate price the very "best buy" is a high grade used car that has been rebuilt in the factory where it was originally made. We have a few four and six cylinder cars, 1908, 1909 and 1910 models, some priced as low as \$1,000. These cars should not be confused with the ordinary "second hand" proposition, as in the rebuilding all parts which show the slightest wear are replaced by new ones. If you want a car for real work, write us and we will send you special bulletins descriptive of rebuilt cars we have on hand. For a reasonable payment we will hold one of these cars for you for early spring delivery. **USED CAR DEPARTMENT, E. R. THOMAS MOTOR CAR CO., Buffalo, N. Y.**

FOR SALE—Two gentlemen's fur-lined overcoats, lined with finest Australian mink; outside broadcloth; beautiful Persian lamb collars; sizes 38-40 and 42-44. Worth \$125 each. Never worn. Will sell for \$35 each. Also two elegant cinnamon bear robes. Value \$100. Sacrifice the pair for \$30. And chauffeur's Siberian dog fur coat, \$30; worth \$90; never used. Call or write, **E. ROBERTS, Room 10, 160 West 119th St., New York.**

WANTED—Automobile designer capable of designing cars of moderate and low price. Factory located in East. All answers should state experience and will be kept absolutely confidential if so requested. Address **L. S. N., Box 649, New York City.**

WANTED—First class experienced salesman to establish agencies for one of the best electric pleasure cars manufactured. Write today, stating experience, salary wanted, and references. **GRINNELL ELECTRIC CAR CO., Detroit.**

FOR SALE—1 Apple 80 V. Ignition Dynamo complete with bevel friction governor, and 1-14 S. Apple recharging switchboard, both in first class condition. First check for \$30.00 takes them. **H. E. HILL, Kenosha, Wis.**

AUTOGENOUS welding of broken cylinders and crank cases is most expertly done by **WATERBURY WELDING WORKS, Waterbury, Conn.**

Polarine

The Best Oil for All Motors

When a car starts out lively in the morning and then shows signs of sluggishness later in the day, it usually means something is wrong with the lubrication.

Use **POLARINE** Oil and you will avoid two-thirds of all motor troubles.

POLARINE is the best automobile oil yet produced.

It gives the maximum lubrication for the amount used. It insures the least possible friction and wear, with full compression and power.

It leaves no carbon deposit.

It feeds freely right down to zero.

Look for the flat, convenient can—just fits in the tool-box. Ask your dealer.

Our free booklet tells all about the Polarine Brands, and contains many useful hints on the care of a car. Write for your copy today to any agency.

No. 90

GENERAL MOTORS RETAINS DURANT

Settles Speculation by Re-electing Him a Vice-President and Director—All Other Officials Continued.

Despite a general belief that he was not in entire harmony with his associates in the General Motors Co., and that because of his activities in promoting two competing concerns—the recently formed Chevrolet and Little companies—he would retire or would be retired from the General Motors' directorate, W. C. Durant will not only remain a director of the big company but will be one of its vice-presidents, and also a member of its finance committee. This was decided, and some speculation thereby settled, at the annual meeting of the General Motors Co. which was held in Jersey City on Tuesday last, 21st inst., when all the incumbent officers and directors were re-elected, as follows:

Thomas Neal, president; W. C. Durant, vice-president; W. J. Mead, vice-president; Emory W. Clark, vice-president; Standish Backus, secretary; James T. Shaw, treasurer; C. A. Magee, comptroller.

Board of Directors: Joseph Boyer, M. J. Murphy, A. N. Brady, Thomas Neal, Emory W. Clark, James J. Storrow, W. C. Durant, Albert Strauss, Andrew H. Green, Jr., N. L. Tilney, J. H. McClement, James N. Wallace, Edwin D. Metcalf, Jacob Wertheim.

Finance Committee: Emory W. Clark, M. J. Murphy, W. C. Durant, Thomas Neal, Andrew H. Green, Jr., James J. Storrow, Edwin D. Metcalf, Albert Strauss.

Owosso Truck Cannot Expire Peacefully.

Although the directors of the Owosso Motor Co., of Owosso, Mich., had decided to peacefully wind up its affairs and go out of business, its going will not be quite so peaceful as it has been anticipated. Instead the company has been thrown into the bankruptcy court on a petition of several

creditors who allege that while insolvent the Owosso company committed an act of bankruptcy by making several small payments with the intent to prefer certain creditors. As a result of the bankruptcy petition, G. H. Gaffley, of Detroit, has been appointed receiver for the company which was organized to manufacture a light truck but which did not produce many of them.

Excelsior Appeals to Supreme Court.

The last has not yet been heard of the litigation involving the Parsons patent covering the Weed chain tire grip. The Excelsior Supply Co., of Chicago, which first upset the patent only to lose the advantage when the Weed Chain Tire Co. appealed from the decision, has carried its case to the United States Supreme Court. The application takes the form of a petition for a writ of certiorari which, if granted, will result in the review of the entire case by the Supreme Court. It is so rare, however, that this tribunal consents to review patent cases that the likelihood that it will do so in this instance is remote.

Big Bond Issue by Little Company.

W. C. Durant's most recent enterprise, the Little Motor Car Co., of Flint, Mich., which is capitalized at \$1,200,000, has recorded in Genesee County, Mich., a mortgage to secure a \$2,000,000 five year bond issue, for which the Detroit Trust Co. is trustee. The bonds, it is stated, were placed in Flint before the mortgage was drawn. C. M. Begile is president of the company and W. H. Little, long Durant's chief lieutenant, is vice-president.

Little Star That Failed to Twinkle.

Theodore M. Weiss, a stockholder in the Star Motor Co., of Indianapolis, has filed a petition in the Indiana superior court, asking that a receiver be appointed to take charge of the assets of the company. The company was organized in November, 1909, according to Weiss, and since that time he says only one motor car has been manufactured. The plaintiff charges that the concern is wholly insolvent.

SLEEVE VALVE LITIGATION BEGINS

Knight Strikes at Scotch Invention Through English Agents for Swiss Car—Wide Scope of His Claim.

Litigation involving the sleeve valve patents, which there was every reason to expect would not be long delayed, finally has begun; not on this side of the water, however, but in England where the sleeve valve principle—an American conception—first found recognition. The litigation was inaugurated during the London show on Monday, the 6th inst., when Charles Y. Knight and L. D. Kilbourne, the Americans who comprise the Knight & Kilbourne Patents Co., owners of the Knight patents, instituted proceedings against Donne & Willans, the London agents for a Swiss car which employs the so-called Argyll sleeve valve engine, and which operates under license from the Argyll Company of Scotland. The action alleges infringement of the Knight British patent No. 14,729 of 1905.

The suit, which it is believed will result in a general threshing out of the sleeve valve idea, was brought against the London firm instead of against the Argyll company itself because the latter has no registered address in England, and to proceed against the Argyll makers direct, Messrs. Knight and Kilbourne would have been compelled to go to Scotland and fight the case there. The Argyll motor, which only recently attained prominence, differs from the Knight engine chiefly in that it employs a single sleeve arranged concentrically with the cylinder, while the Knight uses two sleeves; also unlike the Knight sleeves, the Argyll sleeve moves circumferentially a short distance each way, as well as upward and downward. According to Mr. Knight this construction is quite like the first motor of the sleeve valve type which he constructed and is of the type with which he conducted his early experiments. It is his claim that his in-

vention really consists in the adoption or adaptation of the sleeve valve to the four-cycle engine regardless of the number of sleeves.

In bringing his invention to its present state of development, Knight figures that up to July last he and his associates have spent \$200,000, while his eleven licensees have spent about \$750,000.

To Produce a Gasolene Self-Starter.

For the purpose of manufacturing and marketing a new engine starter, the Motor Starting Co., 427 North Meriden street, Indianapolis, Ind., has been incorporated with the following officers: Lew Cooper, president; Eugene Davis, vice-president; Arthur M. Davis, treasurer and M. L. Wolf, secretary. These officers with L. E. Replogle form the board of directors. The new device operates on gasolene and though its principle is not entirely new, it differs from others of a similar nature in that the gasolene is taken directly from the main tank. The whole apparatus consists of a miniature carburetter, a small hand pump attached near the driver's seat and a pipe to each of the cylinders. By means of the pump a "charge" of gasolene and air is forced into the cylinders and the ignition spark does the rest. It is claimed that the device may be installed at less cost than any other, and that it is infallible, no less than 5,000 successive starts having been obtained without a miss.

Court Refuses to Halt Herreshoff Factory.

Despite the strenuous and united action of the residents of the vicinity of Woodward avenue and Boston boulevard in Detroit, who strenuously opposed the erection of the Herreshoff Motor Co.'s new factory in that neighborhood, and notwithstanding the legal action which they brought in order to prevent it, the factory will be erected. The neighborhood is a residential one, and the residents claimed that the factory would prove a nuisance. The Herreshoff company claimed otherwise and despite the legal proceedings continued building operations and late last week it won its case when Judge Donovan refused to issue the injunction restraining building operations, for which the neighbors applied. He ruled that they would have to wait until the factory proved to be a nuisance while in operation before the injunction could be granted.

Little Heads the Chevrolet Company.

Following its incorporation with \$100,000 capital stock, the Chevrolet Motor Car Co., of Detroit, finally has completed its organization by the election of the following officers: President, William H. Little, of Flint; vice-president and treasurer, Dr. E. R. Campbell; secretary, Curtis R. Hathaway; designer and consulting engineer, Louis Chevrolet; assistant secretary-treasurer, W. W. Murphy. Chevrolet is the well known racing driver, who has designed

the six-cylinder car which the company will manufacture. The other officials formerly were identified with either or both the Buick and General Motors companies, when they were dominated by W. C. Durant, who is the power behind the throne of the Chevrolet company.

Overland Factory in Canada Unlikely.

Although it was incorporated in June last, the fact that there is an Overland Automobile Co. of Canada, Ltd., just has found its way into print, coupled with the statement that John N. Willys, president of the Willys-Overland Co., of Toledo, Ohio, purposed erecting a factory in the Dominion and was seeking a site for the purpose. The statement to this effect served to bring a flood of site offers to the Overland people, but it is wholly improbable that Willys will erect a plant on the other side of the border at least for some time to come. At present he certainly is not seeking a site for the purpose, his far-seeing sales manager, George W. Bennett, having found that it is possible to ship completed cars into Canada at less cost than to send the separate parts and assemble them there. The incorporation of the Overland Automobile Co. of Canada, capitalized at \$250,000, was really to assist this purpose and to overcome certain peculiarities of the Canadian customs laws.

Taxicab Association Elects Officers.

C. C. James, who promoted the International Motor Service Association, of New York, and which is composed of some 1,600 taxicab and motor livery companies, has been elected president of that organization. John F. Murgrew, president of the Universal Taximeter Cab Company, of New York, was chosen vice president and T. P. Gleason, vice president of the Motor Wagon Delivery Company of St. Louis, secretary and treasurer. With the organization thus fully effected, the association is rapidly developing its plan of proving practically a national purchasing agency of supplies for taxicabs and delivery companies.

Curtis to Make Two-Purpose Jacks.

J. R. Curtis, of Springfield, Ill., is the moving spirit in the Curtis Jack and Truck Co., which has been incorporated in Missouri with \$75,000 capital stock, and which purposes establishing a plant in St. Louis for the manufacture of a combination jack and hand truck for the convenient handling of automobiles in garages. Curtis originally intended to locate in Detroit but was induced to select St. Louis instead, although he has not yet obtained the site for his plant.

Company to Expand the Walter Truck.

The Walter Motor Truck Co., of New York, has been organized and incorporated with \$100,000 capital stock to take over the business of W. Walter, who has been

manufacturing trucks in a small way at 49-51 West 66th street for the past several years. These trucks have given a good account of themselves, and it is to enlarge the business and increase the output that the new company has been formed. It shortly will occupy a factory on Broome street, New York, which is now in the course of erection, and will turn out five sizes of trucks, from 1½ to 5 tons capacity.

Stearns Completes Its Service Building.

The F. B. Stearns Co., of New York, has now completed its new service department building at 415-417 W. 55th street, between 9th and 10th avenues. The building is 60 by 100 feet, six floors and basement, and in every respect is a replica of the Stearns factory in Cleveland. It incorporates a machine shop, a forging shop and the various other departments which are necessary to car maintenance.

Miller Swells Capital to \$1,000,000.

The Miller Rubber Co., of Akron, Ohio, has called a special meeting of its stockholders for December 15th to pass on a proposed increase of the company's capital stock from \$500,000 to \$1,000,000. It is stated that not more than \$100,000 of the new stock will be immediately issued, and that it will be offered to stockholders at par in the ratio of one new share to each five shares now held.

Grossman Discontinues Chicago Branch.

Having made satisfactory arrangements for the representation of its Vanguard windshields and Swivelaction and Common Sense bumpers with the Empire Auto Tire & Supply Co., of 1219-21 Michigan avenue, the Emil Grossman Co. has given up its branch in Chicago. Its Detroit establishment, however, will be continued.

Metz Prepares for More Expansion.

The Metz Co., of Waltham, Mass., has acquired what is known in that city as the Governor Gore estate, on which it probably will build a new plant next spring. Offices of the company already have been removed to the Gore mansion and the room in the factory secured thereby will be employed for production purposes.

To Open Branch for Uptown Jobbers.

The Motor Car Equipment Co., of New York, has leased the premises at 238-240 West 56th street, New York, which will be conducted as an uptown branch. It will be ready for business about December 10th and, like the main office of the company at 55 Warren street, will be devoted wholly to the wholesale trade.

Diamond Establishes Oakland Branch.

The Diamond Rubber Co. has added still another branch to its long list, one in Oakland, Cal., which is located at 12th and Harrison streets. It is in charge of C. E. Mathewson.

RUBBER BROKERS FIGHT VERDICT

Federal Jury Awarded Pennsylvania Company \$11,000, But Losers Are Not Content—Echo of Rubber Boom.

Whether or not the H. A. Gould Co., rubber brokers, must abide by the decision of a jury in the United States Circuit Court for the Southern District of New York, ordering it to pay to the Pennsylvania Rubber Co., of Jeannette, Pa., the sum of \$11,138 as damages for an alleged breach of contract, is to be decided by the Circuit Court of Appeals for the Second District, Judges Lacombe, Coxe, Ward and Noyes. The appeal, which was filed October 25, 1911, and which was argued today, is the outcome of a suit for damages which the Pennsylvania company won.

The Pennsylvania Rubber Co., on or about May 13, 1909, entered into a contract with the H. A. Gould Co., by the terms of which the latter company agreed to furnish the Pennsylvania concern eight tons of Manicoba rubber of "regular" grade at \$1.10 per pound, and nine tons of "merchandable" grade at \$1.05 per pound. During the following two months the Gould company carried out its obligations in regard to the regular grade rubber, but was unable, on account of the shortage in the "raw" market at that time, to fulfil its agreement as to the "merchandable" grade. On request of the Gould company and explanation of its predicament, the Pennsylvania company agreed to waive its claim to the \$1.05 quality, and to take an equal quantity of "regular" grade at \$1.10 instead.

According to the complaint of the Pennsylvania company, it did not receive all of this quantity contracted for, nor was all of the rubber delivered up to the quality specified. Finding itself 17,000 pounds short, the Pennsylvania company claimed to have been forced to buy this quantity in the open market at greatly increased prices, and asked damages for the difference between the contract price and the market price. A jury in the Federal court decided that this difference amounted to 65 cents per pound, and awarded the plaintiff \$11,138 for the 17,000 pounds not delivered.

In its appeal against this verdict the Gould company alleges that the quality of some of the rubber returned by the Pennsylvania company as inferior was fully up to contract requirements.

After hearing the argument today, the Court of Appeals took the case under advisement.

Russia is Germany's Best Customer.

During the eight months ending August 31, 1911, Germany exported \$7,299,250 worth of motor cars, as compared with \$4,897,500 in the same period of the preceding year, an increase of exactly 50 per cent. Russia

was the best customer; Great Britain, United States and Argentine Republic followed in the order named. During the same period its imports increased from \$1,927,250 to \$2,007,625, a gain of \$80,375, or a little over 4 per cent.

Manhattan Storage "Busted" at Last.

David Grinberg and Adolph Morris, who for many years have been doing a somewhat fantastic and much mixed business in New York, under the style Manhattan Storage Co., finally have been forced into bankruptcy. Last month Grinberg's other enterprise, the Hayes Rubber Co., went the way to the bankruptcy court, and it now appears as if a semicolon, if not a period, in the history of the Grinberg-Morris partnership has been reached. The petition alleging insolvency was filed yesterday by the Lovell-McConnell Mfg. Co. (\$1,693) and two other creditors whose claims aggregate \$188. The liabilities are given as \$3,000, the assets of \$500, which is a sorry showing for two nimble men who once toyed with diamonds and walked on velvet even though they suffered an occasional and unpleasant interruption.

Cyprus Removes Duty on Motor Cars.

For the period of two years, beginning with November 1, 1911, automobiles, parts and accessories may be shipped to the island of Cyprus free of duty. The authorities of the little island desire to encourage the import of motor cars by temporarily removing the former excessive duty.

Republic Establishes a Detroit Branch.

The Republic Rubber Co., of Youngstown, Ohio, has opened a branch in Detroit at 1001 Woodward avenue. The branch will be conducted under the style the Republic Rubber Co. of Michigan, and will be in charge of C. P. Foley, formerly connected with the Firestone branch in Detroit.

Belgian Exports Increase 40 Per Cent.

Belgium, during the eight months ending August 31, 1911, exported \$3,293,180 worth of motor cars, as compared with \$2,334,365 worth in the same period of last year, an increase of \$959,815, or a little over 40 per cent. During the same periods imports of motor cars into Belgium increased from \$871,385 to \$884,515.

"Tire Preservative" Coming from St. Louis.

The recently organized National Rubber Co., of St. Louis, Mo., of which Eugene Swarzwald is president, has leased a plant in this city at 4414 Papin street. Among other things, the company purposes producing a "preservative" for automobile tires.

More Elbow Room for Remy Branch.

The Kansas City branch of the Remy Electric Co. has been moved from 416 East 15th street to No. 509 on the same thoroughfare. The new place will afford much needed elbow room.

GENERAL MOTORS RENDERS REPORT

Shows Big Reduction in Profits But Company in Fine Shape, Nevertheless—Heavy Orders in Hand.

Having, for the purpose of convenience, advanced the date of its fiscal year so that it now ends July 31, the annual report of the General Motors Co., which was made public this week, covers a period of ten months only. It discloses that during that period the Buick, Cadillac, Oldsmobile, Elmore, Oakland and the 15 other plants constituting the subsidiaries of the \$60,000,000 corporation earned a net profit of \$4,447,146, of which the big holding company's proportion was \$4,066,251.

On September 30, 1910, when the banking interests assumed control and refinanced and reorganized the company by floating a note issue of \$15,000,000, the General Motors' proportion of the profits for the fiscal year, which then ended on that date, was reported by the chartered accountants to be \$10,266,322.27; the gross profits were not given. The assets were stated to be \$51,995,468.76; and the liabilities, less the \$15,000,000 note issue, \$14,225,105.23. In arriving at the assets, the accountants reported that nothing had been included for "good-will, agreements, etc.," and that \$7,663,939.90 representing investments on other than motor car properties also had been excluded. This latter sum constitutes the item "good-will" in this year's report.

On the face of the returns, the company shows a shrinkage in profits of \$5,800,000, which is so large as to excite comment and for which it is difficult to account, even allowing for rose-hues which usually enter into prospectuses—for it was in a prospectus offering the General Motors' notes for sale that last year's profits were reported to be \$10,266,322.

In General Motors' circles, however, the apparent great shrinkage does not seem to be considered a matter of much moment. When seen by a Motor World man, Albert Strauss, the New York banker, who is a director in the big company, said that it was a matter for the accountants to explain and the accountants appeared to be at least mildly surprised and said it was a matter about which they could not talk, but one of them did let slip that this year's profits were "greater than had been expected." He vouchsafed that a consolidated or summarized statement such as had been issued left much to be desired and intimated that matters would be made plain, or at least plainer, by the detailed report, which will not be forthcoming for several weeks.

Whether the shrinkage of profits is as real as it is apparent, the report shows the company to be in good condition. It has met all dividends, taken advantage of all cash discounts, and prior to July 1 had re-

tired notes to the amount of \$998,000, which amount on October 1 had been increased to \$1,546,000, thereby reducing its funded debt to \$13,454,000.

The reserve fund for special purposes decreased from \$7,000,000 to \$3,203,076, while the surplus was lowered from \$2,797,493 to \$1,240,175.

On March 31, 1911, when the reorganization had been fully effected, the six months balance sheet was issued, rendering possible the following comparison with the figures for the ten months ended July 31 which just have been made public:

ASSETS.

	July 31, '11	Mch. 31, '11
Real estate, plants and equipment	\$17,632,682	\$15,253,870
Patents, agreements, etc.	2,049,831	1,815,719
Miscellaneous investments ..	354,803	506,140
Cash in banks and on hand ..	4,054,844	3,718,521
Notes and accts. receivable ..	4,637,076	4,230,347
Inventories	17,303,715	23,860,276
Prepaid expenses	191,179	40,976
Good will, representing excess of appraised value over book value of stocks of subsidiary companies owned, less reserve	7,663,938	14,853,855
Total	\$54,388,072	\$64,279,709

LIABILITIES

Preferred stock	\$14,393,500	\$14,422,300
Common stock	15,822,330	15,823,630
Funded debt	14,002,000	15,000,000
Outstanding capital stock ..	1,436,000	1,510,270
Surplus subd. cos.	1,169,527	1,216,239
Accounts payable	2,143,847	6,508,185
Liabilities accrued, not due ..	641,767
Reserve for pfd. div.	335,848
Reserves for special purposes	3,203,076	7,001,590
Surplus	1,240,175	2,797,493
Total	\$54,388,072	\$64,279,709

INCOME AND PROFIT AND LOSS.

The income account for the ten months ending July 31, 1911, follows:

Net profit, after deducting expenses of manufacture (including maintenance and depreciation), selling, administration, and taxes	\$4,447,146
General Motors Co.'s proportion thereof ..	4,066,251

Accrued interest on General Motors 6 per cent. notes	750,000
Balance	3,316,251
Preferred dividend (10 mos.)	842,074
Undivided profits	\$2,474,176
The profit and loss account follows:	
Profit and loss surplus Oct. 1, 1910	\$1,349,789
Miscellaneous adjustments (credit)	199,845
Total	\$1,549,634
Pfd. div. paid Nov. 30, 1910, out of surplus prior to Oct. 1, 1910	384,552
Balance	\$1,165,082
Profits for 10 mos. ending July 31, 1911 ..	2,474,176
Total	\$3,639,259
Reduction of inventories	\$2,000,000
Adjustment of claims	399,084
Total	2,399,084

Profit and loss surplus July 31, 1911

WORKING CAPITAL.

The net working capital as shown by the balance sheet July 31, 1911, amounted to \$23,065,353.20, as follows:

Current assets:	
Cash	\$4,054,844.21
Notes (\$220,650.00) and accounts receivable	4,637,076.73
Inventories	17,303,715.86
Prepaid expenses	191,179.74
Total current assets	\$26,186,816.54
Less current and accrued liabilities:

Net working capital

The aggregate outstanding preferred stock of the subsidiary companies is \$550,

000, of which the General Motors Co. owns \$500,000, the odd \$50,000 being stock of the Cartercar Co. The aggregate outstanding common stock is \$15,564,003, of which \$14,111,003 is owned by the General Motors.

In rendering his report, President Thomas Neal stated that whereas a year ago several of the factories were shut down and manufacturing operations much curtailed, all plants are now "in active and practically full operation."

"The outlook for the current year is excellent," he added, "and our companies at present are receiving orders faster than their factories can produce their cars, though every effort is being made to meet the demand."

Changes Among Prominent Tradesmen.

E. D. Whortley, formerly manager of the R. F. Goodrich Co.'s Dallas, (Texas), branch, has joined the staff of the Motz Tire and Rubber Co., Akron, Ohio.

M. Gehricke has been appointed manager of the Stromberg Motor Devices Co.'s Los Angeles branch. The branch itself has been removed to 945-7 West Main street.

A. J. Rosseau, formerly connected with the General Motors Co., has been appointed a district sales manager for the Imperial Automobile Co., of Jackson, Mich. He will handle the Mississippi Valley territory.

O. G. Baker has been appointed assistant to General Manager Mead of the Olds Motor Works, of Lansing, Mich. Baker is an experienced automobile man, having been engaged in the business in the East.

Charles E. Stone has resigned the Sales management of the United States Motors Co.'s truck department, and, for the time being at least, will set up for himself in the Times building in New York. His successor has not yet been named.

Having acquired an interest in the Commercial Car Sales & Service Co., which will handle Autocars in Chicago, K. B. Harwood has resigned as general manager of the Auto Car Sales Co., of New York. He has been succeeded by C. M. Allen.

E. P. Horton, manager of the United States Motor Co.'s branch in Syracuse, N. Y., has been transferred to the management of the United States Motor Atlanta Co., in Atlanta, Ga. Horton has been identified with the Maxwell interests for seven years.

Geo. L. Sullivan, until recently automobile editor of the New York Tribune, has been added to the sales staff of the American Locomotive Co. and henceforth will have to do with Alco cars and trucks. H. C. Whitney, who previously was attached to the Gramm Truck establishment also has joined the Alco sales force.

Following the merging of the sales departments of the Rapid and Reliance Divisions of the General Motors Truck Co., L. J. Fasquelle has been appointed general sales manager of the truck company. E.

F. Myers, formerly sales manager of the Rapid Division, has been appointed manager of the General Motors Truck Co.'s service department.

E. A. Bessom, formerly a member of the engineering staff of the Stevens-Duryea and E. R. Thomas companies, and more recently of the American-La France Fire Engine Co., has joined the engineering force of the Stromberg Motor Devices Co., of Chicago. His accession will enable the Stromberg laboratory work to be conducted on a larger scale than ever.

John H. Eagal has been appointed district manager for the Oldsmobile Co. of California, with headquarters in San Francisco. He will have charge of the Oldsmobile interests in all of the Pacific Coast States. Eagal is well known in his territory, having had five years' experience as manager of the Studebaker branch in San Francisco and during the past year having been connected with the Oldsmobile agency in San Francisco.

Chile Classes Parts as "Vehicles."

The Chilean government has decreed that henceforth automobiles shall be subject upon importation to the duty of 60 per cent. ad valorem, as covered by the designation in the tariff of "vehicles" of all kinds. The decree specifies further that the duty shall apply whether the automobile is imported complete or the parts are imported separately. This provision is aimed particularly at motors for automobiles, it being held by the customs authorities that the motor is an integral part of the vehicle, and that, though the motor and the running gear be imported separately, they should be subject to the same rate of duty. Some firms had been importing the motors separately from the rest of the automobile, in order to enter them under provision 7 of the tariff law of December 23, 1897, which grants free admission for machines to be used in agriculture, mining, arts, trades, and industry.

Self-Starters and Electric Lights for Cole.

Following extended experimenting at the factories of the Cole Motor Car Co., Indianapolis, Ind., it is announced that the 1912 Cole cars will be equipped with engine starters and dynamo electric lights systems. The starter adopted is the product of the Prest-O-Lite Co., and the electric lighting system is that manufactured by the Ward-Leonard Co.

Abbott No Longer Draws Color Line.

Bodies finished in any color, to order, and without extra cost is one of the unusual inducements offered by the Abbott-Detroit Motor Co., of Detroit, Mich. Hereafter purchasers will not be limited to stock colors, but may specify any particular hue they like and cars will be finished according to their request, without advance in price.

L. C. Burwell and B. F. Clark are building a garage at Laurens, Ia.

George Rhode has opened a garage and repair shop in New London, Wis.

C. H. Voegelé has opened salesrooms in Mansfield, Ohio. He will handle Velie cars.

George Stroh is building a big garage on Grand boulevard, near Waterloo street, Detroit, Mich.

Louis V. Arcenson has broken ground for a brick garage at Central avenue, Newark, N. J. It will cost \$12,000.

Harry A. Nelson is building a two-story brick garage on West Eighteenth street, Erie, Pa. It will cost \$8,000.

At a cost of \$15,000 Walton A. Crandall is constructing a three-story garage on Water street, Binghamton, N. Y. He will operate a livery business.

The Johnson Carriage Co., of Riverside, Cal., has decided to add automobiles to its business and is building a garage and repair shop, 54 x 100 feet.

The business of Sherwood & Phillips, owners of a garage at Hector, Minn., has been taken over by A. M. Ericson. He will show the Studebaker line.

Kirk & Co. have broken ground for a garage at 215 Crown street, New Haven, Conn. The structure will be of concrete and brick and will cost \$40,000.

The Duval Automobile Repair Works has been formed at Jacksonville, Fla., with R. Kloeppel as owner-manager. It is located at 419 West Forsyth street.

A brick, steel and concrete garage is at present in course of erection at 136 North Thirteenth street, Lincoln, Neb. Charles Stuart is building it at a cost of \$25,000.

Harry Pew has purchased a piece of property on East Main street, Morristown, N. J., on which to erect a garage. He will do a general renting and repair business.

Carlos Armstrong & Sons, Ponce, Porto Rico, have engaged in the automobile business in that city. They will have the agency for Cole cars for the entire island.

Grantley P. Postles has opened a garage and salesroom at 220 West Tenth street, Wilmington, Del. He will handle Bergdoll, Cadillac and Thomas cars and Mack trucks.

A new garage is in course of construction at Westfield, N. J. It is located at the corner of Central and Lenox avenues and will be under the management of C. E. Curtis.

Harry Parker has taken charge of the Kalamazoo (Mich.) Motor Co., West Water street. He has the agency for

Hudson cars for three of the surrounding counties.

C. Elmer Weber, a former newspaper reporter of Streator, Ill., has opened an automobile salesroom in New Orleans, La. He has the Louisiana distribution of Halladay cars.

The Pauly-Bruce & Goldacker Co., which recently was formed in Milwaukee, Wis., to succeed the McDuffee Auto Co., has opened salesrooms at 222 Fourth street. It handles the Stoddard-Dayton line.

The Woodhouse-Lough Engine & Machine Co., of Plainfield, N. J., has added automobiles to its other business. It has secured the Franklin agency, which formerly was held by the F. L. C. Martin Co.

John Knox, one of the "old timers" in New Haven, Conn., has opened a new garage at 677 State street. The building is said to be one of the largest in this section of the country; it covers an area of 14,000 square feet.

Ernest Dick and George Laughlin have formed a partnership under the style Dick & Laughlin, for the purpose of taking over the Buick agency in Quincy, Ill. They will locate in the store vacated by the Kurz Machine Co.

The Pope Piano Store, of Little Rock, Ark., discovering a lull in the sale of the "instrument of tune and torture," has added automobiles to its other merchandise. It will show Case cars at its salesrooms, 706 Main street.

The Buchanan Auto Co. has been formed by Edward Rhodus and Henry A. Berger at St. Joseph, Mo., with headquarters on Frederick avenue. The new company will handle E-M-F, Flanders, Overland and Rambler cars.

The Warren Motor Co. has been formed at Jacksonville, Fla., with salesrooms at the foot of Laura street. Cecil C. Robertson is general manager of the company, which, as the name implies, will sell Warren-Detroit cars.

The Citizens' Motor Co., of Cincinnati, Ohio, has found its old quarters too small and is building a three-story garage and salesroom of reinforced concrete, brick and terra cotta on East Seventh avenue, at an estimated cost of \$38,000.

C. E. Stone, of Madrid, Ia., has leased the repair department of the Elkader Auto & Supply Co., in the Iowa town of that name. The sales department, which offers E-M-F and Flanders cars, will remain under the old management.

The United Car Sales Co. is the style of a new company which just has been organ-

ized in Marinette, Wis., by Myron Churchill and Harold Scott. They have opened salesrooms at 1351 Main street, where they will show Buick and Kissel cars.

H. C. Briscoe and L. R. Colbert have purchased the automobile business of the Fredericksburg Buggy Co., in the West Virginia city of that name. They will operate under the style of Fredericksburg Motor Co., and will handle Ford cars.

The Youngstown Wagon Co. has moved into its new building at Boardman and Walnut streets, Youngstown, Ohio, which is said to include one of the finest garages in the whole country. The company handles the E-M-F and Flanders lines.

The Brown-Corley-Ellis Co., of Des Moines, Mich., has opened a garage and showroom at the corner of West Fourth street and Grand avenue, where it will show the Lozier line. It has the distributing agency for the State of Iowa.

W. A. Dale, president of the Maury Motor Co., Columbia, Tenn., has sold his interest in the concern and resigned the presidency. His holdings were purchased by Warren Titcomb, while J. M. Dedman, another stockholder, succeeded to the presidency.

O. A. Lawton, former New England branch manager of the Franklin Automobile Co., of Syracuse, N. Y., has opened temporary salesrooms at 31 Irvington street, Boston, Mass. The branch has been discontinued and Lawton will handle Franklin cars in his own name and on his own account.

The D. A. Baldwin Co., which conducted an automobile repair shop and storage department at 22 Commercial street, Worcester, Mass., has been reorganized under Massachusetts laws, with \$40,000 capital. The new company will operate under the style Acme Motor Car Co. Ernest O. Wheeler, treasurer of the Baldwin company, occupies the same office in the new concern, while William Vincent is president and A. D. Watson, secretary.

Recent Losses by Fire.

Lewiston, Mont.—R. W. Reynolds's garage destroyed. Loss, \$5,000.

Peoria, Ill.—Avery Mfg. Co., several buildings with contents destroyed. Loss, \$150,000.

Buffalo, N. Y.—Jefferson Automobile Works, Jefferson and Virginia streets, and twelve cars burned. Loss, \$25,000.

Ottawa, Ont.—McVeity & Blackburn, garage and forty cars destroyed. Loss, \$100,000, partly covered by insurance.

This simple device
places your car among
the safe percentage.

Skidding is responsible for 90 per cent. of automobile accidents. See that you do not risk the lives of your passengers on the greasy roads and pavements this Fall and Winter. Equip your automobile with

Pennsylvania Vacuum Cup Tires

The principle is simple, like all big ideas. On a tread of regular thickness is moulded a series of cup-shaped rubber knobs which exert a vacuum hold on wet and greasy pavements. Slipping in any direction is impossible. The rolling of the wheel releases each cup automatically by raising one side first, so that forward speed is not retarded.

In snow and mud the knobs sink in and provide a better hold and better "traction" than any other form of non-skid.

Longer Service is a strong feature of Pennsylvania Vacuum Cup Tires. Even when the rubber knobs wear down, the tire is still as good for service as a smooth tread tire of regular thickness.

You combine the essential qualities of Safety and Economy by using these non-skid and long wearing tires.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, NOVEMBER 23, 1911.

For an Inter-City Team Contest.

In urging the promotion of a touring contest between teams representing the automobile clubs of Chicago, Detroit and Indianapolis, as a form of competition that will quicken sportsmanlike interest and that otherwise is worth while, Mr. Will H. Brown, of Indianapolis, himself a figure in the automobile industry, strongly advises that the contest, if undertaken, be restricted to private owners. "It is the private owner," he says, "who does the most good for the sport."

The Motor World hopes that Mr. Brown's suggestion will not fall on barren soil. It hopes that the idea of an inter-city contest between teams of private owners will be enlarged to include more than the three cities named. Such an event can be made the "biggest thing that ever happened," and create more real interest. It would be positively "bully." As the Motor World more than once has suggested, one or the other of the national trade associations might profitably and gracefully provide a perpetual trophy for a contest of the sort.

To all who care to see, it is becoming increasingly plain that automobile racing,

whether on track or road, is becoming a matter of and for professional promotion and professional promoters and drivers. The private owner has no part in it, and the trade itself is almost through with it. There soon will be no real sport left unless something is done to interest the private owner, and the surest means of interesting him and of arousing interest is an inter-city team contest such as Mr. Brown suggests.

The "Arrival" of the Self-Starter.

In the full sense of the word, the self-starter was a long time "arriving," but that it finally has "arrived" admits of small argument. It came with such a rush in the last two months that it is certain that 1912 will rank as the "self-starter year."

The self-starting device constitutes more than a mere talking point. It is a selling feature that is not to be denied and withal it is a useful feature—one the need for which long has been recognized and which serves such purposes and which has been so much desired that the wonder is that the device has been so long "arriving" on practical form.

Undoubtedly the immensely increased interest in and demand for such devices will give birth to a flood of half-baked inventions, and it is equally undoubted that some of the more conservative automobile manufacturers will refuse to adopt a self-starter of any sort until they have found one or developed one that they consider befitting their use and their respective reputations. But not even such caution and conservatism long can withstand the combined pressure of public opinion, public demand and the unmistakable trend of the trade. Though the forthcoming year may be marked by some opposition to self-starting devices, it will be opposition that is more apparent than real, or earnest, and will be in nature of "sparring for wind" on the part of individual manufacturers who perhaps prefer to be absolutely sure before going ahead.

One thing is certain: The starting crank almost literally is giving its last kick. Its almost complete disappearance within a twelve-month is fairly safe prophecy and none there are who will be sorry to see it go. It soon will be as obsolete as the rear-entrance tonneau, and with it will go as much discomfort and far more toil and danger than ever attended the use of that now archaic type of body.

The bare suggestion of starting a car merely by turning a small cock or pushing a button sounds so good that it cannot well fail to prove a factor in influencing sales.

Mixing Politics and Road Improvement.

Being so largely a governmental function, perhaps it is too much to expect that when the matter of road improvement is discussed in public meeting politics will not enter into the discussion. But when a government employe, however high sounding may be the title he bears, undertakes to stifle free expression of opinion on the occasion of a gathering styled a National Good Roads Congress, it surely is "too much" and a little bit more, even though the Congress may have been called and fathered by a small organization with a large name, that the government employe carries in his vest pocket. Which is to say that Mr. Logan W. Page, director of the Bureau of Roads in the United States Department of Agriculture and president of the American Association for Highways Improvement, which is composed largely of public employes, rather overshot the mark when at the National Good Roads Congress in Richmond, Va., which was promoted largely by himself, arbitrarily declared as chairman of the meeting that he would entertain no motions which favored Federal appropriations for road building. It is small wonder that his action created a hubbub and that despite his ruling the committee on resolutions by a vote of 7 to 2 favorably reported a resolution asking for Federal aid. It may be well for Mr. Page to bear in mind that the Federal aid movement is attaining such strength that it is not unlikely soon to be strong enough to roll over and flatten even the director of a road bureau who may appear to have fortified himself with a nice little private highway improvement association.

After spending several weeks in this country, during which he visited not a few factories, even so competent and so fair a critic as the editor of the Automobile Engineer returned to England with the impression that stampings and drop forgings are one and the same thing, which will serve to give a distinct shock to those engaged in those separate forms of manufacture. The British editor tells his readers that "stamping, or drop forging as it is called in America, has been developed to a high degree of perfection."

Seattle, Wash.—Thomas-McKay Co., under Washington laws, with \$5,000 capital; to deal in automobiles. Corporators—J. D. Thomas, William O. McKay.

Paris, Ill.—Paris Auto Starter Co., under Illinois laws, with \$10,000 capital; to manufacture automobile parts. Corporators—Frank C. Fishback, Paul P. Shutt.

Indianapolis, Ind.—Antidam Manufacturing Co., under Indiana laws, with \$10,000 capital; to deal in automobile parts. Corporators—R. P. Irwin, J. M. Irwin, George R. Bott.

Los Angeles, Cal.—Pathfinder Motor Co., under California laws, with \$50,000 capital; to deal in automobiles. Corporators—H. H. Hawkins, D. J. Gonyer, I. N. Johnston.

Birmingham, Ala.—Auto Tire and Cycle Co., under Alabama laws, with \$2,000 capital; to deal in automobile tires and motor vehicles. Corporators—Reese Stansell, W. R. Grimes.

Indiana Harbor, Ind.—The Central Auto Supply Co., under Indiana laws, with \$600 capital; to deal in automobile supplies. Corporators—C. C. Robinson, F. E. Stephens, B. S. Gardner.

Pittsburg, Pa.—The Krupps Motor Co., under Delaware laws, with \$250,000 capital; to manufacture motors. Corporators—D. Morgan, E. G. H. Anderson, J. McMorran, all of Pittsburg.

Chicago, Ill.—Harder Autotruck Co., under Illinois laws, with \$100,000 capital; to manufacture and deal in motor vehicles. Corporators—Henry P. Chandler, J. M. Johnson, K. Cornwall.

Hartford, Conn.—The Pyramid Automobile Co., under Connecticut laws, with \$5,000 capital; to deal in automobiles and maintain a garage. Corporators—Walter H. Goodrich, Henry P. Johnson.

Indianapolis, Ind.—The Co-operative Automobile Supply Co., under Indiana laws, with \$25,000 capital; to deal in automobile supplies. Corporators—B. H. Rifenburg, J. C. Curtis, J. H. Boesinger.

Columbia, S. C.—The Consolidated Auto Co., under South Carolina laws, with \$5,000 capital; to deal in automobiles and accessories. Corporators—J. B. Roddey, W. W. Pearce, J. P. Matthews, John J. Cain.

Portland, Maine—Hamlin-Foster Auto Co., under Maine laws, with \$100,000 capital; to maintain an automobile school and deal in automobiles and motor vehicles. Corporators—A. D. Hamlin, A. S. Ventres.

New York City, N. Y.—Wishart-Dayton Auto Truck Co. of New York, under New York laws, with \$25,000 capital; to deal in

motor vehicles. Corporators—R. A. Inch, S. E. Wishart, J. B. Smith, all of New York City.

Chicago, Ill.—Empire Auto Top and Supply Co., under Illinois laws, with \$25,000 capital; to deal in automobiles, vehicle tops and automobile supplies. Corporators—Henry Graff, Jr., Albert N. Charles, Joel E. Bullard.

New York City, N. Y.—Trautman Air Rubber Tube Co., under New York laws, with \$100,000 capital; to manufacture automobile and other tires. Corporators—I. Trautman, A. V. Denis, W. G. Newhall, all of Brooklyn, N. Y.

Summit, N. J.—The Dustoline For Roads Co., under New Jersey laws, with \$50,000 capital; to manufacture a liquid known as Dustoline for roads, and other oils. Corporators—E. R. Lamsen, W. J. Lamsen, F. L. La Row.

Kittery, Maine—The Shaw-Lundin Auto Co., under Maine laws, with \$10,000 capital; to deal in automobiles. Corporators—Burton W. Shaw, Newton Center, Mass.; Thomas F. Malone, Dorchester, Mass.; Horace Mitchell, Kittery.

Indianapolis, Ind.—Motor Starting Co., under Delaware laws, with \$1,000,000 capital; to manufacture and deal in a motor starting device. Corporators—L. E. Wales, Wilmington, Del.; E. Replogle, L. W. Cooper, both of Indianapolis, Ind.

Jefferson, N. Y.—The Francis Motor Sales Co., under New York laws, with \$5,000 capital; to deal in automobiles and motor vehicles. Corporators—M. Francis, Worcester, N. Y.; Richtmyer Hubbell, Charles E. Nichols, both of Jefferson.

Boston, Mass.—White, Binford & Robinson Motor Co., under Massachusetts laws, with \$20,000 capital; to deal in automobiles. Corporators—Albert C. White, Jr., Brookline, Mass.; Cecil P. Robinson, Allston, Mass.; Henry O. Cushman, Boston, Mass.

Southampton, N. Y.—Walter Motor Truck Co., under New York laws, with \$100,000 capital; to manufacture and repair automobiles and motor vehicles. Corporators—W. Walter, E. L. Walter, both of New York City, N. Y.; C. W. Fletcher, Englewood, N. J.

Cincinnati, Ohio—Fischer Auto and Service Co., under Ohio laws, with \$30,000 capital; to deal in automobiles and maintain a motor vehicle service. Corporators—H. J. Guckenberger, Arthur G. Fischer, George C. Bauer, George Guckenberger, Jr., William J. Fleming.

Frederick, Md.—The Ideal Garage Co., under Maryland laws, with \$30,000 capital; to manufacture and deal in automobiles, accessories, and maintain a garage. Corporators—Grayson H. Staley, Elias B. Ramsburg, Samuel G. Duvall, Charles H. Conley, Thomas O. White, J. Windsor Williams.

November 20-25, Indianapolis, Ind.—Indianapolis Automobile Trade Association's fall opening.

November 27, Savannah, Ga.—Vanderbilt Cup races under auspices Savannah Automobile Club.

November 30, Savannah, Ga.—Grand Prize road race under auspices Savannah Automobile Club.

November 30, Los Angeles, Cal.—Race-meet at Los Angeles Motordrome.

December 20, New York City, N. Y.—Annual banquet of the Automobile Club of America at Waldorf-Astoria.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

December 30-January 6, Buffalo, N. Y.—Buffalo Automobile Trade Association's annual show in 74th Regiment Armory.

January 2-10, New York City, N. Y.—Importers' salon at Hotel Astor.

January 6-13, New York City—Automobile Board of Trade's 12th annual show in Madison Square Garden. Pleasure vehicles only.

January 10, 13, Peoria, Ill.—Peoria Automobile Club's show in the Coliseum.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual national show in New Grand Central palace. Pleasure and commercial vehicles.

January 13-19, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's annual show in Auditorium.

January 13-27, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show in First and Third Regiment Armories.

January 15-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden. Commercial vehicles only.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-27, Providence, R. I.—Rhode Island Licensed Automobile Dealers' Association's show in the State Armory.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show at Wayne Garden.

January 27-February 3, Chicago, Ill.—National Association of Automobile Manufacturers' 11th annual national show in the Coliseum and 7th Regiment Armory. Pleasure vehicles only.

February 3-10, Montreal, Can.—Automobile Club of Canada's annual show at Drill Hall.

READY FOR SAVANNAH'S BIG BILL

**Late Entries Assure Representative Fields
in the Four Races—Men Who Will
Start—The Arrangements.**

There have been speed carnivals North, South, East and West, but in point of real promise none ever promised more than half as much as does the road racing carnival that will take place in Georgia, which is in the South, between Monday next, November 27th, and Thanksgiving Day, November 30th. The Savannah Automobile Club is responsible for it all and the scene of contest, while not in Savannah itself, will be on the outskirts of the city and over a course which has been groomed and massaged, and manicured as no course

do not close, officially, until to-night (Thursday) and in the mean time, there is

Kulick and his redoubtable Ford will start in the shortest race and that an Ohio car, for which no driver has been selected as yet, will come to the line in the Savannah Challenge event.

The Savannah club has demonstrated that it knows how to conduct such events and to conduct them properly. It has the ears and the active assistance not only of the officials of the city of Savannah alone but of the whole State of Georgia as well. They all pull together, and it is due to this fact that previous events have been among the most successful on the calendar, though the very important part played by the militia cannot well be overlooked. It is to these citizen soldiers that a large part of the credit for "accidentless" races is due. While there have been sad spills in practice, there never has been an accident during a race on the Savannah course. Rather, there has been one—a spectator was jabbed be-

HEARNE (BENZ) AND THE SAVANNAH HOMESTRETCH

DAWSON (MARMON) ON THE WATERS ROAD

ever was groomed and manicured before.

As a rescuer of classic road races, the Savannah Automobile Club is beyond compare. It rescued the Grand Prize race three years ago when it was purely a "spite event," and this year it threw out a life line to the most classic of all classics—the Vanderbilt cup race—at a moment when it was a case not of surviving, but of perishing. Not to mention the two minor events, the Savannah Challenge trophy and the Tiedeman trophy races, the running of the Grand Prize and the Vanderbilt on the same course and within two days of each other, as will be the case at Savannah, will be more than enough to make the Georgia carnival the "greatest ever."

In doing the rescue act this year, however, this same Savannah Automobile Club has had an unusually hard row to hoe. It has been none too easy to induce entrants to sign up. And yet in spite of this reluctance, it has succeeded in lining up 14 cars for the Grand Prize, a like number for the Vanderbilt, seven for the Savannah trophy race and four for the "baby" event, the Tiedeman trophy race. But the entries

a prospect that these numbers will be still further swelled. It is rumored that Frank

tween the house and the barn with a bayonet in the hands of a soldier for the simple reason that he insisted on walking across the course when the soldier was there to keep him off it. But this merely proves the zealous way in which the improvised course guards perform their work, and if it were not for their presence there would not be any racing at all. The rule book of the American Automobile Association states that there must be guards, and Georgia provides good ones.

Though the course this year is the same length as it was last year the resemblance about ends there. It is a very much different course as regards its surface. The amount of oil that has been spilled almost is unbelievable and none of it has gone to waste either. It all has been carefully rolled in and patted down and every inch of the surface has been gone over with a fine-tooth comb. The result is that it almost is as smooth as the proverbial billiard table only it is infinitely superior for automobile racing. The turns as well have been given an enormous amount of attention; they have been widened and banked

TWO OF THE PICTURESQUE STRAIGHTAWAYS ON THE SAVANNAH COURSE

and fence posts and other things that showed a tendency toward undue prominence have been uprooted. And the State of Georgia provided the zebra-striped convicts that performed much of the work.

In view of all this preparation it was to be expected that the course would be considerably faster than it was last year when Bruce-Brown romped around 24 times in a little over 353 minutes for the 415 miles and carried off the Grand Prize. That it is faster has been proven time and again by the speed which some of the drivers have made in practice. Practically all of them now are on the course, and some of them are credited with really phenomenal time. De Palma, with the big 90-horsepower specially imported Mercedes with which he will try for the Grand Prize has been unofficially clocked for a lap at a rate of better than 75 miles an hour; Eddie Hearne, who several times has driven a Benz home to victory in past long distance races, scooted around at just under this figure.

Though the Grand Prize race is supposed to be an international affair there are really only two foreign teams entered to give it an international flavor. Louis Wagner and Victor Hemery—both Frenchmen, and both drivers worthy of the foils of the best there is in America—are the two foreigners

who will drive. Wagner will have the mount on a Fiat and Hemery will drive a Benz. Their teammates, Bruce-Brown and Bragg (Fiat) and Bergdoll and Hearne (Benz) are not unknown, of course, for all four of them have been much in the lime-light before. Of the other American drivers who are expected to give the contingent of foreign drivers and their American teammates a hard tussle Ralph Mulford, whose name is synonymous for Lozier, is perhaps the best known, though all the others, Disbrow (Pope-Hartford), Cobe and Basle (Buick) and Nikrent and Patschke (Marmion) have put up records that entitle them to respect.

The race itself will be for the same distance as last year—24 laps of the 17.3 miles circuit and the man to cross the line in the shortest elapsed time will be awarded the Grand Prize of the Automobile Club of Savannah—a gold cup valued at something like \$5,000—and 4,000 good American dollars, which, as the Britishers put it, is "better than a poke in the eye with a burnt stick." This race will be run on Thanksgiving Day, November 30th, and is a free-for-all.

For the Vanderbilt cup race, no less classy a field of starters will line up, and it is confidently expected by those in the

know that the time made will be every bit as fast. Little comparison can be made, however, for the reason that the Vanderbilt is considerably shorter than the Grand Prize. Vanderbilt contestants must make 17 trips around the course, the total distance being a little over 314 miles. Monday afternoon, 27th inst., has been set as the date, and the race will be run after the two light car events have been gotten out of the way. The prize, of course, is the William K. Vanderbilt, Jr., cup and \$2,000 added. Non-stock cars of from 301 to 450 inches displacement only are eligible.

The Tiedeman trophy road race and that for the Savannah Challenge trophy will be run concurrently on the morning of the 27th, the start being scheduled for very soon after daylight. For the former event the distance is 173 miles, or 10 times around the course, the winner taking away the Tiedeman trophy and \$1,000 in cash. This race is for cars in the 161-230 inch class and also is a non-stock event. Thirteen times around the circuit, or 224 miles is the scheduled distance for the Savannah trophy race which is open to non-stock cars of from 231 to 300 cubic inches piston displacement. In addition to the Savannah Challenge trophy, the winner will receive \$1,000.

WELL BANKED AND GREATLY WIDENED TURNS ON THE SAVANNAH COURSE

GRAFT IN CHAUFFEURS' LICENSES

New York Authorities Discover and Disturb the Practice—How Some "Examinations" Were Conducted.

Because it has been definitely proven that in connection with the Board of Examiners of the State Automobile Bureau in New York City a system of grafting on prospective chauffeurs existed, the board has been reorganized. Of course it has been known for some time that examinations were not as rigid as they originally were and that provided an applicant had a little pull or was introduced by a friend of somebody's friend, he had little difficulty in obtaining the coveted license. But this is the first time that the matter really has been sifted, though the sifting process did not get right down to the very bottom of affairs.

For some time past it has been rumored that some form of emolument was demanded in consideration of the granting of licenses, and as the rumors had steadily increased in strength Secretary of State Lazansky inaugurated an investigation. For this purpose, the services of a private detective were requisitioned, and he was instructed to comport himself like a real applicant and obtain evidence. This he did almost on the first day when he was approached by an affable stranger with the proposition that for the small sum of \$20 the license would be forthcoming within one week.

That was the last the applicant every heard of the stranger, though the license was issued in due course and after he had answered the usual questions just about as he pleased, and with the slight regard for the correctness of his responses. Whether there was any connection between the affable stranger and the members of the Board of Examiners was not proven as Secretary Lazansky preferred to drop the whole matter where it stood and reorganize the board "for the good of the service." Consequently, two of the examiners, Herbert H. Patterson and Charles Reich, were summarily dismissed despite the fact that they held Civil Service positions, and as they offered no protest, the secretary evidently acted on sufficient evidence.

Later, in discussing the matter the secretary stated that he had no doubt but that there really existed a connection between the person who approached the detective and the Board of Examiners, but that he was concerned only with the action of the board in issuing a license to an applicant, evidently green, in so short a time.

Although the cases have nothing to do with the matter involved, at least two similar instances are known. In one case an applicant who had been introduced to

the Board of Examiners by the manager of a garage in demonstrating his ability to manage an automobile was merely required to turn the car in the street while the examiner observed the process from his office window. Comparing the questions of another man to whom a license was issued revealed the fact that not more than two of them were correct and yet he had no difficulty in getting his papers, for, as he explained, "I slipped something to one of the boys, and besides I had a letter of introduction from a mutual acquaintance."

State Association Plans Rousing Meeting.

If the plans of the New York State Automobile Association are carried out its annual meeting, which is to be held in Albany, December 2nd, will prove of uncommon interest. Among the several matters which will be discussed will be the proposition to bond the State for an additional \$50,000,000 to complete New York's system of highways; the need for Federal aid in the construction of highways; the compelling of all vehicles using the highways to carry lights at night; and the illumination of road signs after dark.

Governors Dix of New York, Wilson of New Jersey and Foss of Massachusetts are expected to make addresses. Others invited to speak are: Harold Parker, former chairman of the Massachusetts Highway Commission; Edward Lazansky, Secretary of New York; John A. Bense, New York State engineer; Charles A. Treman, superintendent of public works; W. H. Hotchkiss, state superintendent of insurance and former president of the A. A. A.; C. Gordon Roel, State superintendent of highways; Frank N. Godfrey, master of the New York State Grange; William Pierrepont White, Utica, N. Y., and Albert S. Callan, Albany, N. Y., who is the author of the Callan automobile law.

Accidents Mark Practice at Savannah.

Though the actual races on the Grand Prize course at Savannah have been singularly free from accidents, practice work this year already has claimed one victim, as it did last year. Driving a Case car in the first day of practice, Jay McNay collided with a farm wagon and was instantly killed. The car was completely wrecked but McNay's mechanic escaped with serious but not fatal injuries. Subsequently, Joe Dawson, riding in the mechanic's seat with Nikrent at the wheel of one of the Marmons, was thrown out and painfully bruised when a quick swerve was necessary to avoid collision with another farm wagon. His injuries will keep Dawson out of the contests. Knipper who had been following Nikrent stopped his Mercer at the scene of the accident and almost immediately was run into by Barnes at the wheel of another Mercer. Both of the Mercers were badly damaged, though not too badly to keep them out of the races. The drivers and mechanics escaped unhurt.

TRICKS OF THE INSURANCE TRADE

How Automobile Owners Are Made Party to Brokers' "Graft"—Hazards That Are Affecting the Business.

Although it is not generally known among automobile owners, the growth of casualty insurance of automobiles gradually is working a great change in the system of casualty and accident insurance in general. Alleged sharp practices on the part of a number of the more unscrupulous brokers are largely responsible for this change, and usually the automobile owner himself is made an accessory to these sharp practices, with or without his knowledge and consent.

When the motor car first made its bid for popularity—something like twelve years ago—general liability and accident insurance was being written by about twenty financially sound companies, along established lines of risk and based on voluminous statistics of accidents of all kinds. With the advent of the motor car these same statistics were resorted to in order to fix the premiums best suited to the new style of insurance, but as the number of accidents increased, the number of companies seeking such insurance increased, and the heavy damages given by juries and judges in cases of accident, the prevalence of "joy-riding" with its usual trail of broken heads and broken cars, played such havoc with the surplus of the casualty companies that they found themselves compelled to take immediate measures to safeguard bankruptcy. Instead of placing in their surplus funds the former fixed sum of \$29 for every accident occurring to one of their policy holders, from which to make good anticipated claims, and a sum of \$450 for every suit brought against the company by such a policy holder, the sixty-odd underwriting companies found it necessary to put aside \$60 and \$1,000, respectively, and even then found themselves working on a small margin of safety.

In addition to the extraordinary growth of the automobile insurance business itself, and the short time which the companies have had in which to adjust their rates to anything like a proper proportion based on the percentage of their risk, well informed insurance men report that there has arisen a new factor, which makes the writing of insurance policies more a gamble than heretofore. This is the sharp practice of some brokers, in getting insurance for fourteen, sixteen and even twenty-four months on an automobile, while paying a premium for but one year. In this practice the owner is made an accessory—sometimes with, and sometimes without, his knowledge.

Supposing the owner desires to have his car insured and goes to a broker. The lat-

ter will take out the necessary policy, on which the annual premium is \$150, but he will not send his check to the company until from 40 to 70 days later. If, for instance, the policy is dated November 1, 1910, the broker will not be called upon to send the premium to the company until January 10, 1911. Before the latter date, however, the unscrupulous broker will go to the insured and will tell him that he thinks the Lifesaver company is much better than the one in which he first took out the policy, and will advise him to transfer his policy to the Lifesaver company. In order to make his client the more willing, the broker will offer a rebate on the new policy-premium. The client agrees. The broker then takes the old policy on which he never paid any premium at all, and returns it to the issuing company with the stamped or penciled remark, "Not wanted." That is the end of that policy, and the loser, of course, is the insurance company, which carried the risk on the automobile for upwards of two months without getting a cent of premium for it. Some of the brokers have been known to repeat this same trick several times in succession, and thereby obtain a whole year's insurance for nothing. The owner of the car may share in the "graft," or he may be an innocent tool in the hands of the broker—the insurance company, however, is the loser in each case.

Against this practice the insurance companies confess themselves practically helpless. They may set their whole legal staff in motion, write letters to the insured and threaten him with court proceedings, but they rarely will press the suit as the individual sums involved are not large enough to "make a fuss over," but large enough to cut big holes into the company's profits at the end of the year, when added together.

The splitting of commissions with the broker—a practice now forbidden by the New York law—is another problem which has taken on greater proportions since the advent of automobile casualty insurance. As a result, premiums to the insured are unnecessarily high; for the company has to give big commissions to the broker—usually 25 per cent.—which commission the latter splits with some of his customers. The companies are compelled to charge high premiums, in order to come out even, and the matter has become so acute as to cause the New York State Superintendent of Insurance to issue a general statement in which he advocates the reduction of commissions to the brokers—thereby diminishing their eagerness to split these commissions—and the reduction of premiums to the insured.

Only recently the officials of the bigger companies met and agreed to cut down brokers' commissions to 7½ per cent., but so strong is competition in this line of business that one of the parties to the agreement immediately broke it, and the others had to follow suit in order to pro-

tect themselves. A prominent official of one of the largest companies writing this kind of business stated to a representative of the Motor World, that if a general law went into effect making the premiums and commissions in each company identical, practically all the weaker companies would be forced to the wall; for with the same premium and no chance for "split" commissions the owner would be foolish indeed if he did not insure his car in the largest and financially strongest company possible. As it is, he expressed the opinion that as the risks are so great and the competition so keen, not very many of the smaller companies will be able to much longer weather the storm. He added that perhaps when motorists understand that the new New York law affecting rebates makes both parties to the transaction culpable and liable to legal prosecution, the practice of "splitting the commission" may become less general; that hope is one of the few reliefs that seem to offer.

Wishart's Appeal Not Sustained.

Spencer E. Wishart, Jr.'s appeal to the Contest Board of the A. A. A. against his disqualification in Philadelphia's Fairmount Park road race, November 9th, has not been sustained. Although Wishart, driving a Mercedes, finished first in the 451-600 inches displacement class, the referee awarded the race to Ralph Mulford, who steered a Lozier, because Wishart dropped his mechanic and was unaccompanied for a part of a lap. This action of the board gives the \$1,000 prize, which has been held by the Quaker City Motor Club pending action, to Mulford.

Swan Will Head New Association.

Under the title of the Buckingham County Automobile Association the motorists of that Iowa county have organized and will affiliate with the Iowa State Automobile Association. The officers are: President, R. G. Swan, Independence; vice-president, Dr. H. H. Hunt, Hazleton; secretary, J. H. Wright, Independence; treasurer, D. F. Logan, Independence; governors, John Hekle, Quasqueton; H. C. Unbehaun, Winthrop; Joseph Stary, Rowley; M. C. Young, Jessup; Thomas Hazelwood, Hazleton; G. J. Hill, Stanley; W. H. Raymond, Independence.

Two Drivers Are Refused Reinstatement.

There was no wobbling of the backbone of the A. A. A. Contest Board on Friday last, 17th inst., when two applications for reinstatement were considered. It was the first meeting to be presided over by William Schimpf, the new chairman, and demonstrated that he holds small sympathy for violators of the rules. George H. Clark, driver of Cutting cars, who was disqualified and suspended December 20, 1910, for two years, to January 1, 1913, for driving at one of Barney Oldfield's outlaw race-meets at Ascot Park, Los Angeles, Cal.,

under the name of E. Z. Martin, for the second time applied for and was refused reinstatement. On the 3rd inst. the disqualification was temporarily lifted, pending an appeal, but on reviewing his case the board declined to extend further leniency because Clark not only participated in an unsanctioned race but drove under a name other than his own. The board also refused to reinstate H. D. Fisher, who was disqualified for incompetent driving at Brighton Beach, N. Y., July 3, 1911. Frank P. Fox, of Indianapolis, Ind., was suspended until October 10, 1912, for taking part in an unsanctioned hill climb at Bedford, Ind. He admitted that he had knowingly participated in the event on October 10, last. The report that Barney Oldfield had applied for reinstatement, which was printed in several papers, is wholly untrue. Oldfield undoubtedly knows what the answer would be to such an application.

Illinois to Examine the Chauffeurs.

As in New York and some other States, chauffeurs in Illinois will have to pass a more or less rigid examination before securing a driver's license for 1912. In order to facilitate the work of the examiners, Secretary of State Rose has announced that the examinations will begin December 4th, at offices opened for that purpose in the Heisen Building, 610 South Dearborn street, Chicago, where Douglas L. McKenney, chief chauffeur examiner, will be in charge. The fee for the original license, good for one year, is \$5. Renewals will cost \$3.

Team Prize for French Grand Prix.

Further details in connection with next year's French Grand Prix have been announced. The race, as told in last week's Motor World, will be a two-day event and the entry fees have been fixed at \$300 for one, \$550 for two, \$750 for three and \$900 for four cars. Besides the big prize of some \$4,000 to the builder of the winning car, a prize of \$2,000 will be given to the manufacturer making the best team performance with a minimum of three cars.

Race Promoter Punished; Drivers Escape.

Edson Card, Jr., has been indefinitely suspended by the American Automobile Association for conducting the unsanctioned racemeet on Election day, 7th inst., at White Plains, N. Y. Unusual clemency was exercised by the Contest Board to the drivers who participated, none of whom were suspended, as the board was convinced that they were under the belief that the meet had been sanctioned.

Nebraska Motorists Elect Officers.

The Cumming County Automobile Association is the name of a new organization formed at West Point, Neb. The officers are: President, O. C. Anderson; vice-presidents, C. C. Stahl, A. F. Loewe, F. F. Wortman, W. W. Troxwell; secretary-treasurer, W. T. Fried.

Cooling Systems; Their Pros and Their Cons

To maintain the cylinders of an automobile engine at the proper temperature for the most efficient operation there are only two systems available. One of them is by means of air, which is drawn in by a fan and forced to circulate around the cylinders, heat radiation and dissemination being assisted by forming the cylinders with flanges or fins. The other is by means of water and is by far the more popular of the two systems.

Water circulation systems are further di-

vided into two classes, viz., pump, or mechanical circulation, and thermo-siphon, or physical circulation. Of these two classes, the pump system in one of its various forms is used most, though the thermo-siphon system steadily is increasing in favor and bids fair soon to equal the pump system in number of applications. Neither are new or novel, but, strange to say, many of those who use motor cars and not a few of those who sell them, have confused ideas of how the two systems actually operate.

Water circulation systems are further di-

vided into two classes, viz., pump, or mechanical circulation, and thermo-siphon, or physical circulation. Of these two classes, the pump system in one of its various forms is used most, though the thermo-siphon system steadily is increasing in favor and bids fair soon to equal the pump system in number of applications. Neither are new or novel, but, strange to say, many of those who use motor cars and not a few of those who sell them, have confused ideas of how the two systems actually operate.

the engine is running. A glance at the accompanying illustrations will suffice to show the cardinal differences between the two systems, Fig. 1 depicting the thermo-siphon arrangement and Fig. 2 the pump system.

In the pictures it may be noticed that the piping in the thermo-siphon system is considerably larger in cross section than that in the other system, and this is accounted for in a simple way. As the thermo-siphon system depends on no outside mechanical

FIGS. 1 AND 2—SHOWING PRINCIPLES OF THE THERMO-SIPHON AND PUMP COOLING SYSTEMS

vided into two classes, viz., pump, or mechanical circulation, and thermo-siphon, or physical circulation. Of these two classes, the pump system in one of its various forms is used most, though the thermo-siphon system steadily is increasing in favor and bids fair soon to equal the pump system in number of applications. Neither are new or novel, but, strange to say, many of those who use motor cars and not a few of those who sell them, have confused ideas of how the two systems actually operate.

The thermo-siphon takes part of its name from the Greek word *therme*, which means heat. Regarding the rest of the name little explanation is necessary, inasmuch as siphons are fairly common in other applications and have been used literally for thousands of years. As a matter of fact, evidences of their use among the Egyptians as early as 1450 years before Christ have been unearthed. Without going deeply in-

to the matter, it might be said that a siphon is a U-shaped tube, one leg of which is longer than the other. When the tube is placed inverted, with its shorter leg in a vessel of liquid and the rest of the tube filled with the liquid by suction or otherwise, the weight of the liquid in the longer leg will, provided its end is lower than the level of the liquid in the vessel, create a flow through the tube, and this will be kept up until the vessel has been emptied. This is the theory on which the thermo-

siphon water cooling system operates. The water is siphoned from the cylinders into the radiator, whence it flows back to the cylinders by gravity. But to set up the siphoning action heat is relied on, as no suction is available. As water is heated it expands and becomes lighter and rises. As it rises it is displaced by the cool water in the upper part of the radiator. The siphoning action thus set up continues as long as there is water in the radiator and water jackets and it is heated. It is a simple physical law and the water is circulated by natural means.

In the pump system, on the other hand, the water is circulated by mechanical means. In the water line is inserted a pump of the centrifugal, or gear, or paddle type, and by this means the water is pumped from the water jackets to the radiator and then back to the water jackets. The water is kept in constant circulation as long as

aid to insure the circulation of the water but relies on gravity alone, the rate of flow of the water is slower than it would be if it were pumped. Therefore, in order to circulate a given body of water within a certain time it is necessary to employ larger pipes than would be required if the water flowed more rapidly.

Another reason for the use of larger pipes is that a freer flow of water is insured. For the same reason, it is essential that for thermo-siphon cooling the pipes be as straight as possible, for every bend that is introduced offers resistance to the flow of the water and reduces the efficiency of the system. In this respect it is well to remember that an existing pump system seldom if ever can be made over into a thermo-siphon system merely by the elimination of the pump.

A number of years ago, when the thermo-siphon cooling system first began to attract

attention, not a few manufacturers enthused over it, and without thorough investigation of the conditions necessary, immediately adopted it, using the same piping and general arrangement as they previously had used in their pump systems. Needless to say, the result was failure in each of the several cases. Since then, however, designers have come to appreciate the amount of attention that must be given the production of a successful thermo-siphon system, the result being apparent in the steadily increasing number of installations of this kind which are being made.

In Figs. 3 and 4, the difference in the size of pipes which is necessary is shown more clearly. In Fig. 4 the Overland engine is shown, and as thermo-siphon cooling is used, it may be seen that the piping is considerably larger than that used on the

tially a heat engine, and by the use of thermo-siphon cooling the temperature of the cooling water is governed to a large extent by the heat of the engine itself. Which is to say that the hotter the engine gets, the faster the water circulates and cools. Thus, when the engine is laboring with full throttle and retarded spark—the condition under which the greatest heat is generated—the water actually circulates more rapidly with the thermo-siphon system than it does with the pump system, in which the flow of the water is governed by the speed of the engine.

Similarly, when an engine cooled by the thermo-siphon system is stopped the water continues to circulate until it becomes too cool to rise and set up the siphoning action. When an engine equipped with a pump system, on the other hand, the circu-

engine. When the car is run over level loads with fully advanced spark and little throttle opening the engine does not create as much heat as when it is driven "wide open," and consequently the water circulation is slower. With an increase in heat the rate of flow of the water increases automatically.

On the other hand, the pump system has the indisputable advantage that it is positive in action. Often on long tours it is not possible to obtain other than very dirty water for the cooling system. With pump circulation there is little chance for sediment to collect in the small radiator passages and clog them, for the reason that the water always is under slight pressure. Air and steam locks also are impossible for the same reason. Though such troubles seldom are heard of with well designed

FIGS. 3 AND 4—SELDEN PUMP AND OVERLAND THERMO CIRCULATION ILLUSTRATIVE OF DIFFERENT SIZED PIPING

Selden engine shown in Fig. 3, in which the pump system of water circulation is used.

Though at first glance it might appear that the thermo-siphon system is far superior to the pump system by reason of the fewer number of parts and the consequent simplicity, each has advantages and disadvantages. It always is possible to use the pump system on any engine, but the thermo-siphon system cannot always be applied. This is because engine and radiator locations are not always such that the system will operate.

The manufacturer's first cost in the production of any piece of machinery always requires careful consideration. For this reason, the first objection to the thermo-siphon system, if it may be so styled, is that a larger radiator, pipes and connections are required. But this is offset by the elimination of the pump, and in view of the other advantages of the system and the fact that after installation it requires no further attention, the objection scarcely is serious.

Actually, the thermo-siphon system is considered to be the more efficient of the two, for the reason that the motor is essen-

tially a heat engine, and by the use of thermo-siphon cooling the temperature of the cooling water is governed to a large extent by the heat of the engine itself. Which is to say that the hotter the engine gets, the faster the water circulates and cools. Thus, when the engine is laboring with full throttle and retarded spark—the condition under which the greatest heat is generated—the water actually circulates more rapidly with the thermo-siphon system than it does with the pump system, in which the flow of the water is governed by the speed of the engine.

Another of the points which it is necessary to remember when regarding the internal combustion motor as a heat engine, is that immediately a cold engine arranged for pump circulation of water is started, cold water is pumped into the cylinder water jackets. Since it requires that quite a number of explosions must take place before the engine has become warmed up sufficiently to operate at its rated power, it follows that the pump system is deficient in this respect, for in reality the circulation of the water should not start until the temperature of the engine has reached a certain point.

With the thermo-siphon cooling system, the water does not commence to circulate until it has been heated enough to cause it to rise and set up the siphoning action. Thereafter, the rate of flow of the water is in direct proportion to the speed of the

thermo-siphon systems, there still is a chance of their occurrence, no matter how small it may be.

Thus both systems have certain minor drawbacks, and in an endeavor to produce a system which shall be ideal under all conditions, several manufacturers have combined the two and obtained the advantages of both. This is achieved by using slightly larger pipes than are ordinarily required for the pump system and making the pump casing considerably larger than the rotating member of the pump. The result is that under normal conditions, the pump circulates the water in a manner common to all pump systems. When the temperature of the water reaches a certain point, however, a thermo-siphon action is set up as well, and because the pump housing is large the water flows past the pump blades and circulates faster than it would under the influence of the pump alone. Incidentally, the water continues to circulate after the motor has stopped, and the benefits of both systems thus are realized.

One of the mythical disadvantages of the thermo-siphon system which has at various times been claimed, is that when a car

so equipped is driven up a steep hill the level of the radiator will be so altered with regard to that of the cylinders that the system will become inoperative. As a matter of fact, the hill would have to be very steep indeed if such a consequence was to be expected, and it is doubtful if traction could be obtained on a grade sufficient to stop the siphoning action.

Just how manufacturers view the different systems is evidenced by the fact that of a total of 176 of the more prominent, 58 per cent. prefer circulation by centrifugal pump, 12 per cent. utilize a gear pump, 25 per cent. use thermo-siphon and no pump, and six per cent. employ combination systems. Numerically, they stand 102 centrifugal pump, 41 thermo-siphon, 22 gear pump, and 11 combination.

That the thermo-siphon system of cooling has made remarkable gains in the past year brooks no dispute; there are very few cars in the light, low-powered class in which this system is not used and manufacturers of larger cars, as well, gradually are being converted to its use.

One of the most significant indications of its gain in popularity, however, is its growing use on commercial vehicles. The rigorous conditions under which such vehicles are run make it absolutely essential that the cooling system be of such design that overheating is impossible and in this respect it is doubtful if the thermo-siphon system can be surpassed unless it is by one which is a combination of thermal and gravity circulation.

A. A. A. Plans For Federal Aid Convention.

January 16 and 17 are the dates that have been decided on for the Federal Aid Good Roads Convention of the American Automobile Association, to be held in Washington, D. C., in conjunction with other co-operating bodies interested in modern highways construction and systematic maintenance. It was the consensus of opinion that January, after the holiday recess of Congress, would insure a larger and more representative attendance from the entire country. No less than 33 measures have been introduced in Congress during the past year, and every member who has thus indisputably placed himself on record will be invited by President Robert P. Hooper of the A. A. A. to enlarge upon the merits of his particular measure at the Washington gathering, which means that there will be a notable gathering in the Willard Hotel where the convention will be held. A recent conference in Atlanta, Ga., involving President Charles A. Barrett of the Farmers' Union and President Hooper, brought forth co-operation which will result in Mr. Barrett being one of the speakers, with another farmer advocate in the person of T. J. Brooks, of Atwood, Tenn., National legislative committeeman of the Farmers' Union, which is said to have some 2,000,000 members.

TENDENCIES OF THE FOREIGN TRADE

Show Statistics That Indicate the Growth of Small Car—Chain Drive and Other Things Affected.

"Show statistics" usually make dry reading, but they "speak a piece" that is not to be denied—they show more plainly than anything else the trends of the trade and therefore are full of instructive meaning. The statistics of the London show, just closed, are no exception to the rule, and compared with those of the last Paris show, they unmistakably point the way the British and Continental manufacturers have gone and are going.

These figures prove that European manufacturers have turned their attention more than ever to the production of light, medium power cars with accommodations for only two or three passengers—runabouts and roadsters, they would be called on this side of the pond—the result being that at the last Olympia show the number of "two and three seaters" exhibited was 30 per cent. greater than was the case last year. Though British and Continental motorists always have inclined to this class of vehicle, the great increase nevertheless is significant in that the prejudice against heavy, expensive cars is made plain. Reflecting in a measure the American practice of including in the purchase price many of the "extras" which at one time were considered merely in the light that their name implies, more cars than ever now are listed "with all on." This is perhaps most noticeable in the case of tops. Touring cars without tops took a decided slump in numbers, the loss being just about 50 per cent., whereas the number of cars equipped with detachable tops increased considerably.

Another of the certain indications is that the death knell of the method of final drive by side chains has been sounded. Although the table indicates that seven cars were equipped with chain drive, six of them employed friction transmission of power in conjunction with a single center chain; the seventh also employed a single center chain. Not one of them was of the regulation double side chain drive, which brings to mind the fact that at the 1904 Olympia show the proportion of cars driven by means of double side chains was approximately 66⅔ per cent. Literally, the system has died hard, for in 1906 the percentage of chain driven cars still was 33⅓, while three years ago 10 per cent. of the cars were chain driven. The table in full is as follows:

American Cars Dominate Sydney Show.

The great popularity which American cars have attained in Australia never was more clearly proven than at the motor show which was held last month at Sydney, N. S. W. Of the eighty-nine different makes exhibited no less than twenty-six were of American manufacture, only Great Britain exceeding the American product in number. Apart from a number of commercial vehicles of British manufacture, which still are something of a novelty in the colony, it is stated that the cars listing at from \$750 to \$1,500 created the most attention. A census of the cars exhibited showed the origin of the eighty-nine different makes to be as follows: English, 33; American, 26; French, 16; German, 6; Italian, 4; Belgian, 4.

Taxicab Follows Dead Driver's Hearse.

Pathos and sentiment permeated the funeral of a London taxicab driver, who recently lost his life in a street accident. Following the ancient custom of leading a dead officer's or king's horse behind the hearse to the grave of its late master, the unlucky driver's taxicab followed the hearse without passengers and with its "For Hire" flag turned to the non-recording position. The pathetic incident caused much comment in the world's largest and busiest city, whose people rarely have time to indulge in sentimentality.

THE PROPERLY PROPORTIONED CAR

British Critic Undertakes to Specify the Fine Points of Such a Model—What They Are.

Just what constitutes a well designed car long has been a much mooted question and one which has elicited all manner of opinions. Manifestly, beauty of outline is a feature which cannot be overlooked but it is not everything. There must be incorporated provision for the comfort of passengers as well as a close following of

BRITISH CONCEPTION OF A POORLY DESIGNED CAR

those points of accepted design which make for efficient operation. It is how best to reconcile these various points and to produce a car that shall satisfy all that has been one of the really great problems which only continual study and experimentation has solved.

Comparisons designed to illustrate the point may be odious, but that they also may be instructive is not to be gainsaid, which fact adds real interest to the two pictures which are reproduced herewith. One of them shows the British conception of a well-designed car, and it might be said in passing that John Bull's ideas in this respect differ but slightly from those of his American cousins. The other, which it is explained "has not been exaggerated, but which, it will be admitted, is considerably less eyeable than the other," represents very nearly everything that is wrong in designing, according to the Autocar, which is responsible for the comparison of the two.

In calling attention to the first illustration, which is designed to inculcate into the minds of the uninitiated the principal points which make for good appearance, it is explained that the various points enumerated need not be adhered to rigidly, slight variations bearing but little on the appearance or the operative efficiency of the whole.

"For instance," states the Autocar, "lamp makers are not agreed as to the best height for the headlights, but they need not be too far forward. The seat heights, again, will vary according to the build of the owner, but the height of the body could not

in all cases be exactly the same height as the chassis. There are several points, however, which should not be departed from to a greater extent than is absolutely necessary—overhang, for instance, and the height of the screen (which is the British name for windshield).

"One point which is too often forgotten is that if a really wide back seat, wide enough for three wide people, is insisted on, it is impossible to combine comfort with elegance of outline. If the seat is very wide it must be high above the floor to clear the wheels, as it will overhang them considerably, then the floor must be raised and the back and sides must be

raised, too, if adequate support and protection are desired. Another point is the query, Why should doors be provided with bolsters on the tops? No one sits on them."

BRITISH CONCEPTION OF A WELL PROPORTIONED CAR

1. Headlights not too prominent. 2. No unnecessary space between wheel and wing. 3. Bonnet line and body line coincident. 4. Scuttle merged into body line. 5. Height of screen just below driver's eyes. 6. Doors hung on forward hinges. 7. Seats not more than 14 inches high sloped backward. 8. Inside door latches. 9. Longest body panel not longer than bonnet. 10. Clearance between wing and wheel only sufficient for spring play. 11. Flat neat hood. 12. Center line of back axle and back of car approximately coincident. 13. Back seats same height as front seats. 14. Height of frame from ground and height of body approximately equal. 15. Small unobtrusive side lamps. 16. Bonnet board and body line coincident. No visible filling strip between chassis and body. 17. Front axle center and radiator approximately coincident.

Regarding the illustration depicting poor design, the Autocar remarks that "the radiator overhang dominates the front of the car too much; there is a sharp rise up the dash to the scuttle, and the screen is unnecessarily high. The door and body panels are ill-shaped and do not match and the back panel is considerably longer than the bonnet. There is considerable overhang at the back, too, and the hood (or top) lies badly. The seats are old and uncom-

fortable and there is an ugly filling strip between the body and the frame."

Taxicab Chauffeur Not a "Workingman."

Following closely upon a decision that the British chauffeur is not a servant, another British court has decided that a taxicab driver cannot be considered a workingman either, because he works on a percentage basis. A chauffeur named Taylor sued the British Motor Cab Co., Ltd., for injuries received while cranking the motor preparatory to starting on his daily trip. The court held that, although the plaintiff was bound to drive the respondents' cab for twelve months, the relations between a taxicab driver and a proprietor of the cab were not those of master and servant, and that therefore the plaintiff was not entitled to damages under the provisions of the Workmen's Compensation Act.

French Club Organizes "Mudguard Trials."

Following the example of a Belgian organization, the Automobile Club de Seine-et-Oise, of Versailles, France, is organizing a competition of devices intended to be fitted to motor cars with the object of preventing them from splashing mud in bad weather on the clothes of pedestrians. The contest will be held on February 5th next, at Versailles. The Belgian authorities recently passed a law compelling all automobiles to carry such mud shields in bad weather, and it is stated that France intends to take similar measures. It is in

connection with this proposed law that the big French club is arranging the contest.

Sealing Wax for Short Circuits.

To prevent short circuits in ignition wiring, there are those who advise that the wires be painted with a solution composed of ordinary red sealing wax dissolved in gasoline. The addition of a little linseed oil or melted paraffine will make the improvised varnish less brittle.

DOUBLE SPARKS FOR GARFORD "SIX"

One of Several Distinctive Features of Veteran Maker's Newest Production—Wide Range of Body Styles.

Signalizing the entry of another of America's oldest and foremost manufacturers into the ranks of the six-cylinder exponents, the Garford Co., of Elyria, Ohio, formally has announced its promised six-cylinder, 50-horsepower model, which, with another new model, styled a "Four-Thirty," and having, as its name implies, four cylinders of 30 horsepower, and the well known "Four-Forty" will constitute the Garford line for 1912.

The presentation of the "six" was not made without mature deliberation. For

cylinder motor, the question of the equal distribution of the gases has been carefully worked out, the shape and disposal of the intake manifold being such that this difficulty has been eliminated. The carburettor is of special Garford design and incorporates a venturi tube with air adjustment manually controlled, from the dash.

Ignition is effected by means of a Bosch high tension magneto dual system, though it differs from the usual dual system in that two sets of plugs are used and operated at the same time from the magneto. In this respect the Garford Co. is among the first to adopt the double spark system as stock equipment. The benefits of two sparks instead of one long have been realized and the application is common in racing circles, though up to the present time there have been few installations of the kind on bona fide touring cars. In the Garford arrangement, either set of plugs

quarter platform, the side members being arranged to take the drive. Torque reaction is absorbed in the orthodox way by means of a spring hung torsion rod. Thirty-six by four and one-half inch tires are used in the front and those in the rear are 37 x 5; the distance between wheel centers is 135 inches. Both sets of brakes are located on the rear wheels, the service brakes being internal expanding and the emergency brakes external contracting.

In all, six body styles are supplied on the six-cylinder chassis. With four-, six- and seven-passenger touring bodies the list price, including such items of equipment as Prest-O-Lite tank, combination oil and electric side and tail lamps, horn, tire carriers, top, speedometer, windshield, jack and set of tools, is \$4,500. For the limousine and landaulet the price is \$5,600 and \$5,750, respectively, with similar equipment.

The four-cylinder 30-horsepower model is to all intents and purposes a smaller edition of the "six," and in it are incorporated many of the features of the larger car. The cylinders are cast in a single block with the valves all on one side, and the bore and stroke are the same as in the six, namely, $4\frac{1}{4}$ x $5\frac{1}{4}$. Except in the matter of ignition, which is effected by means of a standard Bosch dual system, the remainder of the specifications are the same as apply to the "six," parts of course being made slightly lighter in conformity with the smaller car. The change gear mechanism affords four speeds ahead with direct drive on third speed. The wheelbase is 118 inches, and tires are 34 x 4.

In touring car style, with accommodations for either four or five passengers, the car costs \$3,200, standard equipment being the same as is supplied with the 50-horsepower model. Four thousand dollars and \$4,100, respectively, are asked for the town car limousine and the landaulet.

For the coming season, the production of the original Garford "Four-Forty" will be continued with but very slight changes—changes which scarcely are noticeable and which do not in any way affect the standard design, which has created for itself a reputation for reliability and efficiency. Cylinders are cast in pairs and measure $4\frac{3}{4}$ inches bore and $5\frac{1}{4}$ inches stroke. The wheelbase is 119 inches and the front tires measure 36 x 4 inches, those on the rear wheels being 36 x $4\frac{1}{2}$ inches. As in the case of the other two models, a four speed change gear mechanism is used in which the direct drive is the third speed. Otherwise, the same general specifications which apply to the two other chassis also apply to the "40."

An even greater assortment of body styles may be had on the 40-horsepower chassis than are supplied with either of the other two and embrace three-, four-, five-, six- and seven-passenger touring cars, for either of which the price is \$3,750, a limousine priced at \$4,800 and a landaulet at \$4,900.

THE NEW GARFORD "SIX-FIFTY"

three years the company has been engaged in experimental work on the car but it was held back until its right to bear the Garford name was abundantly proven. The smaller car, the four-cylinder, 30-horsepower model, has been designed for those who desire less car and less power but the same high standard of excellence.

In general lines and appointments, the six-cylinder model is quite similar to the older four-cylinder car. In detail, too, there is little variance from standard Garford practice, though it is but natural that the new car should embody a number of distinctive features. The motor is of the L-head type with the cylinders cast in sets of three and the valves enclosed by means of a light aluminum plate. In dimensioning the cylinders nothing radical has been attempted, the manufacturers preferring to cling to conventional design as giving the greatest all around satisfaction. To this end the stroke has been made but very little greater than the bore, these two measurements being $5\frac{1}{4}$ inches and $4\frac{1}{4}$ inches, respectively.

With due regard for one of the obstacles incident to the design of a successful six-

may be made inoperative by means of a switch on the dash. Allowing of a slight disalignment of the magneto without serious consequences, a Bosch spring coupling is used. The centrifugal circulating pump which forms part of the cooling system is driven from the magneto shaft.

To lubricate the motor, a combined splash and force-feed system is relied upon, a gear driven pump located in the crankcase being used for circulation. The connecting rod big ends are equipped with small scoops which dip into and splash the oil over the interior of the cylinders and the minor bearings.

A four speed selectively operated change mechanism is used, the third speed ahead being direct drive and the fourth speed an over-step. Power is transmitted to the full-floating rear axles by means of a shaft and a leather faced cone clutch with cork inserts. Three final drive gear ratios are supplied at the option of the purchaser or depending on the locality in which the car is to be used; they are 3.4:1, 3.78:1 and 3.18:1.

The front springs are of the semi-elliptic variety and those in the rear are three-

HOW THE ALCOS HAVE BEEN REFINED

**Few Mechanical Changes but Several New Provisions for Users' Comfort—
"Sixes" and "Fours" Continued.**

As has been the case with so many other manufacturers, the American Locomotive Co., of Providence, R. I., has found little room for mechanical improvement in its Alco cars. Such refinements of detail as have been made pertain principally to the bodies which have been made roomier and handsomer and more luxurious than ever. Both the four-cylinder 40-horsepower model and the six-cylinder 60-horsepower

equipment to the six. Like the larger motor it is marked by a peculiar solidity of appearance, positive and thorough lubrication and efficient carburation.

The most notable of the minor changes which have been made in both motors has to do with the intake and exhaust manifolds. Intake manifolds have been increased in area to provide better gas distribution and to insure absolutely uniform operation of the motors under all conditions of throttle opening. The exhaust manifolds also have been increased in size and their shape altered slightly so that the exhaust gas issuing from one cylinder tends to form a partial vacuum which assists in drawing the burned gases from the next cylinder.

Though the same type of Alco multiple

keep them out after dark there is a clever arrangement by which a tiny incandescent light illuminates the step immediately the tonneau door is opened. Electric side and tail lights are provided, of course, and as a further indication of the thoroughness of the manufacturers, touring cars are equipped with cleverly hidden dome lights arranged in their tops. Limousine bodies are similarly equipped.

Seat lengths, depths and thickness all have been made over in proportions designed to eliminate every possible kind of

THE SIX-CYLINDER ALCO WITH TOURING BODY

model will be continued as heretofore and these together with the little 16-horsepower town car of which so many now are plying as taxicabs throughout the larger cities, will constitute the line.

In the six-cylinder motor is revealed practically the same design which for the past four years has made a record for consistency and economy. Except for slight improvements which have been suggested from time to time, it is unchanged, the cylinders being of the T-head type and cast in pairs. The bore and stroke are $4\frac{3}{4}$ inches and $5\frac{1}{4}$ inches, respectively. For ignition, a Bosch high tension magneto is used, this forming the essential part of the regular Bosch dual system which operates through a single set of spark plugs. The lubrication and cooling systems are the same; oiling is made positive by means of a gear driven pump which feeds the oil under four pounds pressure through the crankshaft to all the main bearings and the timing gears. After having served its purpose, it is strained and the operation is repeated. The cooling water is circulated by means of a centrifugal pump.

Except for a difference in the size of the cylinders, which measure $5\frac{1}{4}$ inches bore and $5\frac{1}{4}$ inches stroke, the four-cylinder motor conforms in general design and

disk clutch is retained it has been refined in detail and its smoothness of action increased. The disks are alternately steel and bronze and the whole mechanism is so constructed that it may be removed intact without the necessity for disturbing any of the other parts. The change gear mechanism provides four speeds forward and reverse, direct drive being the highest gear ratio obtainable. Final drive is by means of a shaft and bevel gear differential; the ratio of engine revolutions to rear wheel revolutions on high gear is 2.59:1 for the 60-horsepower car and 3:1 for the four-cylinder model.

Tire sizes on both cars are the same, viz., 36 x 4 in the front and 36 x 5 in the rear. Similarly the spring arrangement is the same in both, semi-elliptic members being used both front and rear. Both sets of brakes are located on the rear wheels, the service brakes being external contracting and the emergency brakes internal expanding; the drums measure 15 inches in diameter and three inches in width.

It is in the design of the several types of bodies that the greatest amount of change has been made; they literally bristle with contrivances calculated to increase the comfort of passengers. Thus, for the convenience of those whose duties or pleasures

ALCO SIX-CYLINDER CHASSIS

fatigue. The backs in particular have been given unusual care in design and are so shaped that they support passengers in the easiest position; the angle of the seats has been changed and slightly lowered.

Externally, the bodies also have received their share of attention and have been smoothed down and given a truly artistic appearance that is in keeping with the quality of the cars. Gear shift and emergency brake levers have been moved inside the front doors, and door latches have been concealed. A new and distinguishing feature of the color scheme is a two-inch stripe around the top of the bodies, which literally may be termed a finishing touch. The equipment furnished with the several models is unusually complete, the cars being delivered, literally, "ready for the road."

TWELVE ENGINES IN BEAVER LINE

Milwaukee Motor Makers Extend Product to Meet All Requirements—Suited for Pleasure and Commercial Cars.

To those automobile manufacturers who prefer to equip their cars with motors of recognized merit from the factories of a company which specializes in the construction of motors alone, the Beaver Mfg. Co., of Milwaukee, Wis., offers selection from no less than 12 distinct types. The announcement of the Beaver products for

Horse-power	Cylinders	Bore	Stroke
15	2	4 $\frac{3}{8}$	4
18	2	4 $\frac{3}{8}$	4
20	2	5 $\frac{1}{8}$	4 $\frac{1}{2}$
28-30	4	3 $\frac{3}{4}$	5
28-30	4	3 $\frac{3}{8}$	5 (Unit)
40	4	4 $\frac{3}{8}$	4 $\frac{3}{4}$
45	4	4 $\frac{3}{8}$	5 $\frac{1}{4}$
50	4	4 $\frac{3}{8}$	5 $\frac{1}{4}$
40-45	6	3 $\frac{3}{4}$	5 (Unit)
45-50	6	4 $\frac{3}{8}$	4 $\frac{3}{4}$
45-50	6	4 $\frac{3}{8}$	5 $\frac{1}{4}$
50-60	6	4 $\frac{1}{2}$	5 $\frac{1}{4}$

The two-cylinder motors present advantages in their compactness and simplicity for use in light delivery wagons, though their field of usefulness is by no means

removed without disturbing the oil pump or any other part of the mechanism. By the removal of a single wing nut, the aluminum plate by means of which the valve stems and push rods are enclosed may be taken off and the design of the intake and exhaust manifolds is such that very little hindrance is given in the removal of valves. Drop forged bridges hold the manifolds in position and may be quickly and easily removed. Completing the whole Beaver scheme of accessibility, the unit power plants are supported at three points, with the third point at front, and the removal of the whole unit intact is facilitated. Throughout the whole of the engines, care

BEAVER SIX-CYLINDER AND FOUR-CYLINDER UNIT CONSTRUCTION POWER PLANTS

the season of 1912, which just has been made, marks the beginning of their ninth successful year, and during the eight years they have been on the market they have made for themselves a niche in the automobile hall of fame.

Two-cylinder, four-cylinder and six-cylinder motors, ranging from 15 to 50-60 horsepower are included in the line as well as four- and six-cylinder unit construction power plants of from 28-30 to 50-60 horsepower; all are so dimensioned as to make them applicable to standard chassis for both pleasure and commercial vehicles, which feature also makes them available to replace worn motors or slightly smaller ones. The 12 types which are regularly stocked are as follows:

limited to commercial vehicle work. They have been and still are used by a number of manufacturers of well known pleasure cars, and their record for efficiency is only equaled by their reliability. The four-cylinder motors and unit power plants also are particularly adaptable to commercial vehicles by reason of their sturdy design, and it is not unlikely that their reputation in this field soon will equal that gained in the other branch of the automobile industry.

In the construction of the four- and six-cylinder motors, all of them being practically identical except as regards their dimensions, particular attention has been given the necessity for accessibility. Thus, the entire bottom of the crankcase may be

in design and construction is evident; rigid inspection during different stages of assembly ensures a high standard of excellence, and careful tests after completion make the shipment of other than perfect engines an impossibility.

Cylinders are cast in pairs with siamesed intake and separate exhaust ports. Water-jacketing is extremely liberal, ensuring freedom from overheating troubles, and manifolds are properly proportioned to allow of maximum efficiency. One of the smaller points which indicates the desire of the manufacturers to produce only the best is revealed in the valves, which have gray iron heads fused to nickel steel stems; the valve-seat angle is 45 degrees.

Conforming to most approved practice,

THE 28-30 HORSEPOWER BEAVER ENGINE AND THE 45 HORSEPOWER MODEL

pistons are made extra long to eliminate side play and noise. Oil grooves are provided below the piston rings, which are eccentric with 45-degree butt joints and accurately ground; relief holes are drilled through to carry off surplus oil. The piston pin is of special seamless steel tubing hardened and ground to micrometer gauge; the pin is fastened to the connecting rod, the bearing being in the piston bosses. Connecting rods are drop forged of open hearth steel and are adjustable only at the big end. Die-cast nickel bronze bearings are used and these are shimmed in place.

Being one of the most important of the component parts of a motor, the crankshaft has been given particular attention. It is forged from the best high carbon steel, after which it is specially heat treated and ground to within the thousandth part of an inch of the proper size. The flywheel flange is forged integral with the crankshaft. The camshaft is a particularly rigid one-piece forging and the shape of the cams is such that noiseless valve operation is assured. The valve lifters are of the roller type with hardened and ground parts. Further increasing the silent operation of the motor, the camshaft actuating gears are helical.

Lubrication is effected by means of a gear pump which forces the oil through a distributing channel in the upper half of the crankcase from which it flows to the main bearings, connecting rod bearings and timing gears. Though no dash gauge regularly is supplied, provision for one is made by inserting in the oil line a test plug from which a pipe may be led to a gauge and back to the engine. The entire lubrication system is enclosed in the crankcase and still is easily gotten at by the simple expedient of dropping the lower half of the crankcase. Particular attention has been given to ensure oil-tight bearings and leakage of oil is rendered impossible.

In the unit power plants, the clutch is of the three-plate type with Raybestos faced surfaces operating against ground steel. The leverage of the clutch pedal has been carefully worked out so that minimum pressure is required and smooth action is ensured. Three speeds forward and reverse are provided in the change gear mechanism, which is selectively operated and is so designed that the substitution of center control levers is a simple matter and can be made at very slight additional cost.

When it is necessary to be out in a rain storm in an automobile that is minus the usual top it is a wise plan to pull the seats forward so that the water from the backs of the seats runs down past them instead of on them to accumulate in a pool. If this is done it will be possible to keep fairly dry with an ordinary raincoat. There are very few raincoats, however, that will remain water-proof if the wearer sits in a pool of water with the car in motion.

IMPORTANCE OF PROPER TIMING

Bosch Engineer Shows Why Spark Advance Should Depend on Shape of Chamber—Engine Speed a Factor.

Though there probably is no phase of automobile operation with which the average individual is less familiar than the ignition system with its numerous mechanical intricacies, it is a well known fact that the efficiency of the engine depends in no small degree on the proper timing of the spark. It is not possible to establish any cut and dried rule for timing for the simple reason that the proper point of ignition varies according to peculiarities and characteristics of the individual engine.

There are a great many points which must be considered in fixing the exact time at which the spark should take place, and in calling attention to them, Roger B. Whitman, who is consulting engineer to the Bosch Magneto Co., points out that whereas it has been stated that the spark should take place when the piston has reached within one-eighth of its stroke of top dead center, this cannot apply to all engines. Under these conditions, all engines of five inches stroke should be so timed that ignition takes place when the piston has reached $\frac{3}{8}$ of an inch of top dead center.

"It is quite true," he says, "that some engines of five inches stroke require an advance of $\frac{3}{8}$ of an inch, but it is equally true that with other engines of five inches stroke an advance of $\frac{3}{8}$ of an inch would be incorrect. If an engine is so constructed that the combustion space is compact," he explains, "the required advance would be considerably less than the proper advance for an engine in which the combustion space is considerably extended." Which is to say, that if the engine is of the "valve-in-the-head" type, in which a straight, compact combustion space is provided, advance must be less than when valves are located in pockets at the sides, as in the ordinary T-head type of engine, and in which flame propagation is slower.

"The normal speed of the engine is one of the great factors in establishing the ignition point," he continues, "for it goes without saying that a far greater advance is required for an engine running at 1,200 revolutions per minute than for an engine running at 600. Another factor that must be considered is the stroke of the engine, for the longer the stroke the greater must be the advance, other conditions being equal. Thus an engine of 5 inches bore and 7 inches stroke will require a greater ignition advance than an engine of 5 inches bore and only 5 inches stroke.

"Another consideration will be the location of the spark plug. If this is located in the center of the combustion space, and with its point projecting into the mixture, a

small advance will be required, whereas if the plug is located on one side of the combustion space and is possibly pocketed, the advance required will be far greater. The exact advance for maximum efficiency can only be determined by experiment.

"In timing a magneto of the usual rotating armature type, fair all around results may be obtained by so setting it that in the full retard position it gives its spark at the instant when the piston is at top dead center. Whether or not the advance position will be correct can only be determined by trial, and if it is found not to be so, the relation of the armature to the crank shaft can be altered in accordance with tests until the results are satisfactory.

"Another statement that is made is that if a user of an engine desires to have it throttled down to a very low speed, the spark plug points should be opened up until they are fully $\frac{1}{16}$ inch apart.

"This statement is exactly contrary to the actual conditions. When a magneto runs at slow speed, as will be the case when the engine is throttled down, it does not produce a current of as high a voltage as will be the case when it operates at increased speed, and in consequence the current will not be able to jump across as wide a spark gap. Thus, if it is desired to throttle an engine down low, the spark gap must be smaller than is required for higher speeds. For high tension magneto ignition $\frac{1}{50}$ inch spark gap will give correct results for all normal operating speeds. Engine characteristics have some influence on the size of the spark gap, but in no case should this gap be greater than $\frac{1}{32}$ inch."

Forty-four Millions for Southern Roads.

To those motorists who have toured Southward and have had occasion to revile road conditions in general, Secretary of Agriculture Wilson's statement to the effect that in the past year no less than \$44,000,000 has been expended for road improvements by Southern States alone may come as a surprise and, perhaps, serve as balm for wounded feelings. This enormous amount is made by expenditures in the various States as follows: Alabama, \$3,404,000; Arkansas, \$2,450,000; Florida, \$1,505,000; Georgia, \$2,500,000; Kentucky, \$2,500,000; Louisiana, \$1,132,354; Maryland, \$2,250,000; Mississippi, \$3,130,000; North Carolina, \$4,505,000; Oklahoma, \$1,505,000; South Carolina, \$1,100,000; Tennessee, \$3,900,000; Texas, \$7,600,000; Virginia, \$4,004,000; West Virginia, \$1,625,000.

Western Dealers Form an E-M-F Club.

In order to extend the business of the E-M-F and Flanders automobiles in South Dakota, Iowa and Minnesota, agents of the Studebaker Corporation in those States have formed the E-M-F Auto Club, with headquarters at Sioux Falls, S. D. The officers are: President, C. R. Newby; vice-president, J. W. Johnson; secretary-treasurer, H. M. Hassenius.

Truck Problems; The Attitude of the Buyer

Though prospective purchasers of commercial vehicles usually are disposed to place first what make of truck to use, in the opinion of Ellis P. Howland, who read the principal paper before the last meeting of the Motor Truck Club of New York, that consideration really should come last. In his paper, Howland, who is automobile editor of the Journal of Commerce, deals with "The Buyer's Attitude" and after a lengthy prelude in which he remarks that the same salesmanship which achieves results in the field of pleasure cars will not bear fruit in the commercial vehicle trade, he points out that it is only in comparatively recent times that the differences have become known and appreciated.

"There is as much fundamental difference between a pleasure car and a commercial truck," he says, "as between the fine-bred race-horse and the truck horse. From the day that truth dawned on the manufacturers of motor vehicles may be dated the date of the motor truck. That it was destined to enter an immense field of opportunity is beyond question; that it was handicapped by early mistakes and failures is the reason for much of the prejudice now encountered among business men on which their 'attitude' which I am to discuss, is based. Misunderstanding and an imperfect and discredited product are very unfortunate elements on which to build a successful new system of transportation. . . .

"The typical truck salesman has not been, until very recently, a trained business man, and has totally failed to recognize in the buyer's attitude a legitimate condition to be met in a helpful spirit. His training came in selling pleasure cars to men moved by the sporting spirit. He sold a product which had passed its experimental stage years ago; which never had to undergo the exacting conditions which ordinary commercial work imposes on the truck. When a business man demurred and demanded proof or assurance that trucks would do his work and accomplish the economies represented, the salesman too often regarded him as 'fussy' rather than conservative. Such customers were the kind usually 'passed up' in selling pleasure cars, as too much bother to be worried with in the rush of the fast-growing industry. But no such treatment would go with business men. Till they were fully satisfied with the dependability of the truck, they were willing to stick to horse-hauled vehicles.

"A prominent manufacturer's New York agent said to me, the other day, that he would have bought a couple of trucks long ago if he had been able to find salesmen who impressed him as having faith in their

product and their own representations. 'They refused to answer my questions or to give me anything more definite than promises,' he said. 'Some of them were my best friends but when I spend \$4,000 or \$5,000 on something not yet perfected, I want something more stable than the opinion of my very closest friends. No one appeared able to give me any real assurance till very recently. But lately the attitude of the seller is changing and now I am in correspondence with several truck agencies and expect to buy two trucks within a few weeks, when I decide which is the best one to buy. They are all making pretty strong claims, some of them so strong I don't believe them, but when a manufacturer is willing to give me a written guarantee of what his truck will perform, and to show me authentic and conservative figures as to what it has done, I cannot refuse to listen to him. Besides, I have needed those trucks all along.'

"To my mind there is a lot of valuable light in that short statement. Business men do want trucks and as a rule do not expect too much from them. They realize that trucks are, even now, in a somewhat transitory state of refinement and are uncertain which truck to buy. Nor is this uncertainty due solely to the fear of repair costs; it is the loss of efficiency during period of repair that counts most with the business man. He may afford one or two spare horses or horse-trucks in his equipment for emergency, and if he can't he can find ample supply for hiring, for horse trucks are common everywhere. Not so the motor truck; if it goes out of commission, the business man finds himself crippled.

"I need not remark how recently the force of this situation has dawned on truck manufacturers. Today the leaders realize that the thing they sell is not so much machinery or a mere physical vehicle, but 'service.' When a business man is assured of service—efficient, economical service—he has little hesitation in buying trucks. To encourage him to this end, most of the leading truck concerns are devoting quite as much attention to the maintenance of service stations as they do to the making of trucks, and those concerns are very generally receiving the recognition they deserve.

"Close observers of the recent development of the truck business cannot fail to discover that the 'getting together' process between buyer and seller has been by mutual concessions and reforms. The manufacturer has realized the necessity for developing a totally different vehicle from that which he first intended; he has accept-

ed the buyer's conservatism as something legitimate; has studied it and met the buyer's needs with intelligent information. Finally, he has realized his responsibility to keep his trucks in running condition and is co-operating with the buyer to that end. On the other hand, buyers have come to see that they cannot afford to wait for the perfect truck; that trucks made today are as efficient as anyone can reasonably expect, and, with reasonably intelligent use, will operate economically today—irrespective of whatever greater economy they may accomplish years hence. Till business men are willing to use trucks, assume their share of this uncertainty and develop the field for improvement, they are defeating their own interests quite as much as those of the manufacturers. . . .

"There is another influence which affects the interests of both user and maker of trucks—the lack of intelligent and efficient adaptability. It is more important even than prudent use. Having for so many years confined his traffic views to the horse as a unit of efficiency, the business man is disposed to compare his motor trucks with horses, rather than to start fresh, with his traffic problem on one hand and a comparatively new and untried utility on the other. Economy in motor trucks demands their use along entirely new lines; that loading methods, routing, systematization of delivery service, methods of garaging, dividing the work of driver and helper, and innumerable other elements be rearranged and fitted to the new method of transportation. For some kinds of traffic horses still have the advantage over the motor truck for economy; on other kinds, the horse is destined to pass into memory. City haulage and country haulage are totally different. Routes with frequent stops and many deliveries require totally different service from long hauls and the delivery of practically a whole load at one point. And, finally, the care of a truck involves entirely different attendants from that of horses—men of different caliber, frequently.

"One unfortunate feature of comparisons usually made by owners is the fact that few owners of horse-drawn trucks ever have accurately tabulated and studied their costs of horse haulage, and when they undertake to compare the new form of transportation with the old, they fail to realize that mere figures should be modified by a recognition of the better, quicker, more elastic and totally different kind of service performed by the truck. Some improvements in modern commercial life ought to be above rigid comparison with dollars-and-cents standards.

"The first consideration in the mind of the intelligent buyer of trucks is whether his traffic needs can best be performed by a motor truck; this quite independent of the element of cost. Service and efficiency are the progressive business man's first thought. Next, perhaps, comes cost. Both are elements in successful competition. The third consideration, logically, is as to what kind of truck will best do the work, for well informed business men are coming to realize that there are distinct and undeniable advantages claimed and probably possessed by both gas and electric trucks, each in its own place and class of work. How large shall the truck be and what kind of a body should it have comes next.

"Having settled all these, comes the last consideration—sellers are disposed to regard it as rightfully the first—viz., what make of truck shall I buy? In the minds of experienced users of trucks this is really one of the last points requiring attention; the others must be settled before the buyer can intelligently consider the actual truck he is to buy. Here come in such questions as relative cost of installation, relative cost of operation, ease of control, flexibility of service, accessibility to efficient service station, simplicity of construction, comparative costs of repair and the clearly defined measure of responsibility the rival sellers are willing to assume with a substantial guarantee.

"It is at this point and not till then that the salesman enters the buyer's problem, and because buyers, advised or experienced, have come to recognize this, there has lately come about a radical change in the character and caliber of the truck salesman. The men who possess the greatest records as salesmen of trucks have been men who put themselves in the place of the buyer, who helped him study his problem, honestly endeavored to make their product fit his needs, advised him as to methods of use and generally played the part of friend and adviser. Such men have themselves learned valuable lessons from the experience, and sales based on such methods have usually resulted in a co-operative effort between buyer and seller to make motor truck installations succeed.

"That trucks intelligently made, intelligently sold and intelligently used are succeeding, no man with an open eye and an open mind can doubt. . . . Cases are multiplying fast where first trucks are selling two, five and even fifty on re-orders from the same establishments. Manufacturers who have adopted the program of co-operation with the user are today finding it almost impossible to keep pace with the demand for their product. . . .

"There is an immense field for discussion in connection with the various forms of guarantees and maintenance agreements in use and suggested; in the relative responsibilities of buyer and seller; in the question of whether trucks should be sold fully equipped, ready to run or on the unit sys-

tem of a divided contract, in which chassis-maker, body-maker, tire-maker and various others shall have a part in the responsibility and guarantee.

"There is the question of 'quantity price' on trucks; whether the owner of several trucks should enjoy a lower price on re-orders than the buyer of one; whether it is desirable for the owner to confine his equipment to one make or several. I find that opinions on these points differ among users, though there appears to be a general opinion that, with a liberal manufacturer, a user would prefer to trust his traffic with one, rather than with a variety of brands. There is also a common opinion among buyers that trucks today cost more than they should and it might be well to speculate on the probable influence on first cost which will result when manufacturers feel justified in making trucks in larger quantities in order to secure a lower cost of production per unit. We might also consider tire costs and the prospects, if there are any, for lower tire prices and higher tire efficiency—both very important factors in the growth of motor trucking.

"Both these are too specific for my purpose tonight. My aim has been merely to suggest some of the lines on which buyer and seller disagree, to point out some of the reasons why such misunderstandings have been inevitable, and to predict that with a better understanding on both sides, born of a more widespread use of trucks and therefore a greater familiarity with them, most of the avoidable dissensions are being rapidly modified."

Luxurious Landaulet for Delhi Durbar.

What is described as the largest private automobile ever constructed, recently was shipped to India, after having been exhibited at the London show. The car is a landaulet by Offord & Sons, mounted on a 38 horsepower Daimler chassis, and seats eleven persons. It has a wheelbase of 14 feet (168 inches), and is fitted with special armchair seats so constructed that they may be used either forward or backward, and also may be removed from the car and carried on the roof in boxes provided for this purpose. The finish of the car is the most luxurious imaginable. Its upholstery is delicate light blue with lace to match; the windows are fitted with silk blinds; the mounts are inlaid silver both outside and inside the car, the whole body being of aluminum. Despite its immense size, the car is remarkably light, weighing only 3,850 pounds. It was manufactured for one of the Indian princes to be used at the coming Delhi Durbar.

London Proposes Petrol Pipe Line.

The assertion of a British authority, Sir Marcus Samuel, to the effect that a three days' fog on the Thames river would result in a serious interruption, if not a complete cessation, of the supply of gasoline for London, is receiving considerable attention

at the hands of the Commercial Motor Users' Association. As the stoppage of the gasoline supply would involve the virtual crippling of very nearly all motor omnibus, motor car, motor cab and motor truck service, the general committee of the association, of which Col. R. E. Crompton, C. B., is chairman, presented at the last meeting a project for the laying of one or more pipe lines for the conveyance of gasoline from the Thames estuary to various parts of London. As the association includes some of the largest consumers of gasoline in London, among whom are the London General Omnibus Co., Carter Patersons, Pickfords, Harrods, Maples, Selfridges and the leading cab companies, it is expected that the proposed pipe lines will become a reality. For this project Parliamentary sanction will be required and the association will support an application for the necessary powers. City financial circles, it is understood, are favorably inclined toward a definite scheme of the kind.

Wet Upholstery and Slip Covers.

"No more red upholstery for me," remarked a veteran motorist, the occasion being the purchase of a new car. "It looks all right—there is nothing prettier than a gray car with red cushions—but never again! I had one experience with fiery-hued leather and I have no wish to repeat it. The whole trouble was that the color was not fast. It was fast enough in dry weather but immediately the cushions became wet they left their mark on whoever sat on them. I don't mean to say by this that all red cushions are the same, for they are not; I have seen red upholstery that you could not get a smudge from under any conditions. But I simply won't take a chance. Slip-covers are given the taboo also, for a similar reason. When they are wetted by rain or through the too assiduous attention of the washer, they stay wet indefinitely, and no one likes to sit on damp cushions. Just plain leather for me, because if it is wet it can be dried off with a chamois and in two shakes it is as dry as it ever was."

About Working Under Jacked-Up Cars.

Though it is one of the unwritten laws of all really good garages that when a car is jacked up no one shall be permitted to work under it, the rules are not always adhered to and in not a few cases results have been disastrous. If it is absolutely necessary for some one to work under a car when it is raised on jacks great care should be taken to see that the wheels that rest on the ground are chocked so that they cannot move even a fraction of an inch. It is not sufficient to see that the emergency brake is applied when the front wheels are raised for the reason that there always is a certain amount of lost motion before brakes hold, and this slight movement may be enough to throw the car off the jacks.

FACTORS AFFECTING FLYWHEELS

Some of the Considerations Involved in Their Design—Influence of Weight and Size.

Of the many more or less obscure problems involved in the designing of modern automobiles, that dealing with the proper size and weight of flywheels is perhaps least thought of except by those to whom its solution falls. And yet it is of tremendous importance that flywheels receive the most careful and thoughtful study. The importance of proper designing affects not only the manufacturer, for a small amount of variance in the size or weight of a flywheel may wholly alter the action of an engine and thus unmake a car, but it affects the purchaser as well because a flywheel which is not properly designed may at any time become an instrument of destruction due to the action of centrifugal force.

Due to the care which is taken in designing, however, cases of "exploded" flywheels are extremely rare. As a matter of fact it is doubtful if a single case could be found in which the flywheel of an ordinary car used for touring only had exploded, or to use a more correct term, burst. But that the danger exists in racing cars quite recently has been proven by several occurrences. Perhaps the most interesting case in point embraces the bursting of the flywheels in two cars of the same make within a few days of each other. Both cars were entered for the Elgin races. The flywheel in one of them burst in practice and that in the other "let go" in the early stages of the race.

Still another case of the same kind occurred in the first lap of the light car division of the Santa Monica race. But so far as known no such trouble ever had been experienced before with the same makes of cars.

All of which emphasizes the fact that the strain on the rims of flywheels really is tremendous. Most flywheels are cast iron, and on account of their thickness there is difficulty in securing absolute soundness. The ultimate limit of strain which can be allowed with safety is 10,000 pounds per square inch. Using a factor of safety of 10 gives a maximum allowable strain of 1,000 pounds per square inch, which corresponds to a rim velocity of 6,085 feet per minute.

Few flywheels, except those in racing cars, ever attain this rim velocity. Approximately half this rim speed is all that is attained by the ordinary flywheel in the ordinary touring car or runabout. In the special "flyabouts" and "speedsters" which gradually are making their appearance on the market, however, it is not unlikely that

this rim speed is more nearly approached, while in bona fide racing cars greater rim speed is a common occurrence. That even this factor of safety of 10 is entirely too low is the opinion of W. Trinks, who is an engineer of wide experience in the designing of flywheels. In an illuminative article in the Scientific American he elucidates many of the problems with which designers of flywheels have to contend and makes plain many of the points involved. "Average practice in the design of cast iron flywheels," he says, "dictates an upper limit of a mile a minute or 88 feet per second for the mean rim speed. Since the hoop stress in a revolving cast-iron ring is given by

$$\frac{(\text{feet per second})^2}{10}$$

the hoop stress in average flywheel practice is less than 800 pounds per square inch. The tensile strength of cast iron is about

22,000 pounds per square inch and at first thought the factor of safety of

$$\frac{22,000}{800} = 27.5$$

seems ridiculous. Yet the occasional bursting of a flywheel preaches caution and deters engineers from adopting higher speeds. It is known that the difference between simple theory and actual practice is caused by four different agencies:

- (1) The weakening of the rim by the joints of sectional wheels;
- (2) Casting stresses;
- (3) The bending of the rim by the forces in the arms;
- (4) Flaws. . . .

"Casting stresses depend not only upon the design of the wheel but upon foundry practice as well; they are uncertain, and in many designs of wheels their presence cannot be detected. The author remembers a wheel of standard design which, while lying peacefully in the yard of a foundry, pulled an arm off, near the hub, even before the wheel had been delivered to the machine shop. To judge from this one example, even no speed is too high for a flywheel. Fortunately, such a sad combination between poor design and poor foundry practice occurs but seldom. . . .

"With the shrinkage strains practically eliminated the determination of centrifugal

gal strains in the arms and in the rim can be made with some accuracy. Since a woe-ful amount of ignorance exists on the distribution of forces in flywheels a review of the method of calculation will probably be welcomed by 'seekers for the truth.'

"Imagine the rim of a wheel rotating by itself—that is, disconnected from the arms; then its diameter will grow a small amount. Next imagine the arms rotating disconnected from the rim; then they will also grow in length, but not as much as did the rim. If both rotated separately, there would consequently be a gap between the arms and the rim. In reality there is no such gap, from which it must be concluded that the rim pulls the arms out and that the arms pull the rim in. From the size of the gap and the dimensions of the wheel the force acting between the rim and the arm can be computed in this manner. The arm is a rather stiff spring with a certain scale; the rim is a spring with another scale; the imaginary gap furnishes the deformation of both springs due to the force under consideration. These data together with the self-evident condition that the force on both springs must be alike (one being the reaction for the other) make the calculation determinate. A few words may be said about treating the arms and the rim as springs. The arms are straight bars and their deformation by direct tension is easily computed. The rim presents more difficulties as its deformation is made up of two components: First, a reduction of the diameter of the rim by the hoop tension which balances the arm pull; second, a flexure of the rim by the arm pull. All of these calculations, namely, the computation of the size of the gap, the stiffness of the two springs, the rim-to-arm pull and the resulting stresses, are thus purely a matter of applied mechanics; they offer no fundamental difficulties, but are very tedious, because no general formula can be employed.

"On the subject of bending stresses in the arms much confusion exists in the minds of many engineers. Each arm is rigidly held at the hub and is more or less rigidly held at the rim; it can therefore deflect only as is shown in Fig. 1, presenting an inflection point A whose location depends upon the relative stiffness of the arm and the rim. In flywheels proper with deep rims the point A lies near the middle of the arm. In pulleys with shallow rims the point A lies near the outer part of the arm.

The exact location of the inflexion point can be mathematically determined, but the process is tedious, and a skilled designer soon learns to guess the location of this point with considerable accuracy. Force F , Fig. 1, times the radius r gives the transmitted moment. This simple reasoning teaches that the bending at the rim is frequently just as great as the bending near the hub.

"The outer rim speed of this wheel, as before mentioned, is 10,000 feet per minute,

OVERLAND FACTORY IN TOLEDO, OHIO, AFTER ITS SEVERAL RECENT ENLARGEMENTS

but this, is by no means the commercially attainable limit. Wheels with plate walls gripping over a steel rim in halves can be run safely at 15,000 feet per minute. The simple formulae for hoop stress then are no longer applicable, because solid disks have taken the place of arms. We all know that properly designed disks can be run at very high speeds, thus the De Laval disk, for instance, can be run with safety at a speed of 72,000 feet per minute.

"While it is thus apparent that much higher rim speeds may be used than have heretofore been customary, it should not be overlooked that commercial rim speeds depend not only upon strength of materials and design but also very largely upon dollars and cents. Rotative speeds in steam engine practice have been moderate, and low rotative speeds do not permit high rim speed without excessive diameters of wheels."

When Substituting Grease for Oil.

While often it is possible to substitute grease for oil as a lubricant with good results, great care should be taken in making the change. This is particularly so in the case of differential mechanisms, many of which apparently may be lubricated with either grease or oil. The hardest part of the differential to lubricate and the most likely to suffer, therefore, is the "spider" on which the small bevel pinions are carried. Usually, this spider is case-hardened and the pinions may or may not be bushed.

holes usually are drilled in the pinions through which the lubricant is worked by the action of the gears. If, however, the user makes the mistake of using grease which is too heavy, to lubricate the differential, the repairer is likely to find that the bushings of the small pinions have been cut to pieces, because the heavy grease could not enter the small holes. The better way is to use a thinner grease; a grease of the consistency of thick cream generally may be relied upon, though if the manufacturer of the car recommends oil, it is best, always, to follow instructions.

Waverley Weaves a Glorified Catalog.

The Waverley 1912 catalog embodies a new idea in catalog building. The earliest product of the Waverley company's factory in Indianapolis was named after the Waverley novels. In casting about for a suitable scheme of decoration for this year, the Waverley people selected incidents and characters from the novels themselves and scenes associated with Abbotsford, the home of Sir Walter Scott, as the setting of their narrative. The result is one of the most strikingly beautiful catalogs that ever has seen the light. It truly is an edition de luxe.

Thus the outside cover displays in green and gold figures in the medieval armor taken from the entrance hall at Abbotsford. The inner cover shows Scott's coat of arms under a three color picture of the Waverley 1912 limousine in the garden at Abbots-

ford. Across the tops of all the inside pages runs a frieze in three colors and gold representing the tournaments in Ivanhoe. The portrait of Sir Walter backs up the title page and in the wide margins on either side of the printed matter appear panel portraits of different Waverley characters. The two center pages of the catalog are devoted to a large four color half-tone of a Waverley car on the Abbotsford estate.

The artist employed to illustrate the catalog was Frederick Richardson, the well known book illustrator of Chicago. His work shows evidence of considerable study and research in the selection of armor and costumes as well as of skilful handling of line and color. Besides the purely decorative pictures the catalog is well furnished with half-tone illustrations of Waverley electric cars, showing both interior and exterior views.

To Facilitate Drilling of Steel.

Though generally it is a very difficult operation to drill tool steel, the work may be facilitated by using on the drill a compound made of one pound of common washing soda dissolved in about a gallon of water. To this should be added about a quart of machine oil and the mixture allowed to stand for about an hour, when it will be ready for use. Care should be taken to see that the last vestige is removed from the work afterwards or rusting will result. The compound may be used the same as oil for this purpose.

Chains for Cam Shafts; Their Adjustability

Despite the widespread adoption of the "silent" chain by foreign manufacturers and the apparent success which has attended its use in the driving of camshafts, water circulation pumps and magnetos, there still remains considerable difference of opinion regarding the exact conditions under which the most satisfactory results may be obtained.

The principal controversy concerns the necessity for providing means of adjustment, and on this point the two largest chain manufacturers in England, Messrs. Hans Renold, Ltd., and the Coventry Chain Co., are at variance. As a matter of fact, the majority of engine manufacturers provide means whereby the distance between chain wheel centers may be altered within certain arbitrary limits to allow for wear, and this, according to Charles G. Renold, of the firm which bears his name, is the only method by which the best interests of all concerned, the engine manufacturer, the chain manufacturer and the purchaser of the engine, are served.

Speaking for the Coventry Chain Co., however, A. S. Hill, who is managing director of that company and long has been considered an authority on such subjects, states that adjustment is unnecessary and advocates the doctrine of fixed chain wheel centers in no uncertain terms. Inasmuch as the point in question is probably the most vital in the successful application of silent chains, the opinions of these two authorities cannot help but be of surpassing interest to those connected with the automobile industry, for although there are only three American cars in which silent chains are used, namely, the Stearns-Knight, the Stoddard-Dayton-Knight and the Columbia-Knight, indications point to a much more general use of this method in the not far distant future.

"At first sight," says Renold, in arraigning his side of the question, "it appears very much easier to arrange for a drive with fixed centers, but even here the advantage is more apparent than real, since such a drive requires two chains and four wheels set at predetermined center distances, instead of possibly one chain and three wheels, in which the position is conveniently adaptable to the other requirements of the design and may be that previously used for spur gearing. Beyond this, however, the non-adjustable drive for camshafts or magnetos suffers from grave drawbacks, the nature of which it is our business to understand."

"It may be stated at once," he continues, "that the arguments against the fixed center drive are based largely on the defects

of present-day chains, and their force cannot be judged a priori grounds, but only after a close consideration of the defects and their magnitude. Such a consideration will show that as things are at present, these defects are unavoidable. It is, however, possible that such improvements may in the near future be made in silent chains that the arguments may be robbed of some of their force, but it is doubtful whether the scale will ever be turned in favor of the non-adjustable drive.

"We will now examine the conditions under which the fixed center drive works, and the disadvantages from which it suf-

COLUMBIA CAM SHAFT DRIVE

fiers, leaving consideration of the adjustable drive until later. A camshaft drive, especially with poppet valves, is an impulsive load, and the same is true of the magneto. The motion of the crankshaft, which drives the camshaft, is also likely to be impulsive, particularly in the event of any irregular firing. In addition to this, it must not be forgotten that a chain drive on a car, subjected to every kind of vibration, cannot be regarded as working under the same conditions as a chain on a fixed piece of machinery. In short, chains used for camshaft and magneto driving are subject to innumerable impulses, the most severe being those caused by the nature of the load. Now the effect of these impulses, unless the chain is fairly tight, is to produce whipping in the chain, which throws a much greater load than

that of the power pull on the chain, and consequently causes it to wear rapidly, thus further lengthening it, and giving still greater encouragement to whipping, which is thus intensified, the effect being cumulative and of increasing rapidity, until finally the chain breaks, although the driving pull is much less than the breaking strength of the chain.

"A further disadvantage of this type of drive is that slack in the chain can act as back-lash and allow variable timing of the valves or ignition. We are inclined to think, however, that this second disadvantage, important as it undoubtedly is in theory, is in practice overshadowed by the first one, i. e., the risk of chains wearing out quickly and breaking through whipping. It will be time enough to consider the second trouble when the first has been cured.

"From the foregoing arguments it will appear that since so small an amount of sag causes serious whipping, the chain therefore, ought to begin its life either with no sag at all, or with the very minimum. This brings us to the question—how much slack, if any, is allowable in the drive to start with, and at what point does the permissible quantity become exceeded? As will be pointed out later, a slight amount of play in the chain is necessary for satisfactory running; which may be put as being equal to a sag of $\frac{1}{8}$ inch, this representing the necessary minimum. At the other extreme, judging by drives which we have measured, we find that with a center distance of about 5 inches, the wheels having, say, 19 teeth and 38 teeth, not more than $\frac{5}{8}$ inch sag is allowable. This means that it should not be possible to press the center of the slack side of the chain more than $\frac{5}{8}$ inch away from the straight chain line, i. e., the tangent to the pitch circles of the two wheels. With a chain of $\frac{1}{2}$ inch pitch, 50 pitches long, this represents an approximate elongation of .4 inch, equal to .008 inch per pitch, or about 1 $\frac{1}{2}$ per cent.

"Now for an ordinary silent chain drive it is possible to use the chain until it has developed about 4 per cent. stretch, and even allowing for the severe conditions and the accuracy of gearing required for camshaft driving, it would still be possible to use the chain until it had about 3 per cent. stretch. From the above figures it will be seen that owing to the whipping and consequent risk of breakage, the chain has to be discarded when it has undergone only about half of the wear which is in it, and even from this residuum of life certain deductions must be made, as we are about to show. First, we would point out that as

whipping increases, the rate of wear increases, due to the extra load produced. If whipping can be eliminated, not only would double the wear in the chain be available, but this would represent considerably more than double the amount of life, since with no whipping the wear would always be at the slowest rate. Secondly, having shown how far the wear may be allowed to proceed before the chain must be discarded, we must draw attention to the fact that not even all this amount of wear is available for chain life. Two facts are responsible for this, the effect of both being to reduce the available range of sag.

"The first fact is that variations have to be allowed for in any machined article, and from the nature of the case we are considering, these must all be from that dimension at which the chain would join up with the minimum amount of slack, to something larger. By working to the finest possible limits, we find the variations in the total length of a chain may be equivalent to a difference of .001 inch per pitch from the shortest to the longest.

"The second fact is, as stated above, that for satisfactory running at the high speed required, a slight amount of play in the chain is necessary even to start with, or no oil can enter or remain between the bearing surfaces, and galling or seizing will result. To give this play, the chain must have at least .125 inch of sag on the slack side. If the full amount of the manufacturing limit of .001 inch per pitch be taken advantage of, this sag will be further increased to .25 inch. It will be remembered that the outside limit of sag allowable, as before stated, we put at .625 inch, a limit which is reached when the chain is normally only half worn out. If, then, we make the necessary deduction of .125 for the necessary sag, and the possible deduction of another .125 inch for manufacturing inaccuracy, it will be seen how little of the chain's possible life may be available.

"Moreover, the most useful part of the chain's life, viz., when the rate of wear is slowest, due to the tension being correct, may be wasted where chains are on the long side, even though they are still within the manufacturing limit of accuracy.

"The obvious comment on the foregoing arguments is that the limit of .001 inch per pitch is not fine enough, since if this limit were finer, less allowance need be made for manufacturing inaccuracy, i. e., the outside limit of $\frac{3}{8}$ inch sag would not be reached until the chain had worn to it, instead of being reached earlier through the accident of inaccurate manufacture.

"The desirability of finer limits of accuracy brings us to the consideration of the possibility of producing chains of 'dead length,' which would all join up at exactly the right tension to start with. Several methods have been suggested to us:

"Make a chain to 'dead size' with no variations. This obviously does not ema-

nate from engineers, and requires no discussion. The limits within which we can hold the variations are dealt with fully later.

"Make the variations on the short side, and join up the chain by force. This can be done, but apart from the desirability of a slight amount of play in the chain, it means that every chain plate has to be sprung, which destroys the accuracy of the angles of the gearing faces, makes the chain run 'hard' and hot, and more noisily than necessary. It is liable to stress the material of the plates across the arched back above its elastic limit, which distortion of the links will cause uneven running, since the chain combinations are of unequal strength, and each alternate pitch will pull out more than the others. Special appliances would be needed to draw the chain ends together when mounting, and replacement chains would, therefore, be very difficult to mount, except at the works of the car makers. It is an unmechanical proceeding, and puts unnecessary loads on the shaft bearings, chain studs and wheel teeth.

"Make the chain short in pitch and 'run it in' to exact pitch under load. This is based on a misconception as to what 'running in' does. It is found that during the first few hours of a chain's working life the wear is more rapid than later on. This rapid initial wear is due to bedding down of the stud and bush surfaces, and if 'running in' were done at all, it should obviously be carried to the point where the bedding down is complete and the legitimate wear begins. If the chain, however, varies in its manufactured length, it cannot satisfactorily be brought to finer limits of variation by such a 'running in' process, as the amount of increased length will in itself be variable. Such 'running in,' therefore, does not help to produce chains of 'dead pitch' such as are needed for drives without adjustment.

"It is of course conceivable that each chain could be 'run in' until it reached a certain pre-determined length, but this would lead to one of two difficulties:—First, if the 'bedding down' is completed before the chain has reached the pre-determined length, it would be quite impracticable, commercially, to carry the process further, as after 'bedding down' is complete the rate of wear is extremely slow. Thus it will take two to three hours to elongate the chain .001 inch per pitch, but it will take twenty to thirty hours to produce a further .001 inch per pitch increase. In the second case, if the chain reaches the standard length before the 'bedding down' is complete, the gain due to 'running in' will be almost immediately lost when the chain is set to work. 'Running in,' therefore, even if it were otherwise advantageous, would not save the fixed center drive.

"Cut every set of wheels to suit its chain after it has been 'run in.' This could be done, but would only take care of pitch

variations in the portions of the chain that lay on the wheels. It would not cure the variations of the parts of the chain between the wheels, and replacements would be almost impossible.

"We come to the conclusion, therefore, that we must give up the idea of obtaining a chain of 'dead pitch,' and be content to work to the closest limits possible. . . .

"To sum up the case against the fixed center drive—to be satisfactory, the chain must start life, not indeed rigidly tight, but with a very definite minimum of slack. At present chains cannot be guaranteed accurate enough for this. If, on the other hand, each drive is treated specially, i. e., special cutting of wheels, special 'running in,' or special selecting of chains and wheels to suit each other, then neither the chains nor the wheels are truly interchangeable. Further, the chain must be discarded when a certain very moderate amount of sag has occurred. From this allowance, moreover, the aforementioned slight initial slackness, which is necessary for a sweet-running drive, must be deducted, while the possibility of the chain being slightly 'long' in pitch, owing to manufacturing inaccuracy, may mean a further deduction. In a word, lack of adjustment almost inevitably shortens the life of the chain by roughly one-half, and may reduce it even further.

"From what we have said, it will be seen that two conditions are necessary for a camshaft or magneto drive to be satisfactory:—

"(1) The chain must have a minimum of slack.

"(2) The chain must fit the wheels.

"We have shown that at present it is not practicable to produce chains which will always join up at the right tension at a given center distance, but as a given amount of inaccuracy in the chain has a greater effect on chain slackness than it has on the fit of the chain on the wheel, it is quite possible to guarantee that all chains shall fit all wheels. This meets the second condition, and, if the first is met by adjustment of the centers, we have all the requirements of a perfect drive. . . .

"It is too early in the day to give any very general rule, but from what we have seen of adjustable drives we believe it will be found, if the chain is run during engine tests and then adjusted, no further adjustment will be necessary for many thousands of car miles, probably not until the car is sent in for overhauling. In fact, so far as the user of the car is concerned, he need trouble no more over adjustment than if none were provided.

"Taking into consideration what we have said on the subject of initial accuracy, it will be seen that the provision of adjustment is of as much importance for starting a new chain at the right tension as it is for taking up future wear. This has an important bearing on the question of interchangeability, a point of considerable interest to the user of the car, for, even if

the original chain had been put on at the right tension with fixed centers, the task of finding a second chain to join up exactly right at the same centers is well-nigh impossible for the private individual.

"It is of course impracticable to alter the relative position of the camshaft and crankshaft. There seem to be, therefore, only two possible methods of adjusting chain tension. The first, and most obvious, is to arrange an adjustable idler wheel pressing against the chain. With the silent chain such a wheel has to gear with it, and be in contact with at least three teeth; wheels bearing on the back of this type of chain being quite unsuitable. If only the camshaft has to be driven by chain, such an idler wheel would be the only way of providing adjustment, and would be quite satisfactory. If, however, the magneto is to be driven by chain also, a second method for obtaining adjustment can be adopted by allowing the wheel of the magneto to take the place of the idler wheel, and making the magneto adjustable bodily. If there are two camshafts and a magneto, two triangular drives should be arranged, one adjusted by the magneto, the other by an idler. The fan or pump might possibly be arranged to be driven from the spindle of the latter.

"It would generally not be advisable to connect two camshafts and the crankshaft by a single chain, as it would be difficult to arrange an adjusting wheel, either magneto or idler, that would not leave too small an arc of contact for the chain on one or the other of the main wheels. If the disposition of the shafts made this possible, however, there is no objection to it.

"It may be objected that a triangular drive puts unnecessary loads on the bearings of one or the other of the driven shafts, according to the arrangement. This does not seem to have produced any trouble in any drive I have seen or heard of. Moreover, I would point out that any extra load of this sort, if it does occur, is likely to be much less severe than the sudden irregular loads, due to the whipping of a worn chain on a fixed center drive."

From the foregoing it is apparent that Renold's contention is that it is impossible to make a chain exactly accurate in length and that it is therefore essential to provide means for adjustment. Hill's view of the situation, which is exactly the reverse, is interesting, inasmuch as it means, virtually, standardization of the triangular drive.

"On the first question of accuracy in manufacture," says Hill, "it rather depends to what extent the manufacturing processes are carried by the chain maker as to what degree of accuracy can be obtained. It is, of course, quite true that the moment when a chain first forms a complete assembly of its constituent parts that it is not dead to reputed measure in its overall length, for the reason that the total tolerance, or al-

lowed error, is the average tolerance of each pitch multiplied by the total number of pitches in the chain. The tolerance in one pitch itself may be as little as .00025 inches, but the total tolerance in any chain of considerable length must, naturally, be perceptible, always remembering that the total is within reputed length. It is obvious, therefore, that the integral parts of a chain are made to a standard of accuracy higher than that accepted in good automobile practice.

"It remains, therefore, to consider whether a finished chain, as ordinarily understood, and as used in general engineering, can be refined in accuracy by further processes in order to render it serviceable to the special requirements of the automobile engineer. I maintain that it can, and such is the practice with my firm. . . .

"The wear that takes place in these 'running in' processes is essentially superficial in its character; the 'bedding down' is bound to take place, and in the very nature of things the process is fairly rapid.

"When it is finished the apparent wear ceases and the real wear, which is infinitely slow, begins. I say 'infinitely slow' for the reason that I have no knowledge of a chain showing any appreciable signs of wear if the drive has been properly designed and the chains suitably refined before being fitted to the engine, even after running 6,000 miles. . . .

"It must be borne in mind that dispositions of cam-shaft chain drives are numerous, and an argument for the adjustment of one may not be applicable to others. In certain forms of drives, as where two wheels only are employed, it has usually been set forth by prospective users as a fundamental that centers are to remain fixed. Far be it from me to deprecate adjustment of centers for chain drives generally, as I recognize their benefits in general practice, but in the type under consideration the complications necessitated by the introduction of adjustable centers is not warranted when my previous remarks are borne in mind as to refinement both by the chain and automobile manufacturer.

"Undoubtedly an adjustment is advisable if the chain is to go into the engine without being refined, but the principal use of such adjustment will obviously be to take up the sag caused by the initial bedding in. Thereafter there should be little need for its use.

"It stands to reason that to fit an adjustment on every engine for the sake of taking up the sag in its own individual chain is an unnecessarily expensive proceeding when all the chains can be separately run in to length on one adjustable jig specially made for the purpose. In another disposition of design employing one chain as a triangular drive over three wheels adjustment is essential because, in this case, a much longer chain must be used, and the wear is more rapid by reason of the smaller arc of contact between each

of the three wheels and the chain. Moreover, the provision of adjustment on this type of drive is comparatively simple.

"Again, adjustment is useful to decrease the flapping of the free portion of the chain due to the intermittent load of the camshaft and magneto. The necessity of designing for some specific pitch and an exact 2-1 ratio arbitrarily locates the camshaft center independently of any other consideration.

"From my own point of view, as a chain maker, therefore, I would summarize the present position by urging the necessity, on the part of automobile engineers, to regard the following points as essential:—

"(1) Acceptance of the experience of the chain maker in determining suitable widths and pitches.

"(2) Rigorous exactitude in the setting of the chain wheel centers.

"The reason for this latter should be obvious in the light of what has already been said. Any inaccuracy of chain wheel centers frustrates the object of the refining processes to which the chain has been subjected, and cannot possibly be corrected afterwards.

"If regard has been given to the above points, the purchaser of a car with chain-driven camshaft need have no fear but that this member of his engine will be silent and have a long life. It will, of course, be unnecessary to point out to engineers that it is only by accident that existing gear-driven camshafts can be converted to chain drive.

"In conclusion, there is one other point of great interest where chain drives are concerned, and for which some provision for adjustment should always be made. I refer to the question of end float in crankshaft, camshaft and magneto spindles. This is a question not for the chain maker but for the engine designer, and must be borne in mind, for it will be obvious that if wheels have the ability to float fore and aft on the line of their spindles, troubles of cutting of guide plates and mounting of teeth are likely to occur."

Springs That Prevent Hose Breaking.

For the reason that a certain amount of vibration is inherent in all automobile engines, rubber hose frequently is used in making water connections to eliminate the possibility of damage resulting to the comparatively delicate radiator. When such rubber hose has bends in it a simple way to prevent flattening and consequent breakage is to insert a brass coil spring extending several inches each side of the bend. Iron or steel wire never should be used for this purpose owing to its rusting proclivities.

Soft Solder for the Small Jobs.

For the small soldering jobs about a car a soft solder that will fuse at a considerably lower temperature than the ordinary brand, may be made by adding three drops of mercury to each half ounce of solder.

MOTOR CARS FOR MILITARY USE

French Army Tries Out Two More of Them—One of Them an Aeroplane Repair Shop.

The recent addition of wireless outfits and aeroplanes to the armies of the various nations naturally has caused a demand for motor propelled vehicles, especially designed with a view to facilitating the work

TRAVELING REPAIR SHOP USED BY FRENCH ARMY

of these new weapons of offense and defense. Wireless apparatus has been used for some time in maneuvers, but the equipment usually was carried on the regular army wagons, sometimes on ordinary motor touring cars, and sometimes even on motorcycles. The great extension and almost universal use of the same during the recent French and German maneuvers, however, proved the inadequacy of present methods in handling the equipment, and with this idea in view Delahaye & Co. have brought out a special car solely for use as a wireless sending and receiving station. The car, which is shown in the accompanying illustration, carries a jointed steel mast, wire, instruments and a crew of four men.

The other picture shows the latest achievement in up-to-date warfare—the traveling aeroplane repair shop. This is a heavy, powerful truck, capable of carrying without difficulty a wrecked or damaged aeroplane on its top, fitted inside with a mass of drawers, boxes, etc., for spare parts, bolts, nuts and canvas, while a portable steel bench with vise also forms part of the equipment. The car was thoroughly tested in the great French army maneuvers part of this summer and is said to have rendered excellent service. On account of the heavy rains it had to be raised upon wooden beams to prevent its sinking into

the soft ground, with its wooden plug tire equipment.

Gives "Borrowed" Car as Security.

Not every "joy-rider" who is arrested for speeding succeeds in putting up the "borrowed" car as security with the police for his appearance and payment of the fine assessed against him. But that is just what Anthony Smith accomplished in Philadelphia, and as a result the police are very industriously looking for the owner of the

for \$300 and that he was "busted," but offered to go out and get the money, leaving the car at the police station until he came back with the fine. He never came back. Meanwhile the runabout is proving a white elephant on the hands of the authorities.

"Jiu-Jitsu" for Accident Victims.

The prevalence of accidents in motoring, in which the occupants of the car or pedestrians are "knocked unconscious," has brought out a suggestion from an adherent of the famous Japanese system of physical culture, "jiu-jitsu," which, if followed accurately, is claimed to restore to consciousness the most thoroughly "knocked out" person that ever walked the earth—providing he is not killed. The system is nothing more than the beating of a rapid and heavy tattoo with the bare knuckles upon the seventh vertebra, while the patient is lying face down upon the ground. The seventh vertebra is one inch below the line connecting the highest points of the shoulder blades. Its vibration causes a peculiar reflex action in the heart muscles and is said to be absolutely certain of success.

Not Responsible for Horses' Mischief.

While various courts in this country as well as abroad have held that damages caused by a horse or team, running away after being frightened by an automobile, may be laid at the door of the motorist, the New York Supreme Court, sitting at Catskill, last week declared in such a case there was "no cause of action." The opin-

car, with a very small chance of ever seeing "hide or hair" of the ingenious Mr. Smith again. One of Philadelphia's motorcycle "cops" caught Smith going at high speed and promptly arrested him. When arraigned he was fined \$10, but confessed that he did not have a cent with him. He explained that he had just bought the car

ion was rendered in the case of Annie Covell, who sued Austin Newcombe for \$10,000 damages, caused by the death of her husband. In her bill of complaint the plaintiff stated that her husband met her death by being thrown from his wagon, the horse having taken fright at the passing of the defendant's automobile.

997,073. Friction Clutch. Albert Master, Park Ridge, Ill. Filed Jan. 9, 1911. Serial No. 601,651.

1. In a friction clutch, the combination with a pair of shafts, of a hub rigidly connected to one of said shafts and including a cylindrical clutch member, a spring clutch ring surrounding said cylindrical clutch member, said ring being provided with a pair of spaced eyes having coaxial bores of different diameters, and a lug having a bore directed toward the space between said eyes, a collar connected to the other shaft and lying against the aforesaid hub, said clutch ring and collar having interlocking means, an operating lever having a pair of journals of different diameters mounted in the aforesaid eye bores and an integral eccentric lying between said eyes, a bolt having at one end an eye concentric with said eccentric and co-operating at its other end with the said lug, and means to operate said lever.

997,136. Device for Supplying Oil to Internal-Combustion Engines. Philip Devereux Johnston, Cold Spring, N. Y., assignor to American Oil Engine Company, a Corporation of New York. Filed July 7, 1906. Serial No. 325,113.

1. In an internal combustion engine, the improved controlling means for delivering

the fuel, which comprise a pump, a controlling valve therefor, the said valve being a slide valve, and an exit port for the valve, the said port being restricted at the end adjacent to the valve so as to provide a longitudinal passage.

997,151. Spring Wheel. Elton A. Nelson, Chicago, Ill. Filed Feb. 7, 1910. Serial No. 542,555.

1. A wheel comprising in combination a hub, a felly, and cushioning means between said hub and felly comprising spring elements provided with coils between said hub and felly, extending in the plane of the wheel and out of contact with said hub and felly while yielding to normal shock but contacting therewith and bridging the space therebetween in the event of overload or excessive shock.

997,169. Carburetter. Alexander Winton and Harold B. Anderson, Cleveland, Ohio, assignors to The Winton Motor Carriage Company, Cleveland, Ohio. Filed Mar. 13, 1907. Serial No. 362,159.

1. A carburetter comprising an air passage provided with a fluid inlet, means for maintaining a body of oil in a plane above the said inlet by gravity flow therethrough for slowly moving volumes of air, said inlet so restricted as to require suction of fluid therethrough for rapidly moving volumes of air, and a movable deflector adjacent the body of oil and normally closing the air passage but opened by the passage of air through the said passage for the purpose described.

997,176. Ratchet Grease Cup. George W. Bowen, Auburn, N. Y. Filed Aug. 26, 1910. Serial No. 579,093.

1. A grease cup comprising a base, a cap threading on the base and having an imperforate head, a disk fixed in the cap and having an opening therethrough, opposing surfaces of the head of the cap and the disk forming opposite sides of a chamber in the cap, and mechanism for restraining turning of the cap including engaging means fixed within the cap, a second engaging means composed of a disk and stem, the disk being supported within the chamber directly on the first named disk and coacting with the engaging means within the cap, said second named disk being formed of substantially the same diameter as the chamber, and the stem being supported by the disk of the second mentioned engaging means and being connected to the base and held thereby from turning movement with the cap, the stem being passed through the opening of the first named disk and spaced apart from the inclosing wall of said opening, and yielding means for effecting the coaction of said engaging means, substantially as described.

997,190. Internal Combustion Engine. George Roy Harvey, Hamilton, Ontario, Canada. Filed Feb. 6, 1911. Serial No. 606,944.

1. In an internal combustion engine, a frame, a crank shaft journaled to said frame, a plurality of cylinders rigidly supported from said frame and arranged parallelly in a common plane transversely of and in right angular relation to said crank shaft, said cylinders being placed in balanced arrangement laterally to each side of said crank shaft, pistons operating in unison within said cylinder, piston rods rigid with said pistons, a pair of parallelly arranged distance bars rigidly connected to

the outer ends of said piston rods, and a block slidably arranged between said pair of distance bars and rotatably connected to the crank pin of said crank shaft.

997,195. Two Cycle Gas Engine. Charles Francis Jenkins, Washington, D. C. Filed Nov. 18, 1910. Serial No. 593,028.

1. In a gas engine, a cylinder, a piston reciprocating therein, a longitudinal passage located outside of the cylinder but within the water-jacket space of said cylinder, the upper end of the passage being in open communication with the upper end of said cylinder, the lower end adapted to be opened and closed by the reciprocation of the piston, and a spark-plug located at the lower or ingress end of the passage.

997,212. Vulcanizing Mold for Rubber Tires. Anton M. Scheurle, Kiel, and Joseph M. Stine, Milwaukee, Wis. Filed Nov. 7, 1910. Serial No. 590,972.

1. In combination, a vulcanizing mold-box and a clamp therefor, said mold-box having a recess in one side adapted to receive a tire, and said clamp comprising three elements pivoted together, to wit:—a base-member at one end, a yoke-member in the middle and a catch-member at the other end, and means on said yoke-member for pressing the tire into said recess; said box being provided on each side with a longitudinally extending engaging-surface, said base-member having a coasting face adapted to engage in a longitudinally slidable manner with one of said engaging surfaces, and said catch-member being provided with a coasting-surface adapted to engage with said engaging-surface on the other side of said box.

997,223. Spring Tire. Joseph A. Waters, Washington, D. C., assignor of one-half to John O. Waters, Washington, D. C. Filed Sept. 8, 1910. Serial No. 581,052.

1. In a spring tire, the combination with a wheel, of abutments secured to the periphery of the wheel and having curved inner surfaces, flanged rings secured to the wheel outside the abutments whereby spaces are left between the abutment and rings, a shoe having elastic sides movably mounted in the said spaces between the abutments and the flanged rings, and springs located between the abutments and having upper portions in contact with and supporting said shoe, the lower portions of said springs being in contact with the abutments midway between the said inner surfaces thereof whereby the sides of the springs are normally out of touch with the abutments.

997,255. Carburetter. Lars Anderson, Chicago, Ill. Original application filed Oct. 15, 1909, Serial No. 522,710. Divided and this application filed May 21, 1910. Serial No. 562,619.

1. The combination of a float chamber having a bottom inlet; a valve controlling the entrance of fluid into said chamber through said inlet; a float within said chamber; a support in the lower part of said chamber; two parallel links connecting the float to the support for rectilinear movement; and a connection between one of the links and the valve for operating the latter.

997,232. Carburetter. Fredson E. Bowers, New Haven, Conn., assignor, by mesne assignments, to The Gilbert Manufacturing Co., New Haven, Conn., a Corporation. Filed Mar. 30, 1908. Serial No. 424,258.

1. In a carburetter, the combination with means for supplying a fixed amount of

combustible vapor, of a supplemental air-valve operable by suction, a mechanical regulator connected with the said valve for the mechanical operation thereof, and means for driving the said regulator from one of the running parts of the engine supplied with vapor by the carburetter.

997,253. Means for Controlling Reversible Internal Combustion Engines. Knut Jonas Elias Hesselman, Sickla, Sweden. Filed Apr. 8, 1908. Serial No. 425,857.

1. In an internal combustion engine, the combination with a cylinder, of fuel supplying means therefor, fuel introducing means, and operating means adapted to operating means adapted to operate said supplying

No. 10

STOCKHOLDER ACTS AGAINST MAIS

Applies for Receiver for Indianapolis Truck Company—Pique the Cause, Says President Brown.

Notwithstanding its excellent prospects and apparently believing that the company was not progressing fast enough, Harold S. Bloch, of Wheeling, W. Va., a stockholder, on Wednesday of last week filed an application with the Indiana Superior Court asking that a receiver be appointed for the Mais Motor Truck Co., of Indianapolis.

Bloch alleges that the corporation is insolvent, and that it is unable to pay its indebtedness, which, he says, amounts to \$144,000. He complains also that the Mais company had an option on the building and real estate, but that the option expired because the defendant corporation failed to pay \$5,000 on or before November 21, 1911.

The plaintiff avers that the company has on hand a large amount of material for the manufacture of commercial motor trucks. He says he believes that it would be to the best interests of the stockholders and the company to have a receiver take charge of the property and assets of the company and operate it under the order of the court.

In discussing the time for the hearing before Judge Collier, John W. Holtzman, attorney for the Mais company, said plans were under way to clear up the present difficulties. Will H. Brown, president of the company, told the court that the company would complete six motor trucks this week and it was agreed that the company should be permitted to finish these cars pending the hearing on the petition, for which no date has been set.

Brown, when asked about Bloch's suit for receiver, said that there was no occasion for such action; that the company has assets, if properly handled, to pay all of its indebtedness; which assets are about

\$130,000 in excess of its liabilities, and the company is doing a good business and its prospects are good, he said.

Brown said, however, that the company needed more capital with which to do the large volume of business which was coming to it, and that negotiations were pending for financing the company in accordance with its present needs and prospects.

"Mr. Bloch is not a creditor, except as a stockholder, and is fully familiar with the negotiations that are now pending," said he. "It appears to me that his suit is brought out of pique and not for the purpose of benefiting either the stockholders or creditors. In the event that the court appoints a receiver, the only people that will suffer will be the stockholders. Mr. Bloch will suffer to the extent of his holdings, which are small."

Importers of Italian Car Go Under.

A petition in involuntary bankruptcy has been filed against the Zust Motor Co., of 235 West 50th street, New York City, by the following creditors: Victor P. Pisani, of Brooklyn, \$500; John A. Kent, New York, \$250, and Isaac R. Fiegenow, New York, \$17. Victor P. Pisani was formerly secretary and Jacob Weidman president. For some time past business has been dull and the officers of the company have been trying to raise \$60,000 to increase the business and to interest new parties to become active in it. The assets of the company, which handles the Italian Zusta car, are placed at \$10,000, while the liabilities are \$25,000. Judge Holt, on Tuesday, appointed Walter E. Coe receiver.

Grubb Sells His Interests to Fulton.

F. W. Grubb, at one time manager of the Excelsior Supply Co., of Chicago, and more recently a member of the Fulton-Grubb Co., has disposed of his holdings to his associate, J. W. Fulton, who will continue the business as factory sales agent at 1146 Michigan avenue, Chicago. Grubb has joined the Excelsior General Supplies Co. of that city, being influenced to make the change largely by the fact that his new position will require less travel.

TO SOLVE ALL INSURANCE PROBLEMS

Missouri Congressman Engages in the Work, Using Government Stationery—Lincoln's Picture Also Employed.

If only half of the things which the Lincoln National Holding Corporation of America promises to accomplish actually are put into operation, there seems reason to believe that most of the automobile trade's insurance problems will be solved and that many of the insurance companies now enjoying a profitable business through writing fire, life, accident, burglary, theft, earthquake, casualty, liability, automobile, marine and all the other kinds of insurance, will have to seek other fields of endeavor. As, however, at last reports, the corporation still was looking for someone with capital to open an office in New York City, the managing officials of the Equitable, Prudential, Mutual, Travelers, Aetna and Metropolitan insurance companies need not, as yet, scan the "Help Wanted" columns of the daily press in search of new jobs.

The Lincoln National Holding Corporation of America has an office in Washington, and is composed of patriotic men—as is indicated by a picture of Abraham Lincoln which adorns the front cover of its prospectus—its officers being: President, the Honorable Harry M. Coudrey; vice-president, Frank R. Coudrey; secretary, Henry A. Schmid; medical director, Dr. W. P. C. Hazen; superintendent of loans, M. L. Welfley; superintendent of bankers' department, E. L. Franzoni. Its president was a member from Missouri of the Sixtieth and Sixty-first Congress of the United States, and it is he who is the moving spirit behind the enterprise. The insurance company's prospectus specially directs attention to a biographical sketch of Mr. Coudrey appearing in the Congressional Directory, which sketch is reproduced. According to this prospectus the corporation was created for the purpose

of "operating and consolidating profitable insurance companies under one management," and "will have on its Board of Directors capable financiers, prominent business and insurance men of world-wide reputation, whose names will add weight and solidity to a corporation which depends for its existence upon the confidence of its stockholders." It also is stated that "the idea of a clearing house for insurance in Europe has proven most profitable, where companies like the 'Lincoln National' have been operating more than 200 years."

Despite these high-sounding phrases, however, the company, as late as two weeks ago, was looking for a "capable executive, who could invest a sum of money, as manager of its proposed New York office." The advertisement, which appeared in the "Help Wanted" column of a New York daily paper, did not say that. It stated merely that a young lady was wanted for light office work; application to be sent by mail. But when a young lady did answer and later called at the Hotel Pierpont she was told by Mr. Coudrey, whose invitation to call was mailed in a Congressional envelope, that he was desirous of obtaining the name and address of "someone with capital" who could act as New York manager. She was duly impressed with the great resources of the proposed company and with the staggering list of ninety-four different kinds of insurance which the various subsidiary companies are expected to handle. This list takes particular cognizance of the automobile and includes Automobile, Auto-theft, Auto-Public (whatever that may be!), Automobiles under transportation, Property damage by automobile, Automobile bail bonds, Court bail bonds, Automobile collision and Explosion insurance.

Proceeding along the usual line of promoter's talk the Congressman then called attention to the "Millions that are in it," citing the prospectus as to the "authorized" capital of \$125,000, and the "ultimate capital and surplus" of \$15,000,000. He declared that he intends to get a great deal of business by compelling each agent to buy stock in the holding corporation—a not exactly unique idea—and punctuated his remarks by words of wisdom to the effect that "the success of an insurance company depends largely upon the agency force." "When we make money for the agent he will increase the business of the company," he declared. "We desire to distribute our stock among thousands of stockholders who will influence business to the companies held by the Lincoln Holding Corporation."

Hupp Takes up Trucks and \$5,000 Coach.

Despite its comparatively recent production of the R. C. H. gasoline car, the Hupp Corporation, of Detroit, does not mean to lessen its interest in the electric vehicle field. For not only has it just announced an electric truck, but it also has

made ready unlooked-for additions to its line of Hupp-Yeats electric cars. It will no longer confine most of its attention to the \$1,750 model; instead it will have cars listing at \$2,500, \$3,000, \$3,500, \$4,000, \$4,500 and \$5,000, all of which will be coaches de luxe. Although they will employ the same chassis as the \$1,750 model, it is promised the coach work, finish, upholstery and appointments will "bring to mind the State Processions of the Grand Monarque."

Changes Among Prominent Tradesmen.

F. R. Bump has been appointed assistant general manager of the Hupp Corporation of Detroit, and not merely assistant sales manager. His duties comprise the general direction of the company's sales, service and advertising departments.

C. F. Garaghty has been appointed assistant to W. E. Metzger, president of the Metzger Motor Car Co., of Detroit. Garaghty was at one time prominently in the farm implement and machinery business, but more recently served as assistant treasurer of the E-M-F company.

E. W. Arbogast, formerly general manager of the De Tamble Motor Co., of Anderson, Ind., has been appointed manager of the Chicago factory branch of the Schacht Motor Car Co. Before going to the De Tamble company he was for many years identified with several Chicago agencies.

After having served for a number of years in charge of the engineering department of the Simplex Automobile Co., New York City, Robert F. Russel has been appointed assistant engineer of the automobile department of the American Locomotive Co. He will be associated with Montague H. Roberts, who is the chief engineer.

Albert F. Mais, formerly of the Mais Motor Truck Co., of Indianapolis, has joined the staff of the Studebaker Corporation, of Detroit, in the capacity of consulting engineer. Mais has had experience with the Daimler, Benz and other European concerns, and his present connection with Studebaker is taken to presage the early production of a commercial vehicle by that big corporation.

C. S. DeLany, for several years past factory manager for the Stevens-Duryea Co., at Chicopee Falls, Mass., has been made production manager and factory superintendent of the Matheson Automobile Co., of Wilkes-Barre, Pa. DeLany's previous experience embraces connection with the Cramp shipbuilding plant at Philadelphia, and later with the American Ordnance Co. and the Remington Arms Co.

V. M. Palmer, at one time superintendent and chief engineer of the Selden Motor Vehicle Co., of Rochester, N. Y., and latterly chief engineer and manager of the automobile department of the Sheldon Axle Co., of Wilkes-Barre, Pa., has re-

signed that position to join the B. F. Board Motor Truck Co., of Alexandria, Va., of which he will become chief engineer and factory manager. He has also acquired a financial interest in the Board company.

Dealers Want \$30,000 for Tardy Deliveries.

White, Ware & Leatherbee, automobile dealers at 895 Boylston street, Boston, have filed suit for \$30,000 in the Massachusetts Superior Court against the Louis J. Bergdoll Motor Company of Philadelphia for damages caused by alleged failure of the defendants to deliver cars on time, and the loss of sales that resulted. As a step in the litigation, the court issued a temporary injunction against the National Shawmut Bank and the Boston and Albany railroad, restraining them from returning two cars to the defendant company.

Pittsburg to Repeat Two Weeks' Show.

There will not be two automobile shows in Pittsburg, Pa., this year. The differences which caused the annual two weeks' exhibition of the Automobile Dealers' Association of Pittsburg, Inc., to take place in April after the "insurgents" held one in March having been adjusted, the 1912 display will be under the auspices of the association. Duquesne Gardens will be the scene, the week of January 27—February 3 being devoted to pleasure vehicles, and the week following to commercial vehicles.

Kiel Placed on the Automobile Map.

Kiel, a town in Manitowoc county, Wis., is a little bit of a place, but Frederick Thiessen, Philip Juenheimer and William Ducker believe it is big enough to support an automobile factory of at least modest proportions. Accordingly, they have organized and incorporated the Kiel Motor Car Co., with capital stock of \$14,000, and it is not improbable that the citizens of the town will supply the factory building necessary to keep the town on the automobile map.

Fretz Trustee for Pennsylvania Auto Motor.

E. S. Fretz, of the Light Mfg. & Foundry Co., has been elected trustee in bankruptcy for the Pennsylvania Auto Motor Co. of Bryn Mawr, Pa. While it was first thought that the Pennsylvania company would be re-organized, its future is shrouded in considerable doubt and it is probable that if a favorable offer is obtained, the property ultimately will be disposed of.

Havers Increases Capital; Enlarges Output.

The Havers Motor Car Co., of Port Huron, Mich., which makes the Havers "Six" has increased its capital stock from \$60,000 to \$200,000. It is stated that most of the new stock was taken by the old stockholders of the company and that the new capital will permit the company to increase its output for 1912 from 500 to 1,000 cars.

NEW MEN ENTER MITCHELL COMPANY

**Directorate Enlarged to Admit Six Bankers
—Flotation of Note Issue Reveals
Big Assets and Earnings.**

Backed by verified statements showing an average annual profit of 820,130.81 during the last three and one-half years, the Mitchell-Lewis Motor Co., of Racine, Wis., has successfully floated an issue of \$2,500,000 6 per cent. notes, the unsold portion being offered for public subscription through White, Weld & Co., and George H. Burr & Co., of New York and Chicago, at 100 and 98½ and interest, the latter being the quotation on the long term notes.

Of the issue, \$750,000 matures August 1, 1912, and the remainder, \$1,750,000, one year later, the interest being payable semi-annually. The notes are redeemable at 101 on 60 days' notice. The Continental and Commercial Trust and Savings Bank of Chicago is the trustee.

Preceding the note issue, the Mitchell-Lewis company amended its charter increasing the number of directors from 10 to 16, the new men who then entered the directorate being George H. Burr and Noble Craindall, of Burr & Co.; Ray Morris and V. McM. Rutter, of White, Weld & Co.; Herman Waldeck, vice-president of the Continental and Commercial National Bank, of Chicago, and Joseph Winterbotham, Jr., who was elected chairman of the executive committee. William Mitchell Lewis remains president of the company and W. T. Lewis chairman of the board of directors.

With such items as good will, patents, etc., excluded, the report of the accountants shows the financial condition of the Mitchell-Lewis company as of October 1, 1911, to be as follows:

Real Estate, Plant and Equipment	\$2,674,066.08
Investments	199,850.00
Current Assets (Cash Accounts and Bills Receivable, and Merchandise Inventory) . . .	4,599,498.01
	\$7,473,414.09
Current Liabilities	\$2,944,046.74

The proceeds of the note issue will be sufficient to retire all the bills payable, leaving as the only obligations current operating accounts and customers' advance deposits on cars ordered.

For the three and one-half year period ended June 30, 1911, the net profits of the company amounted to \$2,870,457.83, which works out at \$820,130.81 per year. The plant at Racine has an annual capacity of 30,000 farm wagons—which business was established in 1834—and 8,000 automobiles. Since the manufacture of the latter was undertaken in 1904, the statement accompanying the note flotation, shows that the number of automobiles sold was as fol-

lows: 1904, 82 cars; 1905, 315 cars; 1906, 666 cars; 1907, 1,377 cars; 1908, 2,166 cars; 1909, 2,946 cars; 1910, 5,614 cars; 1911 to November 1st, 4,049 cars.

On November 15, 1911, the company had orders for 9,500 cars for domestic and foreign delivery, which justifies the proposed 1912 production of about 5,000 to 6,000 cars.

The company's capital stock is \$10,000,000, equally divided into common and preferred, the latter being 7 per cent. shares.

The property, which is free of mortgages, loans or other incumbrances, covers a floor space of 1,270,000 square feet, the real estate on which the buildings stand being in excess of 79 acres. What the item of insurance alone means to such big enterprises also is revealed, the Mitchell-Lewis company carrying insurance amounting to \$5,389,170.

More Actions Against Morris-Grinberg.

Judgments for \$2,436 in favor of the Canfield Rubber Co., of Bridgeport, Conn., were entered on Tuesday last, 28th inst., against the Hayes Rubber Co. the Manhattan Storage Co. and Adolph Morris and David Grinberg, of New York, the individuals who comprise the companies, both of which have been thrown into bankruptcy. It is understood that opposition to the bankruptcy petitions will be interposed and that sensational disclosures are not unlikely. In reporting the filing of the petition against the Manhattan Storage Co., it was stated that the chief petitioning creditor was the Lovell-McConnell Mfg. Co., when as a matter of fact the petitioner was the Klaxon Company of New York, the former selling agents for the Lovell-McConnell company. The latter has lived up to its reputation by resolutely refusing to permit its Klaxon horns to be handled by such people as Morris and Grinberg or any of their several enterprises.

Motion Argued in Lozier-Williams Case.

Argument of the Lozier Motor Co.'s motion to require Fletcher R. Williams to file a bill of particulars in the suit he brought for \$500,000 because of the failure of the Lozier company to consummate an alleged agreement for the sale of a certain share of its stock, was heard in Part I of the New York Supreme Court on Friday last, but judgment was reserved. Whether or not the motion is granted it probably will be two months or more before the case actually comes to trial and its merits are inquired into.

Fire Destroys Big New York Garage.

Fire occurring late on Friday night, 24th inst., in the garage of the Sidney B. Bowman Co., dealers in Apperson and Clement-Bayard cars, at 225-231 West 49th street New York City destroyed 25 automobiles and gutted the building. The damage is estimated at \$40,000, fully covered by insurance.

OPPORTUNITIES IN SOUTH AMERICA

**They Exist and Are Worth Embracing,
Declares Returned Salesman—Flouts
Statements of a Recent Critic.**

William H. Brouwer, who recently returned to this country after spending more than a year selling American machines in South America, is one of those who does not believe that that market holds particularly great difficulties for the American automobile manufacturer. On the contrary, he considers it a most promising market and one well worth cultivating, but he believes that the best results will be obtained only by the establishment of factory branches in either Buenos Aires or Rio de Janeiro.

Two American manufacturers and one French manufacturer already have grasped the fact and established depots in the foreign cities. Practically all other automobiles which are sold in the South American markets are handled by import houses which deal with an almost endless variety of wares and naturally do not devote particular effort to the sale of automobiles. To the best of Brouwer's knowledge, there is but one exclusive automobile agency in Buenos Aires.

Contrary to the opinion of the New Yorker who only recently visited South America and who was so discouraged by what he conceived to be the expensive outlook that he returned without unloading from the steamer the several cars which he took with him, Brouwer does not believe that either the cost of living or the cost of doing business is very much greater than is the cost in this country, nor does he agree with the returned New Yorker's statement that there is no middle class in South America, or that the population is divided merely into the very rich and the very poor. Also, he flouts the notion that in order to make business progress it is necessary to become a social lion and acquire a reputation as a champagne buyer and spender generally.

"When the New Yorker returned from his unsuccessful quest and gave the Motor World several items of the expenses to which he had been subjected in South America," said Brouwer, in speaking of the matter, "he neglected to explain that when he said dollars, he meant South American dollars—or pesos—which are worth 42½ cents in United States gold, which explanation would have placed quite a different face on the situation. I maintain, and I was in South America long enough to know, that it is possible to live at about the same rate that it is possible to live in the United States. It is possible to obtain for \$5 or \$6 per day as good hotel accommodations as any man can desire. Brazil and Argentina are both very

prosperous and while there are some very rich and some very poor people in both countries, there is a very numerous middle class just as there is in the United States and everywhere else. There are innumerable small store-keepers and large store-keepers, and while the small farmer may not be so numerous, the equivalent of the western ranch owner is very much a factor in South American industry.

"One of the mistakes made by many salesmen visiting South America, and, for that matter, other countries, is to seek information from the men handling similar lines of goods. As a result most of them receive poor comfort and are quickly discouraged. For how many merchants in the United States are likely to invite competition by painting for the benefit of would-be rivals rose-hued pictures of the conditions of the particular business in which they are engaged. Also, many salesmen appear to believe that they can fill their order books to the bursting point in the course of a two or three months and, doubtless, their employers at home are possessed of the same opinion. The Europeans, who cultivate the South American market, proceed differently. They devote time and study to the subject and if they have obtained substantial returns within a twelve month they count themselves fortunate.

"It is useless for any automobile manufacturer to attempt to enter South America with the expectation that big orders will immediately result. If any man is able to sell 50 popular priced cars the first year, he is doing well. It is not until after the first year that large results are likely to become apparent, or that business will be very much more than doubled; and such manufacturers must be prepared to spend about \$2,000 per month for the maintenance of their own depots, which cost, I believe, will cover substantially everything, and which, in the course of time, will pay good returns on the investment. Also, the manufacturer must not make the mistake that has been made by a number of manufacturers, of asking the South American people two or three times the price asked for the same car in America; and whoever manages an American branch in the Southern countries must be able to speak the Spanish or Portuguese languages, and his mechanics and other employees also should be competent to do the same thing.

"It is quite true that, as stated by the unsuccessful American whom the Motor World recently interviewed, men who occupy positions of importance must dress well and must not engage in manual labor, which is to say that it is considered unseemly and undignified for any man to drive his own car, or to be seen in his shirt sleeves working over a car; but it is untrue that the South Americans have a champagne appetite, and that it is a part of a salesman's duty to wet it copiously.

As a matter of fact, most of the drinking down there is done by American and Englishmen.

"The long and short of the whole matter is that Argentina and Brazil offer splendid opportunities and that the only way to make the most of them is to appreciate the fact that South Americans do not differ radically from North Americans and that the same methods and about the same costs will achieve results there as here. 'Absent treatment,' doubled or tripled prices, and dealing with them through import houses, who sell thousands of wares and who will not even soil, and thereby depreciate an automobile—will not bring big results in South America any more than they will bring them in the United States. The American manufacturers in other lines who have become factors in the markets are those who have established their own houses, and who carry their own stocks and control their own employees on the ground."

"Little Six" Added to Locomobile Line.

Following the trend of the trade, the Locomobile Company of America has placed on the market a six-cylinder car which is to be a "little brother" to the Locomobile 48 horsepower "six." The newcomer is styled the "little six," and is similar in design to the larger machine, but its dimensions are smaller throughout. The wheelbase is 128 inches—as against 135 for the "big six"—and the motor has cylinders of $4\frac{1}{4}$ inch bore and 5 inch stroke, is rated at 38 horsepower, but it is claimed to turn up 60 horsepower. Characteristic Locomobile features embodied in the "little six" are the manganese bronze crankcase, four-speed selective transmission, multiple-disk clutch, high-tension ignition, three-quarter elliptic springs and ten inch upholstery. Either a five-passenger touring body or a four-passenger torpedo body may be had, the price being the same in either case, \$4,200. The regular equipment includes top and demountable rims for all four wheels.

Warren Adds a Self-Starting Model.

The Warren Motor Car Co., of Detroit, Mich., has brought out another model on its well-known 30-horsepower chassis which is styled model "30-K." What is more to the point, however, is that the new car, which is an addition to the line as previously announced, will sell at \$1,300 fully equipped and the "fully equipped" in this case means not only a mohair top, a windshield and sundry other, "extras" including acetylene gas tanks and lights, tonneau fittings, pump, jack and tools, but an engine starter as well. This is the first time that a five-passenger touring car so equipped ever has been offered at so tempting low a price. In general design and construction the new car bears marked resemblance to the other members of the Warren "30" family; as a matter of fact, ex-

cept for a few minor detail refinements, the chassis is identical. The same four-cylinder, $4 \times 4\frac{1}{4}$ -inch block motor is used and power is transmitted through a cone clutch and three speed selective change gear mechanism as in the other cars. Ignition and lubrication are carried on in the same way as in the previously announced new models, the former being by Bosch high tension magneto and the latter by constant level splash.

Regal Enters Commercial Car Field.

Having the equipment and experience gained in the manufacture of pleasure vehicles, the Regal Motor Car Co., of Detroit, Mich., is expanding its line of production to include commercial vehicles. The entrance of the company into this field is marked by the disclosing of two models, one a light express delivery car at \$1,000 and the other being of the enclosed delivery type and selling at \$1,050. In these vehicles the mistake of trying to adapt a purely pleasure car chassis to heavy trucking service has been avoided and the vehicles are designed for light, high-speed service which, from a mechanical aspect, resembles the requirements of the pleasure car. Effort has been made to combine a moderate first cost with a simple, sturdy construction that assures years of usefulness at a low maintenance cost. The new vehicles in the future will be given a prominent place in the Regal line and will be available to Regal agents throughout the country.

General Cutting Dead at Ripe Age.

General John Tyler Cutting, until April last a co-partner in the Oldsmobile Co. of New York, when he became a merely nominal vice-president of the corporation of the same name, died at Toronto, Can., on Friday last, 24th inst. His funeral was held at Westport, N. Y., where he made his home since his withdrawal from active business. Gen. Cutting was a veteran of the civil war, a member of the National Guard, in which he attained the rank of brigadier-general, and was elected to Congress in 1891. For many years he was one of the best known figures in the New York retail automobile trade and, despite his ripe old age, he served several terms as president of the New York Automobile Trade Association.

Crankshafts Must Pay 45 Per Cent. Duty.

That steel crankshafts cannot be imported into this country under the classification of forgings, is the decision of the Board of Appraisers of the New York Custom House. Peter A. Frasse & Co. imported a number of crankshafts and listed them under the head of "forgings," but the Custom House authorities exacted duty of 45 per cent. ad valorem, under the classification "manufactures of metal." The appeal of the importers against this decision was denied by the Board of Appraisers on Thursday last.

The Lincoln Motor & Machine Co. has opened a garage in Merrill, Wis.

The Havers Sales Co. has been organized in Milwaukee, Wis., to handle the Havers line of cars.

John M. Roberts is erecting a brick and concrete garage at 213 Park avenue, Utica, N. Y. It will cost \$5,000.

E. C. T. Miller is erecting a brick garage at 3738 Euclid avenue, Cleveland, Ohio. It will cost, when complete, \$10,000.

C. L. Perrin has opened a salesroom on West Pico street, Los Angeles, Cal., where he will handle the Michigan line of cars.

F. W. Burgers has opened salesrooms at 409 Golden Gate avenue, San Francisco, Cal., where he will display Batavia tires.

Fred Chadsey and William Chadsey have formed the Chadsey Mercantile Co., at Cherokee, Kan., and will handle Cole cars.

Hamblin & Volts have added a salesroom to their garage and repair shop in Washtucna, Wash. They will handle Reo cars.

The Oakland Motor Co., on Saturday last, opened its new branch at 1600 Broadway, New York City, with R. R. Hall as manager.

T. H. Sears and John Wilson are building a garage at Whitewright, Tex. It will be 50 x 100 feet and will cost, when complete, \$4,000.

The Penn Auto Co., 515 Mulberry street, Scranton, Pa., has changed its name to Scranton Penn Auto Co. The company handles the Cole line.

J. T. Mose and G. N. Lewis, of Kendrick, Idaho, have opened a garage and salesroom in that town. They have the Reo agency for several counties.

D. A. Blakeslee and F. C. Woodruff are building a three story brick garage at 213 Crown street, New Haven, Conn. It will cost, when complete, \$42,000.

Thomas Swearingen is erecting a two-story brick and concrete garage at 4727 Troost avenue, Kansas City, Mo. It will cost, when complete, \$18,000.

C. F. Cole, who handled Cole cars in Canton, Ohio, has removed to Denver, Colo., where he will become State distributor for the same line of cars.

Under the style Stahl & Stone, a new firm has been formed in Topeka, Kan., with headquarters at 928 Kansas avenue. Cole cars will be dealt in exclusively.

H. Cunningham, of Tampa, Fla., has purchased half an interest in the Kissimmee

Auto Co., in the Florida town of that name. The company handles Hudson cars.

The Moscow Automobile Co. has been formed in the Idaho town of that name, with Harry K. Moore as the moving spirit. The new concern will sell Cole "30" cars.

A. W. Loeffler, member of the Loeffler Brothers Auto Co., Des Moines, Ia., has sold his interest to F. J. Walker, who brings with him the agency for Nyberg cars.

A. A. Albright has purchased the Overland Garage, at Clinton, Ia., hitherto conducted by Dr. R. E. Gearhart. He will add a repair shop and establish a renting service.

Still another garage is being added to the already large number on Farnam street, Omaha, Neb. C. W. Downs is building it at the corner of Fortieth street, at a cost of \$25,000.

The Dillon Auto Co., which was organized on October 1, 1909, at Davenport, Ia., has been dissolved by a vote of the stockholders. Edward Dillon was president of the concern.

The M. R. Cheesman Co. has been formed in Salt Lake City, Utah, for the purpose of handling automobiles and supplies. It has the State representation for the Ohio car.

The Breen Motor Co., Winnipeg (Man.) agent for Cole cars, has left its old quarters at 151 Portage avenue. Its new salesrooms are at the corner of Broadway and Sherbrooks street, and include a complete service station.

The Velie Motor Vehicle Co., of Moline, Ill., has absorbed the Velie Motor Car Co. of Chicago, and will operate it as a factory branch. Morton H. Luce will continue to act as manager.

The Robert Wiley Auto Co. is building a large modern garage at the corner of Wealthy avenue and Charles street, Grand Rapids, Mich., where Winton and R. C. H. cars will be displayed.

A petition in voluntary bankruptcy has been filed by the Missouri Valley Automobile Co., 1114 East 15th street, Kansas City, Mo. The liabilities are placed at \$23,792.40 and the assets at \$16,876.34.

H. W. Alexander, of Penacook, N. H., has formed a partnership with H. A. Gardner under the style Concord Auto Sales Co., with salesrooms at Concord, N. H. They will distribute Cole cars.

Lundstrom Brothers have moved into more commodious quarters at 212 Seventh

street, Rockford, Ill., their old garage at 518 in the same street having been found too small for their growing needs.

The Stewart American Motor Car Co. is the style of a new concern which has commenced business at 213 West Fifth street, Waterloo, Ia. As the name indicates, American underslung cars will be handled.

The Goodyear Tire & Rubber Co. has moved its St. Louis (Mo.) branch from Olive street to new quarters on Locust street, near Nineteenth. The new store is said to be the most complete tire establishment in the Southwest.

Under the style the Mack Motor Truck Co. of St. Louis, a company has been organized in the Missouri city for the purpose of handling Mack trucks in the Middle West. The company, of which William R. Bush is president and C. G. Fennell general manager, has its headquarters in the Holland building.

The Standard Automobile Co., of Bellefontaine, Ohio, has been petitioned into involuntary bankruptcy by the King Top Mfg. Co., of Dayton; Hamilton Brothers, of Bellefontaine, and the E. L. Essley Machinery Co., of Chicago. Preferential treatment favoring two creditors is charged and the appointment of a receiver is asked.

The Packard Motor Co. of Chicago, Ill., has purchased the business of the Welch Brothers Motor Car Co., its agents, at Milwaukee, Wis., and will continue the sale of Packard cars at the same address, Grand avenue and Seventh street. The business will be run as a branch of the Chicago concern, under the management of O. G. Heffinger.

Following the example of the larger companies, the Schacht Motor Car Co., of Cincinnati, Ohio, has decided to establish factory branches in the larger cities. The Chicago agency for the Schacht delivery wagons and trucks, which formerly was in the hands of Cornish & Friedberg, hereafter will be conducted as a factory branch, with E. W. Arbogast as manager.

On the application of W. W. Hopewell, one of the partners in the E. C. McCormack Co., which operates an automobile livery in Sioux City, Ia., the court has appointed D. R. Chapman receiver for the company. The property of the concern consists of four automobiles, against which an indebtedness of \$1,000 has accumulated. In his petition Hopewell states that the business of the company in renting cars has been practically nil for several weeks and that the storage charges on the cars are piling up so as to threaten the disappearance of all the assets.

This simple device
places your car among
the safe percentage.

Skidding is responsible for 90 per cent. of automobile accidents. See that you do not risk the lives of your passengers on the greasy roads and pavements this Fall and Winter. Equip your automobile with

Pennsylvania Vacuum Cup Tires

The principle is simple, like all big ideas. On a tread of regular thickness is moulded a series of cup-shaped rubber knobs which exert a vacuum hold on wet and greasy pavements. Slipping in any direction is im-

possible. The rolling of the wheel releases each cup automatically by raising one side first, so that forward speed is not retarded.

In snow and mud the knobs sink in and provide a better hold and better "traction" than any other form of non-skid.

Longer Service is a strong feature of Pennsylvania Vacuum Cup Tires. Even when the rubber knobs wear down, the tire is still as good for service as a smooth tread tire of regular thickness.

You combine the essential qualities of Safety and Economy by using these non-skid and long wearing tires.

SOLD BY THE BEST DEALERS EVERYWHERE

The "Temperamental Thing" in Business.

In rounding out his well-tempered and unusually fair criticism of American cars and American institutions which has extended over a period of several months, the editor of the London Automobile Engineer, who spent several weeks in this country, brought himself to a somewhat remarkable conclusion which can be made to account for part or all of many things.

"There is one temperamental thing which has a great effect on all industries in America," he says, "and this is the fact that men do not choose a profession or a business for life, in the way which is usual in this country. A man who is occupying a high position on the engineering side of the automobile industry to-day may be the moving spirit of a typewriter concern tomorrow, and the next day his only interest in life might be something equally different. Similarly, the capitalists who are now taking up motor car manufacture are not by any means always doing so with the intention of studying the business and building up great firms with great reputations—they are often content if they can work at it for three, four, or five years, clear some profit, and then transfer their attention to the next new thing."

It is not to be denied that there are not at least two grains of truth in these assertions, but in its last analysis it well may be questioned if the "one temperamental thing" is peculiar to America. The new industry and the booming industry attract the speculator and the get-rich quick gentry as naturally as honey attracts bees and, differences of population considered, it is doubtful if they are much more numerous in this country than they are in the United Kingdom. Certain it is that the capitalists of the two countries do not greatly differ. Their business is the investing of money and the loaning of money where it promises the greatest return. In the true sense, the capitalist is nowhere a real builder of great industries, even though he may dominate them.

Undoubtedly there are men prominently engaged in the automobile industry of America who will sell out and clear out the moment they have made their "piles" and care naught what becomes of the business, but, looking backward, it is not easy to recall any of those who started when the industry started, or soon after, who are not still engaged in it. It is much easier to call to mind other newer and large manufacturers who have refused opportunities to sell out or engage in mergers which promised still larger and easier fortunes.

It is incontestable that, like Americans, practically all automobile manufacturers of Great Britain and of Europe once were engaged in other lines of industry, and that they "switched over" solely because of slackness of trade, and the promise of better returns. And they all have their price. Offer it to any of them and it is fairly safe prophecy that the foreigners who "have chosen a profession or business for life" quickly will abandon it and "seek the next new thing."

It will take more than the sophistry of the Automobile Engineer to make us believe that a stretch of salt water greatly alters human nature.

Gear Ratios and Gasolene Consumption.

To the observant mortal who has had even a little experience, one of the most striking points in the upkeep of a car which suggests itself is the truly remarkable difference in gasolene consumption shown by cars of practically the same size and weight, but of different makes. One car, for instance, can be operated consistently

at 15 or 16 miles to the gallon of fuel, but another car having an engine of exactly the same size will fall short of these figures by as much as five miles to the gallon.

Obviously, engines of different construction, even though their cylinders measure the same, cannot be expected to show exactly the same efficiency; there always will be a slight difference. Similarly, two cars in the hands of two drivers will differ as regards their gasolene consumption, but the fact remains that in a great many cases the actual difference is out of all proportion to what legitimately can be expected. Naturally, a great deal depends on the make of carburetter used, and the accuracy of its adjustment, but in nine cases out of ten the real answer to the riddle will be found in the gear ratios of the cars. The car that is geared the highest within prescribed limits will show the greatest economy, but it will not be able to climb as steep a hill on "high" as will a lower geared car. Therefore why not retain the lower gear for direct drive and provide a higher gear—an overstep—for ordinary running on level roads where most running is done, and thus obtain the benefits of both?

A few manufacturers do employ gear change mechanisms arranged along these lines, but nearly all of them produce cars of the heavy, expensive type, the ownership of which is restricted largely to those who have not to care particularly about gasolene consumption. But in the light, cheap car class there is yet to appear a car so equipped and there really is need of the arrangement. The ordinary four-speed gear box with direct drive on high was a step in the right direction, but there still is room for improvement, and there is double or triple reason for the improvement, inasmuch as it would decrease upkeep cost, which would increase the popularity of the vehicle, and it would reduce wear and tear on the engine by permitting it to run at more nearly reasonable speed when the car is traveling at reasonable speed, as prescribed by law, over level roads. Of course, it may be said that the average light car engine is not sufficiently powerful to propel a car unless it is geared low, but the rate of speed at which the average engine in a small car runs when the car is running at say between 25 and 30 miles an hour sets at naught the contention and merely serves as an additional argument in favor of higher gear ratios.

Detroit, Mich.—M. & P. Electric Vehicle Co., under Michigan laws, with \$10,000 capital.

Worcester, Mass.—Acme Motor Car Co., under Massachusetts laws, with \$40,000 capital; to deal in automobiles. Corporators—W. Vincent, E. D. Wheeler.

Washington, Pa.—American Tire and Filler Co., under Pennsylvania laws, with \$200,000 capital; to manufacture and deal in automobiles and other motor vehicles.

Chicago, Ill.—Studebaker Corporation of America, an Indiana corporation, admitted to do a general automobile business in the State of Illinois. Illinois capital, \$100,000.

Dallas, Texas—Oldsmobile Co. of Texas, under Texas laws, with \$10,000 capital; to deal in automobiles. Corporators—Clinton C. Clark, Rhodes S. Baker, Wendel Spence.

Mulford's Victory in the Vanderbilt Cup

Lozier Star Earns the Reward of Swift but Consistent Driving, Simply Wearing Down the Foreign Cars—Completes 291 Miles in 238 Minutes—Hughes Takes the Savannah Challenge Cup and Witt the Tiedeman Trophy.

THE SCENE AT SAVANNAH WHEN MULFORD CROSSED THE LINE A WINNER

There are those who said that the Vanderbilt Cup race could not thrive on other than Long Island soil. They prophesied that its transplantation to Georgia would serve to diminish the renown of America's most famous classic. But the prophets were wrong, as prophets often are, for the results prove beyond cavil that it actually was as big even if it was no better than before. And it proved an unqualified triumph for an American car and an American driver. Smiling Ralph Mulford won it with his white Lozier, as every one knows, and the speed that he made—74.09 miles an hour—is just a hair less than the new world's record recently established on the Santa Monica course in California.

It was the fourth time in as many years that an American driver and an American car proved the best combination. George Robertson with a Locomobile started the winning streak, and since then no foreign car or driver has had a look in. They have come mighty near to it, it is true, but not near enough. Ralph De Palma, who is an Italian, and who drove a specially imported German car—a Mercedes of 90 horsepower—very nearly touched the famous cup on Monday last. But he will have to wait a whole year, and possibly longer, for another chance. He did not drive quite fast enough, and though he finished but a little more than two minutes behind Mulford, his best efforts were unavailing. But he has the consolation of knowing that

he made the fastest lap in the race, or for that matter the fastest lap that ever was made on the 17.14 miles circuit. He shot around in the almost phenomenal time of 13.14 seconds, which is equal to a speed of 78.09 miles an hour, or 46.3 seconds to the mile, and is certainly pretty fast going from either angle. His time for the 17

MULFORD'S SMILE AND HIS WIFE

laps—291.38 miles—was 238 minutes 11.95 seconds.

"Spence" Wishart, as he is affectionately styled by those who know him well enough, was third, also in a Mercedes, but he had to drive like fury to get it, for Harry Grant, who, as history records, twice before, and in succession, had accounted for

Vanderbilt Cup races, was close behind him all the time and pushing him to the limit. At the finish the Lozier pilot whizzed over the line just about four minutes behind Wishart, whose time was 246 minutes 20.37 seconds. Grant's time was 250 minutes, 23.57 seconds. E. H. Parker nosed in fifth, his Fiat being the only one of the three entered to complete the distance. Parker's time was 254 minutes 25.83 seconds, and Louis Disbrow in his old reliable Pope-Hartford, was the only other driver to finish before the race was called. His time was 259 minutes 3.68 seconds.

Competition was just as keen in the two night car races that preceded the Vanderbilt, too—the Savannah Trophy race for cars in the 231-300 class at 221 miles and the Tiedeman Trophy race for cars of less than 230 cubic inches piston displacement at approximately 170 miles. Though it almost was a foregone conclusion that Hughie Hughes and his Mercer were unbeatable in the former event, there was nothing too sure about it and the result was in doubt right up to the last. He won, however, in 195 minutes 37 seconds flat, an average speed of 68.35 miles an hour, as against Dawson's last year's average of 62.98 miles. There were only two Marmon cars entered for this event and their drivers, Louis Heineman and Joe Nikrent finished second and third, respectively. Heineman's time was 201 minutes 41 seconds and Nikrent's was 204:42.

The "baby" car race for the Tiedeman trophy proved as clean a sweep for one brand of cars as ever has been chronicled. Three E-M-F's, driven by Frank Witt, Robert Evans and Jack Tower, finished one, two, three in that order, the leader's time being 176 minutes 19 seconds. Evans's time and Tower's were 180 minutes 12 seconds and 181 minutes 33 seconds, respec-

such and like diversions. Otherwise, however, the course was infinitely different and infinitely superior to the old stamping ground of Vanderbilt cup hunters. In the first place it was smooth, it had been oiled and oiled and oiled and rolled until there scarcely was a real wrinkle in its entire 17 miles of length. This is borne out by the speed made over it. Last year when the

and they escaped injury. What might have happened had the spectators been permitted to crowd over the course, as they always have been permitted to do at every other Vanderbilt race, is open to conjecture. But they were not, and in this respect the guards who patrolled the roads have earned a record for efficiency that is unexcelled. As was the case last year, the guards were provided with real rifles equipped with sure enough bayonets and woe betide the spectator who attempted to get beyond the pales of the side lines.

"Long before daylight the crowds commenced to arrive"—that's the way all the previous Vanderbilt cup race stories have been sub-started, and the same phrase applies in this case as it has in the others. As a matter of fact, a big section of the crowd was right on the ground all night, and one New Yorker who was there remarked that it was just like the good old times on the Long Island Motor Parkway when racing enthusiasts shivered and waited for the first car to pass, snorting and shooting flame in the blue haze. For it was decidedly chilly on the Savannah course on the night previous to the races. Northerners who never have occasion to wander Southward may be surprised to know that when Old Sol eventually took down his shutters and commenced to do business there was a heavy coating of hoar frost on the grass and the big, bleak grandstands.

But it did not last long and by the time the light cars were ready to be started at

LINED UP FOR THE START OF THE VANDERBILT

tively. Frank Kulick in a Ford was the only man still in the running when the race was declared finished. He covered the distance in 201 minutes 7 seconds.

More than once it had been more than hinted that the Savannah Automobile Club knows how to run race meets; it was proven by the handling of last year's Grand Prize race, and the performance was repeated this year during the three races that were held on the one day. Of course, there were crowds on hand, that was to be expected in view of the exceptional racing feast provided in the Vanderbilt and Grand Prize races within a few days of each other, to say nothing of the light car races. But the crowds were out of proportion to what might have been expected. Everywhere everyone was speed mad but good-natured withal, as crowds which attend races usually are.

And not a little of the increased population could be traced to Northern origin. From practically every city of any size special trains were run and turned into hotels during their four days' stop on sidings near the race course. From the city of Savannah proper out to the course, which is just outside the city limits, extra trolley car service was inaugurated and the steam train lines doubled the number of cars in service for the day. It is safe to say that never before was such a crowd gathered in or near that old Georgia city.

Of course there were three card monte games and strap games and just plain shell games, and in this respect the Savannah course was not unlike the Long Island course, which always has been noted for

Grand Prize race was run over practically the same course it was pronounced very nearly perfect, and this year it was even more so. Curves had been widened, as

MULFORD NEGOTIATING ONE OF THE BANKED TURNS

had many of the straight stretches, and in several places where fences or posts showed too great a liking for the limelight near the course they were removed bodily. Never was such a course before and the drivers liked it.

It goes without saying that no one was hurt—that is seriously—during the progress of a race over the Savannah course. A couple of the drivers had narrow escapes, to be sure, but Providence was with them

about half past seven the sun was shining brightly and a few of those who were most energetic commenced to shed overcoats. By this time the grandstand was fairly well filled though there still was plenty of room. The really big crowd did not put in an appearance until the light car races were well under way, for as usual, chief interest centered in the Vanderbilt.

Immediately the two light car races were run, it then being in the neighbor-

BURMAN (MARMON) PASSING UNDER BRIDGE AT FAR EDGE OF GRANDSTAND

hood of 11:45 by the clock, Starter Fred Wagner, who always has officiated at Vanderbilt races as long as can be remembered, commenced to get the heavy cars ready for the piece de resistance. There were 14 of them, and when they lined up America, Germany and Italy were represented. The race, by the way, was for the Willie K. Vanderbilt, Jr., Cup, with \$2,000 added, and \$1,000 more to the driver of the first American car to finish. It was run under the

rules of the American Automobile Association for cars of from 301 to 600 cubic inches piston displacement.

As Starter Wagner clapped Harry Grant on the back in the manner for which he has become famous and the big, white Lozier car slid out over the line, a great howl emanated from the grandstands, for Grant was a prime favorite, and from then until the last of the cars had been sent away grandstandees remained standing,

excited, and literally held their several breaths. The rest of the cars were sent away at 30 second intervals, the order of start being as follows: Grant (Lozier), Burman (Marmon), Disbrow (Pope-Hartford), Wishart (Mercedes), Cabe (Jackson), Hughes (Mercer), Limberg (Abbott-Detroit), Mulford (Lozier), Mitchell (Abbott-Detroit), De Palma (Mercedes), Parker (Fiat), Patschke (Marmon), Bruce-Brown (Fiat), Matson (Fiat).

HUGHES (MERCER) ROMPING HOME AN EASY WINNER OF THE SAVANNAH CHALLENGE CUP

At the outset it was an open secret that De Palma was out for speed. Apparently it was his purpose to drive wide open in the hope that some of his rivals at least would be killed off in the early stages of the race. But his rivals were sticking for the present anyway, and drive as furiously as he would he could not gain an awful lot of ground in the first lap. But in the second round he drove even more furiously and it was in this lap that he made the fastest time of the day, averaging in the neighborhood of 78 miles an hour. But his burst of speed had stood him in good stead, for in the second, third, fourth and fifth laps he led the pack on elapsed time though not in position. Except for the fact that Wishart had passed both Burman and Disbrow, the rest of the cars came around in very nearly the same order in which they started.

In the meantime the unusually fast pace had commenced to tell and the first to retire was Harry Cobe. Up to the time of his retirement he had been going great guns, but was forced out early with engine troubles. Tire trouble, too, began to be evidenced, and at the end of the fifth lap De Palma was forced to stop for replacements. This permitted Mulford, who had been steadily plugging along and leaving his competitors behind him one by one, to move up into first place, his time for the 103 and a fraction miles being 82 minutes 31 seconds. Burman had forced his Marmon up into second place, a little more than a minute behind the leader, and De Palma was third another minute further back.

Flushed with his recent victory in the Savannah trophy race, Hughie Hughes was pounding around in great style. His Mercer was the only six cylinder car in the race and in view of the consistent work of the four cylinder Mercers wherever they have appeared, the rate of speed at which it traveled was not wholly unlooked for. But in the fourth round, when Hughes was well

up among the leaders, his engine began to evince signs of derangement and the car was withdrawn.

Slowly but surely the field was being thinned down, the next man to come to grief being David Bruce-Brown, last year's Grand Prize winner, and on whom not a few had pinned their faith, secure in the knowledge that the end would see his newly imported Fiat, if not in first place,

disappointment that swept over the grandstand at the announcement was keen. At the time of his withdrawal he was running in second position, his elapsed time for the distance being 97 minutes 28 seconds. The cause of his downfall was a rather heftier stone than usual which was picked up by one of his tires and landed against his gasoline line with force sufficient to fracture it beyond repair in time.

At the end of the eighth lap Mulford still retained his lead with Wishart second, though some four minutes behind him, and De Palma two minutes later in third place. At the end of the next lap, with the race more than half over, there remained 10 of the original 14 starters still in the running, and Mulford was leading them by practically the same margin as in the previous lap. Wishart, however, had nosed out De Palma for second place, the latter having stopped for tires. From this time on it was a three-sided fight between these three drivers, Mulford gaining still more time in the tenth lap, his lead then being a little over five minutes. It was in this lap that Grant, pursuing his usual tactics, first began to loom large on the horizon. Wishart was forced to stop for tires and the delay was sufficient to put him back into fourth place, De Palma moving up to second again and Grant sliding into third from fourth, where he had been hanging on doggedly for several laps.

It was in this lap that Mulford made his first stop to replenish oil and gasoline, and in his hurry to fill the tanks he spilled more than half of the "gas" in the roadway. But he evidently got enough for his purpose, for after having been at work for just 42 seconds he was under way again, and the rousing cheer that he got from the grandstand must have warmed the cockles of his heart. At 206 miles Mulford's average was very close to the 75 mile mark, and though it was stated that the world's road race record for this distance had been broken, a review of the rules of the Ameri-

REFEREE MORRELL, AND PRESIDENT GRANGER, OF THE SAVANNAH CLUB

then not far from it. But on the seventh round his car shed a rear wheel at Montgomery cross roads and went into a ditch. Neither Bruce-Brown nor his mechanic was hurt beyond a shaking up but needless to say, the car was placed hors du combat. "Bob" Burman likewise went out of the race in the seventh lap, and the wave of

WITT (E-M-F) TAKING TITLE TO THE TIEDEMAN TROPHY

can Automobile Association, under which records for intermediate distances are not allowed, will show that this was an error.

De Palma still retained second place at the end of the twelfth lap. He was then some six minutes behind the leader, with Grant plugging along in third place about seven minutes behind. At the time that Bruce-Brown went out of the race, one of the other two Fiats, in the hands of Parker, though running well, was far behind the leader; both of them had suffered more than the usual amount of tire trouble. As a matter of fact, it was tire trouble that was chiefly responsible for the poor showing made by the other cars. All of them showed up well while they were running, and if it had not been for these unavoidable delays it is possible that a different story might have been written.

Matson's Fiat, however, succumbed in the fourth lap with a leaky radiator, Patschke going out later in the ninth, due to trouble with the water circulation in his Marmon. Both of the Abbott-Detroits were running when the race was called off.

With less than 70 miles to go the race narrowed down to a real duel between De Palma with his chunky-looking Mercedes and Mulford in his Lozier. Wishart, however, was not to be denied and never once got out of striking distance of the leaders. In the 14th lap Mulford and De Palma were running first and second but Wishart had succeeded in crowding Grant from third place. In the 15th lap De Palma let loose an unusual burst of speed and gained two minutes on the flying Mulford-Lozier combination. Which meant that Mulford then was just about two and a half minutes ahead of De Palma, with 35 miles to go. At this stage of the race Mulford's time was 208 minutes 7 seconds and De Palma's 210 minutes 40 seconds; Wishart was third in 118 minutes 32 seconds, this being the end of the 15th round.

As Mulford showed up for his 16th lap pandemonium broke loose in the grandstand. He was cheered wildly as he flashed past in a blue haze, and though it was almost certain that he had the race well in hand, both De Palma and Wishart were

close behind him—so close, in fact, that few really knew where Mulford stood.

The rest of the story is quickly and easily told. Continuing the fast pace at which he had traveled throughout the whole of the race, Mulford came around for the 17th and last time in his same consistent manner and, flashed over the wire a winner by a little more than two minutes. De Palma next showed up, and closely following him Wishart pounded over the line into third place. Grant in his Lozier was next, both he and Parker, who finished fifth, having been held back by tire trouble. Disbrow, at the wheel of his Pope-Hartford, was the last man to cross the line before Starter Wagner called the race off.

Of the six cars that crossed the line before the race was called, the first five were sparked by Bosch magnetos and all of them were Michelin shod. Disbrow's Pope-Hartford alone was equipped with other than Bosch ignition apparatus, a Spliltorf magneto being used on this car. Both Mulford's and Grant's Loziers were equipped with Rayfield carburetters.

The Fights for the Savannah Cup and the Tiedeman Trophy

Though chief interest naturally centered in the running of the Vanderbilt, which is not to be wondered at in view of the fact that it was possessed of an international flavor and promised to be productive of the greatest number of thrills, the two light car events which preceded it proved little wonders in themselves. They were started concurrently, seven cars lining up for the Savannah trophy event and one less than that number coming to the line for the Tiedemen trophy race.

For the former event, which was for cars having not less than 230 nor more than 301 cubic inches piston displacement, the starters were as follows: Louis Heineman (Marmon), Hughie Hughes (Mercer), Harry Buckley (Case), W. F. Barnes, Jr. (Mer-

cer), Joe Nikrent (Marmon), Louis Disbrow (Case) and William Knipper (Mercer). Thirteen laps of the course, equal to 222.82 miles, was the scheduled distance.

During the early stages of the race Disbrow in his Case was a little bit more than the whole show; he ran away from the field, but the terrific strain commenced to tell and in the fifth lap he was compelled to withdraw, a broken camshaft being the cause of his untimely end. Hughes drove his usual consistent race, his Mercer humming contentedly around the course with clock-like regularity and never evincing the slightest sign of trouble. He looked all over a winner and with Disbrow out, he rapidly ran away from the others.

The principal feature of the race devel-

oped in the later stages and embraced a battle royal between Nikrent and Heineman for second honors. First one and then the other would slip up into second place, only to fall back again and repeat the operation. Heineman's was the glory eventually, however, though at first it was thought that Nikrent had brought his Marmon in second.

In completing the 222.82 miles in 195 minutes 37 seconds, which is at the rate of 68.35 miles an hour, Hughes bettered Dawson's record by nearly six miles an hour. Heineman was second, six minutes and four seconds behind Hughes, and Nikrent third in 204 minutes 42 seconds. Barnes in one of the other Mercers was flagged while he was going strong, the

others, Disbrow in his Case and Knipper in a Mercer, having dropped out earlier in the race.

In the "baby" car race for the Tiedeman trophy, which was for cars of less than 230 cubic inches displacement and went 10 laps or approximately 170 miles, the three E-M-F cars, driven by Frank Witt, Robert Evans and Jack Tower, finished in first, second and third places, respectively, in remarkably easy fashion, though Roberts in the Abbott-Detroit made things interesting for them while he lasted. When he retired it became apparent that the winner was among the E-M-F trio, but all of them ran so consistently that nothing short of a good guess could evolve the winner until well toward the end. Mortimer Roberts in the Abbott-Detroit ran off the course in the sixth lap and was put out of the race, though neither he nor his mechanic was

injured. At that time he was leading Witt's E-M-F by a narrow margin. Hartman in

the other Abbott-Detroit went down and out in the first lap and was not seen or heard of again.

Witt's time for the 171.4 miles was 176 minutes 19 seconds and his average speed was 58.34 miles an hour, which is just a shade better than Knipper made last year with a Lancia in a slightly longer race for cars in the same class. Evans finished in 180 minutes 12 seconds and Tower in 181 minutes 33 seconds. Kulick, who drove his Ford into fourth place, negotiated the distance in 201 minutes 7 seconds.

All three of the cars to finish in the Savannah trophy race were Michelin equipped, as was Kulick's Ford in the Tiedeman. Firestone tires and Splittdorf ignition apparatus was the equipment on the three E-M-F cars; the Mercers in the longer race were sparked by Bosch magnetos.

Ticketed Tourists Complete Long Trip.

Fifty-three days after their picturesque departure from New York City, on October 2, last, the first transcontinental ticketed tourists' agency party, organized and "chaperoned" by the Raymond & Whitcomb agency of New York, reached Los Angeles, Cal., on Thursday, 23d inst. They were escorted into the city by a considerable gathering of motorists. The 4,200 miles of good, bad and indifferent roads were covered on schedule time without serious accidents, despite several unusually severe rain and snow storms, and the four Garford passenger cars and the Garford truck finished the long and arduous trip none the worse for their experience. Ten passengers, including three women, finished the entire trip from New York to the Pacific, paying \$875 each for transportation and maintenance en route. A. L. Westgard acted as the official pilot.

While at first it had been proposed to use ten passenger cars, the number had to be reduced to four, owing to the reluctance of people to trust themselves on such a seemingly hazardous undertaking. The splendid manner in which the cars surmounted the great difficulties before them, and the fact that three women covered the entire route, without suffering hardships or inconveniences, however, are the best proof that a transcontinental trip of this kind is feasible enough, and well worth taking. It is by no means improbable that similar tours ultimately will be regularly promoted, for the scenery and wonders to be seen on the 5,200 mile journey are such as to form the greatest possible inducement to people of leisure and comparative affluence.

The route, which bears the poetic name "Trail to Sunset," led through thirteen States, besides Canada and Mexico, seven of them being traversed in their entire length. It touched the following cities: Albany, Syracuse, Buffalo, Cleveland, South Bend, Chicago, Davenport, Des Moines,

Omaha, Kansas City, Hutchinson, Dodge City, La Junta, Santa Fe, Globe, Phoenix, Yuma, San Diego, Los Angeles. Most of the participants will remain West until spring, while several others will go to Hawaii and the Orient.

The passengers included: Mr. and Mrs. George F. Foote, of Ithaca, N. Y.; Sydney H. Gadding, of Newport; Frederick Bierchank, of New York; R. L. Fox, a globe trotter from Philadelphia; W. F. Harris, of South Orange, N. J.; Col. W. J. Studwell, of Brooklyn; Mr. and Mrs. John Legg, of Worcester, Mass., and Mr. and Mrs. A. L. Westgard.

Bounced Out of Car and Killed.

That New Jersey roads are by no means as smooth and perfect as certain Mosquito politicians would have motorists believe, amply was proven last Sunday, 26th inst., when David Tepper, a two year old boy, was killed, and his mother, Mrs. Mordecai Tepper, of Ridgefield, N. J., severely injured by that rare form of accident—being bounced out of the rear seat of a touring car while crossing over a depression in Grand avenue, Leonia, at less than 12 miles an hour. The car was driven by Mordecai Tepper, its owner, and was fitted with a full-size back, over which the woman and child were hurled with great force.

Fayette County Club Re-elects Officials.

John M. Core, Uniontown, Pa., who has been directing the affairs of the Automobile Club of Fayette County, Pa., will continue at the head of the organization for another year. He was re-elected president at the annual meeting last week. The other officers, all of whom have served the club during the past year, are: Vice-presidents, Dr. A. C. Smith, Brownsville; George F. Titlow, Uniontown; R. W. Playford, Uniontown; governors, A. J. Cochran, Dawson; C. S. Hempstead, New Salem; Judge R. E. Umbel, Uniontown; G. S. Harrow, Uniontown.

Brooklyn Club Celebrates an Anniversary.

Despite good roads and ideal weather conditions none of the 23 members who participated in the Long Island Automobile Club's 100 mile endurance contest on Saturday last, 25th inst., came through with perfect scores. The run was one of the non-stop events, of which several have been held by the club and commemorated the tenth anniversary of the first motor car endurance contest conducted by the organization in 1901. Failure to obtain clean scores was not wholly due to the contestants for the confetti which was strewn along the route on the preceding day had been blown away in places, causing practically all to make a wrong turn at these places. The start and finish was at Jamaica (L. I.) Town Hall, and the course was by way of Flushing, Port Washington, Roslyn, Oyster Bay, Massapequa, Hicksville, Hempstead and back to Jamaica. The time limit was five hours. The prize—a tire donated by Charles Herrmann, secretary of the club—will be awarded today (Thursday) when the committee computes the scores.

Motor Car Commits Murder and Suicide.

Automobiles have been known to develop a tendency to start "on the jump" when cranked, but it has been rare indeed that this predilection has resulted so disastrously as on Sunday last, on board the ferryboat Oswego, while crossing the Hudson from New Jersey to New York. Edward Barry, of 242 Fourth street, Jersey City, owner of the runaway car, started to crank the motor, when nearing the New York shore; he had just stepped aside in order to climb into the seat, when the ferryboat was driven by the tide with great force against the side of the slip. The jar sustained by the boat must have dropped the clutch into position, for in the next instant the car jumped forward violently, running over a boy and breaking his leg, then knocking a man overboard and finally tumbling into the Hudson. The man was drowned.

"PICK-UP" TOUR AROUND GEORGIA

Not a Contest But Newspaper Offers Prize for "Steadiest Schedule"—One Week's Halt at Savannah.

Although conditions for autumn touring in the State of Georgia generally are good, the participants in the 800-mile run of the Automobile Club of Atlanta did not find the near-winter tour, which started from the Georgia city, Wednesday, November 22nd, as easy as they expected. The affair was conducted by the club but the Atlanta Constitution, which termed it the "Around Georgia Tour," really fathered it, and its principal purpose—aside from advertising the Constitution—appeared to be to bring motorists from various sections of the State to Savannah in time to witness the Vanderbilt and Grand Prize races. It was not a reliability contest and no sanction had been obtained from the A. A. A., but prizes will be awarded for what the Constitution calls "the steadiest schedule"

throughout the tour, which will not be concluded until December 2nd.

Sixty-five motorists, with guests, started, although all did not leave Atlanta at the same time as a number fell into line at various places along the somewhat circular route. This was permitted, but to compete for the prize the entire course must be traversed. The first night's control was Americus, Ga., 149.1 miles from Atlanta, and the route was through strictly agricultural country where the farmer knows the value of good roads. Most of the cars made the trip without mishap but T. C. Swann's Buick was side-swiped by another car and the Buick was ditched. Both wheels and an axle were broken and the occupants slightly injured. Repairs were made, however, and the journey continued the next day.

The run on Thursday, the 23rd inst., was to Valdosta and for a short part of the 137 miles the roads were in excellent condition, but a cold, raw rain made the going uncomfortable. Tire troubles were numerous and frequent but most of the contestants checked in on time. Because of the downpour the journey on Friday, 24th,

to Bagley over 112 miles of road that in places had been rendered almost impassable by the rain, the schedule time was lengthened two hours in each class. This permitted all to check in with perfect scores for the day. The run into Savannah on the 25th, was without incident, and roads were in fairly good condition. Miss Regina E. Rambo, Marietta, driving an Overland, made the entire trip into Savannah in good shape. She won somewhat similar fame in a similar run last year. She was the only woman driver, although Mrs. Henry Meinert, also of Marietta, assisted her husband in piloting a Maxwell.

Sunday, 26th inst., the motorists were permitted to make an inspection trip over the Savannah races, as they spend the entire week in Savannah. The return to Atlanta will start next Sunday when the route will lead by the way of Dublin.

Motorists of Augusta, Ga., did not join in the Atlanta run but made the trip to Savannah for the races under the auspices of the Augusta Herald. There were nearly 100 of them.

The participants and the towns at which they fell into line, are as follows:

DEVELOPING THE IDEAL TAXICAB

James Takes the First Step in that Direction—Questions that Are Expected to Assist the Project.

Part of the plan of the International Motor Service Association, which, as has been told in the Motor World, was organized by C. C. James for the purpose of proving a national purchasing agency for taxicab and livery companies, is eventually to provide its members with a standard cab. But it is not the purpose of James, who is the president and moving spirit of the venture, to make the plunge without profound study and consultation. It is his intention first to obtain the views of as many as possible of the 1,600 members of the association on the subject. To this end he has prepared a set of questions that cover pretty nearly every imaginable point in the construction of taxicabs and has invited members of the association to answer them according to their tenets. The questions which thus are expected to evolve the ideal taxicab are as follows:

CHASSIS—

Wheelbase.....inches. Tread.....inches.
Clearance.....inches. Tires (size).....inches
(Q. D. or demountable?).....
Brakes—Emergency brake.....inches diameter;
.....inches width; Internal service brake
.....inches diameter;inches face.
Springs—Semi-elliptic; three-quarter elliptic; or
full elliptic?.....

BODY—

Landulet or Limousine?.....
Single or double front seat?.....
With or without trunk rack?.....
Total seating capacity inside?.....
Knee room between front and rear seats?.....
Stationary or folding front seats?.....
Grade of leather used in upholstery?.....
Inside electric dome light or not?.....
Kind of material to be used on floor?.....
Kind of leather used in top?.....
Do you recommend covering the bows with leather
or an inside lining?.....
Do you recommend putty or screws for holding
window panes in place?.....
What kind of material for curtains?.....
Do you favor the plan of making every panel in the
body removable separately?.....

MOTOR—

Cylinders—How many?.....
En-bloc or separate?.....

CONTROL—

Throttle, foot or hand?..... Spark.....

Lever, center or side?.....

GASOLINE TANK—

Location..... Capacity.....

RUNNING BOARD—

Material.....

How London and New York Compare.

According to the most recent official figures there are at present 50,149 motor cars in the London Metropolitan district, of which 3,067 are classed as heavy cars and

include buses, trucks, etc. In addition to these automobiles there are 16,376 motorcycles in the world's largest city. In Greater New York 55,000 motor vehicles have been registered so far this year, but in motorcycles the New World metropolis is far behind London, there being barely 3,000 machines in use here. Since the law first was passed, licenses to drive have been issued in London to 196,103 drivers and riders; this number, however, is somewhat misleading, as it includes many persons who since their registration have died or moved from London.

Board of Trade Adopts an "Angel."

The Automobile Board of Trade has adopted a new "girl" to herald the forth-

BOARD OF TRADE'S NEWEST "GIRL"

coming show in Madison Square Garden. The pert, smartly-gowned and distinctly motorized American young woman who did duty on the bill boards last year has been thrown over and abandoned to her fate. In her place, the fickle show managers have embraced an angel, so to speak—a distinctly Oriental angel—one who not only wears wings but who has cast aside the flowing robe common to angels and garbed herself, or rather the artist has garbed her, in a clinging, filmy and radical decollete gown; and more, this automobile show angel has been adorned with ear rings, a necklace and other geegaws which Orientals probably wear within the pearly gates. Though her arms do not suggest it, she's a muscular angel, too. She is able to hold aloft in either upraised hand a modern motor car. In every respect she's an uncommon angel. Look her over! That's her picture up there, in all her glory and geegaws.

SELF STARTERS OF SIX YEARS AGO

French Tests Recalling That There is Nothing New Under the Sun—Germs of Present Day Ideas.

There is nothing new under the sun—not even in the realm of the engine starter which recently has sprung into such prominence and which to the average individual was distinctly an innovation when first it came to be generally used about a year ago. As a matter of record, the self-starter really is almost as old as the automobile itself, and those who are afflicted with particularly good memories will have little difficulty in calling to mind some of the old devices which made their appearance six or seven years ago. Many of them have disappeared long since but the most surprising thing is that almost an equal number have survived in principle and may be seen in daily use on the cars of some of the most prominent manufacturers. True, they have been improved and perfected, for the automobile industry does not stand still but the ideas involved in all the principal devices of the kind in use to-day are the same, fundamentally, as those on which the old types were constructed.

It was in 1905 that the self starter really first began to attract attention, and it is probable that since the Paris show of that year no greater array of such devices ever has been exhibited at one time. No less than 17 different types were shown, and though considerably more than half of them have gone the way of the sundry other half-baked "improvements" of the time and have been discarded, the remainder contained the germ in embryo from which present day starters have been evolved.

Subsequent to the Paris exhibition, to dig up ancient history, though it is none the less interesting because it is history, there was held an open competition in which the various exhibitors of starters were invited to participate. Eleven of the 17 competed and it is interesting to note that first prize for reliability was divided between the More Co. and A. M. Isnard, the device used on the former product being almost identical with one which has been brought out in modified form in America within a month. It was nothing more nor less than a small air pump arranged to force a charge of air and gasoline vapor into the cylinders after which the ignition spark was relied on to start the engine. The Isnard device, however, was very much more complicated and almost immediately disappeared from the market. It was styled the Cinogene and embraced a small auxiliary piston and cylinder provided with a rack and pinion device, the motive power being contained in a small cylinder or "bomb" of compressed

carbonic acid gas. When the compressed gas was released behind the piston the engine was "turned over" through the medium of the rack and pinion which actuated the crankshaft.

Third prize, which amounted to \$200, went to the manufacturers of the Demar-reur Lamele car and the device which was used is being used to-day in slightly modified form by not a few manufacturers. It consisted of a coil spring which was wound up by the engine while it was running and which served to start the engine when permitted to uncoil at the will of the operator. Compressed-air starters even were used at that time, and probably even earlier, though there is little record of earlier use, for one was exhibited on Saurer vehicles which approximated in general construction present day types.

Similarly, the dynamo-motor system of starting engines was in use at that early

FACE OF PITTSBURG TAXIMETER

TAXIMETERS TO BE SOLD OUTRIGHT

Pittsburg Concern Places New Recording Instrument on Market—Gear Trains Replace Springs and Levers.

Interest has been added to the taxicab situation—which is rather peculiar in that the meters in most general use are closely held by a New York company which rents but does not sell its instruments—by the placing on the market of the Paul Richert taximeter by the Pittsburg Taximeter Co., of Pittsburg, Pa., which company will sell its meters outright.

Improved construction is given by the

REAR OF PITTSBURG TAXIMETER

so that their accuracy is ensured. An aluminum shutter is provided for the back reading, which is securely closed by a Yale lock and therefore cannot be tampered with.

As appearance is a factor of importance in the equipment of taxicabs as well as of private pleasure cars, the Paul Richert taximeter has been made as unobtrusively handsome as such a purely utilitarian object well can be made. Its outlines are simple and smooth and the finish neat and durable and its figures are large and easily read.

The Pittsburg Taximeter Co., which just has commenced the real manufacture of the new instrument, is an outgrowth of the Pittsburg Taxicab Co., of which John B. Weibley is the treasurer and the moving spirit. It has its main offices at Centre and Negley avenues, Pittsburg, and its factory at Shadyside, Allegheny county, Pa.

Flanders "20" With Racing Type Body.

While the Flanders "20" is in no sense

MECHANISM OF PITTSBURG TAXIMETER

date, the Pellorce device being one of those which was entered in the competition, but which received only a consolation prize. In this system the dynamo temporarily was converted into a motor to start the engine. Immediately the engine had started several switches were turned and the motor became a dynamo to charge the storage batteries from which it was operated as a motor. Operating as a dynamo it also served for ignition purposes and to light the lamps.

The Proper Way to Cut Gaskets.

In cutting joint gaskets, the material should not be cut all the way through from one side as there is danger of leaving rough edges by this method of procedure. The better way is to cut half way through from one side and then turn the material over and finish the cutting from the other side. If the center of the gasket is cut out first this will prevent the drawing of threads which otherwise would leave channels for the gas or water to escape when the gasket is applied.

makers as the reason they are willing to allow their taximeters to go beyond their direct control. The mechanism of the instrument is divided into three separate and distinct units. One unit comprises the time-keeping section, another the distance recording part and the third the "clock" indicator which converts time and miles into dollars and cents and shows the result on the two indicators, one in the front and the other in the rear of the taximeter. The distinctive feature of the device is that any one of these units may be removed for repairs without disturbing the others, and after repairs have been made, can be as easily and quickly replaced, obviating the necessity for removing the entire taximeter from the car or of entirely dismantling the meter in order to repair one of its constituent parts.

Instead of levers, cams and springs, trains of gears are employed for transmitting motion from the flexible shaft rotated by one of the road wheels of the car to the mechanism of the meter. The front and back indicators are connected by gears,

a speed creation, it has engaged in not a few road and track events and hill-climbs and, driven by Frank Witt, among others, it has given a good account of itself. A direct result is the Flanders "Witt Special," so called because it is built according to that driver's ideas. The new model consists of a Flanders "20" chassis geared up for speed and fitted with a light, low-seated racing type body and big cylindrical gasoline tank. The "Witt Specials," which are making their appearance at the various Studebaker branches, are practically the same as the cars driven by Witt in his races.

Record Attendance at Olympia Show.

No less than 226,095 persons visited the Olympia Show in London during the eight days from November 3rd to 11th, inclusive. Compared with the figures for 1910 this shows an increase of 7,000 visitors, and this despite the fact that on three separate days the admission fee was advanced to two and one-half and five times the regular rate of one shilling.

THE GAPS THE SPARK SHOULD JUMP

Considerations That Govern Setting of Ignition Points and Their Effects—Manufacturers' Recommendations.

If any one, by chance or design, has collected a number of catalogs descriptive of ignition apparatus and is of an investigating turn of mind, one of the first things that will become apparent is that though magnetos in general are of very nearly the same shape and the principle on which they operate is almost identical, there is a surprising amount of difference regarding the accepted size for the gap at the contact points of different instruments. Incidentally, there is very nearly as surprising an amount of difference in the size of the gaps which the same manufacturers recommend between the points of the spark plugs.

In the products of eight of the more prominent magneto manufacturers, no less than five different lengths of gap are advocated; they vary from .016 of an inch, which is the smallest, to nearly double that size, or .031 of an inch, the largest. The gap in question, it should be explained, is that between the contacts of the make and break mechanism when they are most widely separated and not that in what is styled the safety gap. Of course everyone who is well informed knows that the purpose of the make and break mechanism in a magneto is to interrupt the primary current generated by the rotation of the armature in the magnetic field. The safety gap, on the other hand, acts merely in the same capacity as a safety valve on a steam generating boiler. Which is to say, that if the high-tension current cannot find an outlet at the spark plugs because of a broken wire, the damage which otherwise might result to the comparatively delicate winding on the armature is prevented by the safety gap, which permits the "bottled up" current to escape.

Naturally, the different methods of construction which are used by different manufacturers have considerable bearing on the size of the gap between the magneto contact points that is most efficient. But there are several other considerations that govern this size as well and they all must be met. Incongruous as it may seem, the chief consideration is a mechanical one rather than an electrical one. Actually there is no electrical reason for any particular size of opening, assuming, of course, that the condenser is 100 per cent. efficient. Not all condensers are, however, and this imposes another condition. But disregarding other things, an opening is an opening, regardless of its size, and it serves its purpose in interrupting the primary current.

But, that the gap cannot well be greater than a certain size readily may be appre-

ciated, in consideration of the fact that contact must be made and broken twice for every revolution of the armature. Properly adjusted, and with an efficient condenser, a well-designed magneto will operate properly at speeds up to 5,000 revolutions a minute, and in order to do so it is necessary for the make and break mechanism to interrupt the current 10,000 times in a minute. Which is to say, the contact points must be brought together and separated again that number of times in a minute. From which it may be seen that the actual amount of time for the contact points to come together and separate almost is infinitesimal.

It follows, therefore, that the gap between them must be as small as possible, within certain well defined limits, which are governed by the efficiency of the condenser, because the time required for the points to come together after having been widely separated would be considerably greater. Operating at such speed, as a matter of fact, it is likely that the enlargement of the gap by the merest fraction of an inch would so throw the apparatus out of kilter that the cam which causes the contact points to come together would make another revolution before they had had the time to move the required distance.

Another consideration which makes a fairly small gap necessary is the hammering action to which the points are subjected when they are brought into contact. Though each single blow is necessarily very light, it occurs with great frequency, and the aggregate force is considerable. It is practically the same as the continual dropping of water on a stone. Also, with too large a gap, the circuit is broken before the armature has reached the position for the greatest efficiency with the timing lever in the full advance position; as a result, the magneto is likely to miss. Similarly, if the gap is too small the contact points will be separated too soon with the ignition timed at full retard, and consequently the spark will be weaker.

Briefly, these are the principal points which govern the size of gap which must be used, and though magnetos will operate with gaps smaller than the manufacturer advocates, a common form of trouble almost invariably results—though it seldom is attributed to the right cause—in the burning of the spark plug points. This is due to the fact that up to a certain limit a magneto will deliver a hotter spark with a smaller gap, but in addition to burning the spark plug electrodes as a result, there also is grave danger of ruining the condenser. And it is here that the efficiency of the condenser bears on the size of the gap which must be used. When the gap is very small the arc which results when the current is interrupted continues longer than it does when the gap is larger. Theoretically, the condenser should damp out the arc; some are more efficient than others in this respect but none will damp it out entirely.

It is this arcing that burns up the magneto contact points. When the gap is increased, the time that the arc survives is reduced and the longevity of the contact points is increased.

How great is the diversity of opinion regarding the proper gaps that should obtain is shown by the following table of sizes recommended by several magneto manufacturers:

Magneto	Gap	Plug Gap
Pittsfield016	.031
Simms019	.031
Bosch019	.019
Heinze020	.020-.025
Connecticut020	.0625
Splitdorf031	.020
Remy031	.031
Pfanzstiel031

Naturally, the size of the gap between the electrodes of the spark plugs will be governed largely by the character of the spark delivered by the magneto. Thus the Pittsfield magneto delivers a fairly long spark and consequently the manufacturers recommend that the spark plug gaps be just about twice as large as that in the magneto. The Simms Magneto Co. advocates a similar relation of magneto and plug gaps, but the Bosch Magneto Co. requires that they be the same. As a matter of fact, a number of other magneto manufacturers advocate that magneto and plug gaps be the same, but the rule does not hold good in all cases. The Connecticut Telephone and Electric Co., for instance, recommends that plug gaps be three times as large as that in the magneto.

Regardless of what manufacturers recommend, however, it is not possible to specify any particular size of plug gap for any make of magneto, for the reason that there are too many other factors which in practice have upset theory. Thus it has been found in not a few cases that a certain plug gap which works well when the plugs are located over the intake valves may be entirely wrong when the plugs are located over the exhaust valves. Similarly, though a plug gap of the same size as that between the contact points in the magneto may give the best results in an engine in which the plugs are in side pockets, it may be necessary to increase it or diminish it slightly to obtain equally good results in an engine in which the plug electrodes project directly into the cylinder.

Actually, the best size of plug gap to use can only be determined by experiment. The size of the gap between the contact points in the magneto, however, never should be varied from what the manufacturer recommends. Even the slightest increase or decrease in the size of either gaps may have a most decided effect on the operation of the engine, and though the average individual scarcely can be expected to measure so small a gap as one of .016 of an inch, for instance, nearly all manufacturers supply gauges with their instruments for the purpose of establishing the proper setting of the points.

RUTENBER IN UNIT POWER PLANT

Time-Tried Engine Rendered Available in Most Modern Form—Distinctive Valve Mechanism is Retained.

Supplementing its announcement of some six months ago when the Model X 30-horsepower Rutenber motor formally was placed on the market, the Western Motor Co., of Marion, Ind., now announces

each pair of valve push rods. The valve actuating mechanism is peculiar to the products of the Western Motor Co., and is shown partly in section in the accompanying illustration. Instead of the orthodox valve mechanism in which the valves are actuated directly from the cams, a forged arm or lever is interposed between the push rods and the cams, the purpose of the arrangement being to quicken both the opening and the closing of the valves. Incidentally as this method permits of a

frame "weaving," the new unit is arranged to be supported at three points in the chassis.

French Court Decides Against "Guest."

Following closely upon the decision of the highest German court, according to which a guest accompanying the owner of an automobile on a tour or trip without paying for the accommodation cannot collect damages in case of accident, the French Superior Court has gone even further and

INTAKE AND EXHAUST SIDES OF THE NEW RUTENBER UNIT POWER PLANT

the evolution of the same motor into a unit power plant. Though in the main the new motor very closely resembles previous practice as exemplified in the older Rutenber motors, and for this reason is of interest to the trade in general, chief interest centers around the fact that this is the first time the Western Motor Co. has turned its attention to the production of a unit power plant.

Practically the only change in the accepted design of the 30-horsepower motor which has been made in bringing out the new model is in the crank case. This has been redesigned and made longer to provide for the housing in of the flywheel and the attachment of a standard type of change gear mechanism. As is the case with all the other members of the Rutenber family, the separately cast cylinders which have become a distinctive mark of the line are retained, the bore and stroke being $4\frac{1}{8}$ inches and $5\frac{1}{4}$ inches, respectively. Cylinders are cast of a special grade of semi-steel and are carefully treated both before and after machining.

Another of the characteristic features of the Rutenber motors which is apparent in the Model X unit, as it is styled, is the arrangement of the magneto and water circulation pump on the same side, both of them being actuated from the same shaft which in turn derives its motion from a vertical shaft which carries the timer at its upper extremity. This vertical shaft carries the oil pump at its lower end and is rotated by means of spiral gears from the crankshaft.

The cylinders are of the L-head type, all the valves being arranged on one side and enclosed by individual removable plates for

closer adjustment of valve tappets a greater degree of silence also is included among its advantages.

Conforming to the general tendency to make provision for a certain amount of

declared that any one accepting an invitation from an automobile owner to take a seat in the latter's car, thereby accepts all the risks connected with fast traveling. The court's opinion differs from the German idea insofar as it makes an attempt to declare what may be considered "legitimate" or inherent risks in motor traveling.

In the French case in question the driver of the car sent it down a long hill at a speed of over 50 kilometers an hour, in order to gain sufficient momentum to climb an equally long and steep incline immediately thereafter. At the bottom of the hill the car swerved and upset, severely injuring the guest in the tonneau and mortally injuring the driver. The guest sued for damages, charging that a speed of 50 kilometers an hour down hill could only be considered a result of gross carelessness on the part of the owner or his driver. The court found for the owner, deciding that not only did the guest not pay anything for the accommodation, and had therefore no cause for damages, but also that the driver was perfectly justified under the conditions to get whatever speed he could out of the car, in order to reach the top of the hill in the shortest time.

Effect of Freezing of Water Pump.

The refusal of a motor to start often may be traced to a loose or broken timer or magneto shaft coupling. Though such troubles seldom are looked for and are infrequent occurrences in warm weather, the advent of cold weather makes them much more likely, inasmuch as water pumps, driven from the same shafts as such devices are unprotected and freeze up easily.

RUTENBER VALVE MECHANISM

DISAPPEARING SEATS FOR NEW KLINE

They Constitute a Striking Novelty in York Product—Four Speed Gear Adopted for All Four Chassis.

Simplification of design, greater strength of construction, a general refinement of the details calculated to increase the comfort of passengers, and the adoption of four speed change gear mechanisms on all models are the principal features which mark the extensive line of Kline cars for the coming season, announcement of which just has been made by the Kline Motor Car Corporation, of York, Pa., into which Virginia capital and several Virginia capitalists recently were introduced, with the result that a plant now is being operated in Richmond,

jacketing, vertical cellular radiators and centrifugal pumps. Indicative of the attention which has been given the desirable feature of accessibility, the construction of the radiators is such that tubes readily may be removed for repairs or replacement.

The lubrication system used in the "6-60" is common to all the motors and is by splash, a constant level in the crankcase compartments—one for each cylinder—being maintained by gear driven pump in the crankcase. The main oil reservoir is located below the crankcase compartments and from this the oil is pumped through a sight feed glass on the dash and thence to the crankcase through a distributing pipe with branches to each of the compartments. The level of the oil in the compartments may be raised or lowered according to the requirements of the motors.

Ignition on all the models is accomplished by means of two separate systems,

tion and increase its longevity and embrace a slight enlargement of the gears and the use of heavier shafts. As heretofore gear changes are made selectively by means of a side hand lever and the orthodox type of gate quadrant, third speed being direct drive and fourth an overstep. Clutches remain unchanged, the same type of leather-faced cone member being used in all models. To facilitate gear changing a clutch brake is fitted

The full-floating type of rear axle is employed on all models, the casing containing the differential and the live axle being all in one piece. The whole differential mechanism with its bearings may be removed bodily from the housing without the necessity for disturbing adjustments. The brakes in each case are of the internal expanding type and both sets are mounted on the rear wheels. In making provision for adjustment for wear the necessity for ac-

TWO VIEWS OF NEW KLINE CAR SHOWING CONTROLS AND DISAPPEARING SEATS

Va., also. Though the line has been slightly depleted by the removal of one car, the four cylinder 30 horsepower model, there still remains considerable latitude for choice in that four other distinct chassis remain, and on them are mounted a variety of body types which gives a total of no less than 17 types of car. These four chassis embrace two six cylinder models, one of 50 horsepower and the other of 60 horsepower, and two four cylinder models of 30 and 40 horsepower, respectively.

Except for slight changes, the motors remain the same, the cylinders in the three larger sizes being cast in pairs, and those in the "4-30" being separate. In the three larger models the valves are located on opposite sides and are interchangeable, and in the 30 horsepower motor the valves are located on the same side. In both the six cylinder motors the arrangement of the cylinders is such that the rigidity of construction possible only by the use of a crankshaft bearing between each is obtained. Water cooling is employed in all the motors, the system being the same in each case and embracing liberal water

including a Bosch high tension magneto which operates through one set of plugs, and a single unit coil and distributor which operates through separate plugs. Dry cells furnish current for the coil system, the distributor being located on a vertical shaft and actuated through gearing from the valve gear train. The distributor itself is unusual in that its moving parts operate in an oil bath and are completely housed by means of an oil-tight cover. Single platinum contacts serve for all four or six cylinders as the case may be. To increase the flexibility and easy starting quality of the motors in cold weather, the carburetors of the three larger models are water jacketed; the carburetor on the 30 horsepower engine is arranged to be supplied with hot air by means of a connection to the exhaust pipe.

Regarding the transmission elements, the same type of four speed change gear mechanism which last year constituted one of the features of the 60 horsepower model has been adopted for all the others. Such slight changes as have been made are calculated to increase its "sweetness" of ac-

cessibility has not been lost sight of, and to this end the adjusting nuts have been placed outside the drums where they can be reached quite easily.

As already has been stated, the design of the several body styles is indicative of more than a little thought with the aim of increasing the comfort of passengers, one of the striking features in this respect being the unique manner in which the obliteration of auxiliary seats is effected when they are not required. When they are not in use they disappear entirely beneath the front seats, the method of mounting them being shown in the accompanying illustration. The upholstery in all the bodies has been made thicker and softer and the seat cushions have been redesigned so as to provide the easiest of positions.

The wheelbase of the 60 horsepower car has been increased from 128 to 130 inches, which permits the use of slightly larger bodies. Conforming to usual practice, all bodies are equipped with front doors and their presence in really hot weather is rendered less obnoxious by the use of liberal sized ventilators let into the dash. On the

THE 4-40 FIVE PASSENGER KLINE AT \$2,250 AND THE 6-60 AT \$3,500

"6-60," wheel sizes have been increased to 38 x 4½ front and rear and tires are mounted on Firestone quick detachable and demountable rims. Though the price of the car has been increased slightly, the touring, small tonneau and roadster listing at \$3,500 for the first two and \$3,200 for the last, as against \$3,250 and \$2,950, which were the prices last year, considerably more equipment is included at these figures and the price in reality, it is said, is lower. Stand-

same equipment, the car is furnished in five passenger touring, small tonneau and roadster styles, at \$2,850 for the two former bodies and \$50 less for the latter.

The motor in the four cylinder 40 horse-

For the five passenger touring car and the toy tonneau the price is \$2,950 and the roadster lists at \$2,200. For those who so desire, this car also is built to order with a three speed change gear mechanism and a roadster body at a reduction of \$75.

Separately cast cylinders are used in the "4-30" motor, which differs from the others in that it is of the L-head type. Otherwise, it differs but slightly from the larger motors, lubrication, ignition and cooling being

CONSTRUCTION OF 6-60

VALVE SIDE OF 4-40

KLINE 4-30 MOTOR

THE 6-50 IN PERSPECTIVE

ard equipment includes "semi-duquesne" silk mohair top, side curtains and dust hood, windshield, combination oil and electric side and tail lamps with six volt 80 ampere hour storage battery, pump, jack and tools.

Except for a difference in the size of the cylinders, which measure 4 3/32 inches bore and 5 inches stroke, the six cylinder 50 horsepower model is nearly identical in construction and detail with the larger model. The wheelbase has been increased to 126 inches and tire sizes also have been increased to 36 x 4½ all around, which was the size used in the rear only last year, the front tires measuring 36 x 4. With the

power car is the same in construction and design as that in the "6-60," except that it has two cylinders less; the bore and stroke are 4¼ inches and 5½ inches, respectively. The wheelbase of this car also has been increased slightly and now is 118 inches; tire sizes are 36 x 4 for both front and rear.

effected in the same manner as is common to the others. The cylinder measurements are 4 inches bore and 4¾ inches stroke. In five passenger and small tonneau touring car form, the list price of the car is \$1,750; the two passenger roadster lists at \$50 less, all of these prices including equipment similar to that supplied with the other cars.

Eight Thousand Trucks in New York.

According to a statement made by Secretary of State Lazansky, in a recent public address, there are 8,000 commercial motor vehicles registered in the State of New York. Of this number 60 per cent. are in use in the metropolitan district.

NEW 4 CYLINDER 30 HORSEPOWER KLINE CAR IN SMALL TONNEAU AND ROADSTER FORM

TRIPLE JET IN ONLY CARBURETTER

Original Features of Device Invented for Big "One-Lunger"—Now Adapted to All Types of Motor.

One of the original features of the Only car, which, as originally developed by the Only Car Co., was propelled by a single-cylinder engine of $5\frac{1}{8} \times 10$ -inch proportions, was a triple jet carburetter. Such gratifying results were achieved with this invention under the trying conditions imposed by the big "one-lunger" motor that it was tested on a four-cylinder 50-horsepower car of entirely different construction. Its economy was marked. Whereas formerly the second machine had showed no better than six miles to the gallon of gasoline, with the Only carburetter it developed as many as $11\frac{1}{2}$ miles to the gallon. With more than a $33\frac{1}{4}$ per cent. increase in mileage it is claimed that upwards of 20 per cent. more power also was developed. The results were so marked that it was deemed advisable to put the device on the market independently and it is now being introduced by the Only Car Distributing Co., of New York City.

As is indicated by the accompanying illustration, the arrangement is that of a triple jet, or "three-speed," adaptation of the familiar aspirator principle. The three jets are arranged side by side, drawing from a main which is fed from the float chamber, M, in the usual way. By means of poppet valves, which are controlled by the movement of the throttle lever, however, the outlets from two of the mixing chambers are closed while the engine is being started or when it is running under very light loads. As the throttle is opened the second and third jets are thrown into action progressively, through the opening of their respective mixing chambers to the main delivery chamber.

The low-speed, or starting jet, is the upper one in the illustration, lying next to the float chamber. The nozzle is mounted in a straight induction tube which terminates in the main mixing chamber, immediately back of which is shown in dotted outline, at T, the intake to the engine. This jet and mixing tube, constituting an elementary carburetter, is constantly in operation.

At the first outward movement of the throttle lever the valve, B, is lifted from its seat, permitting air to flow through the second mixing tube, entering at openings in its back end and flowing over the second jet. As the engine accelerates and the suction increases more air is admitted through an opening, G, which normally is closed by a spring or reed. The added component of mixture thus formed joins that supplied by the starting jet.

Further throttle movement causes an arm

offset from the main stem to press against a spring, K, and thus lifts the valve C from its jet, overcoming the resistance of a second spring which ordinarily holds it in closed position. This has the effect of causing air to be drawn over the third jet, which supplies a relatively rich mixture at first, later to be compensated by the action of a second "breather" or automatic reed valve. The final throttle movement opens a third poppet valve, D, which admits an auxiliary supply of air to the mixing chamber and thus overcomes the enriching tendency of the maximum suction obtained.

In explaining its advantages the manufacturer claims that, in addition to affording smooth-running and economical results, it is noteworthy in that it is not automatic. Its action throughout, as is indicated, is wholly mechanical—the action of the reed air inlets not being classed with the ordinary suction air inlet, it appears. On this account its performance should not be sub-

ject to the irregularities which in so-called automatic instruments sometimes give rise to difficulties.

Demountable Rims for Wire Wheels.

Wire wheels with demountable rims have been thought of as a combination much to be desired ever since the wire wheel began to claim the serious attention of builders of modern automobiles, but no one on either side of the big pond seems to have hit the solution of the problem until W. N. Booth, inventor of the well known Booth demountable rim, worked out a design that has the appearance of being the right answer. Several of the new wheels just have been shipped from the Booth Demountable Rim Co.'s factory in Detroit. In order to apply the Booth rim to a wire wheel, the latter is fitted with a flanged steel felloe which is similar to the channel rim fitted to artillery wheels equipped with Booth rims. The wire spokes are secured direct to this channel, upon which the demountable rim is placed exactly as on the wood wheel.

No changes have been made in the worm-and-gear rim locking mechanism, which has no loose bolts, nuts or other parts to take off and which is operated by a brace included in the outfit. The rim has a close, solid bearing on both flanges of the channel all the way round, and the three equally spaced locks not only hold it firmly in position, but draw it off easily no matter how tightly it may be jammed in position, through the powerful leverage of the worm gearing.

NICKELING WITHOUT ELECTRICITY

German Claims to Have Solved Problem With Galvanit—Powder, Water and Friction All That is Necessary.

How properly to nickel plate a piece of iron, steel or copper without the use of cumbersome and expensive electric apparatus, has been a dream of the inventor for many years. Many so-called "compositions" have been offered, but none of them proved capable of serving the purpose. Quite recently, however, M. A. Rosenberg, a distinguished German chemist, is credited with having discovered a method of covering metals with layers of tin, nickel, silver or cadmium by an electrolytic process which is absolutely independent of batteries, electric current, electrolytic solutions, etc. The necessary electric current is developed by humidity and friction while supplying the powdered coating metal to the cleaned surface of the metal to be covered.

The secret of Rosenberg's success lies in his discovery of a metallic mixture which will not attract humidity from the atmosphere, while stored, but which will set up electrolytic action immediately upon contact with water. For this reason the powder composition is mixed with certain inert substances, the object of which is nothing more than the protection of the effective particles of metal from humidity. To create the electrolytic action necessary for obtaining a smooth, serviceable coating of nickel small quantities of electro-positive metals, such as zinc, magnesium and aluminum, in the very finest powdered state, are mixed with the oxides or salts of the metal to be deposited.

For instance, if it is desired to nickel a plate of copper, the surface of the copper is dampened and the powdered composition sprinkled over it. The composition, in this case, would contain nickel oxide, finely powdered magnesium, and some powdered inert material such as infusorial earth. Immediately on contact with the water innumerable minute electric currents are created, by the aid of which tiny particles of metallic nickel are deposited upon the copper, forming a dense layer of nickel. It is this creation of electric current of very small intensity by means of the powder itself, which constitutes the novelty, for it long has been known that deposits of silver, mercury, etc., could be made upon polished surfaces by rubbing the oxides or salts of these metals upon the surfaces to be coated. The mere sprinkling of the powder on the copper surface, of course, does not create a perfect coating; in order to obtain this the powder must be rubbed in with a soft rag. During this friction a process of amalgamation takes place, and a homogeneous coat is formed, ready for pol-

ishing or buffing. The more powder that is placed on the rag, and the longer the rubbing is continued, the thicker the layer of metal coating becomes. It is even possible to produce beautiful designs by this method on iron, steel or copper; all that is necessary being a stencil, through the openings of which the nickel or silver is rubbed onto the metal to be covered.

Furthermore it is claimed that with the Rosenberg method it is unnecessary to first cover iron or steel with a layer of copper in order to cause the nickel to adhere properly; it is even possible to re-nickel damaged articles without removing the jagged coating or nickel still adhering to the surface. Simply by applying the powder and rubbing it hard into the metal, it is declared it will form a perfect connection with the old coating, impossible of detection even by the microscope.

In this connection it is stated that in none of the compositions is there any use made of cyanides, mercury salts or free acids; they are not poisonous and do not even stain the fingers. The powders are to be marketed under the general trade name "Galvanit," and may be obtained for the following processes: To deposit tin upon copper, brass, German silver, silver, iron, steel; silver upon bronze, copper, silver, German silver, iron, steel; cadmium (a rust preventive) upon copper, iron, steel, German silver, and nickel upon copper, iron, steel, brass, German silver, nickel.

Rambler's Great Manufacturing Record.

The Thomas B. Jeffery Co. believes that it has a record which has few parallels, in that since it was organized and started building Rambler cars in 1900, its plant in Kenosha, Wis., never has been shut down on a single working day, not even during the commercial depressions in 1903 and 1904 and in 1907 and 1908. The factory has been running at least 10 hours a day and many days over time, excepting for a single period of three weeks following the panic in 1907, when it ran eight hours a day. For 3,419 days this factory has been operated continuously, increasing in size from 60,000 square feet of area to more than 550,000 square feet of factory floor space. The factory site, including the half mile testing track, now covers 93 acres, while the pay roll has been increased from 100 to 1,700 men on Monday last, the largest pay roll in the history of the business.

Economy of Old Shoes in Winter.

One way to economize in the matter of tire expense is to use old, ragged, patched and re-treaded shoes in winter and save the good ones for summer use. The philosophy of this is that a patched shoe in all probability will give out in some weak spot long before it is actually worn out, so that it will run practically as long in winter as in summer. A good shoe, on the other hand, will have its useful life shortened by the friction of icy road surfaces.

NO MORE LAP ROBES FOR RADIATORS

Indiana Inventor Evolves Device to Retain Heat of Engine—Forms Antidam Company to Make It.

When the horse was replaced by a motor and the whip socket taken off the dashboard to make room for a sight feed lubricator, it was fondly hoped that everything equine had been removed from the auto-

ANTIDAM RADIATOR COVER, OPEN

mobile and that the carriage had been completely emancipated from things horsey. But no sooner did men begin to drive their cars in winter than they found it advisable, when they halted, to throw their lap

ANTIDAM RADIATOR COVER, CLOSED

robes over their radiators to keep them warm, exactly as they had made shift to protect their horses under similar conditions. And the practice has persisted to a great extent despite the great advance of the automobile.

Taking advantage of the fact, the Antidam Manufacturing Co., whose name must be quite proper because it is incorporated under the laws of the State of Indiana, has brought out a device designed to relieve the motorist from the necessity for thus

decorating his radiator with a lap robe when leaving his car standing in cold weather, and to prevent over-cooling when Old Boreas blows.

George Bott, of Indianapolis, is the inventor of the device, which is styled the Antidam heat-retaining radiator cover, and which consists of a shield of heavy Pantasote backed by sheet metal to give stiffness and prevent displacement by the frisky breezes; also it is fitted with six shutters which can be adjusted to any desired opening, thus providing a means for regulating the volume of wintry atmosphere admitted to the radiator, as shown by the accompanying illustrations. In placing the cover on the market the manufacturers make the most of the fact that even if a radiator does not freeze when carelessly left out in the cold with no protection, the motor is much harder to start than if kept warm and comfortable. Moreover, a radiator capable of adequately cooling a motor in hot weather can cool it excessively in winter, appreciably reducing the power output.

The top of the Antidam radiator cover is slipped over the radiator cap and the bottom is strapped to the starting crank bracket or other convenient point of attachment, and forms a permanent part of the car's winter equipment.

George Bott, the inventor, will be secretary, treasurer and general manager of the company, which has been incorporated under Indiana laws with a capital of \$10,000. R. P. Irwin, J. M. Irwin and George Bott are the incorporators. Manufacturing operations have been commenced in Indianapolis.

When Turpentine is Better Than Oil.

A motorist who, like many others of his kind, had used a mixture of graphite and oil to make a tight joint where the bearing surfaces were narrow, and who found that he could not keep his joints tight by this means, hit upon the idea of mixing the graphite with turpentine instead. The scheme worked like a charm. He also used the mixture to rub on his exhaust manifold when he wanted it to look nice, applying it with a piece of waste while the pipe was hot. The result was highly satisfactory, and though the polished black finish was not by any means permanent, it was so easily applied and so cheap that the shortcoming could be overlooked.

Cleaning Aluminum With Weak Acids.

It has been suggested that aluminum surfaces that have become dull and unsightly may be cleaned up by the application of a 10 per cent. solution of sulphuric or muriatic acid applied with a stiff brush and afterward washed off with clean water. Though there is little doubt of the efficiency of this method, great care should be taken not to get the compound on the skin or clothes. The paint and nickel will also suffer from the affects of the acid. The best way is not to use acid at all, but soap.

PULLMAN LAUNCHES A "SIX-SIXTY"

**Also Adds a Brand New "Four" Model—
Full Equipment Includes Self Starter
and Electric Vulcanizer.**

Further extending its already complete line of pleasure vehicles, the Pullman Motor Car Co., of York, Pa., has launched two brand new models—one of them a 60 horsepower six cylinder, the other a 40 horsepower "four"—and these, with the older 30, 35 and 50 horsepower four cylinder models, will comprise the company's offering for the coming season. The continuance of the three last named models with changes

Naturally chief interest centers on the six cylinder car, inasmuch as this is the first time that the Pullman company has turned its attention in this direction. Though it is essentially a new creation and as such incorporates a number of features not found in the others, it still retains many of the distinctive touches which mark the other and older cars that bear the Pullman name plate. Thus, though the cylinders are of the T-head type, in conformity with previous Pullman practice, they are cast in pairs instead of singly, both the new motors being built in this way. As a matter of fact these two motors are identical, except that the "four" has two cylinders less than the "six," and a description of one therefore suffices for both. Cylinder dimen-

ism and full-floating rear axle, the component parts of the transmission being so arranged that a straight-line drive is obtained under normal service conditions. Both sets of brakes operate on the rear wheel hubs, the service brakes being internal expanding and the emergency brakes external contracting. An unusual feature of construction is that the service and emergency brakes operate on separate drums, between which there is an air space to insure maximum heat radiation. The diameter of the drums is approximately 16 inches and the width is $2\frac{1}{4}$ inches; both brakes are lined with Thermoid brake lining.

The diameter of the wheels on both the new models is 36 inches, though those on

SELF-STARTING PULLMAN 6-60, \$2,750

SELF-STARTING PULLMAN 4-50, \$2,700

which are so slight as to be scarcely noticeable is evidence that very little improvement in design or construction was found possible. Therefore they will remain in the same form that has proven thoroughly dependable and efficient during the past year.

Almost of equal importance to the announcement of the two new cars, is the information that, departing from the usual Pullman custom in this respect, their purchase prices will include full equipment.

sions are $4\frac{1}{2}$ inches bore and $5\frac{1}{2}$ inches stroke, the disposition of the valves on either side permitting the location of the magneto on one side and the water pump on the other, this arrangement allowing of a more even distribution of the driving strain on the timing gear train from which both are driven.

Having given satisfaction for a number of years, the Pullman pump-over splash lubricating system is retained, but has been improved in that the oil level adjustment

the "60" are fitted for $4\frac{1}{2}$ inch tires and those on the "40" for 4 inch tires. The wheelbase of the six cylinder car is 138 inches and that of the "40" is 122 inches. Semi-elliptic springs in the front and three-quarter elliptic in the rear are used on both models, the front and rear spring on the larger car being 2 and $5\frac{1}{2}$ inches longer, respectively, than those in the 40 horsepower car.

The six cylinder chassis is regularly supplied with seven passenger touring, small

SELF-STARTING PULLMAN 4-40, \$2,150

PULLMAN 4-30 TOURING CAR, \$1,675

And that it is full in a fuller sense of the word than usually is supposed, is evidenced by the fact that not only is a self starter and an electric lighting system included with both of the new models, but a distinct departure is made in the inclusion of an electric tire vulcanizer as well in the equipment of the six cylinder car. The other items of equipment, common to both, embrace such standard features as demountable rims, windshield, speedometer, robe, coat and floor rails, pump, jack, tools and top with dust cover.

has been placed on top of the crankcase and is much more easily "get-at-able" than when it was at the bottom of the crankcase. On all models the timing gears are of the spiral type and those in the two new motors operate in oil instead of in grease, which is the case in the older motors. Ignition is effected by a Bosch high tension magneto dual system in which dry cells are used for starting.

Power is transmitted to the road wheels by means of a leather faced cone clutch through a four speed change gear mechanism

tonneau and roadster bodies at the list price of \$2,750. It also is fitted with coupe, landaulet and limousine bodies. The same styles of body are supplied on the four cylinder 40 horsepower model in addition to a five passenger touring body; the price for the open cars is \$2,150.

As has been stated, the changes which have been made in the other three older models are so slight as to be negligible. They differ from the new models principally in that, with the exception of the "30," their motors have singly cast cylin-

ders, lubrication and ignition being effected in the same manner as in the new cars. The four cylinder 35 horsepower car has a motor in which the cylinders measure $4\frac{1}{2}$ x $4\frac{1}{2}$, and is regularly supplied in five passenger touring, small tonneau and roadster form, the details of construction in regard to transmission being the same as the new models. For that matter, all the other cars are the same as the new models in respect to their transmission components.

In the 30 horsepower car, the cylinders measure $4\frac{1}{16}$ x 5 inches and are cast in pairs. Five passenger touring, small tonneau and roadster bodies are mounted on this chassis, and the price with either of the open bodies is \$1,675; coupe, landaulet and limousine bodies also are fitted to this chassis. The cylinders in the motor of the 30 horsepower car are cast separately, the bore and stroke being $5\frac{1}{4}$ inches and 6

SIMMS TO MAKE SEEBRIGHT HERE

**Will Reproduce British Ignition and Lighting System at Bloomfield Plant—
Differs Radically from Others.**

Very shortly the American trade and public will be afforded the choice of another combined lighting and ignition system—the Seebright, which will be placed on the market by the Simms Magneto Co., of Bloomfield, N. J. It already has made its appearance abroad where it was brought out by the Simms English company, but active preparations are being made to reproduce it on this side.

The instrument differs radically from the familiar type of high tension magneto, or the combined magneto and dynamo, in that

is completely enclosed in an aluminum housing, all the moving parts being thoroughly encased. At 1,000 revolutions a minute, the output of the dynamo is 100 watts, the voltage being $8\frac{1}{2}$, and the amperage 12. An automatic magnetic cut-out switch serves to maintain the dynamo in connection with a storage battery except when the speed of the armature drops below a certain limit.

Effect of Large Tires on Taxicabs.

While tire manufacturers for some time have urged the use of large tires as a means of real economy, what it really amounts to in every-day work was shown by the experience of the company which operates the "yellow taxicabs" in New York City, the manager of which declares that since the adoption of $4\frac{1}{2}$ -inch tires for the 32 inch wheels, tire troubles have been reduced and tire efficiency has been increased

INTAKE AND EXHAUST SIDES OF THE PULLMAN 4-40 MOTOR

inches, respectively. For a five or seven passenger touring body, or a roadster body on the 50 horsepower chassis, \$2,700 is asked, the price being slightly higher for coupe, landaulet or limousine.

Racing Drivers Engaged to Aid Dealers.

In the endeavor to induce Cole agents to maintain service stations on service departments for the users of Cole cars, the officials of the Cole Motor Car Co., are employing the drivers of their racing cars to good purpose. These drivers are circulating in various parts of the country instructing the mechanics employed by Cole agents in the fine points of the car and how best to get the happiest results. Thus Harry Knight now is doing this work in the South, while Johnny Jenkins will be kept on the California coast for at least two months and then moved to some other point. "Con" Tucker also has already made several trips in various directions with the same purpose in view. Officers of the Cole company and the Henderson Motor Sales Co., which markets the Cole output, are also personally visiting their dealers, with a view of instilling the service idea.

two separate armatures are employed. For the fields, eight magnets arranged in four rows of two superposed are used, and between their twin pole shoes the two armatures rotate, one above the other. The lower armature generates current for the magneto ignition and is of the accepted double-wound high tension type with the exception that the high tension slip-ring, from which the current is passed to the distributor, is carried at the non-driving end of the armature, and feeds the distributor through an external cable. The contact breaker, distributor and distribution gear are the same as in the ordinary Simms magneto.

Above the high tension armature is the second armature which is of the conventional drum-wound low tension type. This rotates at twice the speed of the high tension armature, from which it is driven by means of spur gearing. The low tension commutator is located at the driving end of the armature; carbon-copper brushes of the usual type are pressed against it by springs and serve to collect the current. The instrument is approximately of the same size as the regulation magneto and

by fully 100 per cent. According to his statement, the company's tire cost now is but three cents per mile, which he considers reasonable in view of the varied road conditions encountered by the cabs in city and suburban travel and the frequent sharp stops and starts.

Premier Produces Its First Truck.

The Premier Motor Mfg. Co., of Indianapolis, has added a truck to its productions. It is of the two ton class and in its essentials is a heavier reproduction of the Premier touring car. The first truck was exhibited in Indianapolis last week. Its braking surface is one of its features, providing 330 square inches, which is said to afford the most powerful brake in automobile use. It is also distinguished by Goodrich twin pneumatic tires on the rear wheels.

Steam Cars Good for "Automobilism."

They have even a Steam Car League in England. "Fairplay for Steam" is its motto and its chief object is "the encouragement of the use of steam as a means of automobilism," whatever that may be.

ELECTRIC HAS NOT FULLY ARRIVED

Belief That It Has So Arrived "Comforting but Fatuous," Declare Messrs. Martin—Room for Improvement.

"Has the electric vehicle fully arrived?" was the question asked and answered—in the negative—by T. Commerford Martin and Kingsley G. Martin, father and son, at last week's meeting of the Electric Vehicle Association of America at the Engineers' Club in New York. The senior Martin is renowned in the electrical industry and is now serving as president of the National Electric Light Association, while his son also has made a mark, being electrical engineer for the Ray D. Lillibridge Co., of New York. The question and the answer—a long one—comprised a joint paper which was read on the occasion and which handled the subject aptly and broadly. It pointed out wherein the electric vehicle has fallen short, wherein lies room for its improvement and how and why it has failed to "fully arrive."

After dealing with the attitude of the central station men and the manner in which some of them have grasped the opportunities afforded, while a larger number have failed to provide charging facilities or to otherwise assist the electric vehicle, and after remarking the necessity for an electric garage wherever there is an electric lighting plant, the Messrs. Martin said:

"These are broad considerations wherein we are likely to have the agreement of all of you when the assertion is made that the electric vehicle has not fully arrived. Another point upon which we are all likely to be in agreement is that an art is more or less conditioned by rival or sister arts. If the question were put: 'Has the hydrocarbon automobile fully arrived?' the answer would be a very decided 'No' and it follows as a corollary that however well satisfied we might be with the status of our own art, the electric vehicle can never reach perfection while it has this formidable rival in the field to measure up against."

"The records of the patent office, the results of trial runs, the pages of the automobile papers, the annual exhibitions, and our own daily observation all prove to us that the gasoline vehicle is still undergoing a splendid evolution, from which the electric branch of the art is indeed no small beneficiary. There is here quite a curious parallelism with the earlier phenomenon familiar to those whose lives have been spent in the field of illumination, namely, the long struggle between gas and electricity, which has been of the greatest stimulus to both, but never more so than when competition has been friendly or now when so frequently and generally the two services to the public are under a common

administration or ownership. Competition and warfare are not seldom founded upon misunderstanding; and in the case of utilities and appliances, upon a misconception of the real function. No device arrives fully until its sphere is thoroughly recognized and defined, and until opposition ceases from those whose greatest gain will be in helping it onward.

"It certainly cannot be regarded as other than a good sign, so far as the future of the electric vehicle is concerned, that some of those who have been leading advocates and producers of the hydrocarbon types are looking with favor upon the electric type and undertaking its manufacture. To say the least, one of the deterrent influences from which the electric vehicle has suffered the most has been the 'knocking' it has had to endure not only from within but without. First of all, a new invention or article of commerce has to make good in establishing its right to exist as meeting some human want or necessity. That done, as in the case of the electric vehicle, the stage is reached where the occupancy of a definite domain must be determined; and that also appears to be in process of speedy accomplishment. The 'battle of types' is usually very slow in reaching its conclusion; just as every illuminant the world has known is still in use somewhere; while every kind of bicycle still runs the streets years after the introduction of the chainless. The electric types are probably much more various than they were two years ago; will probably be even more numerous two years hence; and will probably differentiate to a striking degree as uses become more varied."

"It is not unlikely that very few of us realize the possibilities before the manufacturer of electric pleasure and commercial vehicles and their constituent parts. The opportunity has always been there, but apparently it has been necessary for the gasoline car to show the way and do the pioneering work in many branches of the automobile industry. The reward, however, has been great, a reward that can just as well come to us if we but put ourselves to the task as did the other fellow. Some of the earliest successful self-propelling road vehicles were electrics and their modernized and some of the original designs are in use today. The cases where original design has survived, unaltered to any great extent, are, however, very few, and this alteration and redesigning has been assentation as the electric vehicle becomes more and more a real machine instead of an experiment."

"There are, however, many makers of electric cars, of both pleasure and business types, whose designs contain each year changes of considerable extent. Again, manufacturers are found entering the field with machines which from an engineering standpoint are truly disheartening. They seem totally to disregard tried and proven methods of construction, and are unable to

realize or foresee the operation of certain parts under service conditions.

"It would be well if every builder could spend a year or two driving cars as a paid chauffeur. He would learn some essentials that would last him a life time."

"In pleasure cars one is more apt to encounter fairly comfortable, correctly placed, and properly formed brake pedals, for instance, but on trucks the usual thing is an entirely inadequate contrivance, cramping the operator and exhibiting very little thought as to the comfort, convenience and safety of manipulation. Changes in design must of course occur, but they should be those which only could be shown desirable by operation in the hands of users, not those which are evident upon inspection to any one with mechanical training. We are building today pleasure cars having speeds up to 30 miles per hour which weigh at least a ton. Would anyone buy a gasoline machine with equivalent properties having a 'tiller' steer? No; and what is more significant, you couldn't if you wanted to. It is on such points that the designer of the electric vehicle could more than benefit by giving attention to gasoline car construction."

"It is true that we have made great technical progress of recent years, but an average of electric cars would show characteristic features that were abandoned by gasoline car makers long ago, and yet we are constantly striving to cover the entire field of the gas car, and do all that it can do, as swiftly, as surely and more safely, and with absolute assurance of ultimate success. In the meantime we do not progress as rapidly as we should, because makers employ obsolete and superseded methods in the worst cases and poorly designed systems in the average."

"We are not attempting to criticize the necessary work that is being done in solving the problem of chain or shaft, hub or spur drive, of two motors or one, of acid or alkali batteries, but wish to point out that it is in the steering gears, axles, brakes, control arrangements, etc., that established practice is to a large extent ignored. In the personal experience of the authors, for instance, two axles have broken. There were four distinct cases of fracture. The steering gear has disintegrated while calmly driving on a smooth avenue, hot bearings have developed many miles from home, controller leads have gone astray, and brakes have proved excellent when running backward but leaving much to be desired in their effect on forward motion, etc., etc. And yet we are staunch and optimistic believers in the 'Electric.' It is of interest to note, showing what can be done, that the commercial cars now performing the most exacting service anywhere in the world are electrics, and their design evinces a more than ordinary appreciation of real automobile engineering, and what really takes place when a heavy self-propelled vehicle travels at good speed over all kinds

of pavements, in all weathers, and with all kinds of drivers. Such machines in general are of the wheel-steer, single-motor, double side chain drive, ranging from 1,000 to 4,000 pounds capacity.

"Vehicles of this type handle United States mail between post office substations and railroad terminals, etc., penalizations being imposed for any delay over two minutes. In two years these wagons, one always in reserve, and one being overhauled, covered 689,819 miles, this being almost 40 miles per day per vehicle, counting the whole 26. In summer the mileage is minimum, reaching its maximum at Christmas, when the wagons are often in continuous service the whole 24 hours, changing drivers and batteries every eight hours. The total loads carried at this time are five times the actual capacity of the wagons. For this extraordinary 'limit' service the cost has proved to be for:

	Tires per Mile	Lead Batteries at .04 per Mile	Current K. W. H.
1,000 lb. wagons	\$.0076	\$.0221	\$.0211
2,000 lb. wagons	.0103	.0260	.0224
4,000 lb. wagons	.0218	.0404	.0258

"Total average cost of tires, batteries and current—\$.0658.

"Three makes of tires and two makes of batteries figured in this compilation. The current was all central station Edison service. The main difficulties encountered were sprung axles and broken straps and jars, nearly all being reported on the lighter, higher speed type.

"Pleasure (or business) cars are still either an open or closed affair. There awaits a large field to the successful builder of a convertible vehicle, not one that needs changing bodies or weighty additions, but one that offers weatherproof protection to the occupants and is instantly available at any time. The recent tendency toward a lowered center of gravity is to be much commended, as it is a step in a rational and forward direction.

"One of the problems that came to the attention of the authors this summer, as it must have done to many others, is that of ability to supply sudden or 'rush' orders. The fact was noted in October in the president's address that in the four cities of New York, Chicago, Boston and Philadelphia, in a few days, nearly 4,000 horses died of heat exhaustion, with a loss to the owners of about a million dollars. The appeal that went up immediately for electric trucks and delivery wagons was startling in its eagerness and insistence but it was not satisfied, and under the conditions never could be. There has been an insuperable difficulty in prompt supply. To what extent the solution of this problem lies in the present or the future one can hardly say, but it is at least pertinent to quote from a letter dated November 14, addressed to one of the authors of this paper, which says as to electric vehicles: 'We are going to manufacture eight standard classes—each with three different standard

lengths of frames—and varying in load capacity from 1,000 pounds to 12,000 pounds. These 24 standard classes will enable us to supply from stock a chassis to meet practically any requirement for a commercial vehicle within our range.' With this, it is stated, goes an ironclad guarantee as to maximum operating cost for a period of three years covering chassis, batteries and tires.

"We may let this go for what it is worth, and it has some potential value, and pass on to one or two other subjects. Of these, the most important from the technical standpoint is certainly that of standardization. The great national engineering societies have thrown much of their energy on this subject for many years past, and in our own field it is difficult to imagine just where we would find ourselves without the rules as to apparatus of the American Institute of Electrical Engineers, or the rules of the National Electric Light Association as to rating of arc lamps, overhead line construction or central station accounting.

"In the electric vehicle field we are merest tyros in regard to standardization, whether as to the technical details of the apparatus or as to the simplest principles of bookkeeping. One or two items may show the imprint of our work, one or two matters may have been brought to the basis of a common computation, which is what we mean by standardization, but outside of that all is chaos. Quite lately the authors have been impressed with the almost entire absence of data and curves in regard to any other feature of the industry except battery input and output. The whole tenor of the brilliant and incisive paper presented by Mr. Hayden Eames at our annual convention, on 'Impediments to the General Introduction of Power Wagons,' was along the lines of the present criticism, and then as was said by Mr. P. D. Wagoner in commenting on that paper: 'I think a great many people do not realize the absence of accurate information of the cost of horse service. There is reason for this, because when horses were practically the only method of transportation there was no reason for keeping the cost to compare with anything else. It was the best known.'

"That is well put, but today ours is the best known, and how little do we know definitely and finally? The paper of Mr. Eames itself showed the absence of basic data in citing the case of a man who instead of taking high priced central station current for his automobile, put in a gas engine generator set and cut his current cost down to one seventh. That sounds simply preposterous, but instanced in all good faith by a distinguished expert and engineer, it merely shows how far we are from fully arriving. There are, it is imaginable, many isolated plants, from which, under necessity, a man may charge his own vehicle economically; and if the local central station will not join issue, it deserves

to lose the business. But the acceptance as true of such comparative figures as those just cited as an instance, would be deplorable and disastrous in the ultimate effect upon the owner of the vehicle who found the facts so far from the proposition.

"The recent figures of the Census Office show that in 1909 there was an output of automobiles to the value of \$250,000,000. It is now perhaps far in excess of \$350,000,000. In the same year, it is reported, the value of the 3,639 electric vehicles produced was \$6,564,500, or 163 per cent. more than in 1904. It will be 1914 before authentic government figures are again available, but we all know that even since 1909 the whole industry has grown enormously and the electric end of it very remarkably. Inquiry would go to show a total value of electric vehicle output at the present time of \$40,000,000, and it has even been put by some authorities in excess of \$50,000,000.

"The statements of the manufacturers would be startling if they were not occasionally more than confirmed by reports from different localities as to vehicles in actual use. While this little paper was being written, one of the authors received from a well known central station man in Denver, a statement that there are at least 800 pleasure vehicles in that city, and although it is known that in addition there are several commercial types, it certainly comes with a sense of surprise to be told that Denver has so many. It strengthens one in the belief that the progressive West is altogether a leader in our field, but it also deepens the conviction that the electric vehicle is today by far the most rapidly advancing branch of electrical industry.

"General statistics over about 40 years go to show an average rate of growth in the electrical industry of 20 per cent. per annum, or double the rate of the country and if industry as a whole. The electric trolley or railway art has an annual growth of about 10 to 12 per cent., and this has been slightly bettered by telephony, but electric light and power has in all except dull years and periods of panic, maintained a rate of growth in excess of 20 per cent. But as we see, the electric automobile has a rate so far in excess of all this it is hardly reducible to a comparison. Maybe we are now, as sailors say, 'pulling in the slack,' and cannot determine real advance till the rope is taut. Such growth is at once our encouragement and our peril.

"In spite of frightful setbacks, due to reaching hasty conclusions from uncertain experiments, the industry has in reality forged steadily ahead, and the men who have contributed to such happy results as now confront us on every hand are entitled to our heartiest praise and our warmest admiration. It is they, doubtless, who would urge us now to redoubled effort and who would warn us above all things against the comforting and fatuous belief that the electric vehicle has fully arrived."

997,227. Automobilst's Tool. Frank S. Baird and William Peters, Congress, Ariz. Filed Dec. 5, 1910. Serial No. 595,834.

1. In combination, a lifting jack body comprising a base forming a tool spaced sides, a lifting member slidably mounted on said body, a lever, and a lifting dog carried by said lever and coacting with the body when the lever is used as a lever to raise the lifting member, said lever being adapted to be positioned between and in alignment with the sides of the body when the device is not used as a jack, and the lifting member having means to engage the lifting dog of the lever to prevent displacement of the latter from aligned position between the sides of the body.

997,233. Carburetter. Fredson E. Bowers, New Haven, Conn., assignor, by mesne assignments, to The Gilbert Manufacturing Company, New Haven, Conn., a Corporation. Filed Jan. 11, 1909. Serial No. 471,738.

1. In a carburetter, the combination with the body thereof, of a Venturi tube located in the said body and open at its upper and lower ends, a spray-nozzle cup removably attached to the lower end of the said body from which it is separated by the main air-inlet of the device, and a spray-nozzle carried by the said cup and rising within the said Venturi tube to the most restricted point thereof.

997,960. Illuminating Identification Device. Frederick L. Briggs, Brookline, and George Morris, Jr., Boston, Mass. Filed April 6, 1908. Serial No. 425,499.

1. An identification device comprising a one-piece casing having a convex rear wall and beveled ends, removable interchangeable information bearing members having each a semi-transparent area constituting an interchangeable combination, a constant additional information imparting means of substantially the length of said casing, the edges of the casing disposed to receive said information bearing members, illuminating means therefor, a detachable locking member for attachment to said casing and provided with a tension member to securely lock said information bearing members in position.

997,970. Lever Lock. Albert B. Diedrich, Detroit, Mich. Filed Aug. 11, 1909. Serial No. 512,296. (Model.)

1. In a device of the class described, the combination with a pair of operating levers having inwardly extending jaws, pivots for said levers, a controlling lever mounted concentrically with the operating levers, parallel guide and stop bars for said levers, and a securing device engaging between the jaws of the operating levers to hold the controlling lever in engagement with the stop bars.

997,979. Ball Retainer. Frank H. Farmer, Cleveland, Ohio, assignor to The White Company, Cleveland, Ohio, a Corporation of Ohio. Filed Dec. 11, 1908. Serial No. 466,954.

1. In a ball retainer, the combination of

WANTS AND FOR SALE

15 cents per line of seven words, cash with order.
In capitals, 25 cents per line.

REBUILT THOMAS CARS—One year's work usually tells the story of the difference in construction between a high grade, high priced and high powered car and those built to sell at a low first cost. The strain of gear shifting, the jar of road shocks, and the stress of brake work begin to tell on the cheaper cars. Therefore the logical deduction is that for the man who wants a thoroughly dependable car at a moderate price the very "best buy" is a high grade used car that has been rebuilt in the factory where it was originally made. We have a few four and six cylinder cars, 1908, 1909 and 1910 models, some priced as low as \$1,000. These cars should not be confused with the ordinary "second hand" proposition, as in the rebuilding all parts which show the slightest wear are replaced by new ones. If you want a car for real work, write us and we will send you special bulletins descriptive of rebuilt cars we have on hand. For a reasonable payment we will hold one of these cars for you for early spring delivery. **USED CAR DEPARTMENT, E. R. THOMAS MOTOR CAR CO., Buffalo, N. Y.**

FOR SALE—Bodies. We offer subject to sale some four and five-passenger touring car and fore-door roadster bodies. Can be rebuilt to fit, and fore-doors can be added to touring bodies if desired. **RACINE MANUFACTURING CO., Racine, Wis.**

FOR SALE—By **THE PATTERSON TOOL & SUPPLY CO., Dayton Ohio**, specialists in garage repair shop outfits, a 15 in. by 6 ft. compound rest "Sebastian" lathe. \$160.

STORAGE—\$4 a month and upward. **RIVERSIDE STORAGE WAREHOUSE, 618 West 131st St., N. Y. City.**

FOR SALE—Knox Model O, water, full equipment. Oakland Model K, top, glass front. Oakland Model 25, elegant full equipment. Oakland racer, a dandy hill climber. Oakland Model K, near new, good. Maxwell D-A model touring, good shape. **F. W. SMITH, 161 Commerce St., New Haven, Conn.**

FOR SALE—1911 Clark 5 passenger, 4 months old, double door type, 30 H. P. Rutenber motor, Remy magneto, demountable rims, 34 x 3½, mohair top, etc. Cost \$1,500. Sacrifice for \$850. **BOX 54, Beavertown, Pa.**

two rings each concavo-convex in transverse section, and each having a plurality of holes, said rings being arranged with their concave sides facing each other, with a plurality of separators which lie between said rings and have tongues which project through holes in said rings and are turned over against the convex outer faces thereof, said separators also having, adjacent to said tongues, convex ends which engage with and fit the concave inner surfaces of said rings.

997,997. Driving Axle Structure for Motor Vehicles. Emil C. Hardegen, Indianapolis, Ind., assignor to The Hardegen

FOR SALE—65 shares United Motor (Rutherford Rubber Co.), 7% cumulative preferred. **LEWIS W. BROWN, Englewood, N. J.**

AUTOMOBILE repairing and overhauling done by a first-class mechanic. **STRAUSS, 25 W. 114th St., care Merkler, New York.**

ACCOUNT CONTRACT CANCELLED, will sacrifice Knox commercial delivery automobile; large size, fancy panel body; solid tires; recently overhauled and repainted; guaranteed perfect; sacrifice \$350, worth \$1,000. **SUPERINTENDENT, CONTINENTAL ICE COMPANY, 437 East 23rd St., N. Y. City.**

FOR SALE—Bargain prices in several used cars—Cadillac, Maxwell, Hup, Flanders and others. **RUSSELL CURRY, Ridgeday, Pa.**

WELD-IT-ALL—Cast iron, aluminum, crank cases—in fact any metal. Machine shops and garages, send your address, we will tell you how; absolutely safe. Good territory for good sales agents. Don't delay. **H. D. PROSE & CO., Hutchinson, Kan.**

FOR SALE—1911 "Oakland," 40 H. P., five passenger, fore-door touring car; full equipment; run three weeks as demonstrator; perfect condition; great bargain; color, battleship gray. Will sell \$1,100 cash; list \$1,785. **DR. F. J. HARLAN, 202 Dryden, Flint, Mich.**

PRIVATE FAMILY will sacrifice Jackson five passenger touring car, \$200; perfect running order; also Overland run-about, \$125; act quick. See **MR. BALDWIN, 437 East 23rd St., N. Y. City.**

WANTED—A capable, experienced advertising and publicity man; one who can get up attractive advertisements and handle publicity properly for one of the best known lines of automobiles in America. State experience and give references in first letter. Address, **N. V., Box 649, New York City.**

FOR SALE—1911 Elmore Touring Car, 30 H. P., fully equipped, cost \$1,500, guaranteed fine condition, price \$850 for quick sale; full description sent; a bargain. **H. J. DANIELS, Norwich, N. Y.**

AUTOGENOUS welding of broken cylinders and crank cases is most expertly done by **WATERBURY WELDING WORKS, Waterbury, Conn.**

Axle Company, Indianapolis, Ind., a Corporation of Indiana. Filed July 21, 1910. Serial No. 573,137.

1. In a rear axle structure, the combination of the main hollow body having oppositely extending tubular extensions and a removable cap, of a differential gearing mounted in said main body and having bearings at its ends, a pair of bearing cups mounted in said main body, said cups relatively axially adjustable to engage or entirely free the differential gearing upon removal of the cap, and shaft sections mounted within the tubular extensions of the main body and having an axial withdraw-

able non-rotative connection with the differential gearing.

998,002. Driving Mechanism for Automobiles. Henry K. Holsman, Chicago, Ill., assignor to Independent Harvester Company, a Corporation. Filed Feb. 9, 1909. Serial No. 476,915.

1. In a driving mechanism, the combination with a driven member having a friction sheave, of a driving member having friction surfaces for one speed and sprocket teeth for another speed, and a sprocket chain adapted to connect said sheave and friction surfaces at one speed, and said sheave and sprocket teeth at another speed, and to be disengaged from either the friction surfaces or the sprocket teeth of the driving member when it is desired to stop the driven member.

998,005. Speed Controlling Means. Elijah Hunter, Boston, Mass.. Filed Apr. 28, 1910. Serial No. 558,241.

1. In a mechanism of the character stated, a supporting frame having a bearing, a driving shaft mounted in said bearing, said driving shaft having a squared end, a plate mounted on said squared end, a driving disk mounted on said squared end, bolts secured to said plate and pinned to said disk, a driven shaft, a bearing on said frame for said driven shaft, a sliding friction disk on said driven shaft to engage said disk on said driving shaft, said sliding disk having a grooved portion, a pivoted lever having a fork to engage said grooved portion, a spring connecting said lever with said frame continuously tending to move it in one direction, and means for moving said lever in an opposite direction.

998,042. Tire Case. Charles H. Semple, Trenton, N. J. Filed Apr. 12, 1909. Serial No. 489,304.

A tire case having an inner strip and a flap formed on its inner side and attached to the same edge of a side of the case, said strip having at its free edge a series of studs, and said flap having a series of socket buttons near its free edge, another

inner strip attached to the edge of the other side of the case, and having formed in it a series of apertures through which the said studs may pass and enter said socket buttons; said inner strips and flap forming a closure lying entirely between the side pieces of the case.

998,099. Ball Bearing. Oliver C. Knipe, Palo Alto, Cal. Filed Dec. 20, 1909. Serial No. 534,207.

1. A ball bearing comprising a hard steel cup, a hard steel cone, balls interposed therebetween, and an abutment on the cone overlapping the end of the cup and molecularly integral with the cone to which it is united by a zone of soft steel.

998,123. Carburetter. Arthur J. Scaife, Cleveland, Ohio, assignor to The White Company, Cleveland, Ohio, a Corporation of Ohio. Filed Dec. 12, 1910. Serial No. 596,758.

1. In a carburetter, the combination with a fuel chamber, a spray nozzle, a conduit connecting said chamber and nozzle, an air conduit open to the atmosphere, and a tubular sheath which surrounds the nozzle and is in communication with said air conduit, and has lateral discharge orifices near its upper end, of a valve casing having aligned inlet and outlet openings in its lower and upper walls, a cylindrical air throttling valve mounted in said casing and having through it a hole in the shape of a Venturi tube, said valve being so placed that the sheath and nozzle project into the sole in the valve, and said valve having in its wall a circumferentially extended slot to accommodate said sheath when the valve is closed.

998,127. Tire for Vehicles. Ernest Siegel and Michael J. Cantor, New York, N. Y., assignors of fifty-one one-hundredths to Jacob Ruppert, Jr., twenty-four and one-half one-hundredths to Ernest Siegel, and twenty-four and one-half one-hundredths to Michael J. Cantor, New York, N. Y. Filed Sept. 29, 1910. Serial No. 584,433.

1. A wheel for vehicles comprising an annular felly, an annular rim surrounding the felly, and intermediate cushions connecting the felly and rim, the rim comprising sections of rigid material, links connecting said sections, and lugs projecting radially from the felly on opposite sides of the connecting links.

998,141. Automatic Fender. George L. Wheeler, St. Louis, Mo. Filed Feb. 20, 1911. Serial No. 609,599.

1. In an automobile fender, a fender proper comprising a frame pivotally mounted to a suitable support in advance of the automobile body, rods constituting forward extensions of said fender frame, an auxiliary fender pivotally supported upon the forward ends of said rods and poised to normally carry in a vertical position, the fender frame proper having a preponderance of weight to the rear of its pivotal point, for the purposes stated.

998,200. Spark Plug Holder. William J. Randolph, Jr., Moscow, N. Y. Filed Dec. 8, 1910. Serial No. 596,318.

1. A spark plug holder comprising a base adapted to be secured to the cylinder of an engine and having a seat for the spark plug, a cap detachably secured to said base, and clamping means on said cap which are adapted to engage said spark plug and clamp the same against said seat, substantially as set forth.

998,213. Recording Speed Indicator. John Osborn Tonkin, Steglitz, near Berlin, Germany. Filed Mar. 23, 1910. Serial No. 551,075.

1. In an indicating device of the class described, in combination, a time stamp, a paper strip adapted to have time indications printed thereon by said stamp, means controlled by the motion of a vehicle for feeding said paper strip relatively to said stamp, an inking roller adapted to be actuated to ink said stamp, a pad adapted to press said paper strip against said stamp, and means comprising a system of cranks for alternately actuating said inking roller and said pad.

No. 46

INVITATION EXTENDED TO GLIDDEN

Asked to Become Head of "Contemplated Merger" and is Considering It—Admits He's Still in the Dark.

Charles J. Glidden, of Boston, the donor of the Glidden trophy, has been invited to head what he himself describes as a "contemplated merger" of automobile companies.

Beyond the fact that he received such an invitation from a man prominently connected with the industry, and that he had promised to consider it, Mr. Glidden, with every appearance of sincerity, admitted to a Motor World man that he knew nothing of the project; he declared that he did not know the names of the companies—if any—that had been or would be approached or that are likely to join the proposed and rather intangible merger. He knew only the emissary who had called on him, who seemed anxious to secure the use of the name Glidden and who promised to return later and supply the details that should be known to every prospective president of every well regulated merger movement.

The emissary has not yet imparted the necessary information but as he had bound Mr. Glidden to hold his identity secret the latter could not disclose his name.

There are those, however, who associate the project with certain things which it is quietly rumored are likely to occur in the vicinity of Detroit on January 1st, or soon thereafter, and which by linking the name Glidden with another well known name can be turned to no small advantage in attracting investors.

N. A. A. M. Reinstates Two Exhibitors.

The December meeting of the board of managers of the National Association of Automobile Manufacturers, which was held in New York yesterday, was short and sweet. It lasted less than half an hour, the only business other than routine which was transacted being the reinstatement to

good standing, so far as shows were concerned, of the Chase Motor Truck Co., of Syracuse, N. Y., and the Penn Motor Car Co., of New Castle, Pa. Both of them exhibited at the unsanctioned show in the Grand Central Palace last January and thereby disqualified themselves. Their reinstatement will permit them to exhibit at the forthcoming shows in New York and Chicago.

Flanders Heads His Pontiac Company.

Walter E. Flanders finally has assumed the presidency of the Pontiac, Mich., company bearing his name, the Flanders Mfg. Co., which makes the Flanders Electric, the Flanders motorcycle and also produces gears, forgings and castings for the trade. He was elected to the office on Tuesday last to fill the vacancy caused by the resignation of Robert M. Brownson, who previously had resigned the general management of the company, which was taken over by Don C. McCord. Brownson's resignation as president and the recent death of John T. Shaw leave two vacancies on the Flanders directorate which have not yet been filled. Flanders himself still remains general manager of the Studebaker Corporation's Detroit interests.

Supreme Court Won't Review Weed Patent

The attempt of the Excelsior Supply Co., of Chicago, to induce the United States Supreme Court to review the merits of the Parsons patent covering the Weed chain tire grip has failed—that tribunal, on Monday last, denying the application for a writ of certiorari which had been filed by the Excelsior company against the decision of the United States Court of Appeals for the Seventh District. The writ of certiorari being the last step possible in patent litigation, the Parsons "non-skid" patent, No. 723,299, is, therefore, valid beyond question or dispute.

Henry Company in Receiver's Hands.

John H. Moore, of Muskegon, Mich., has been appointed receiver of the Henry Motor Car Co. of that city. Both assets and liabilities are said to be small.

STUDEBAKER ADOPTS CREDIT PLAN

Departs from Cash Basis and Will Accept Notes—Protected by Leases and Insurance—Conflicting Opinions.

Undoubtedly few occurrences of recent years have caused more perturbation and excited more variegated comment within the industry than the announcement made late last week by the Studebaker Corporation that henceforth it would accept notes from responsible buyers in payment for its E-M-F and Flanders cars.

While "selling on consignment" to agents has been by no means rare, the action of the Studebakers marked the first departure from the cash basis on which the automobile business has been conducted almost from its inception. There are those who have believed that ultimately something of the sort would come to pass but the nature of the automobile and the amount represented by each sale make the risk so great that none cared to hasten the day or looked forward to it with equanimity.

The reasons for the radical move on the part of the Studebaker Corporation were thus summarized by its general manager, Walter E. Flanders:

"We have in view the future rather than the immediate present, and with the object of expanding and at the same time placing our business on as solid a foundation as others, we simply have adopted the credit method which, more than any other factor, has been responsible for the success of such concerns as the International Harvester, the Rock Island Plow, the Studebaker Wagon, the Singer Sewing Machine and other concerns whose market is worldwide. We have considered the advent of the credit in this business as inevitable and our move is but the consummation of a plan long since laid."

On Tuesday last an official of the Studebaker Corporation stated that the stimulating effects of the announcement had been felt almost immediately.

"In many cases," he added, "dealers have reported that their local banks discounted the buyers' notes, so that the paper will not reach us at all. But we are not doing an instalment business," he continued, "and if the Motor World will assist in counteracting that impression it will perform a service for the industry. We simply are extending credit—extending the same form of accommodation that prevails in nearly all other businesses. But by no means are we throwing the door wide open to anyone who is able to attach his signature to a note and cares to do so. We merely are making it possible for those who are financially responsible to purchase an automobile and in a sense permitting them to use it while paying for it."

The Studebaker plan includes the execution of a lease when a sale is effected and a car delivered, the dealers being supplied with blank leases drawn in accordance with the laws of their respective States. No fixed first payment or percentage of the purchase price is required.

"It all depends on the circumstances and the character of the buyer," said the Studebaker official, in reply to the Motor World's question on this point. "In most cases we believe we can obtain from one-half to three-quarters down. When we get at least one-half, the car immediately is insured in favor of the Studebaker Corporation or of the dealer making the sale. We do not anticipate that many of the notes will run for a longer period than six months."

Opinions expressed by two "high-up" men, who were members of a trade group that discussed the Studebaker departure, best serve to show the views that are held.

"There are only about three businesses in which 'cash on the nail' has been the rule, and the automobile business is one of them," said the first man. "It is hardly supposable that it could last for all time and it was inevitable that some day we must break away from it. There will be no general breaking away for quite awhile yet, but we may as well look facts in the face and though it will require big money to swing it and the risks will be great, if we must do it we simply must set about making arrangements to that end."

The other member of the party was not quite so philosophical.

"It is well enough to talk about wagons and bicycles, plows and sewing machines," he remarked, "but in no respect are they comparable with automobiles. The difference in their cost and the character of their use is too great to place them in the same class. We all know what trifles often cause buyers to dispute their bargains, so what will be the position of manufacturers or dealers, if, by the credit system, purchasers are placed in position to repent of their bargains or throw their cars back on our hands after having taken up a few notes. We would either have to carry an army of lawyers or go into the used-car business."

ANDERSON SEES A BANNER YEAR

Returns From Coast-to-Coast Trip Filled With Enthusiasm—Country is Hungry for Motor Cars, He Declares.

After a coast-to-coast trip covering more than 10,000 miles, J. D. Anderson, general sales manager of the United States Tire Co., has returned to New York extremely enthusiastic over the trade outlook for 1912.

Mr. Anderson visited practically all of the branches maintained by the United States Tire Co., and had occasion to study business conditions in many different sections of the country.

"I am convinced," he says, "that next year is going to be a hummer for the automobile trade and its allied interests. The whole country seems to be automobile hungry. There will be a big demand for cars of every class, and in the middle and far West, particularly, there seems to exist a great field for small, medium-priced cars. The farmers out that way are very much alive to the fact that the automobile is something more than a toy for the use of the opulent city man, and it really is surprising the number of machines that are going into the rural districts.

"Passing through a small western town of perhaps 2,500 inhabitants, I counted 17 cars lined along the main street. To me this indicates the extent to which the automobile has been adopted as a means of transportation in farming communities.

"Business on the Pacific coast is booming. I visited Los Angeles, San Francisco, Portland and Seattle, and found our branches there head over heels in work trying to keep pace with the tire demands of that section of the country. San Francisco is humming with activity and enthusiasm in preparation for the Panama Exposition, which undoubtedly will be a big thing for the West.

"We have opened several new branches and established numerous agencies in the West during the past few months and their reports to me, coupled with my own observations, carry the conviction that the Pacific slope is destined to be an amazingly prolific field for automobile and tire manufacturers.

"The general tone of trade throughout the country is decidedly good and the future outlook extremely bright. Personally, I think there is every reason for saying that 1912 will be by all odds the best year, from every standpoint, that the automobile industry has known."

Colorado Truck Company Acquires Plant.

The Byron Motor Co., of Denver, has purchased what formerly was the plant of the Pueblo Steel Wheel and Wagon Co., in Pueblo, Col., and is installing machinery

for the manufacture of the Byron motor truck, which is described as being designed on a "unit plan" which permits the engine and other parts to be readily replaced without disturbing other parts. The plant occupies 10 acres and is expected to be in operation by January 1st. It is the purpose to produce about 600 trucks, in one, three and five-ton sizes, during the year.

Tires to Be Branded "United States."

At the forthcoming shows, the United States Tire Co. will exhibit for the first time a tire styled and bearing the brand "United States Tire," which it is explained will incorporate "the strongest individual points" of each of the company's four brands at present produced—the Hartford, G & J, Morgan & Wright and Continental. There are those who prophecy that it will not take long for the new tire to wholly supplant the four older brands and that the company's output will soon comprise "United States tires" only, as, indeed, its productions rapidly are becoming generally known.

Kentucky Wagon Makers Add Electrics.

The Kentucky Wagon Mfg. Co., of Louisville, Ky., of which W. C. Nones is president, has taken over the business of the Electric Vehicle Co., which was started in that city several months ago and which produced only a few electrics. The Wagon company will continue the manufacture of the electric vehicles, devoting its first attention to wagons and later to pleasure cars, but without in any way curtailing its production of horse-drawn wagons.

Electric Starter to be Made in Paris.

Under the style the Paris Electric Starter Co., a company has been formed at Paris, Ill., to manufacture an electric starting device for motor cars. Carl Farnham, the inventor of the device, is president; Frank Fishback, vice-president; Chester Showalter, secretary, and Paul P. Shutt, treasurer. Farnham is the owner of a garage and salesroom in Paris, and is backed by local capitalists.

S. G. V. Elected to Board of Trade.

At the regular monthly meeting of the Board of Directors of the Automobile Board of Trade, which occurred yesterday in the organization's New York office, the S. G. V. Motor Co., of Reading, Pa., was elected to membership. All else was of a routine nature. The next meeting of the Board of Trade, which falls on January 9th, will be its annual meeting.

M. A. M. Fixes Date for Annual Banquet.

The annual banquet of the Motor and Accessory Manufacturers has been fixed to occur on Tuesday, January 9th. It will be held in the Waldorf-Astoria. The annual meeting and election of the organization will occur the day before, also at the Waldorf.

DOUBLE-ACTING ENGINE IN SIGHT

Well-Backed Company Adapts Marine Motor to Automobile Service—Its Design and Its Advantages.

While the air has been filled with talk of sleeve valves, rotary valves, slide valves, vibration dampers and numerous other mechanical devices tending toward more or less radical changes in automobile engines, there has been quietly evolving at Bordentown, N. J., a two-cycle motor of a type that is expected to create a considerable stir when it is ready for public exploitation. It is being developed by the Rice Gas Engine Co., of which Harris Hammond, a son of John Hays Hammond, is president; John V. Rice, Jr., the inventor of the engine, is vice-president; W. H. Bartlett, secretary and treasurer, who, with John Hays Hammond, Jr., Wm. W. Baldwin and Fred E. Tasker, constitute the board of directors. The financial resources suggested by several of these names indicate that the company is a substantial one and one whose efforts must be accepted seriously. It has ample resources, a fine large plant, and has been operating, chiefly on the production of marine engines, for some years.

Not only is the new Rice engine of the two-cycle type, but it is double-acting to boot, the crankshaft receiving two impulses per revolution from each cylinder, or a total of eight impulses per revolution from the four cylinders of the motor. For several years the principles involved have been tested in marine motors built in sizes ranging from 25 to 300 horsepower, and with such marked success that a lighter type for automobile service has been designed, built and tested on the block. A car is now under construction for the new Rice motor, and when completed the machine will be thoroughly tried out under road conditions before actual manufacturing operations are commenced.

Owing to the peculiar design of the engine the crankshaft, main bearings and connecting rods are all outside, only the pistons being enclosed in the cylinders, and there is no crankcase, unless that term can be applied to a light metal pan which serves as an excluder of dust and a retainer of oil. Self-starting is a feature of the motor, compressed air being used as a medium for the storage of energy, and distribution is effected through a revolving valve which admits air to the lower combustion chambers of the cylinders, leaving the upper chambers free to take in and fire their charges of gas and pick up the load. The starter will turn the engine over in either direction and the motor will run equally well forward or backward and can be started under a considerable load.

The advantages claimed for the engine are light weight, fuel economy, perfect lu-

brication and extreme simplicity, owing to the absence of valves and the very small number of working parts; great power for its light weight; long life, because the design of the engine permits the use of ample bearing surfaces and there are no small working parts to wear rapidly; accessibility, all bearings being outside; steady running at all speeds and ability to pull well at low speeds because of the constancy of torque, and reversibility and easy starting under air pressure.

Lozier Bestows New Titles on Staff.

Because of a semi-reorganization of its staff, necessitated by its increased volume of business, the Lozier Motor Co., of Detroit, has created the office of general manager and filled it by the appointment of Fred C. Chandler, second vice-president of the company, who, heretofore, has been in charge of the sales department. The management of the latter has been turned over to C. A. Emise, the former advertising manager. Simultaneously John G. Perrin, the company's chief engineer, has been created a vice-president, and Russell E. Benner has been made production manager. All, save the latter, have been connected with the Lozier interests for many years and date from the time when the name Lozier was one to conjure with in the bicycle industry. Benner, who has had manufacturing experience in several other automobile factories and other producing plants, has been connected with the Lozier Motor Co. for some little time and his taking the new title is in the line of deserved advancement.

May Build Golden Arrow in California.

The Curtiss-Shea-Cox Co., of San Francisco, in conjunction with a party of Los Angeles investors, is seeking to float a \$500,000 bond issue, the proceeds of which will be devoted to the erection of an automobile factory in Los Angeles. They purpose manufacturing a 30-horsepower car which will be styled the "Golden Arrow."

Krit English Company Incorporated.

The Krit Motor Car Co., Ltd., of London, which is handling the American car of that name, has been incorporated under English laws with capital of £100 in £1 shares. Its headquarters are at 24-25 Long Acre.

Another American Enters Great Britain.

The Hupp Corporation, of Detroit, is the most recent American manufacturer to "invade" the British market. It has placed its representation for the R. C. H. car in Great Britain with Byrom & Co., of London.

Coldwater Plant For Atkins Carburetter.

The Atkins Mfg. Co. has acquired a plant in Coldwater, Mich., where it henceforth will manufacture the Atkins carburetter. Operations in Detroit, of course, will be discontinued.

BRIGGS COMPLETES HIS COMPANY

His Associates Disclosed and Factory in Detroit Acquired—The Car That Will Be Manufactured.

Claude S. Briggs, who resigned the general management of the Brush Runabout Co. of Detroit, to devote himself to the organization of the Briggs-Detroit Co., preliminary announcement of which was made some two months since, has perfected the organization of his enterprise and has acquired the factory for which he has been negotiating, and is about to begin actual operations. Briggs, as already was known would be the case, has been elected president and general manager of the company, but his associates just have been disclosed. They are John A. Boyle, who has been chosen vice-president, and Emil D. Moesner, who is secretary and treasurer. They comprise the present board of directors.

Briggs, who heads the new company, is one of the best known and most energetic developments of the Detroit trade. Before joining the Brush Runabout Co. in the capacity of general manager, he served as president of the Krit Motor Car Co. in the organization of which he was largely instrumental. Emil D. Moesner, the secretary and treasurer, is at present treasurer of both the Brush Runabout Co. and the Briscoe Mfg. Co., both of which offices he will relinquish to join Mr. Briggs. John A. Boyle, the vice-president, is general manager of the Briscoe Mfg. Co., and it is generally understood that his interests in the Briggs-Detroit Co. will be of a financial and advisory nature, and that it is not likely he will resign his connection with the Briscoe company.

The plant which they have acquired is a modern structure which was built about a year ago for the Reinforced Concrete Pipe Co., which, because of alterations in their plans, never occupied it. It is located in Detroit at the junction of Holbrook avenue and the Grand Trunk Railroad. It has cement floors throughout and is up-to-date in every particular and is of a sufficient size to permit of a production of 5,000 cars per year. It also readily may be expanded to bring the output up to 8,000 cars. The Briggs-Detroit Co., which is capitalized at \$200,000, of which 80 per cent. has been paid in, will occupy the factory within two weeks and expects to be able to make delivery of cars about February 1st.

The car which will be produced and which will be styled the Briggs-Detroit, will be a five-passenger, 25 H. P. touring car, selling for \$850 fully equipped, and a two-passenger roadster on the same chassis priced at \$700 fully equipped.

The motor is of the long stroke type, $3\frac{1}{4} \times 4\frac{1}{4}$ inches, its crank shaft being mounted on ball bearings. The modern

tendency to enclose working parts and quiet their operation as much as possible is exemplified in the housing of the timing gears within the crankcase, the covering of the valves by removable plates and the encasing of the flywheel and clutch in a single housing. The intake passages are carried under the water jackets, the idea being to heat the gas and improve carburation, in addition to making a clean looking engine. Cooling is accomplished by the thermosiphon system, and both inlet and outlet for water are two inches in diameter.

Carburettor and magneto are placed on opposite sides of the motor and valves, all alike and interchangeable, on the right hand side. The clutch is of the multiple disk type and transmits power to a change speed gear which gives three forward speeds and a reverse, the gears being carried in a one-piece aluminum case. Final drive is through propeller shaft and bevel gears to the full floating type rear axle running on ball bearings in a one-piece pressed steel housing. The brakes are enclosed and the brake-drums are 14 inches in diameter.

Center control is used, with left side drive. The steering gear is of the worm and nut pattern and is adjustable; the wheel is 16 inches in diameter. Metal sheets form the body, which is of the closed front type and will accommodate five passengers. Doors open forward. In proportion to the weight of the car, said by the makers to be 1,750 pounds fully equipped, the tires should be of ample carrying capacity, being 32 by 3½ inch. Rear springs are of the full platform type, which it is asserted are not used in any car listing at less than \$1,750.

Internal War Disrupts Rubber Company.

Largely because of long continued internal dissension the Mansfield Rubber Co., of Mansfield, Ohio, a \$250,000 corporation, is in the hands of S. E. Ward as receiver, the bankruptcy proceedings having been instituted by New York creditors who shared the dissatisfaction which existed. The company was organized in December, 1908, by Charles H. and F. W. Walters and F. A. Wilcox, of Akron, who were experienced rubber men. They soon got into trouble with the other stockholders, however, and some bitter allegations resulted. Among other things, it was charged that F. W. Walters and F. A. Wilcox disposed of their stock to other Mansfield people and made misrepresentations regarding the condition of the company, to effect the sale. There were also accusations of stock and other financial manipulations, because of which it was stated Charles H. Walters was forced out of the vice-presidency and general management of the company in August last. Several suits growing out of the situation have been filed not only against the company but against Charles H. Walters personally. When it was seen that the company was heading for the bankruptcy court, B. L. Chase, its president, sought to effect

a reorganization, but the majority of the stockholders would not consent to his plans.

Changes Among Prominent Tradesmen.

P. S. Beamer, who for a considerable period has been identified with the Metzger Motor Car Co. in Detroit, has been promoted to the post of general auditor of the company. He will have charge of all accounting and similar work.

George Main, formerly assistant traffic manager of the Chalmers Motor Co., has been appointed traffic manager of the Metzger Motor Co. of Detroit. He has been identified with the traffic service in Detroit for many years which implies that he has ripe experience.

Charles W. Sponsel has been appointed factory manager of the Pierce Motor Co., of Racine, Wis. Sponsel is an old resident of Hartford, Conn., where he was connected with the Colt Fire Arms and Pratt & Whitney factories. He has served also with the General Electric Co.

P. P. Willis has resigned as advertising manager of the Mais Motor Truck Co., of Indianapolis, to assume a similar position with the National Motor Vehicle Co., of the same city. Previous to his connection with the Mais company, Willis performed publicity work for the Willys-Overland interests.

Durant Honored at "Wizard's Banquet."

W. C. Durant, who placed Flint, Mich., on the automobile map, and who expanded the Buick Motor Co. to such huge proportions, was the guest of honor at what was denominated "The Wizard's Banquet," which was tendered him by the business men of that city on the 28th inst. Several of his associates, including his chief lieutenant, W. H. Little, who heads Durant's and Flint's newest enterprise, the Little Motor Car Co., were among the many who paid tribute to the bundle of energy who certainly did things in a way that made the automobile industry "take notice."

Westerdale to Manage Hupp Branch.

The Hupp Corporation, of Detroit, has established a branch in Chicago in temporary quarters at 2515 Michigan avenue. It will be managed by H. E. Westerdale, formerly manager of the Studebaker branch, and will direct the sale of R. C. H. gas cars and Hupp-Yeats electrics in Illinois, Iowa, Wisconsin and Nebraska.

Loan, Fire and Debts Cause Mix-up.

Affairs of the R. E. Lawrence Auto Livery Co., of Peoria, Ill., are in a more than tangled state, owing to a loan, a fire and two bankruptcy petitions filed by R. E. Lawrence personally, and the Lawrence company as a corporation, and both the debtors as well as the creditors have applied to the courts to straighten out the tangle. It appears that in March of this year, Lawrence borrowed \$750 of the Mer-

chants' National Bank, turning over as collateral a fire insurance policy payable to the Auto Livery company. Just before Lawrence became bankrupt the garage burned down and the bank collected on the insurance policy; it is still keeping the money. When Lawrence became bankrupt, this money was claimed by Charles C. Cockle, the trustee in bankruptcy, as part of his assets; a short time later when the company itself went bankrupt, Clarence W. Heyl, who had been appointed receiver for the company, also claimed the same money, on the ground that it properly belonged to the assets of the company. The bank has caused the dispute to be aired in court and will pay the money to whomsoever the court designates as the rightful claimant.

New Locations for Ajax Branches.

The Ajax-Grieb Rubber Co.'s Detroit branch has been removed from 745 Woodward avenue to No. 507 on the same thoroughfare. The Denver branch of the company also has been removed from 1518 Broadway to a new location at 1529 Cleveland place. In both instances the additional room secured which will permit the carrying of larger stocks.

Jones Locates Wheel Plant in New York.

Phineas Jones & Co., of Newark, N. J., who have been building wheels since 1885, have set up a branch plant in New York City at 12th avenue and 55th street. They long have made a specialty of automobile wheels and the New York plant will enable them to supply or repair either pleasure car or truck wheels more quickly than heretofore.

Hagstroms Adding to Their Productions.

The Hagstrom Bros. Mfg. Co., of Lindborg, Kans., which manufactures an emergency tire sleeve, has taken over the business of the Auto Vehicle Washer Co., of Topeka, which produced a patented mop or washing device. The Hagstroms are also negotiating for another automobile invention which probably will be added to their line.

Motz Branch Opened in New York.

The Motz Tire & Rubber Co., of Akron, Ohio, has opened a branch in New York City, at Broadway and 55th street. It is in charge of E. P. White, who previously was with the Goodyear Tire & Rubber Co.

More Room for Splittorf in 'Frisco.

Because of pressing need of more elbow room, The C. F. Splittorf, San Francisco Branch, has been removed to 430-436 Van Ness avenue. It remains in charge of P. E. Kempton.

Gould and Dean in Credit Association.

The Gould Storage Battery Co., of New York, and the Dean Electric Co., of Elyria, Ohio, have been elected to membership in the Automobile Trade Credit Association.

El Paso, Texas.—The El Paso Automobile Club, under Texas laws. Corporators—French S. Cary, W. J. Rand, C. W. Kenny.

Detroit, Mich.—Simpson Tire Fiber Co., under Michigan laws, with \$100,000 capital. Corporators—S. L. Simpson, James D. May, Harry J. Dingman.

Davenport, Iowa.—Davenport Auto Co., under Iowa laws, with \$10,000 capital; to deal in automobiles. Corporators—Charles A. Frey, August A. Leberman.

Milwaukee, Wis.—Packard Motor Car Co., an Illinois corporation, admitted to do a general automobile business in the State of Wisconsin. Wisconsin capital, \$25,000.

Richmond, Va.—Broad Street Garage Co., under Virginia laws, with \$5,000 capital; to deal in automobiles and maintain a garage. Corporators—A. Zachary, O. B. White, C. Stokes.

Louisville, Ky.—The Transit Motor Car Co., under Kentucky laws, with \$20,000 capital; to deal in motor vehicles. Corporators—R. C. Walker, George H. Laib, W. B. Young.

St. Joseph, Mo.—Grassfield Automobile Co., under Missouri laws, with \$2,000 capital; to deal in automobiles. Corporators—E. A. Grassfield, F. E. Frank, George Vetuske.

Peoria, Ill.—Reliable Tire Repair Co., under Illinois laws, with \$2,400 capital; to deal in automobile tires and accessories. Corporators—John V. Leslia, George Haas, Bert Fritz.

Newark, N. J.—Lenox Motor Car Co., under New Jersey laws, with \$25,000 capital; to deal in motor vehicles. Corporators—L. Lippman, J. M. Shreffler, M. Lippman, C. Shreffler.

Buffalo, N. Y.—Pierce-Arrow Sales Co. of Buffalo, with \$75,000 capital; to deal in automobiles and other motor vehicles. Corporators—W. J. Minehan, T. D. Powell, W. H. Huntington.

Taunton, Mass.—The Perry Auto Co. of Taunton, under Massachusetts laws, with \$3,000 capital; to deal in automobiles. Corporators—Homer L. Lane, Frank W. Perry, James B. Wetherell.

Eagle Grove, Iowa.—Middleton Auto Co., under Iowa laws, with \$10,000 capital; to deal in automobiles and other motor vehicles. Corporators—Lyman B. Middleton, Claude E. Middleton.

Toledo, Ohio.—Moore Motor Truck Co., under Ohio laws, with \$10,000 capital; to deal in motor vehicles. Corporators—D. W. Bliss, M. M. Bliss, E. L. Skidmore, C. H. Rauch, F. E. Moore.

Chicago, Ill.—Fort Dearborn Auto Repair Co., under Illinois laws, with \$1,200 capital; to deal in motor vehicles. Corporators—Albert Campbell, Henry L. Baum, Donald S. McKinlay.

Indianapolis, Ind.—General Specialty Co., under Indiana laws, with \$40,000 capital; to manufacture automobile tires. Corporators—C. F. Gregg, R. E. Gregg, W. W. Gregg, N. W. Coulter.

GARDEN'S FULL DRESS DESIGN

First Glimpse of Setting Selected for Madison Square Garden Show

Denver, Cal.—Maxwell-Chamberlain Motor Co., under Colorado laws, with \$20,000 capital; to deal in automobiles and other motor vehicles. Corporators—Glen A. Maxwell, Fred B. Chamberlain.

Duluth, Minn.—Grand Avenue Garage Co., under Minnesota laws, with \$25,000 capital; to deal in automobiles and maintain a garage. Corporators—Frank Chambers, C. A. Knippenberg, C. M. Phillips.

Buffalo, N. Y.—Herkimer Garage Co., under New York laws, with \$10,000 capital; to maintain a garage and deal in automobiles. Corporators—Roland J. Conover, Robert E. Conover, Louis J. Jilson.

Charleston, W. Va.—Collison-Pierson & Co., under West Virginia laws, with \$25,000 capital; to deal in automobiles. Corporators—J. F. Collison, S. R. Pierson, W. B. Taylor, O. H. Ashley, A. B. Koontz.

Kiel, Wis.—Kiel Motor Car Co., under Wisconsin laws, with \$10,000 capital; to deal in automobiles and other motor vehicles. Corporators—J. Fred Thiessen, Philip Jugheimer, William A. Duecked.

New York City, N. Y.—Gurlitt-Braun-Davis Corporation, under New York laws, with \$25,000 capital; to manufacture and deal in motor vehicles. Corporators—H. Gurlitt, D. S. Davis, Jr., V. C. Bogardus.

Marshalltown, Iowa.—The Motor Car Accessories Manufacturing Co., under Iowa laws, with \$10,000 capital; to manufacture and deal in automobile accessories and supplies. Corporators—Charles C. Eldridge, Edwin J. Beebe.

Ogden, Utah.—Blair-Jones Auto Co., under Utah laws, with \$25,000 capital; to deal in automobiles and other motor vehicles. Corporators—Poseph S. Campbell, M. W. Kimball, J. Parker Blair, S. H. Blair, L. H. Blair, H. C. Blair, Jr.

Naugatuck, Conn.—S. M. B. Rubber Co., under New York laws, with \$150,000 capital; to manufacture and deal in rubber and rubber goods. Corporators—A. C. Squires, Akron, Ohio; E. Beekman, C. C. Beekman, both of New York City.

Dubuque, Iowa.—The Dubuque Rambler Auto and Supply Co., under Iowa laws, with \$10,000 capital; to deal in automobiles and motor accessories. Corporators—Arch Frater, E. J. Schreck, B. M. Fitzgerald, William E. Ellwanger, William M. Gerenger.

Changes in Corporate Name.

Chicago, Ill.—Pope-Hartford Motor Car Co., changes name to Deibler Motor Car Co.

Joliet, Ill.—Steinhart-Jansen Automobile Co., changes name to Towle Automobile Co.

Detroit, Mich.—Auto Brass Manufacturing Co., changes name to Brass Products Co.

Increases of Capital.

Urbana, Ill.—Illinois Motor Sales Co., from \$12,000 to \$25,000.

Detroit, Mich.—Michigan Stamping Co., from \$10,000 to \$300,000.

St. Louis, Mo.—Banner Rubber Co., from \$100,000 to \$400,000.

Port Huron, Mich.—Havers Motor Car Co., from \$60,000 to \$200,000.

Nashville, Tenn.—Marathon Motor Works, from \$600,000 to \$1,000,000.

Sandusky, Ohio.—Sandusky Auto Parts & Motor Truck Co., from \$150,000 to \$500,000.

This simple device
places your car among
the safe percentage.

Skidding is responsible for 90 per cent. of automobile accidents. See that you do not risk the lives of your passengers on the greasy roads and pavements this Fall and Winter. Equip your automobile with

Pennsylvania Vacuum Cup Tires

The principle is simple, like all big ideas. On a tread of regular thickness is moulded a series of cup-shaped rubber knobs which exert a vacuum hold on wet and greasy pavements. Slipping in any direction is im-

possible. The rolling of the wheel releases each cup automatically by raising one side first, so that forward speed is not retarded.

In snow and mud the knobs sink in and provide a better hold and better "traction" than any other form of non-skid.

Longer Service is a strong feature of Pennsylvania Vacuum Cup Tires. Even when the rubber knobs wear down, the tire is still as good for service as a smooth tread tire of regular thickness.

You combine the essential qualities of Safety and Economy by using these non-skid and long wearing tires.

Utility of the Extra Air Valve.

In view of the fact that manufacturers as a rule have been quick to see and adopt valuable features which are calculated to increase the efficiency of their products in general, perhaps it is not to be wondered at that they have completely overlooked at least one small thing which, if properly designed and applied, should go far toward decreasing maintenance cost and depreciation. Briefly, it is the fitting of an extra air valve to the carburetter, by means of which pure air may be admitted to the cylinders when the engine is used for braking, instead of making necessary the use of the "mixture" for this purpose.

That not a few motorists appreciate the advantages incidental to the use of the engine as a brake is not to be gainsaid; depreciation is lessened for the reason that the braking effort is applied smoothly and steadily. Also the braking effect is perfectly equalized, assuming, of course, that the same coefficient of friction exists at both rear wheels. But in order to obtain the greatest braking effect from the engine the throttle must be opened to its widest limit, and herein arises the objection that under such conditions gasoline consumption increases.

If, instead of necessitating the use of the "mixture" in order to obtain the greatest braking effect, an extra air valve were provided, the benefits accruing would be twofold, in that gasoline consumption would be decreased and the general wear and tear on the car incidental to ordinary braking strains would be reduced materially.

Of course the design of such a valve requires considerable thought and study, for it must be so constructed that under ordinary running conditions the quality of the mixture is not affected as it would be by leaks. But its design scarcely entails the solution of problems harder than those that have been solved in the evolution of other parts of the car, and because of its undoubted advantages it should be plain that the initial expenditure necessary in its production will be more than repaid in the end.

Noises That Make Garages Nuisances.

The undoubted ill favor in which garages are held in residential districts is due in large measure to causes that can be removed, in most cases, by the exercise of authority and a little ingenuity on the part of the garage management. One prolific source of disturbance and probably the most unpleasant, is the raucous sounding of the automobile horn by the chauffeur who, arriving at the garage finds the doors closed and takes such a method of expressing his desire that they be opened. If his signal is not heard or heeded at once it is repeated, with ever increasing vigor, until the car is admitted.

At this season of the year, when garage doors are kept closed at all hours to exclude the cold air, the horn tooting nuisance is at its worst and at certain hours is sufficient to constitute a public nuisance.

Another effective murderer of peace is the turmoil caused by the opening of the muffler cut-out when a car mounts the short, sharp grade that is frequently found at the garage entrance. Rather than take the trouble to change to a lower gear the chauffeur opens his exhaust to the atmosphere in order to realize the added power which he fancies "cutting-out" gives to his motor, and the fusillade that follows is second only to the clamor of the horn in its nerve-racking or sleep-dispelling power.

Although existing conditions do not seem to bear out the statement, there are good reasons why garage proprietors should not permit such a state of affairs to exist. The good-will of neighboring residents is as-

surely of value, for many are potential, if not actual customers, and prejudice, easily aroused, is difficult to allay. Moreover, organized opposition to a public nuisance can make much trouble, even to the extent of causing arrests or forcing the removal of the offending establishment in case of persistent misdeeds. And this horn-blowing nuisance is so necessary and so prevalent that the wonder is that garage owners will suffer it to continue when it holds promise of so much trouble for themselves, and when it so easily may be abated.

Making Truck Sales and Losing Them.

In this day of keen competition and of battles of wit and knowledge between rival motor truck agencies, a salesman is justified in making use of every legitimate plan he can concoct in the furtherance of his business. A task particularly difficult to accomplish is the sale of a vehicle to a prospective purchaser who already has become interested in the product of another manufacturer, and the salesman who can secure an order under such conditions, by legitimate means, may consider himself a real salesman.

But in the mad rush for orders and still more orders, the ethics of salesmanship too frequently are ignored, and methods are adopted which assuredly cannot be classed under the head of fair salesmanship. For example, there are dealers who keep carefully compiled lists of users of motor trucks of various makes, with the names of dissatisfied users carefully checked. Every user thus indicated can be depended upon to make a discouraging report—in the salesman's parlance he is a "knocker." When the holder of such a list finds that the "prospect" is already interested in some particular car, he at once looks up the vehicle on his list and, selecting one of the "knockers," cites his case to the prospect and adroitly suggests that he be asked to give his experience. This often brings the desired result, but there are cases where the would-be purchaser, finding that his efforts to obtain information result in "confusion worse confounded," abandons, at least temporarily, the idea of motor haulage.

In the enormous field that is now open for the sale of commercial motor vehicles, it would seem that there is no need for work of this kind. It does not smack of fair dealing.

THE MOTOR WORLD

At a cost of \$45,000 the Brown Taxicab Co. is erecting a three-story fire-proof garage at 1129 Cathedral street, Baltimore, Md.

At a cost of \$20,000 the Crispen Motor Car Co. is building a three-story hollow tile garage on South Cameron street, Harrisburg, Pa.

The Capital City Garage Co. has opened salesrooms at 316 Court avenue, Des Moines, Ia. The company handles the Jackson line.

M. J. Nolan and George A. Smith are building a one-story garage at 1306 South Main street, Los Angeles, Cal. It will cost, when complete, \$8,000.

H. A. House, of Iliou, N. Y., has leased the garage now in course of construction on Washington street, Utica, N. Y. He has the agency for Mitchell cars.

Milton Wolfe, one of the partners in the Eureka Auto Co., of Lone Tree, Minn., has disposed of his interest to John Rife. The company will continue business under the same style.

Henry Litt and his two sons have opened a garage at the corner of Ninth and G streets, Modesto, Cal. Aside from operating a renting service they will handle several lines of popular-priced cars.

H. E. Dunseth has formed a partnership with Fred S. Beckwith, who has the Abbott-Detroit agency for Spokane, Wash., under the style Abbott-Detroit Sales Co. They have opened salesrooms at 1223 Sprague avenue.

John Bender, formerly connected with the Stevens-Duryea, Thomas and Knox agencies in Chicago, has gone into business on his own account and opened salesrooms at 2437 Michigan avenue. He will handle Garford cars.

Salesrooms have been opened at 110 West Second street, Oklahoma City, Okla., for the display of Penn "30" and "40" pleasure cars and commercial vehicles. J. T. Wheatley and John Sharp are the men behind the enterprise.

The Jacobs & Anderson Auto Supply Co., which has been doing a supply and accessory business on Park avenue, Omaha, Neb., has filed a petition in voluntary bankruptcy. Its liabilities are given at \$1,163 and its assets at \$86.

W. H. Vinal, president of the Motor Car Co., which handles the Nance car in Boston, Mass., has sold his interest to S. S. Anderson and has resigned the presidency. L. W. Abbot has been appointed sales manager of the company.

D. E. Kelly, a farmer near Clinton, Ia.,

has found plowing too slow and has purchased the business and good will of the Clinton Auto & Supply Co., formerly owned by M. J. Dannatt. The company has salesrooms on Sixth avenue.

Canadian Agencies, Ltd., which handled Republic and Moon motor cars at 188 Market street East, Winnipeg, Man., has been adjudged bankrupt and C. H. Newton has been appointed receiver. The creditors expect to realize about 50 cents on the dollar.

J. H. Weller, until recently superintendent of the Matheson Automobile Co., has formed a partnership with one of his former foremen, J. B. Davidson, for the purpose of conducting a garage and machine shop. It will be located at Williamsport, Pa.

The Acme Motor Co., which was organized last month at Worcester, Mass., to take over the business of the D. A. Baldwin Co., has purchased the four-story garage at 22 Commercial street, for \$40,000. The building is 60 x 100 feet and will be used by the Acme company as salesrooms and service department.

R. W. Gallagher, formerly president of the American Motor Car Co., of California, and F. B. Tompkins have formed the Gallagher-Tompkins Co. and opened salesrooms at 1876 Broadway. Tompkins is president of the company, which will handle Selden cars in the territory covered by Manhattan and Long Island.

Clifford Southwick, one of the partners in the Maxwell Automobile Agency, Erie, Pa., has filed a petition in the Superior Court, asking that George McLaughlin, the other partner, be restrained from selling, collecting or purchasing in the name of the firm, pending a dissolution of the partnership, and that a receiver be appointed.

Emulating the policy of several of the larger motor car companies, the Moline Automobile Co., East Moline, Ill., has opened a factory branch in Minneapolis, Minn. It is located at 1401 Hennepin avenue, and is in charge of G. H. Wright. The branch will cover the territory comprising Minnesota, North and South Dakota and western Wisconsin.

The Mooney Automobile Co., which formerly had the Canadian agency for Warren-Detroit cars, with salesrooms on Main street, Winnipeg, Man., has gone out of business. The company had no liabilities and dissolved by mutual agreement between the partners. Warren-Detroit cars in the future will be represented in Winnipeg by the American-Abell Engine and Thresher Co.

Recent Losses By Fire.

Savannah, Ga.—Ford Automobile Co.'s salesrooms, 221 East Broughton street damaged. Loss, \$4,000; not insured.

Toledo, Ohio—Lewis Electric Welding & Mfg. Co., and McNaull Auto Tire Co., 234 Cherry street, damaged by fire. Loss, each company about \$2,500.

December 20, New York City, N. Y.—Annual banquet of the Automobile Club of America at Waldorf-Astoria.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

December 30-January 6, Buffalo, N. Y.—Buffalo Automobile Trade Association's annual show in 74th Regiment Armory.

January 2-10, New York City, N. Y.—Importers' salon at Hotel Astor.

January 6-13, New York City—Automobile Board of Trade's 12th annual show in Madison Square Garden. Pleasure vehicles only.

January 10-13, Peoria, Ill.—Peoria Automobile Club's show in the Coliseum.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual national show in New Grand Central palace. Pleasure and commercial vehicles.

January 13-19, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's annual show in Auditorium.

January 13-27, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show in First and Third Regiment Armories.

January 15-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden. Commercial vehicles only.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-27, Providence, R. I.—Rhode Island Licensed Automobile Dealers' Association's show in the State Armory.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show at Wayne Garden.

January 27-February 3, Pittsburgh, Pa.—Automobile Dealers' Association of Pittsburgh, Inc., sixth annual show of pleasure cars.

February 3-10, Montreal, Can.—Automobile Club of Canada's annual show at Drill Hall.

February 5-10, Pittsburgh, Pa.—Automobile Dealers' Association of Pittsburgh, Inc., sixth annual show of commercial vehicles.

February 5-17, St. Louis, Mo.—Annual show in the Coliseum.

February 12-17, Ottawa, Can.—Ottawa Valley Motor Car Association's first annual show.

February 12-17, Kansas City, Mo.—Motor Car Trades' Association's show in Convention Hall.

OHIOANS STIR THE A. A. A. MEETING

**Cincinnati Delegates Question Minutes—
"Deep, Dark Hints" Result—Few
Changes of Officials.**

Robert P. Hooper, of Philadelphia, Pa., was re-elected president of the American Automobile Association at its annual meeting which occurred Tuesday, the 5th inst., in New York. There were no dissenting voices and his re-election therefore was formally unanimous. It is doubtful, however, that all of the Ohio delegation raised their voices to say "Aye."

In Cincinnati and the vicinity thereof there are at least several delegates who, if they did not possess a grouch, at least inclined to a ruffling of feathers. They created a flurry last year and they repeated the performance on this occasion. They maintained that at the last meeting of the A. A. A. it had been agreed that the annual meeting, just held, would occur in the West. They brought their contention to New York and doubted the accuracy of the minutes which, when read, did not bear out their belief. The minutes nevertheless, were approved by an overwhelming majority.

There were indications that the Cincinnati men did not accept their defeat in good part. They absented themselves from the association banquet which occurred Tuesday night, and, according to one highly-colored story, sought comfort in the company of a one-time and disaffected secretary of the A. A. A., who at present is engaged in selling maps for a private corporation which styles itself the Touring Club of America—which, if true, suggests that the map salesman and the disgruntled Ohioans may do something which will afford at least fleeting entertainment and reading matter for the public. The fact that a Cincinnati man was re-elected third vice-president suggests that the story is a false alarm, but it is as certain that H. L. Vail, of the Cleveland Automobile Club—Cleveland is in Ohio—declared in a public speech that his club had no sympathy with the effort "to disrupt the national organization," which could imply but one thing.

With the exception of the second and fourth vice-presidents the entire board of officers was re-elected, the complete slate of officials being as follows:

President—Robert P. Hooper, Pennsylvania.

First vice-president—Frank M. Joyce, Minnesota.

Second vice-president—Laurens Enos, New York.

Third vice-president—C. L. Bonifield, Ohio.

Fourth vice-president—Ralph W. Smith, Colorado.

Fifth vice-president—F. L. Baker, California.

Secretary—John N. Brooks, Connecticut.
Treasurer—H. A. Bonnell, New Jersey.

Executive committee—A. G. Batchelder, New York, chairman; Robert P. Hooper, president; Lewis R. Speare, Massachusetts; Frank G. Webb, New York; F. T. Staples, Connecticut; H. L. Vail, Ohio; P. J. Walker, California; H. E. Coffin, Michigan; Frank M. Joyce, Minnesota; J. H. Weeks, Pennsylvania; E. C. Smith, Vermont; A. H. Knoll, New York; J. H. Edwards, New Jersey; Dr. A. P. Overgaard, Nebraska; C. M. Robinson, Connecticut; David Beecroft, Illinois; John N. Brooks, Connecticut; Powell Evans, Pennsylvania; P. M. Milner, Louisiana; J. P. Coghlin, Massachusetts; Paul C. Wolff, Pennsylvania; James T. Drought, Wisconsin; S. A. Miles, New York; F. C. Battey, Georgia; Charles E. Doe, Rhode Island; Edwin S. George, Michigan; H. O. Bonnell, New Jersey; H. C. Peck, Virginia; H. B. Race, Florida; H. M. Rowe, Maryland; S. D. Capen, Missouri; H. L. Gordon, Ohio; Oliver Quayle, New York; W. E. Metzger, Michigan; C. H. Verschoyle, Texas; Preston Belvin, Virginia; H. J. Clark, Massachusetts; John A. Wilson, Pennsylvania; W. E. Moyer, Iowa; W. M. Stevenson, Massachusetts.

The chairmen of the various boards are: Legislative—Charles Thaddeus Terry, New York; Good Roads—George C. Diehl, New York; Touring Information—Howard Longstreth, Pennsylvania; Contest—William Schimpf, New York.

Although the constitution permits the executive officers to say where the annual meeting shall be held, as a matter of courtesy and good will and to avoid such misunderstandings as ruffled Cincinnati, the A. A. A. formally voted on Wednesday to hold next year's meeting in Chicago.

The State associations of Nebraska, South Carolina, North Dakota and Montana were formally admitted into the association, while the admission of North Carolina only requires a meeting to perfect its State organization. During the year the individual membership increased from 35,000 to over 51,000, while the number of State associations rose from 36 to 42, and that of affiliated clubs from 249 to 314.

The report of the treasurer showed that for the last year the receipts were \$44,678.60 and the disbursements \$41,385.53, which leaves a balance of \$3,293.07, though there are other available assets, principally dues payable, which will bring up the balance to approximately \$5,000.

According to the report of the Contest Board, the number of events sanctioned during the past year decreased to 116 as against 175 for the previous year and 127 two years ago.

In the report of the committee on resolutions reference was made to the recent death of Chairman S. M. Butler of the contest committee, who lost his life while on the Glidden tour, and a resolution will be drawn up, adequately expressing the great loss to the association in the death of such

an efficient and thoroughly respected official.

Realizing that in its endeavors to have the Yellowstone National Park opened to automobile traffic it could do little alone, the Bannock County Automobile Club, of Pocatello Idaho, requested that the A. A. A. have its other Western State associations approach their legislators on the subject. Support was pledged to the Bannock County Club, and a bill to have the park opened will be drafted for introduction into Congress, either by that organization or by the A. A. A. itself.

"Regulars" Win in Wolverines' Election.

At the annual meeting of the Wolverine Automobile Club, which was held in Detroit, Mich., on Tuesday last, December 5th, the "insurgents"—good-naturedly so called—were snowed under, only one of the entire ticket escaping the blizzard. Both tickets were headed by H. J. Porter, who naturally was elected president, the other officers chosen being as follows: First vice-president, Charles F. Gilmour; second vice-president, W. F. Zimmer; treasurer, E. W. McGookin; directors, the officers and William G. Bryant, H. H. Robinson, William P. Culver, and Charles A. Grant.

The secretary of the club in his report covering the past year called attention to the phenomenal growth of its membership, which has increased from 317 to 1,441 members in good standing. They include the majority of Detroit's large colony of automobile manufacturers, parts and accessory manufacturers and dealers, and most of their staffs. The treasurer's report showed the finances of the club to be in excellent condition, its receipts during the fiscal year having been \$7,882 and its disbursements \$4,211, leaving a cash balance of \$3,671. The organization, which now has quarters in Hotel Griswold, has in view the building of a clubhouse of its own.

Next Glidden, Minneapolis to New Orleans.

In all probability there will be no unseemly doubts and postponements affecting the Glidden tour of 1912, such as marked the preparation for this year's event. St. Paul and Minneapolis want the tour and already have set about getting it, and as interest in New Orleans also is stirring the Minnesota people are in touch with the Louisianans and as a result there is every prospect that the route of next year's tour will be from Minneapolis to New Orleans, which will not be exactly a route for "tenderfeet" to follow. The Minnesota motorists, however, have promoted so many grueling endurance contests—notably from the Twin Cities to Helena, Mont.—that they know what they are doing in this instance. The clubs in both cities have taken formal action and their officials already are in touch with the A. A. A. officials. There is small doubt that the Twin Cities will be able to get the 1912 tour almost for the asking.

NEW YORKERS BUSY AT ALBANY

State Association Elects Officers, Banquets
and Listens to Notable Men—Governor
Dix Expresses Co-operation.

Totally eclipsing all previous records for interest and attendance, the annual convention of the New York State Automobile Association which was held at the Hotel Ten Eyck in Albany, N. Y., on Saturday last 2d. inst., was by far the biggest and most important gathering of the kind that ever has taken place since the banding together of the various local clubs into a State organization. In all something over 50 automobile clubs were represented by the 300-odd delegates from every section of the State who attended. For comparison it is merely necessary to state that last year's representation was scarcely one-third as great.

With the exception of Secretary J. Arthur Ritchie, of Albany, who was re-elected, all the officers elected are new to their positions, A. J. Deer, of Hornell, N. Y., taking the presidency. Laurens Enos, of Buffalo, was the man originally slated for president to succeed Frank G. Webb, of Brooklyn, but press of business necessitated his withdrawal. The other officers elected were as follows: Vice-presidents, H. C. Strong, Rochester; Howard Martin, Albany, and Arthur B. Maynard, Utica; treasurer, Fay C. Parsons, Cortland; delegates-at-large, Charles Thaddeus Terry, New York; H. A. Meldrum, Buffalo, and A. G. Batchelder, New York. Watertown, Amsterdam and Plattsburg were admitted to membership in the State association.

The convention was split up into two sessions, one in the afternoon and one in the evening, the last session being terminated with a banquet, at which Governor Dix was the guest of honor. He was escorted by the delegates from the State House to the Ten Eyck, where he spoke at length on the necessity for good roads, and drew attention to the active part which the Federal government has taken in the building and maintenance of highways. During the course of his address he favored abolishment of grade crossings by the State and brought out the fact that in the past year the United States government has expended an average of \$27 a mile for repairing its highways, as against \$593 a mile which has been spent in Great Britain during the same period of time. He earned hearty applause when he declared that "opponents of good roads are brakes on the wheels of progress." As a matter of fact a good part of the time at both sessions was taken up by discussions on the roads question, seven of the papers that were on the list having to do with the subject in its various phases.

That the movement for good roads eventually will bear fruit was the almost uni-

versal opinion, and that in the not far distant future those who are at present designated as the "Fathers of good roads" will be ashamed of their titles in view of the reforms which soon are to take place is the expressed sentiment of State Engineer John A. Benschel. "There is danger in making this distinction at the present time," he said, "and it seems to me that it will take but a few years before many of the roads which now are referred to by their so-called 'fathers' with pride, will be abandoned, cast aside, and it will be a different proposition to find those who are willing to 'father' the responsibility of their existence."

The abolishment of grade crossings was another subject which came in for a considerable share of the discussion, and the association went on record as being in favor of this proposition, as well as the proposition to enforce the carrying of lights by all vehicles, regardless of their propelling power, after dark. The question of the passing of laws designed to regulate the use of automobiles also came in for a share of attention and though the idea expressed in the views of State Superintendent of Insurance William H. Hotchkiss to the effect that it is up to the people themselves to obstruct the passage of bad laws is not new, its reiteration serves to give it emphasis. He warned the association against mixing in politics.

Of the other speakers who addressed the meeting, Albert S. Callan, father of the present automobile law in New York State spoke on "Automobile Legislation," and frankly called the registration fee a tax and prophesied that it would be doubled within ten years. George C. Diehl, of Buffalo, and chairman of the Good Roads Committee of the American Automobile Association, spoke on "Automobile Traffic in Its Relation to Good Roads," Harold Parker, former Chairman of the Massachusetts Highway Commission, spoke on "The Dust Nuisance," which he said was best allayed by use of the right oil in the right way. Secretary of State Edward Lazansky spoke on "The Automobile Bureau and Its Plans for 1912," and State Superintendent of Highways Charles E. Treman spoke on "The Maintenance of New York State's Highways." He said: "The more I have studied and become familiar with the great problem of highways the more it seems to me from a business standpoint that the so-called highway improvement movement has in this State, as in every other State begun at the wrong end. What is really needed are 50,000 miles of good serviceable roads, instead of 14,000 miles of boulevards and 66,000 of only fair or poor roads. By the judicious use of materials found locally, at an average cost of less than \$500 a mile, roads could be put in very good condition."

A. G. Batchelder, Oliver A. Quayle, Laurens Enos, Lewis R. Speare, A. J. Deer and W. Pierrepont White also spoke, the

latter favoring another \$50,000,000 issue of State bonds for road improvement.

Before the meeting was adjourned it was definitely decided to hold the next convention at Utica, N. Y., and it is confidently expected by President Deer that no less than 1,000 representatives will be present, for it is his intention to swell the membership in the association to that figure in the interim.

Germany to Hold Small Car Road Trials.

The abandonment of plans for running the Prince Henry tour in 1912 left the Germans' way open for an international reliability tour for small cars of from five to eight horsepower, to be held on May 12-15, 1912, over a total distance of a little more than 1,200 kilometers, or 750 miles. The tour which is to be held under the auspices of the Kaiserlicher Automobil Club and the Allgemeiner Deutscher Automobil Club, will start from Berlin via Mittenwalde, Frankfurt - on - the - Oder, Schwiebus, Neustadt and Posen, where the first night stop will be made; distance, 296 km. On the second day the route will again go through Neustadt and Schwiebus, but will then turn south to Gruenberg, Lueben and Breslau, where the second night will be passed; distance of the second leg, 302 km. The third day a trip through the mountains of Silesia, over 316 km. will occupy the attention of the tourists, during which the cities of Glatz, Neisse, Oppeln, Brieg and Ohlau will be visited. The fourth and last day the motorists will be required to cover the 281 km. between Breslau and Dresden, the capital of the Kingdom of Saxony, touching Freiburg, Goerlitz and Bautzen.

Chicago "Insurgents" Are Outvoted.

As was the case last year, the annual election of officers of the Chicago Motor Club, held in the Illinois city Tuesday, 4th inst., resulted in a close victory for the regulars. It was hotly contested, for although over 500 members cast ballots, Charles E. Gregory defeated John M. Kelly for the presidency by only 25 votes. With Gregory the entire ticket which he headed went into office, a tie between David Beecroft and W. D. Foreman for a directorship being waived in favor of the latter. Those elected are: First vice-president, Gaylord Warner; second vice-president, Richard J. Finnegan; secretary, W. E. Stalnaker; treasurer, Henry Paulman; directors, J. P. Frisby, H. N. Fowler, W. D. Foreman, W. J. Zucker, E. A. Hearne; auditing committee, L. R. Campbell, Frank X. Mudd, W. J. Boone.

New Wellington (O.) Club Formed.

Wellington (Ohio) motorists have organized under the name of the Wellington Motor Club, with the following officers: President, O. J. Baumgardner; secretary-treasurer, R. C. Bennett. The club will affiliate with the Ohio State Automobile Association.

How Bruce-Brown Played Part of "Repeater"

His Victory in Grand Prize Race Forms Fitting Climax to Savannah's Carnival of Speed—Completes 411 Miles in 331 Minutes—Contest Marked by Kaleidoscopic Changes of Leadership—Decision Not Reached But Future Races in Doubt.

"GUESS WHO!"

Bruce-Brown came back, too—came back and won one of the longest road races ever run and in record time, as well. Lately it has become quite a habit, this repeating. Grant started it by winning the Vanderbilt two years running. Then Herrick did the same thing with the famous desert race out West, and now Bruce-Brown has taken his turn at repeating. But Bruce-Brown's performance eclipses the others completely, for the Grand Prize race which he won at Savannah on Thanksgiving Day, November 30th, is next to the longest road race that ever was run—last year's Grand Prize was about four miles longer—and to win it twice in succession, in addition to setting up a new world's record in the bargain, surely is "going some," and a little bit more.

And what a howl of delight went up as the popular Fiat pilot rolled over the line that marked the start and finish of the 17 miles circuit for the 24th and last time and was officially declared the winner. Though the race was one of the greatest fights that ever has been put up, and even to the last lap nobody was by any means sure who would be the winner, spectators in the jammed grandstands seemed to sort of feel that Brown would win—and they were not disappointed. His time for the 411.36 miles

was 331 minutes and 29.13 seconds, which figures out at the rate of 74.45 miles an hour. Though this is some four miles an hour faster than he drove last year, when he won with a Benz, rooters for the famous German car can have little to complain of, for Eddie Hearne, who drove one of them and finished in second place, just two minutes and four seconds behind Bruce-Brown, led him by a comfortable margin for 11 consecutive laps, from the 9th to the 19th. There was nothing spectacular about Hearne's driving. Of the contenders, he drove one of the most consistent races; not once did he get under the 13 minute mark for a circuit.

As a matter of fact there were only four drivers who did get under the 13 minute mark. Bruce-Brown was the first man to do it, and he romped around on his second lap in 12 minutes 47 seconds, which is just about 80 miles an hour. Victor Hemery, in a Benz, was the only driver to eclipse this mark, and his time of 12 minutes 46 seconds stands as the fastest made during the race; his average speed on this lap was 80.71 miles an hour. Similarly, none of these four drivers, Bruce-Brown, Bragg, Wagner and Hemery, was able to get under the 13 minute mark more than five times. Bruce-Brown did it in his second, third,

ninth, tenth and twenty-third laps; Bragg did it in his second, fifth, twelfth, twenty-third and twenty-fourth laps; Wagner did it in his second, eighth, ninth, twelfth and fourteenth laps, and Hemery in his fifth and seventh laps.

Ralph De Palma, in a Mercedes, another German car, annexed third honors, and with Bragg, in a Fiat, fourth. American cars were pretty well shut out from the prize money. Their glory was none the less, however, for every one of them that was running when the race was called off had considerably less piston displacement than the first four cars to finish. Louis Disbrow, Pope-Hartford, was fifth, his being the first American car to finish. Of the others, the performance of the two Abbott-Detroit cars, driven by Limberg and Mitchell, really was remarkable. With just about half the piston displacement of any of the other cars, they ran consistently and finished in sixth and seventh positions, having worked up from 15th and 16th positions against cars of double and triple the power. Mitchell covered 377 miles in 374 minutes, which is at the rate of 60.5 miles an hour, and Limberg was only a little slower, his time for 359 miles being 374 minutes; his average was 57.5 miles an hour.

Ralph Mulford, in the Lozier, was the

BRUCE-BROWN (FIAT) IN THE ACT OF "REPEATING" FOR THE SECOND TIME

WHEN HEARNE (BENZ) WAS GIVEN THE CHECKERED FLAG

other American combination for which great hopes were entertained, and up to the 23rd lap his chances of winning were on a par with those of Bruce-Brown and Hearne, who were immediately ahead of him in first and second places. But though he had worked up from ninth position to third, and for several laps had been second, disaster overtook him in the 23rd lap and he was forced to retire with a broken short driving shaft.

Though the spectators sat or stood in tense excitement during the continuance of the whole race, it was not until after Mitchell in his Abbott-Detroit had crossed the line and the race was called off that the real demonstration took place. Immediately, everybody in the grandstand tried to crowd around Bruce-Brown's Fiat at once.

gold cup presented by the Automobile Club of America and \$4,000 added, to say nothing of the "incidentals" offered by the different tire and accessory manufacturers. Not that Brown needs the money, however, for if not a millionaire, he is well-to-do. Still, "every little bit added to what you've got makes just a little bit more," as some one or other has remarked, and he did not refuse it. Hearne's share in the distribution of the prize money was \$2,000, and De Palma received \$1,000—not including the various "dots" added as the incentive for the use of particular equipment, which probably swelled these figures to double that amount.

The day of the race broke clear and cold—a little too cold, perhaps, for the drivers, as they sped away from the starting line

complete list and the order of start being as follows: Louis Wagner (Fiat); Louis Disbrow (Pope-Hartford); Charles Basle (Buick Hundred); L. A. Mitchell (Abbott-Detroit); Ralph Mulford (Lozier); Robert Burman (Marmon); Eddie Hearne (Benz); David Bruce-Brown (Fiat); Harry Cobe (Buick Hundred); Carl Limberg (Abbott-Detroit); Cyrus Patschke (Marmon); Erwin Bergdoll (Benz); Caleb Bragg (Fiat); Victor Hemery (Benz); Ralph De Palma (Mercedes); Spencer Wishart (Mercedes).

With the last of the roaring cars away, spectators settled down in their seats and listened to peanut vendors and program boys and scrutinized their score cards, pencils poised, to score the first of the bunch to appear in the stretch. That Wagner would be the first one around scarcely was

THE QUICK AND THE DEAD—DE PALMA IN FULL CRY; HEMERY AND BERGDOLL DOWN AND OUT

In a second he was the center of a seething mob of souvenir hunters, well-wishers, photographers, newspaper men and just plain spectators. But as was the case last year, Mrs. Bruce-Brown, his mother, was the first one to be allowed to get near him, and as she planted a kiss on his oil-be-grimed face cameras clicked. Later she had to do it all over again for the moving picture men had missed the scene.

Then it was that he was presented with a wonderful bouquet of flowers and praised and congratulated, and it is safe to say that he was photographed just a few more times in a minute than the most popular actor or actress or ball player ever was. Literally the crowd was in a frenzy of excitement and Brown was hoisted to the shoulders of his helpers and borne in triumph up and down before the stand, just as he was last year, happy and smiling, for he had achieved what no other man ever had achieved before and rightfully had earned the plaudits of the multitude.

His prize for winning the race was the

and flew down Ferguson avenue at a speed well over 100 miles an hour, and undoubtedly disagreeable for the thousands of spectators who crowded the grandstand and the sides of the course. If the crowd that turned out for the Vanderbilt was a big one, then the crowd that turned out for the Grand Prize was tremendous. There was not a seat in the grandstand to be had for love or money, and for most of its entire length the course was well sprinkled with spectators. But they stayed behind the ropes, however, for the militia which served so efficiently in the Vanderbilt was on duty for the Grand Prize, and, needless to say, there were no accidents of any kind.

Long before the time of the start, which had been set for nine o'clock, the 16 cars which were entered were lined up before their pits, and promptly on the hour Wagner, in his big Fiat, as the first of the contingent to get under way, was given the word, and the race was on. The rest of the drivers followed at 30-second intervals, the

unexpected, and he was followed immediately by Disbrow, his old reliable Pope-Hartford, slightly changed in appearance but still emitting the same regular exhaust, very low in tone and suggestive of power. According to the order of start, Charles Basle in his Buick Hundred was the next man to be expected, but instead Mulford next put in an appearance, white streamers flying from the helmets of both occupants of the white Lozier, which surely was "moving some," as more than one spectator remarked. Mulford had passed both Basle and Mitchell (Abbott-Detroit), and after all the other cars had passed and their times had been computed, Bragg in his Fiat was first, his time for the lap—13 minutes and 1 second, being the fastest. Eddie Hearne was next and De Palma with his Mercedes was third. Hemery, of whom great things were expected in view of his performance last year, was fourth, having worked up from the back of the field, and the others passed much in the order in which they started.

The course was in prime condition. As has been told, it was more than carefully groomed and manicured for the Vanderbilt race, and in the interim it had been still further looked after and fairly gone over with a fine-toothed comb. At least it was gone over with brushes, for they had the convicts out with brooms, and every little stone was chased off the road into the

mon, fourth. Patschke, Burman's team mate, in another Marmon, was sixth. Burman held his place as fourth only a very short while, however, as he was forced out on the next round with a broken magneto. It was in this lap, the fifth, that Hemery made his record smashing circuit, his time for the lap being 12 minutes and 46 seconds, and his rate of speed 80.71 miles an

of greater things. Spencer Wishart, who was just ahead of him in 12th position, was the next man to retire, his giant Mercedes going bad with a cracked cylinder in the next lap.

This was in the eighth lap of the race, and Patschke in his Marmon then was leading by a comfortable margin. In attempting to take a corner too fast, however, the car was overturned and Patschke's chances were forever lost. Neither he nor his mechanic was hurt beyond a severe shaking up. At this time Hearne was second and Louis Wagner in his Fiat was third, with Mulford fourth and Bragg fifth. Bruce-Brown was sixth, in which position he had been for the last three laps.

Charles Basle, with his big Buick Hundred, was the fourth man to come to grief during the three laps. He was running in eighth position at the time and running well, when a cylinder head blew off and he had to retire. Thereafter things settled down to a pretty steady grind. Eddie Hearne had succeeded in working his Benz up into first place at the end of the ninth round, and from then until the 19th lap he could not be displaced. Though Bruce-Brown had driven a remarkably consistent race up to this point, from the 10th lap to the end his performance was still more consistent. It was so much so, in fact, that he never once dropped below fifth place, and the only time he got that far back was when he stopped for tires and gasoline and oil. But he immediately got into his

BASLE PASSING PATSCHKE ON A LONELY TURN

ditches. The drivers had just one little kick coming and that was that the turns had been banked. They kicked about this, too, in the Vanderbilt race, for there is hardly one of them but would rather have had them left flat. It is the consensus of opinion that with banked turns there is too much tendency to take them too fast. With flat turns drivers are inclined to be more cautious and the hazard is less.

In the second lap, Bragg still held his lead but De Palma required nearly twice as much time as he did for the first lap, the result being that he dropped back to fifth place, both Wagner and Hemery running in ahead of him in that order. Brown still retained second place, his time of 12 minutes and 47 seconds being just one second slower than the record lap made by Hemery later in the race. At the end of the third lap there was very little change in the positions of the leaders, the first four to cross the line being Bragg, Bruce-Brown, De Palma and Hearne. Of the others, all were running consistently except **Harry Cobe, who was forced to retire** at the end of his second round because the steering mechanism of his Buick Hundred became deranged. He was not seen again.

In the fourth lap, De Palma moved up from third to first place. Bragg, who had been first, being forced back to third by tire troubles, and Brown, who up to that time had been second, going back to ninth place for the same reason. Hearne then became second, and Bergdoll, who had been steadily pushing his big Benz to the front, nosed into third place, Burman in his Mar-

mon. He had been having an unusual amount of ignition trouble and in the seventh lap he quit for good.

LIMBERG (ABBOTT) IN THE WAKE OF HEARNE'S BIG BENZ

In the next three laps things happened fast and furiously, and when everything had been duly tallied on the score boards at the end of the 10th lap, there were but nine survivors, four more of the contestants having stopped by the roadside and quit. Bergdoll was the first of the four to succumb, carburettor trouble in his seventh lap being the cause. He then was running in 13th position and giving promise

stride again and forged steadily to the front.

It is, perhaps, needless to say that Wagner was almost as much a favorite as was Bruce-Brown, and when he was forced out in his 14th lap because of a damaged steering gear, a wave of disappointment swept over the spectators. He had driven a perfect race replete with the usual exhibition of Wagner headwork, and had by steady

HEMERY EXPLAINS "HOW IT HAPPENED"

driving worked up into second place when the mishap which put him out of the race occurred.

It was at about this time that stops at the pits became most numerous, for with half the race over gasoline and oil was beginning to run low, and several of those who had not had occasion to change tires stopped now in order to be on the safe side when the hard battle in the last few laps should be fought. Pit work by attendants was not all that it might have been. In several instances it was almost a case of "too many cooks spoil the broth"; when a car would stop at its pit immediately a swarm of mechanics would surround it, and though they were not allowed to do anything to the cars, they did get in the way, and some of the drivers were in anything but an enviable frame of mind when they finally were able to get away.

In the 17th lap, there were only eight cars left in the race, and Hearne in his Benz was leading the bunch, with Mulford

DE PALMA STOPS FOR A TIRE CHANGE

BRUCE-BROWN'S GRAND PRIZE SMILE

second, less than one minute behind him, and Bruce-Brown third. De Palma was fourth, which position he held for the next five laps, and Bragg was fifth, and he also held the same position for the next five laps. Disbrow was sixth, and the two Abbott-Detroits, with Mitchell and Limberg up, were seventh and eighth, respectively. At the end of the 18th and 19th laps, the positions were exactly the same. In the 20th lap Hearne and Bruce-Brown changed places, Bruce-Brown moving up into first place and Hearne going back to third. Except for this change, the positions remained the same, and with only four laps to go it was just as hard to pick the winner as it was at the start of the race.

It was in the 22nd lap that probably the greatest excitement of the whole race obtained. Hearne then was in second place, he having moved up from third in the previous lap and when he stopped at the pits for a tire a groan went up from the grandstand. Mulford was the next around, and

"MANICURING" THE COURSE

WAGNER (FIAT) ON ONE OF THE LONG, STRAIGHT STRETCHES

he, too, stopped, and his stock took a slump, for he was then in third position and it looked as if the stop would eliminate his slim chances. Then Bruce-Brown showed up, and when he pulled up at his pit pandemonium broke loose. Mechanics worked

feverishly to get their several charges out on the road again and going. Mulford was off first, but it was the last that the thousands saw of him, for a short distance from the grandstand the short shaft between the clutch and the change gear mechanism of

DE PALMA ALONE BUT SMOKING THE ROAD

his Lozier snapped under the terrific strain, and he was forced to quit with the prize almost within reach.

The others got away quickly afterward and almost together. Hearne had a little better of the stop and nosed out Bruce-

Brown for first position by the time they came around on the next to the last lap. Another stop for a tire, however, permitted Bruce-Brown to move up into first place again, and he stayed there to the end. With Mulford out, De Palma had moved up into

ANOTHER STATE "MANICURIST"

third place and finished there. For fourth place, Bragg had no real contender, as Disbrow, who finished next and got fifth place, was some 30-odd minutes behind him. Immediately after he crossed the line the race was called off, with no other cars running except the two Abbott-Detroits, which finished in sixth and seventh places, after having been driven gamely by their drivers, Mitchell and Limberg, and having given an account of themselves that might well be envied by some of the others.

As was the case in the Vanderbilt race, the result of the Grand Prize was largely a Bosch-Michelin triumph. Every one of the seven cars to finish was shod with Michelin tires and all of them except Disbrow's Pope-Hartford, on which Splittorf ignition apparatus was used, were sparked by Bosch magnetos. De Palma used a Rayfield carburettor on his Mercedes and the two Abbott-Detroits had mixture furnished them by Scheblers. Bruce-Brown's Fiat, Hearne's Benz, Mulford's Lozier and Disbrow's Pope-Hartford all were equipped with the new Mondex shock preventer.

Though there are those who believe that this will be the last really classic road struggle to be held in America for some time—on the Atlantic seaboard at least—the matter still is very far from settled. Last year application for permission to use the roads for this year's race was made immediately after the race, but this year this was not done, which probably accounts for the feeling. At any rate it costs a lot of money to conduct a race meet of such magnitude as the one which just has been terminated, and as it is principally public-spirited citizens who are looked upon to finance such affairs it has been left with them to decide whether or not Savannah will bid for a repetition of these two blue ribbon events on Southern soil. Though they now incline not to do so, that as soon as Savannahians recover from the excitement and hard work of the last week or so they will commence to lay plans for next year is the opinion of one who is fairly high up in Savannah affairs, though whether the races will be run on a shorter course or under different conditions is problematical. At any rate no Lozier, Benz or Mercedes cars will be seen hereafter in purely speed events, for the manufacturers of these three famous brands of cars have definitely decided to withdraw entirely from racing.

Long Island Run Declared "No Contest."

The prize offered by Charles Herrmann, secretary of the Long Island Automobile Club, for the club's 100-mile non-stop endurance run on November 25th, will have to be contested for again. As stated in the Motor World, last week, all of the contestants went off the course because the confetti which marked the path had been blown away in places and on this account the contest committee of the club has declared the affair "no contest."

Blew two cylinders.

Broke cam shaft.

York (Pa.) Has Thanksgiving Meet.

With characteristic freedom from restraint, the so-called South Jersey Motor Club held another of its periodic racemeets on the dirt track at the York, Pa., fair grounds on Thanksgiving Day, 30th, and despite the fact that the course was decidedly sloppy, nothing happened. That is to say very little happened which can be construed to indicate that spectators were kept in a favor of excitement. Eight races in all were carded and with the exception of a mile time trial all were at five miles, and most of them were two-man affairs. John Menker at the wheel of a Kline accounted for five of them in easy fashion, and therefore occupied considerably more than half the limelight.

The summary:

Five miles—Won by John Menker (Kline); second, V. P. Padula (Abbott-Detroit); third, Haupt (Buick). Time 7:37¼.

Five miles—Won by John Menker (Kline); second, Harvey Ringler (Mercer). Time 7:25.

Five miles—Won by John Menker (Kline); second, Harvey Ringler (Mercer). Time 6:46¾.

Five miles—Won by V. P. Padula (Abbott-Detroit); second, William Mullin (Buick). Time 7:23¼.

Five miles—Won by Harvey Ringler (Mercer); second, V. P. Padula (Abbott-Detroit). Time 7:03¾.

One mile time trial—Harvey Ringler (Mercer). Time 1:16.

Five miles—Won by John Menker (Kline); second, Joseph Di Napoli (Knox). Time 7:26½.

Five miles, free-for-all handicap—Won by John Menker (Kline), scratch; second, Harvey Ringler (Mercer), 10 seconds; Earl Seachtist (Kline), 10 seconds. Time 6:25¼.

Galt Chosen to Lead Long Island Club.

At the annual election of the Long Island Automobile Club, held in Brooklyn, N. Y., Wednesday, 6th inst., William Schimpf, head of the Contest Board of the A. A. A., declined a tender of re-election to the club presidency, although he will continue as a trustee. The officers chosen were: President, Clarence H. Galt; vice-president, Charles Herrmann; treasurer, William C. Bolton; secretary, Edward B. Jordan, Jr.; trustees, William Schimpf, Dr. H. H. Price, Frank G. Webb.

Date Set for Bay State Banquet.

Horace G. Kemp, chairman of the Bay State Automobile Association has announced that the annual banquet will be held at Hotel Somerset, Boston, Mass., December 11th. Among the speakers will be Mayor Fitzgerald, President Robert F. Hooper of the A. A. A.; George W. Coleman, president of the Advertising Club of America, Hugh Chalmers of Detroit and George S. Smith, president of the Boston Chamber of Commerce.

STATE RIGHTS AT A. A. A. BANQUET

Terry Discusses Them and Tells When They Become "State Wrongs"—Pope Urges Individual Memberships.

Charles Thaddeus Terry, chairman of the A. A. A. legislative board, easily played the star part at the American Automobile Association's annual banquet, which occurred at the Hotel Astor on Tuesday night last, 5th inst. R. P. Hooper, president of the organization, served gracefully as toastmaster and some other speakers acquitted themselves as creditably. But Terry fairly sparkled; he sent home as many good-humored thrusts, told as many good stories and returned to the well-known subject of Federal automobile legislation in a fashion that so well disguised the worn spots that they were not visible to the naked eye, so to speak. And withal, Terry has mannerisms and a trained delivery that simply compel attention.

"Whenever Federal legislation is attempted," he said in the course of his address, "we promptly bring up against what appears to be a stone wall—the stone wall of State rights. But they are not State rights; they are State wrongs. The rights of the State end when they interfere with the rights of men as citizens of the Nation"—a sentiment that earned applause. Terry went on to declare that there are too many laws—that there is too much legislation for the public good and that not much of it was reasonable, even, in the sense given to that word by the United States Supreme Court. He pointed out that trouble arose from the annual influx of new men into the various legislatures. When they gathered they found that there was nothing for them to do and accordingly they passed laws simply to prove to their respective constituents that they had not been idle and that they had earned their keep. But Mr. Terry believes that the situation is clearing and that the future holds promise.

At the time of its organization, the A. A. A. had held a banquet, but that was comparatively so long ago that nearly every one had forgotten it. The function on Tuesday night, therefore, marks a new dating, and the occasion proved such a happy one that there is small doubt that each year hereafter a similar banquet will follow the work-a-day proceedings of the A. A. A. annual business meeting.

There were about 150 persons present at Tuesday's banquet. The gathering was striking because of the many silvered heads and the heads which were barren of hair, silvered or otherwise, which betokened the substantial character of the A. A. A. Those who occupied the guests' table were: Laurens Enos, Powell Evans, Lewis R. Speare, Preston Belvin, F. M. Joyce, Robert P. Hooper, M. J. Budlong,

Albert L. Pope, Alfred Reeves, Chas. Thaddeus Terry, H. L. Vail, Dr. H. M. Rowe.

Among those present was the mayor of Montpelier, who is also one of the Vermont delegates to the A. A. A. He was not seated at the guests' table nor in fact did he occupy any particular seat for any particular length of time. He visited practically every table in the room, and when not so visiting he assisted the negro orchestra which made music vocal and instrumental while the viands were being disposed of.

The speakers were few and their speeches were short, but each of them had at least one good story to tell that served to keep laughter in action.

Lewis R. Speare, a former president of the A. A. A. and the present head of the Massachusetts State Automobile Association, voiced a plea for good roads and sane driving. He declared that if motorists did not regulate themselves the law would regulate them even more sternly than is now the case.

H. L. Vail, of the Cleveland Automobile Club, who was introduced by the toastmaster as "the best peacemaker we ever had," paid tribute to the usefulness of the A. A. A. and the work which it had performed, the fruits of which, he said, were shared by all, although but a comparative few bore the burden. He remarked that if the work of the organization was but half appreciated it would not require much effort to obtain the 100,000 members which President Hooper had declared was his aim. Reverting to happenings at the business meeting earlier in the day, Vail declared with fine emphasis which taught the assemblage that though he, himself, came from Ohio, he had no sympathy for any attempt to disrupt the organization. He knew that he reflected the sentiments of the Cleveland club and he believed he reflected the sentiments of practically the entire State.

Alfred Reeves, of the United States Motor Co. and the National Association of Automobile Manufacturers, spoke for the trade and voiced its appreciation of the work accomplished by the A. A. A. and of its efforts in the cause of road improvement, of which he recalled to his hearers the late Colonel Albert A. Pope was the real father. Colonel Pope, he said, began the work more than two decades ago, in the heyday of the bicycle and the League of American Wheelmen. All the good that since had resulted was the outcome of those early efforts.

Paying a splendid and deserved tribute to the lamented Colonel Pope and the great work which he had inaugurated and giving him all credit therefor, Toastmaster Hooper introduced a scion of the Pope family seated at the guest table—Albert L. Pope, who modestly expressed his appreciation of the tributes paid his lamented father. He urged the A. A. A. to even greater effort and pointed out that 200,000 members and not merely 100,000 easily is possible if the membership of the individual motorist is sought.

WOMEN CONTENDERS IN HILL CLIMB

Evansville Permits Their Participation in Unsanctioned Contest—"Mere Men," of Course, Go Fastest.

Evansville, which needless to say is in Indiana, departed from the usual order in a hill climbing contest on Thanksgiving Day, November 30, by having not only a class for cars driven by women, but by adopting a book classification for the other events. The affair was under the direction of the Evansville Automobile Club but was not sanctioned by the A. A. A., which prohibits contests between women. While they were a special attraction Charles French, driving a Cole, secured the honors by negotiating the Springer Hill course in 48½ seconds. This was in the free-for-all. Armand Emrich at the wheel of a Buick was a half a second behind. French also won the class for cars of 4½-inch bore, his time being 48¾ seconds. Miss Vetriss Curry drove a Cadillac up the incline in 58 seconds, and Miss Eloise Koch, also at the wheel of a Cadillac, made the trip in one minute and 15¾ seconds. The summary:

Free-for-all—Won by Charles French (Cole), time 0:48½; second, Armand Emrich (Buick), time 0:49; third, Fellwock Auto Co. (Pullman), time 0:51½; fourth, John Wimbberg (Stutz), time 0:55½; A. Sierra (Oldsmobile), time 1:10.

Cars of 4½-inch bore—Won by Charles French (Cole), time 0:58¾; second, Morton Mannheimer (Knox), and Elmer Lehnhard (American), tied, time 0:52; third, J. F. Charley (Locomobile), time 0:52½; fourth, William Scherffius, Jr. (American), time 0:53; fifth, Advance Auto Co. (Buick), time 0:57; sixth, Fellwock Auto Co. (Cadillac) time 0:59.

Cars of 4¼-inch bore—Won by Keck-Gonnerman Co. (Chalmers), time 0:54; second, Echert-Maxwell Co. (Maxwell), time 0:56.

Cars of 4-inch bore—Won by F. W. McNeely (E-M-F), time 0:58½.

Cars of less than 4-inch bore—Won by Korb & Stewart (Ford), time 1:01¾; second, Herbert Laubscher (Cameron), time 1:03; third, Dr. Laubscher (Cameron), time 1:16½.

Ladies' class—Won by Miss Vetriss Curry (Cadillac), time 0:58; second, Miss Eloise Koch (Cadillac), time 1:15¾.

Grand Island Motorists Organize a Club.

Under the title Hall County Motor Club, motorists of Grand Island, Neb., have organized to affiliate with the A. A. A. State association. The officers are: President, Emil Wolback; vice-president, C. H. Tully; secretary, F. E. Slusser; treasurer, L. M. Talmage; directors, Dr. Sutherland, Oscar Reimers, George WaDechter.

POWER REQUIRED TO START MOTORS

Laboratory Tests Prove That It Amounts to One-half Horsepower—Opening Relief Cocks Adds to Labor.

To the average individual who has had occasion to "spin" his motor, perhaps on a cold day when starting has not been quite as easy as it might be, the knowledge that in doing so he has expended considerably more than one-half horsepower in energy may come as somewhat of a surprise. If he has acted on his own initiative, or at the

tests are interesting because they serve to indicate the amount of actual work which must be performed by the various self-cranking devices which are in use. The motor tested was of the four-cylinder four-cycle type with cylinders measuring 3 9-16 inches bore and 4 3/4 inches stroke. As is shown in the accompanying chart, it required 22,000 foot pounds a minute to revolve the crankshaft 200 times in one minute with the pet cocks closed and nearly 29,000 foot pounds a minute with the pet cocks open. The principal reason that more power is required with the pet cocks open is that the effect of compression in storing energy is lost.

ENERGY ABSORBED IN "CRANKING" 20-HORSEPOWER MOTOR

suggestion of others, and has opened the cylinder relief cocks, ostensibly to make his work easier, he has actually made matters worse for the energy expended then will be considerably more, and probably will be over the one-horsepower mark. All of which was proven in a series of tests which were made in the technical laboratory of the Automobile Club of America.

Aside from being instructive in that they should go far toward settling once and for all the question which has lurked in minds of some as to whether it really is easier to "crank" a motor with the pet cocks open than it is with the pet cocks closed, the

In the lower part of the chart is given the amount of power required as measured in electrical watts, approximately 500 representing the energy expended in revolving the crankshaft 200 times a minute with the pet cocks closed and nearly 700 watts being required for the work when the pet cocks were left open. As a unit of 746 watts is equivalent to one mechanical horsepower it is apparent that five-sevenths of a horsepower is required to start a motor of the size tested at that speed with the pet cocks closed. With the pet cocks open the power required is equal to nearly 700 watts or just under one horsepower.

BELIEVES TWO-CYCLE WILL TRIUMPH

Enthusiast Declares It Will Displace Four-Cycle Motor—His Reasoning and Retort to Skeptics.

As long as there are men to talk and motors to talk about doubtless there will be warm discussions as to what will be the ultimate type of internal combustion engine, and something new always crops up to furnish new subject matter and prevent too much dullness. For example, just as the makers of poppet-valve motors were beginning to feel that they were entitled to sit back a bit and enjoy the feeling that they had worked out a pretty good sort of motor—which they had—Knight pushed his sleeve valve into the limelight, and immediately the discussion started afresh, with any amount of new "dope" on single sleeves, double sleeves, rotary valves, slide valves and their attendant mechanisms.

Unmoved by all the evidences of progress made by the four-cycle type of motor, however, the advocate of the two-cycle principle holds firmly to his belief that all improvements in valves are merely steps leading slowly—very slowly, someone remarks—toward the evolution of the commercially perfect two-cycle motor.

"You can't get away from the conclusion that—barring the advent of a real gasoline turbine—the two-cycle motor will ultimately displace the four-cycle type," emphatically asserted a two-cycle enthusiast a few days since. "Poppet valves, sleeve valves, rotary valves and slide valves all can be made to do the work, and some of them do it beautifully. But what's the use of using valves at all, and what's the use of having an idle, power-absorbing stroke when it is possible to build an engine without valves and with a power impulse every revolution for each cylinder?"

"If all that is true, why haven't two-cycle motors been developed to a point where they are as widely used as are four-cycle motors which, broadly speaking, are the standard type of our day?" queried a skeptic.

"Why?" retorted the two-cycle man with a show of heat. "Why? There are more than several reasons," and then the enthusiast fairly oozed information and "reasons." "It is necessary to go away to the beginning of things," he said—"that is, to 1885—when Gottlieb Daimler, over in Germany, began building four-cycle gasoline motors of 12 horsepower weighing 1,300 pounds—featherweights in comparison with contemporary steam power plants of equal capacity. These worked so well and attracted so much attention that two years later motors were shipped to the United States and business arrangements were made for their sale and, ultimately, for their manufacture in this country. Owing to

business difficulties of some sort the importation and sale of the Daimler engines was very soon discontinued, but Americans had seen enough to convince them of the really enormous possibilities of the new prime mover and lost no time in getting actively into the field.

"The early Daimlers were marine motors, and the time was ripe for the introduction of a light and compact boat engine, as the Herreshoffs had brought the small steam plant to what seemed at that time to be the practical limit of development, and the naphtha motor—a development of the condensing steam engine in which a volatile vapor is used in the retort instead of water—was in high favor and had given the public a taste of the delights of real power-boating. So dazzling was the prospect of a motor lighter, smaller and cheaper than the successful naphtha engine that a veritable wave of marine motor building swept over the country, starting first at San Francisco and being taken up soon afterward in Detroit and New York.

"Then there happened one of those things that mold destinies. American builders saw that the Daimler motor was good, but they also saw that it was decidedly expensive to build and involved a considerable outlay of time and cash before profits would begin to lighten the burden. So, with surprising unanimity, they set to work to build two-cycle motors, this type having been experimented with in France and Germany and, in a very small way, in the United States, and as the inevitable result of hurry to get on the market, in combination with a very much mistaken idea that the two-cycle engine is just as simple as it looks, the market was soon flooded with little squat, ugly motors that looked awfully good on paper and were comparatively light and compact and could be shoved away back out of the way in the stern of the boat—but which would run or refuse to run without reference to any hitherto known laws, and with utter disregard for the convenience of the unfortunate owners.

"Doubtless because of the lack of a basis for comparison, the public was quite a long time in waking up to the fact that the moody chunks of cast-iron in their boats were not all they had imagined they had a right to expect; and when the awakening came, the two-cycle principle got a black eye that is sensitive and tender, even to-day. To make the two-cycle situation worse, the few concerns that had commenced building on the four-cycle principle were turning out engines that were much better than the two-cycle motors, and odious comparisons were inevitable. Not a few two-cycle makers were converted to the four-cycle principle, and it so happened that when the automobile was about to be born most two-cycle engines had evil reputations, while most four-cycle engines had very good ones. So the automobile started with a four-cycle engine, was developed with a four-cycle engine and, except for a

few scattered instances, to-day is a distinctly four-cycle institution. And it is just as hard to buck against a strongly prevailing practice backed by a majority opinion, and deeply rooted in time and money, as it is to butt down the proverbial stone wall with one's head.

"One reason why a two-cycle engine is a hard proposition from the builder's standpoint is that, notwithstanding its apparently guileless simplicity it is a very complex problem in designing, and is prone to make unto itself laws that don't seem to have any relation to the well-behaved rules that hold good in four-cycle motor designing. Another thing: When you build a four-cycle motor there are lots of things you can do to help it if it does not work quite right. The timing of the valves, for instance, can be changed, with very marked changes in the performance of the motor. With the two-cycle, however, once it is finished that is about all there is to it, for the ports, which fulfill the functions of valves, are fixed and unalterable, and excepting ignition and carburetter adjustments there is little that can be done to help a poor motor—outside of melting it and recasting it according to a better design. On the other hand—it's a poor rule that won't work both ways—if the motor is a good one it will stay good, and ordinary wear and tear cannot affect its essential features.

"And still another thing: Millions of dollars have been invested in the manufacture of four-cycle motors, and many of those millions are doing very good work in the matter of dividends, to the satisfaction of the investors. To abandon the manufacture of the prevailing type of motor would mean starting in again at the beginning and developing along new lines. This would call for the investment of more money, the reduction of dividends for the present and a great deal of trouble and delay in getting a start. Add to this the undeniable prejudice against the two-cycle principle, which would of course have to be overcome in order to make a market, and you have an array of obstacles to the development of what I firmly believe will be the ultimate type of motor that is downright discouraging.

"Looking at the sunny side of the question, however, things are better. The two-cycle marine motor has developed into a surprisingly efficient and reliable type and within certain limits of horsepower has the field practically to itself. Some of the largest gas engines in the world are of the two-cycle type. Designers are giving more and more attention to the problems involved, and are gradually gathering data that will help very greatly, and experience is constantly getting in its good work. Two-cycle motors are pushing their way into every field and even into the air, and are giving good accounts of themselves. New designs, some involving distinct advances, are constantly appearing, and when the wheat and chaff have been separated it

will be found that there is a good deal of wheat left.

"There are not many automobile manufacturers equipping their machines with two-cycle motors, but those who are doing so appear to be doing business right along and to be well satisfied with it. Owners of two-cycle cars like them and stick to them, and the number of makers as well as the number of users is on the increase.

"In short, I believe that if the two-cycle motor had received the amount of attention, time, money and brains that have been lavished on the four-cycle, it would be a far better motor today, and would dominate the industry. And whatever skeptics may say, I believe it is only a question of time when it will occupy the advent of a genius with a successful gas turbine. The two-cycle engine is infinitely simpler than either the four-cycle poppet valve or the Knight types, and if simplicity is the great factor that the world says it is and believes it is, how can the two-cycle fail to triumph ultimately?"

Skyrocket Story of Belgian Smuggling.

Methods of smuggling by stealth and under cover of darkness, over lonely mountain roads—as used to be the fashion both in fact and in fiction—now are out of date. Speed alone now is relied upon to carry contraband goods past the obnoxious custom house, but that it does not always succeed is the burden of a tale that comes from Paris. According to the report the French custom officers on the Belgian frontier had been for some time on the lookout for a large motor car which was known to make frequent trips across the frontier, carrying large amounts of contraband. In the evening of December 1, the contraband car dashed past the Custom House at Dronk-aert at a speed of not less than 50 miles an hour, and immediately rockets were sent up to warn the neighboring customs stations, and three barricades made with carts and harrows hastily were thrown up. The car managed to get through two of the obstructions, but was thrown against the embankment of the road by the third. One of the two occupants escaped, while the other was arrested. The car was found to contain over 3,000 pounds of tobacco.

Truce Arranged in London Taxicab War.

The London taxicab strike, which was expected to tie up all traffic in the metropolis of Great Britain, after all did not prove so disastrous to the public, nor did it end in a victory for the drivers, who went out because of "extras." A temporary agreement was reached according to which the striking drivers returned to work on the understanding that they were to pay their employers five pence per day in lieu of all extra charges they might be able to collect. Until the new arrangement is given a thorough tryout by the parties concerned, no trouble is expected to occur, and the strike practically is ended.

FIAT "SIXES" FROM POUGHKEEPSIE

American Branch of Italian Factory Announces Big Monobloc Motor of Long Stroke—Its Chassis Specifications.

Having obtained more than a full measure of success with monobloc motors which now are produced in sizes ranging from 15 to 300 horsepower, the Fiat Automobile Co., Poughkeepsie, N. Y., which is a branch of

in the 35-horsepower model, namely 4 $\frac{1}{2}$ inches bore and six inches stroke; the motor, therefore, properly may be classed as being of the long stroke variety which construction has been consistently advocated by the manufacturers for several years past. Valves are located all on one side and are enclosed by means of light aluminum plates held in place by thumb screws. The valves themselves are 2.086 inches in diameter, the heads and seams being nickel steel to which are fused gray

made of the same close-grained alloy iron as the cylinder casting, particular attention has been given the necessity for allowing for expansion under heat, and to this end they are made slightly tapered, the smallest diameter being at the top. The wrist pin bearings are hardened steel against hardened steel, as are all other bearings which sustain merely an oscillating movement; other bearings in which the movement is entirely rotative are of bronze.

The location of the high tension magneto and the centrifugal water pump at the extremities of a transverse shaft at the front of the cylinder casting is unusual, and adds materially to the general air of simplicity which is a feature of the whole engine. This shaft is worm driven from the back of one of the two gears which compose the timing gear train, the gears themselves being of the helical type, one bronze and the other steel. For ignition, the magneto forms part of a dual system operating through a single set of plugs with a 100-ampere-hour storage battery as auxiliary.

In working out the lubrication of the motor the benefits of both splash and force feed have been obtained, splash being re-

THE NEW FIAT "SIX" WITH TOURING BODY

SHOWING BOTH SIDES OF FIAT "SIX" MOTOR AND LOCATION OF MAGNETO AND PUMP

the parent company, the Fabbrica Italiana Di Automobili, of Turin, Italy, has commenced the production of a "six" which in general outline and design bears strong resemblance to its latest previous example of this system of construction, the 35-horsepower model which made its first appearance simultaneously in Italy and America last year. As a matter of fact, the "six" is practically an enlargement of the "four," the addition of two cylinders, with the corresponding necessary structural alterations being the only change in the motor which has been found advisable; and it is a splendid piece of workmanship. Fiat "sixes" are not new, of course; they have been produced for several years at the Turin factory though they have not been extensively advertised either here or abroad. This is the first time, however, that the American factory has turned its attention to the production of a six-cylinder car.

The new car is rated at 50 horsepower, the cylinders measuring the same as those

iron seats to reduce pitting and facilitate regrinding.

By coring exhaust and intake passages in the cylinder casting, an extremely smooth exterior has been obtained in addition to which carburation is assisted and hot exposed pipes are eliminated, as are a number of nuts, bolts, studs and gaskets. In the construction of the pistons, which are

lied upon for the lubrication of the cylinders. The main bearings, however, as well as those in the wrist pins, and the timing gears are lubricated by forced feed, the oil being pumped through a hollow crankshaft. Suitably placed ducts conduct the oil up to the wrist pin bearings and to the timing gears in the front of the crankcase. The oil reservoir is of four gallons capacity and

SIX-CYLINDER FIAT CHASSIS IN ELEVATION

extends the length of the crankcase. An oil gauge on the dash serves to indicate that the system is in operation.

As has been the case in so many instances, simplification in its widest sense means the elimination of as many parts as possible. The fan, therefore has been done away with and the spokes of the flywheel made in such a way that any other means of inducing a draft through the radiator is unnecessary. The same type of Fiat radiator trunnions as are used on the four-cylinder car and which are designed to obviate the possibility of damage resulting to the radiator through vibration, are used in supporting the radiator on the "six." The radiator itself is of the standard honey-comb pattern.

As regards the construction of the chassis and component parts of the transmission, but one noteworthy change in accepted design as exemplified in the four-cylinder model has been made and this concerns the location of the service brakes. In the smaller car, a single contracting band and drum on the propeller shaft serves this purpose, but in the "six" twin brakes, one on each rear wheel, are used. They are of the external contracting type, and the emergency brakes which are internal expanding also are on the rear wheels.

The clutch and change gear mechanism are the same, the former being of the multiple disk type with 51 steel disks operating in an oil bath and completely housed. Four speeds forward and reverse, selectively obtained, are provided in the change gear mechanism, the fourth speed being direct drive. That not even little things have been overlooked in the attempt to make a good car even better is evidenced by the fact that the gear box is provided with a vent.

The same distinctive Fiat arched rear construction, the employment of which permits the elimination of strut rods, is used, the housing being of pressed steel heavily ribbed and in two pieces bolted together. The drive axles are of the semi-floating type. The spring suspension embraces the use of semi-elliptic members in front and three-quarter elliptic members in the rear, all springs being hung on Fiat patented spring hangers which are integral with the chassis frame. The wheelbase of the "six" is 135 inches as against 123 inches in the four-cylinder model. The tires are 36 x 4 inches in the front, and 37 x 5 in the rear, demountable rims with two extra rims being standard equipment.

In all, the six-cylinder model is produced in six body styles, including two and four-passenger roadster, five-passenger phaeton, seven-passenger touring car, limousine and landaulet. The price of the car with either of the open bodies and including such items of equipment as top with curtains, front and envelope, foot and robe rails, trunk rack, demountable rims, horn, tire brackets, combination oil and electric tail and side lamps, six-volt storage battery, Prest-O-Lite tank, tools, pump and jack, is \$5,500.

THE "REAL THING" IN TOURING CARS

Premier Company Believes It Has Evolved

It—Born of Cross-Continent Experience—Its Features.

While the ordinary type of touring car, equipped with top, side curtains, wind-shield and other protecting devices, is an exceedingly comfortable conveyance under average touring conditions and in pleasant weather, when the tourist goes very far afield he too often has found something lacking and has sighed for the luxury and the absolute protection from the elements provided by the limousine type of body.

which the glass windows, the upper sections of the doors, the partition back of the driver's seat and the vertical members serving as supports for the sash and filling pieces to make the enclosure complete and tight, are made to drop into pockets, where they are securely held and prevented from rattling. With the glass work snugly stowed, the top may be folded back just as the familiar touring car top is folded, leaving the car perfectly open. While the car is said to possess all the comfort of a limousine, the increase of weight is claimed to be only about 200 pounds over the touring type. The "Touring de Luxe" style of body is regularly supplied on both the four-cylinder 40-horsepower and the six-cylinder 60-horsepower chassis, the body itself be-

PREMIER "4-40" WITH TOURING DE LUXE BODY

It has been recognized, however, that the weight of the conventional limousine precludes its use for anything like real touring, even if the motorist were willing to put up with the discomfort of an enclosed body with only the windows open in hot weather—which he is not.

The logical inference is that a car combining the light weight and openness of the touring machine with the security and weatherliness of the limousine would be almost ideal for long journeys. In fact, a number of cars have been built embodying these features in greater or less degrees, but all were specially designed, and it remained for the Premier Motor Co., of Indianapolis, Ind., to bring out the first car of this type listed as a regular stock model. It is styled the "Touring de Luxe Premier," and its design is an outcome of experience gained in the recent transcontinental tour of 40 motorists in 12 Premier cars. Naturally the tourists while on the road hatched out many ideas concerning the perfect touring car, and their conclusions, put into practical form by the Premier designers, are embodied in the new model.

The most interesting constructional feature of the car is the ingenious system by

ing identical as mounted on either. There is a slight difference in the length of the hood, however, to conform to the different engine lengths.

Krupps Discover a New Bearing Metal.

In the course of scientific investigations it often happens that a search for one particular thing will develop others perhaps more valuable than the actual object of the search. An instance of the sort recently occurred in the great Krupp steel works in Germany, where the metallurgists, making laboratory experiments with a view to producing a special steel for automobile parts, accidentally produced an alloy of unprecedented hardness. According to the report, a thin plate of this metal resisted the fervor of the oxy-acetylene flame for several hours—for so long, in fact, that the idea at once occurred to the metallurgists that a safe made of the new alloy would resist the attentions of burglars long enough to discourage them or permit the guardians of the peace to take a hand in the game. It is said that the Krupp works will use the newly found steel in the manufacture of ball bearings and other parts requiring great hardness.

Ventilating the Front Half; the Methods in Vogue

He was the average type of self-reliant motorist who prefers to do his own driving, and his car, a low, rakish appearing machine with a sloping windshield and a deep skuttle dash, stood outside the doors of an automobile salesroom having a pretentious glass frontage. His business was to purchase a new car—a later model of the same make as his own—and after he had asked several questions regarding the changes which had been made in the new model, he casually remarked:

"I see you don't equip your cars with ventilators."

"We haven't found them necessary," replied the salesman, "at least on our open body cars. Our limousines, of course, and the landaulets, too, have ventilators, but

happening. It is part of an actual conversation which occurred, as the story books say, "not more than one hundred years ago," nor more than 45 seconds from Broadway, New York City. In substance, it is exactly the same thing that hundreds of other motorists have said, and as a result there will be very few closed front cars put on the market in future that are "ventilatorless."

When the first closed front cars were produced, their designers made one grave mistake; they forgot all about the motor. They forgot that it is essentially a heat engine and that as such it must necessarily radiate a certain amount of heat. In their laudable attempts to increase the comfort of passengers in the front com-

respect, the virtue of ventilators is real virtue, inasmuch as they serve as the key to comfortable riding in a closed front car, particularly if it is equipped with a windshield and has a skuttle dash. That they really are a necessity and not merely a useless "fixing" is evidenced by the fact that not only are they demanded but the majority of manufacturers are voluntarily using them in the realization that the closed front car has become the standard; the open body car is passing so quickly that within a year or two it probably will become as much of a curiosity as a rear-entrance tonneau.

Naturally, it is only recently that attention has been drawn to the necessity for providing some scheme for ventilation, for

DIRECT METHOD OF VENTILATION AS EXEMPLIFIED IN PIERCE-ARROW CONSTRUCTION

you will find that plenty of air gets down over the dash to ventilate thoroughly the front compartment."

"That sounds very well," retorted the motorist, with just a suggestion of a gleam in his eye, "but it is theory—pure theory. Now see here, I have driven my car thousands of miles—and it is just the same as this one on the floor—and you can't tell me that ventilators are not necessary. In theory, I suppose they are not required, for, as you say, the air is supposed to curl around the dash and project itself downward into the compartment; but in practice it does nothing of the sort. There is only one way I can make my car bearable in warm weather. That way is to prop one of the front doors open and let in a current of air, but I don't like to do that because of appearances, and unless you can equip your car with ventilators I don't think I want it."

Needless to say he got the ventilators, and though the foregoing conversation may appear mythical it represents an actual

happening. It is part of an actual conversation which occurred, as the story books say, "not more than one hundred years ago," nor more than 45 seconds from Broadway, New York City. In substance, it is exactly the same thing that hundreds of other motorists have said, and as a result there will be very few closed front cars put on the market in future that are "ventilatorless."

When the first closed front cars were produced, their designers made one grave mistake; they forgot all about the motor. They forgot that it is essentially a heat engine and that as such it must necessarily radiate a certain amount of heat. In their laudable attempts to increase the comfort of passengers in the front compartment by shielding them from the rigors of the weather they actually made conditions worse in a great many cases. And this for the simple reason that they neglected to provide means of ventilation. Closed front cars in winter are one thing and closed front cars in summer are quite another, as any one who has ridden in the front seat of one can testify. In winter, protection and warmth are necessary but in hot weather, when by far the greatest amount of motoring is done, protection of a kind is necessary, but added warmth is distinctly undesirable. In fact, to ride in the driver's compartment on even a tolerably warm day may become more than uncomfortable before very many miles of road have been covered.

The answer to the problem is ventilators—not make-shifts but properly constructed ventilators—and manufacturers have not been slow to appreciate it. Time was when all such devices were heralded and welcomed merely as "talking points," and while they still possess virtues in this

it is only within the past twelve-month that the closed front car has attained popularity.

As in the case of everything else, whether or not it be connected with the building of automobiles, there is a right way and a wrong way of accomplishing an end, and though the problem of supplying efficient ventilators appears almost ridiculously simple, in reality there is a great deal more to it than greets the eye of the casual observer. Obviously, the simplest way to provide a circulation of air through the front compartment is to punch a couple of holes through the dash and let it go at that. But the trouble with this method is that the current of air becomes a draft and a draft directed on one spot continuously is not always comfortable. The real answer is to provide some means of insuring ventilation without drafts, and there are several ways of doing this, as evidenced by the arrangements used on the products of any number of the more prominent manufacturers.

In the first place there are two ways in

which ventilation may be effected. The first of these is by causing a direct inrush of fresh air merely by providing openings in the dash; it is understood, of course, that the openings must be arranged so that they may be closed at will, for there are times even during summer when it becomes necessary to close them. This is particularly true in the case of a rain storm, for instance, and in passing it may be said that in this respect a great number

The second consideration—and one which is of greater importance than generally is supposed—is their location. Manifestly, it is fresh air that is wanted and therefore the ventilators must be so positioned that fresh air will be admitted. Probably the mere assertion that the positioning of ventilators constitutes a problem will appear superfluous, but a glance at the ventilators on some of even the higher priced cars will reveal the fact that they might have been

should not be lost sight of. Of course, when the engine hood is not provided with vents, the location of the ventilators is of little moment provided only that they are so positioned that a steady stream of air comes in contact with them when the car is in motion.

Lately, several manufacturers have turned their attention toward providing ventilation from above the engine bonnet where there is nothing to obstruct the passage of the air and there is a continual draft. In such arrangements, the ventilators almost invariably are placed in which is styled the "filler-board" of the windshield, or the strip which is used to connect the windshield and the dash board. The ventilators used on Pierce-Arrow cars, two views of which are shown herewith, are so placed and are interesting inasmuch as they provide proper ventilation with none of the drawbacks which have been mentioned.

As may be seen in the front view of the car, the ventilators are two long, narrow slits which extend nearly the length of the windshield. Covering them there are two hinged shutters which may be opened or closed by means of a small knob which can be reached from the driver's seat. As the shutters are hinged at the top and therefore open upward it may be seen that in case of rain they may be left partly open to insure ventilation and still rain cannot enter. It is behind the windshield, however, that the really ingenious part of the

VENTILATING METHOD USED ON CHALMERS TORPEDOS

of ventilators are deficient. On the other hand, the necessity for proper ventilation during a rain storm may be just as great as it is when the sun is shining. The fact remains, however, that if many of the existing types of ventilators were left open during a downpour something akin to a flood in the front compartment would result.

The other way of providing ventilation is by the indirect method in which the rush of air past suitably placed openings causes a partial vacuum in the region of the ventilators, the result being that the heated air is exhausted from the compartment and cool air enters from the top to replace that which has been drawn out by suction. This method is not used as extensively as the direct method though it possesses many distinct advantages and if properly designed may be equally as efficient as the other.

To be efficient, one of the first considerations is that the ventilators shall be of sufficient size. Of course, half a loaf is better than no bread, and even if they are small they will be better than nothing. The actual manufacturing cost and the cost of installation of adequate ventilators need not be much greater, if indeed it is any greater, than is the cost of inadequate ones, and manufacturers have not been slow to appreciate this fact, either. Hence, it is only fair to say that the majority of ventilators fitted to late model cars are large enough. As a matter of fact some of them really are too large though the fault more often is on the other side.

placed to better advantage had the question been thought out a little more deeply.

The engine hoods of a great many cars

FRANKLIN ARRANGEMENT OF DASH VENTILATOR

are provided with longitudinal slits so that the air which is drawn in by the fan may, after having passed over the engine, issue out into the air. It stands to reason that this air must have become slightly heated in its passage in addition to which it has absorbed some of the odor of burnt oil and gasoline. Therefore, if the ventilators are placed low in the front of the dash and to the sides of the engine hood it is apparent that not all the air which passes through them into the driver's compartment will be fresh and cool. This is one of the principal considerations and

ventilators is revealed. To prevent a direct blast of air against the passengers, a leather deflector is used and this causes the air to travel downward parallel with the dash to the floor.

A somewhat similar system is used on the torpedo models of Chalmers cars as shown in the accompanying illustration. The ventilator in this case is a U-shaped aluminum casting which is fastened over the edge of the cowl by means of set screws inserted from below. The forward movement of the car forces air in at the front of the ventilator, the shape of which is

such that the air is deflected against the dash board, and thence downward to the floor eliminating objectionable drafts. In order to show the device more clearly, the lower section of the windshield has been removed. This consists of a mohair strip

ANOTHER CHALMERS VENTILATOR

which takes the place of the usual "filler-board" and is attached to the center cross-bar of the windshield and to the cowl. When weather conditions require it the

PREMIER WIND SCOOPS

aluminum casting may be removed in a few minutes and the mohair strip attached directly to the cowl.

Among the first manufacturers to realize the necessity for ventilators and to supply them on their products was the H. H. Franklin Mfg. Co., and the arrangement which it has used consistently from the first is shown herewith. The ventila-

tors are simply two openings at either side of the dash provided with screens and doors. To hold the doors closed, small latches which operate as wedges and prevent rattling are used; the doors are held open by springs.

As the Franklin engine hood is devoid of vents, the location of the front compartment ventilators is such that the admission of fresh air is assured.

Winton cars also are equipped with similarly located ventilators in which are combined receptacles for the electric side lights. These ventilators also are equipped with screens to exclude as much dust and dirt as possible, though they differ from the others in that they may be opened to any desired width by simply revolving a small shutter. Thus the maximum or the minimum, or any other desired degree of ventilation may be obtained quite easily. The arrangement used on Rambler cars is

RAMBLER DASH VENTILATOR

quite similar and these ventilators also are let into the sides of the dash. They are circular in shape with three semi-triangular openings which may be opened or closed by merely turning a small thumb nut.

Small wind scoops serve to ventilate the front compartments of Premier cars and their location on the skuttle dash proper is such that only fresh, cool air is admitted. These, also, are arranged with a sliding shutter, by means of which the amount of air admitted may be regulated over a wide range. The ventilators which are used in the Chalmers bodies that are of other than the torpedo variety also are located in the dash, one of them viewed from the inside being illustrated herewith. As may be seen, each opening is equipped with a small cowl, the effect of which is to deflect the current of air forced in toward the floor. Adjustment of the size of the openings is provided in a sliding shutter.

In the Oldsmobile ventilators is exemplified the indirect system of ventilation. Which is to say that the ventilators are so arranged that a direct current of air is not forced into the compartment. By

inverting the cowls of the ventilators so that the openings face backward instead of forward an entirely different effect is obtained. In rushing past the cowls the air literally sucks the heated air out of the compartment, the result being that

WINTON VENTILATOR AND LIGHT

fresh air then enters from the top to replace that which has been exhausted. Therefore, there can be no direct draft, add to which it is impossible for rain to enter for the simple reason that the cowls

OLDSMOBILE REVERSED OPENINGS

are turned the wrong way to permit of such an occurrence. The width of the slits in the ventilators is adjustable by means of a shifting shutter actuated by means of an unobtrusive knob.

The simplest way of providing for ventilation and the cheapest from the manufacturing point of view is simply to equip the front doors with long hooks by means

of which the doors may be latched "ajar." Several manufacturers are employing this method at present and though it is open to several objections it still has given satisfaction. The first objection to it, which is more or less hypothetical, is that when the doors are left partly open the appearance of the car suffers; it all depends on the manner in which the latching is done. Cars have been turned out with provision for latching doors open a few inches and their appearance is none the less pleasing. Others, however, have been made unsightly, to say the least, by a similar arrangement.

The other objection is much more real and is due to the fact that much or little ventilation must be endured; there is no provision for adjustment, in other words. Incidentally, if it is desired to leave the doors open for ventilation during rain the objection becomes more real than ap-

HUDSON ADDS TWO CLOSED CARS

Limousine and Coupe Mounted on Regular "30" Chassis—Comfort for Passengers and Chauffeur Considerations.

Elaborating on the practice of not a few manufacturers in giving their customers considerable latitude for choice as regards body styles, the Hudson Motor Car Co., of Detroit, Mich., has increased the size of its line, announced some six months ago as consisting of four models, by the addition of two new models, one of them a full-sized limousine and the other an inside driven coupe. Both of the new bodies are regularly supplied on the "33" chassis which serves to carry the other four body styles.

In the introduction of these two en-

when the weather makes greater ventilation advisable and for bad weather the front glass is arranged to swivel outward in the same manner as that in the limousine. Liberal space for the storage of tools and spare parts is provided behind the body.

Both cars are equipped with engine starting devices and the equipment in each case embraces demountable rims, the usual allotment of body fittings such as robe and foot rails, toilet cases, flower vases, etc., combination electric and oil side and tail lamps, Prest-O-Lite tank, tools, pump and jack. The price of the limousine is \$2,750, and the coupe lists at \$2,250.

"Blitzen" Starter Appears on the Market.

To the lengthening list of engine starting devices which recently have been placed on the market has been added another which is styled by its producers, the Henry Mfg. Co., of 111 West Fifty-fifth street, New York

THE NEW HUDSON INSIDE DRIVE COUPE AND THE LIMOUSINE

parent. Of course when the doors are arranged to open toward the back of the car the foregoing objection cannot be entertained. With such an arrangement the system then partakes of the features of the indirect method and beyond doubt is delightfully simple.

To Oil Cylinders Through Fuel Tank.

If a motor which has been overhauled and fitted with new pistons is found to be getting insufficient cylinder lubrication owing to the pistons being too close a fit to carry up the requisite oil, the difficulty may be overcome by putting oil into the gasoline tank in the proportion of one pint of oil to each five gallons of gasoline. The oil is carried into the cylinders and deposited on the walls, providing an auxiliary supply which can be regulated by varying the proportion of oil to gasoline. This method should not be used as the sole means of lubricating the cylinders, however, but only as an auxiliary where the regular system proves inadequate. The bearings of a four-cycle motor will not be lubricated from oil mixed with the gasoline.

closed bodies, conservative design has been adhered to and nothing radical has been attempted. Though nothing which could be expected to increase the comfort of passengers has been omitted from either, the manufacturers have preferred to stick to accepted practice in the utilization of only that which has come to be considered as standard construction.

In the limousine, the comfort of passengers scarcely has received more careful attention than has provision for the comfort of the chauffeur. Full height front doors are provided and the driver is still further protected by the addition of liberal width glass sides to his compartment. Inside the car, particular attention has been given the upholstery with a view to obtaining at once beauty of appearance and easy riding qualities. To this end, the cushions are properly shaped to allow of the easiest position and are of unusual depth and luxuriousness.

The coupe, of course, is intended primarily for the accommodation of two passengers and is hardly less complete in the luxuriousness of its appointments than the limousine. The windows all may be opened

City, the "Blitzen" self-starter. It is of the acetylene variety, which is to say that the operation of the starter depends on the explosion of acetylene gas in the engine cylinders.

Though it is similar to other devices of the same general nature in that the gas is admitted to the cylinders under pressure from a Prest-O-Lite tank, or one similar to it, the method of admitting the gas and the arrangement by means of which it is admitted are different. From the gas tank a pipe is led to a valve on the dash, and from there to the intake manifold instead of directly to the cylinders. Normally, the handle which actuates the acetylene valve is horizontal in which position it is held by a spring; when the motor is to be stopped, the handle is turned down, this action short-circuiting the magneto and at the same time liberating the acetylene which is drawn into the cylinders during the last few revolutions before the motor stops. The motor, therefore, is automatically made self-starting merely by being stopped. The whole device is remarkably simple and its total weight is approximately one pound. It may be attached to any motor.

LIPPARD-STEWART ABANDONS WORM

**Buffalo Truck Maker Reverts to Bevel Gear
—Combination Rear Springs Adopted—
Simplicity of Motor and Chassis.**

To the producers of the Lippard-Stewart delivery cars belongs the distinction of having embodied in its product a greater number of those features which in the eyes of the average user are ideal, than is usual. The Lippard-Stewart Motor Car Co., Buffalo, N. Y., manufactures and markets the car, which made its initial appearance some

sary, of course. Similarly, batteries, coil and timer are dispensed with, ignition being effected by means of a high tension Bosch magneto with set spark. In addition to simplifying the ignition apparatus this also makes the control mechanism less complicated, as there is but a single lever—the throttle lever—on the steering column.

The same degree of simplicity is apparent in the motor itself and though it is of exceptionally compact design its construction is none the less rugged as is testified by the use of a crankshaft $1\frac{1}{8}$ inches in diameter, mounted on unusually large ball bearings. In general design, the motor is of the conventional four-cylinder, four-cycle type with

able and unnecessarily expensive. Lubrication is effected by means of a centrifugal, worm-driven pump which maintains a constant level in the several compartments under the connecting rod big ends. A sub-base in the crankcase forms the oil reservoir from which the lubricant is drawn and into which it drains through a strainer after having performed its function. The sub-base can be removed quickly and easily for inspection and cleaning.

As a further indication of the policy of simplicity which has been adopted, intake and exhaust passages are cored in the cylinder casting, heat radiation from the latter being assisted by longitudinally cast fins. A Kingston floating-ball carburetter is used and is placed at the end of a very

THE LIPPARD-STEWART 1,500-POUND TRUCK

nine months ago, at which time it was illustrated and described in the Motor World. Since then, however, it has undergone two important changes in design, the most significant of which is the adoption of a standard type of bevel gear drive in place of the worm-driven rear axle with which it was equipped at first. The other is the substitution of a combination of semi-elliptic and coil springs for the full-elliptic rear springs which at first were used; otherwise the car remains unchanged.

As may be seen by the accompanying illustrations, the car is quite different in appearance from the usual type of light delivery wagon and its lines suggest not a bit the vehicle which is "made over" from pleasure car designs. Simplicity and accessibility have been most in view in producing the chassis, which is made in only one size and is rated at 1,500 pounds capacity, and to this end, each part—motor, steering gear, change gear mechanism, clutch, radiator and axles—is made a separate unit which may be removed intact without the necessity for disturbing other parts or their adjustments.

Further increasing simplicity, quite a number of parts which in the eyes of the designer are superfluous in this type of vehicle have been eliminated. Thus, for instance, the fan is done away with, cooling being effected by the thermo-siphon system with the radiator located behind the engine in a protected position and a draft through it insured by the flywheel which carries radial blades. No pump is neces-

sary, of course. Similarly, batteries, coil and timer are dispensed with, ignition being effected by means of a high tension Bosch magneto with set spark. In addition to simplifying the ignition apparatus this also makes the control mechanism less complicated, as there is but a single lever—the throttle lever—on the steering column.

The same degree of simplicity is apparent in the motor itself and though it is of exceptionally compact design its construction is none the less rugged as is testified by the use of a crankshaft $1\frac{1}{8}$ inches in diameter, mounted on unusually large ball bearings. In general design, the motor is of the conventional four-cylinder, four-cycle type with

sary, of course. Similarly, batteries, coil and timer are dispensed with, ignition being effected by means of a high tension Bosch magneto with set spark. In addition to simplifying the ignition apparatus this also makes the control mechanism less complicated, as there is but a single lever—the throttle lever—on the steering column.

The motor is mounted directly on the chassis frame by means of exceptionally heavy and strong lugs cast integral with the crankcase, subframe methods of mounting the motor having been deemed inadvis-

LIPPARD-STEWART GEAR SET

short, jacketed induction pipe in which there are but two flange joints, one at the carburetter and the other at the cylinder casting.

The change gear and clutch cases are cast integral of aluminum and thus form a rigid unit. Any of the gears, or the clutch, may be removed separately, however, without disturbing other elements. The change gear mechanism is selectively operated and provides three speeds forward and reverse. The clutch is of the multiple disk variety in which 25 plates are used, the alternate disks being faced with Raybestos. The clutch shafts are carried in ball bearings. One of the little things that make for efficient action of the whole is that the supports for the change gear lever are cast integral with the cover of the gear box, thus making complicated linkage or other means of connection unnecessary.

The rear axle is of Timken construction and of the full-floating type with a gear ratio of five to one at the differential. Both sets of brakes are carried on the rear wheels, the service brakes being external contracting and the emergency brakes in-

ternal expanding; brake drums are 17 inches in diameter and three inches in width. The front axle is drop-forged and of the conventional I-beam section with steering knuckles hung on Timken roller bearings and adjustable stops to govern the turning radius.

By way of providing equally easy riding qualities whether the vehicle is loaded or empty, full-elliptic springs are used in front, and those in the rear are a combination of semi-elliptic and coil, the effect being that when the vehicle is empty only the semi-elliptic springs support the weight in the rear. When the vehicle is loaded the coil springs also come into use. The wheelbase of the car is 115 inches and the weight of the chassis on the tires, which

FACILITATING THE LUMBER BUSINESS

Rollers and Portable Loading Platform Employed to Increase Truck's Efficiency— How the System Works.

Custom and habit, to say nothing of prejudice, are responsible for the fact that things are often done in ways that really ought to be obsolete. For example, the volume of lumber hauled by motor trucks is exceedingly small as compared to what it ought to be, to say nothing of comparison with the quantity transported on horse-drawn trucks. Hitherto a potent reason for this has been that the time required for

the motor truck backs up to it until the roller on the rear end of the body passes under the projecting load of lumber and partly lifts it, the heights and slopes of the platform and truck body being arranged for this purpose. Then a workman gets busy with the hand crank, turning the roller, whose corrugations grip the lumber and cause the entire load to roll smoothly into place, other rollers taking the weight as the load moves along. Ratchets on the rollers prevent slipping or backward movement of the load.

The motor truck proceeds on its way and the platform is again available for a fresh burden which is placed while the motor is on the road. At the unloading place the ratchets on the rollers are disen-

SAMPSON TRUCK FOR LUMBER CARRYING, SHOWING "CARTRIDGE" SYSTEM OF LOADING AND ROLLER BED

are 34 x 4 pneumatics all around, is 2,200 pounds. In locating the steering wheel at the left and the control levers in the center of the floorboard it has been the aim of the designers to increase the efficiency of the vehicle by facilitating the work of the driver who thus is able to save time by entering or leaving his seat from either side. Though but a single chassis is produced it is regularly mounted with any of a number of body styles to suit the requirements of the purchaser's service. The price of the car with an enclosed panel body is \$1,675; with express body and top, open box body or platform stake body, it is \$1,650 and with police patrol, ambulance or hotel bus body it is \$2,200.

Kerosene Not a Safe Anti-Freezer.

Kerosene oil mixed with the cooling water of a motor is sometimes recommended as an anti-freezing mixture. Even if it were possible to mix oil and water intimately, the combination would still possess serious drawbacks, for its boiling point would be high, causing the motor to become abnormally hot, and scale would be deposited on the interior walls of the radiator and of the cylinder jackets.

loading lumber is so protracted, sometimes running into three or four hours, that a motor truck would be required to stand idle so much of the time that no economy worth mentioning could be effected by its use.

Where there's a will, however, there's usually a way, and the truth of the old saw was never better exemplified than by the system employed by the United States Motor Co., of New York, in adapting its four-ton Sampson truck to the needs of the Shevlin-Carpenter Lumber Co., of Minneapolis. Instead of loading lumber directly on the truck it is first piled on a portable loading platform large enough to carry a full truck-load. One end of the platform is carried on two wheels and the other rests on a wooden horse. In piling on the boards they are allowed to project over the forward edge of the platform—that is, at the end supported by the wooden horse.

The platform of the motor truck is fitted with corrugated rollers, as shown by the accompanying illustration, one of the rollers being at the extreme rear end and arranged to be rotated by means of a hand crank. When the platform is loaded

gaged and the hand crank on the rear roller again brought into requisition, this time to work the load off the truck, the entire load, roped or chained into a huge bundle, dropping in an orderly pile on the designated spot. On returning to the yard a loading platform is again ready, and the truck is thus kept on the road and unprofitable delays at the loading and unloading points are avoided.

Speedwell Sounds Call to Truck Agents.

Believing that the free exchange of ideas is a great help to salesmen, the Speedwell Motor Car Co., of Dayton, Ohio, has arranged for a convention of all its truck agents to be held at Dayton on December 11, the company paying all expenses of those who attend. One of the tenets of the Speedwell company is that motor trucks should be sold only to concerns that are in a position to use them with profit, and that prospective purchasers should be thoroughly posted as to all expenses connected with motor haulage, with a view to avoiding, as far as possible, dissatisfaction arising from lack of advance information. The convention is expected more deeply to instill this idea among others.

TO PROTECT MOTOR FROM CHILLS

Illinois Company Offers Thermo-Valve for This Purpose—How It Regulates the Various Cooling Systems.

For years motorists have listened to discussions, heard lectures and read papers on the subject of motor cooling problems, and it has been so strongly impressed upon them that the gasoline motor is a thing requiring the application of a mild refrigerating process, that it comes as a distinct shock to be told that what is really needed, at least a good part of the time, is something

FIG. 1

to keep the motor from catching cold. And with the avowed object of keeping the motor warm the Thermo-Valve Works, of Berwyn, Ill., offers to motorists a device which, placed in the water circulating system, automatically checks the flow of water when the motor is running too cool and permits free circulation when the full effect of the cooling system is required.

FIG. 2

The operative principle involved in the "Thermo-Valve," as the device is called, is that of the thermostat acting upon a valve, the whole enclosed in a casing and arranged for connection with rubber hose. Two models are made, one for thermo-siphon or gravity circulating systems and the other for forced circulation, as when a pump is used. The thermo-siphon type is the simplest, and is shown in Fig. 1, while Fig. 2 illustrates the mechanism and Fig. 3 indicates the method of attachment. In Fig. 2 the valve in the water passage is shown at A and the thermostat at C. A

passage permits water to flow into the thermostat casing, as shown by the curved arrow in Fig. 2. When the bolt D is withdrawn the Casing B, Figs. 1 and 2, can be removed for inspection and cleaning. The action of the thermostat is such that when heated it tends to open the valve and when

FIG. 3

cooled to close it. When the water is cold, as it will be when the motor has been idle for a long time, the valve will be closed and the water in the cylinder jackets remains there until the motor attains its proper working temperature, which would require a considerable time, in cold weather, with icy water circulating rapidly. When the water reaches a temperature of about 170 degrees, however, the valve is opened by the thermostat and circulation is permitted. When 200 degrees is reached the valve is wide open.

An attempt to use this model in connection with forced circulation would lead to trouble, as the water pressure would probably result in damage to the pump or the thermo-valve itself because of the closed passage. Therefore a different arrangement is used, as shown in Figs. 4, 5 and 6. The difference consists in the addition of a bypass (Fig. 5) enclosed in an extension of

FIG. 4

the lower part of the thermo-valve and connected across the circuit by means of a tube G, Fig. 6, so that the active cooling agent, the radiator, is cut out and the uncooled water travels through a "short circuit" while the main valve is closed, until the motor is warm.

It is pointed out by the makers of this device that the gasoline motor is a heat

engine and that the hotter it can be worked, within certain practical limits, the higher its efficiency. This point is illustrated by the well known efficiency of air-cooled motors of good design. Moreover, the heavier grades of gasoline require more heat for their carburation than the lighter, and year by year the standard of fuel supplied by the refiners goes lower and more heat is needed for its use. It is not claimed that the thermo-valve will create heat for a cold motor, but that it will conserve heat and prevent over-cooling in cold weather.

FIG. 5

The thermo-valve is the development of H. H. Wixon, who invented the Imperial-Wixon compound tire pumps and who for three years was connected with the engineering department of the Stromberg Motor Devices Co., of Chicago.

When Too Much Oil Causes Overheating.

Incongruous as the suggestion may seem, the overheating of a multiple disk clutch that is designed to operate in an oil bath

FIG. 6

may be due to the presence of too much oil in the housing quite as well as to a shortage of lubricant. The reason for this is that too much oil causes excessive liquid friction, the result being that the disks heat up quickly and retain their heat. Clutches which are designed to operate dry never should be lubricated, of course, and though too much oil in the housing of clutches of the other variety is better than none in any case, the best results will be obtained if the quantity prescribed by the manufacturer is not exceeded.

Janney-Steinmetz Produce a Self-Starter.

The mere fact that self-starters have been so long in attaining practical form indicates to the discerning that the obstacles to be overcome are real, very real, which lends point to the fact that when such a long-established firm as Janney, Steinmetz & Co., of Philadelphia, produces a device of the sort it is likely to command uncommon attention. Briefly, the Janney-Steinmetz invention, which is shown by the accompanying illustration, utilizes compressed air for starting the motor. A double-cylinder air compressor charges a steel tank with air to a maximum pressure of 150 pounds to the square inch. Pressure on a valve-button on the footboard of the car admits air to the cylinders of the motor, the air first passing through a rotary

distributor which supplies the cylinders in their firing order. On the dashboard is a pressure gauge which indicates the pressure in the tank; starting an average sized motor once causes the pressure to drop from three to five pounds, and a short run of the pump soon brings the needle back to top notch. A positive clutch enables the driver of the car to start his compressor at will while the motor is running and as readily cut it out when the proper pressure is attained. The distributor has a ball-bearing rotor which takes the thrust of the compressed air, and may if so desired be run on a timer shaft, or any shaft running at camshaft speed. All parts of the air pump are lubricated by splash, one filling of oil being sufficient, the makers state, to lubricate it while the car runs a thousand miles. Mounted on a single base, seven inches wide and eight inches long, the pump and rotating distributor weigh less than 25 pounds. True to its mission as a conservator of human energy, the outfit can be used for inflating tires as well as starting the motor.

Considers Automobiles a "Necessity."

While the reports published several weeks ago, stating that the United States government intended to purchase 2,000 motor wagons for army use, were shown to be premature, to say the least, it seems assured that the government will go into the buying of motor-propelled vehicles more heavily than is generally believed. Secretary of War Stimson has given the matter considerable thought, and as the result of an inquiry from him the Inspector-General of the regular army, General A. W. Brew-

ster, has made the following terse recommendation as to the usefulness of motor trucks in army service: "Automobiles are a necessity for commanding generals of divisions and higher units. It is recommended that rigid experiments be made with motor trucks and motor ambulances to show their suitability for field use."

Red Fluid to Indicate Fuel Level.

When the cooling water in the radiator and cylinder jackets of a motor car begins to run low the driver is amply warned by sundry spurts of steam, and when the supply of lubricating oil is nearly exhausted the sight-feeds show queer little bubbles that foretell the end; but when the last thimbleful of gasoline trickles into the carburettor it wends its way through dark and devious paths, unheralded, and only when the motor, deprived of its life-blood, coughs, chokes and dies, does the motorist come to a realization that his gasoline tank is dry. Therefore a reliable instrument that can be attached to the dashboard and will indicate at all times the level of the fuel in the tank is a thing much to be desired, and this the Van Auken Indicator Co., of 123 Liberty street, New York, believes it has evolved in the "Vanometer."

It comprises a brass-cased glass tube on the dashboard in which a broad band of vivid red liquid rises and falls with the changing level of the gasoline in the tank; the only connection between gauge and tank is a small metal tube of about the diameter of a lead-pencil which is run out of sight under the floor, and passing through a hole in the top of the tank, reaches to the bottom of the tank. When gasoline is poured into the tank it rises also in the little tube, compressing the air trapped in it. The pressure is carried to the dashboard gauge and raises the red signal. According to the manufacturers it takes a temperature of 20 degrees below zero to freeze the red liquid; further, they say that changes in the position of the tank, as when going up or down hill or driving with two wheels in a ditch, will not induce the Vanometer to depart from the truth, and that the gauge can be placed in any place that may be convenient, above or below the level of the tank. It is made for either pressure or gravity tanks and can be installed in a few hours.

Cincinnati Dealers to Hold Two Shows.

Having found the Music Hall in Cincinnati, Ohio, not large enough for a display of pleasure cars and commercial vehicles during the same week the Cincinnati Automobile Dealers' Association will hold two shows. Pleasure cars will be on display during the entire week of February 19-24, and for three days, February 26-28, commercial vehicles will be staged.

Mayo, Too, Makes Tire Inflation Easier.

With an abundance of mechanical power available, it is rather a matter for wonder that motorists so long have been slaves of the hand operated tire pump. It is a long lane that has no turning, however, and the motorist now can take his choice of several types of appliance as substitutes for human energy in performing the detested task of pumping up tires. One of the newest of these is the "Spark Plug" tire pump, so called because it screws into the place of a spark plug in one cylinder of a multiple-cylinder motor, and which its maker, the Mayo Manufacturing Co., of

Chicago, claims to be capable of compressing air up to 150 pounds to the square inch and of fully inflating the largest tire in about four minutes.

The piston of the pump is actuated by the compression in the cylinder of the motor, and as the upper or pumping end of the piston is smaller than the lower or power end, there is a multiplying action which results in a pressure higher than that in the cylinder to which the tire pump is attached. Piston rings and generally substantial construction tend to make the device efficient and long-lived. Only pure air, taken in through a little valve in the pump, is delivered to the tires. The pump is provided with twelve feet of special rubber tubing, tire valve connections and with various sized fittings.

Brazil Big Buyer of French Cars.

Although France still records a greater export of motor cars than any other country, its sales are not increasing as rapidly or as steadily as those of the United States, the figures for the ten months ending October 31, 1910 and 1911, being \$28,962,400 and \$29,802,800, respectively; representing a gain of \$840,400, or less than 3 per cent.. Brazil accounting for the greater part of the increase. Imports during the same respective periods rose from \$1,442,800 in 1910 to \$2,176,000 in 1911, an increase of \$731,200, or 51 per cent. Of the imported cars, the United States supplied \$427,800 in 1911, an increase of over 300 per cent. over the \$137,400 in the first ten months of 1910. The entire gains in French exports were contained in the trade with Brazil, Turkey and Austria.

997,258. Internal Combustion Engine. Frank X. Bachle and John C. L. Krebs, Clyde, Ohio. Filed Nov. 11, 1909. Serial No. 527,560.

1. A multiple cylinder engine having its cylinders each provided with a pumping chamber, a combustion chamber and an air compressing chamber, the pumping chamber having one port leading thereto and the combustion chamber having two ports leading thereto, one of such two ports leading from the associated air compressing chamber, a rotary valve co-operating with said ports to admit gas to and from the pumping chambers and then to the combustion chambers through one of the ports of each combustion chamber, and to admit scavenging charges of air to each combustion chamber from its compression chamber, substantially as described.

997,273. Vehicle Brake. Thomas A. Coleman, St. Louis, Mo. Filed Mar. 21, 1910. Serial No. 550,598.

1. A vehicle brake comprising a depending frame which is pivotally mounted and adapted to swing free of the ground, a shoe mounted on said frame and adapted to be moved into contact with the ground, mechanical means for operating said shoe, a releasable device for rigidly holding the frame in normal position, and a tripping device arranged and adapted to release said

holding device so that the frame is free to swing out of the way of an obstruction lying on the ground in the path thereof.

997,290. Brake. James A. Hart, Trenton, N. J. Filed May 24, 1910. Serial No. 563,117.

In a brake, the combination with a support and a brake drum; of a split band embracing the drum and secured at one end portion to the support, a stud located on the secured end portion of the band and extending radially with respect to the drum, a disk having an eccentric opening to freely receive the stud and provided with radial arms, one of said arms having its free end portion adapted to loosely engage that end portion of the band opposite the one to which the disk is connected, and means connected with the opposite arm serving to rock the latter, for the purpose described.

997,302. Resilient Wheel. Charles A. Langford, Rio, Wis. Filed July 28, 1910. Serial No. 574,364.

A resilient wheel comprising a hub, an annular air chamber encircling said hub and connected thereto, tubular spokes radiating from the outer wall of said chamber and made integral therewith, said chamber and said spokes being adapted to contain air under pressure, there being communicating passageways between said spokes and said chamber, a rim connecting the outer ends of said spokes integral spaced bosses on said rim provided with recesses to receive the ends of said spokes, an outer rim, a plurality of piston rods fixed to said outer rim and extending into said spokes, pistons in said spokes and fixed to said rods, said bosses being provided with elongated radially disposed re-

cesses upon opposite sides of said rods, ball bearings in said recesses, and check valves at the inner ends of said spokes controlling said passage ways between the spokes and the chamber, whereby said passage ways are closed as the piston moves inwardly and open as the pistons move outwardly, substantially as described.

997,315. Oiling Device. William L. Morris, Batavia, Ill., assignor to S. F. Bowser & Company, Incorporated, Fort Wayne, Ind., a Corporation of Indiana, Filed June 19, 1903. Serial No. 162,173.

1. In an oiling device, the combination with an oil-cup having an oil inlet and an oil outlet, of a piston fitting in said cup and adapted to control said oil outlet, said piston being operated by the pressure of the oil in said cup and being provided with a passage-way affording communication between the upper face of said piston and said oil outlet.

997,388. Spring Wheel and Tire. George Lincoln Hays, Bellevue, Pa. Filed Oct. 8, 1910. Serial No. 586,043.

1. A wheel of the character set forth comprising a hub composed of united stamped metal sections having circular flanges, a tire composed of united stamped metal sections and carrying a tread member, clips on the flanges of the hub sections and on the tire sections, resilient spokes having coiled portions and flattened heads at their extremities to fit in said clips, pivots uniting the heads of the spokes to said clips, telescoping tubular casing members arranged on the spokes and bearing against the tire and hub to completely envelop the spoke and its connections, stops within the telescoped ends of the casing

Glide The 5 to 7 Year Service Car

Luxury, style, easy-riding, perfect performance—not for one year but for 5 to 7 years. Built to do it, not simply advertised to do it.

Send for 1912 Glide Catalog

Find out about this car that stands the critical buying of the shrewdest purchaser in the field—the substantial man who wants service—hard service—long service.

997,398. Pneumatic Tire. Francis Ather-ton Macon, Henderson, N. C. Filed Feb. 20, 1911. Serial No. 609,721.

1. In a pneumatic tire, a series of independent collapsible air chambers, means whereby said chambers are independently inflated, a protective casing arranged around each of said chambers, said casings comprising boxes formed in inner and outer sections, said outer sections having a telescoping engagement with said inner sections, a tube formed on the bottom of each of said inner sections, said tube being adapted to be inserted through the rim of a wheel whereby this end of the casings are secured to the rim, lugs formed on the opposite end of the sections and adapted to be inserted beneath the fastened ends of the adjoining sections whereby said casings are held in place and flanges arranged on the outer sections of the boxes and adapted to slidably engage the outer sides of the inner sections.

FISH BECOMES STUDEBAKER'S HEAD

Retirement of J. M. Studebaker Causes Official Changes—New Office of General Manager Created.

Because of the desire of J. M. Studebaker to be relieved of the presidency, a special meeting of the directors of the Studebaker Corporation was held in New York on Saturday last, 9th inst., at which Frederick S. Fish, first vice-president, was elevated to the higher office. Mr. Studebaker, who has reached a ripe old age, was made chairman of the board, which is largely an honorary office. Clement Studebaker, Jr., was elected first vice-president and chairman of the executive committee; A. E. Erskine was re-elected treasurer, and Scott Brown secretary and general counsel; Frederick P. Delafield was continued as special counsel.

A new office, that of general manager of the corporation, was created, which was filled by the appointment of J. N. Gunn, of New York. His duties will be to "coordinate the administrations of the automobile division, the horse drawn vehicle divisions and the harness divisions of the Studebaker business." Mr. Gunn is of the New York firm of Gunn & Richards, production engineers. He already has performed special service for the Studebaker Corporation, and his designation as general manager now makes him a regular member of its staff. The changes made do not affect the positions of Walter E. Flanders, as vice-president and general manager of the automobile division and F. K. Parks as vice-president in charge of accounts.

Steinbock to Form a New Company.

H. E. Steinbock, who for several years was in charge of the Maxwell-Briscoe engineering department and who, after the Brush Runabout Co. was taken over by the United States Motor Co., was temporarily transferred to the Brush Runabout Co. in

Detroit, also a United States Motor subsidiary, has resigned all connection with the big company and is preparing to strike out on his own account. He is designing a new car which it is expected will be placed on the market in the early spring by a new company which will be backed by a number of moneyed men in Westchester County, N. Y., in which the Maxwell-Briscoe factory is located.

Colby Control Passes to New Hands.

The controlling interest in the Colby Motor Co., of Mason City, Iowa, last week passed into new hands which are understood to be identified with the National Farm Machinery and Implement Co., a \$5,000,000 Iowa corporation. As a result the executive officers of the company also underwent a change, the new officials elected being as follows: President, J. E. Burmeister; vice-president, Wm. M. Colby; treasurer, H. S. Murphy; secretary, W. N. Smith; general manager, D. W. Henry.

Messrs. Burmeister, Murphy and Smith are the new men who entered into the company's affairs. W. M. Colby, the vice-president, was the head of the old company. While the new management will increase and not lessen the production of pleasure cars, more attention than heretofore will be devoted to the development of trucks, a full line of which is in hand.

Goodyear Declares 12 Per Cent. Dividend.

The Goodyear Tire & Rubber Co., of Akron, O., has declared an annual dividend of 12 per cent. on its common stock, payable January 1 to holders of record December 22. This is an increase of 5 per cent. over previous disbursements, which have been at the rate of 7 per cent. per annum. It is stated that the gross sales of the company this year were approximately \$13,000,000, and that it earned slightly in excess of 50 per cent. on its \$2,284,000 common stock.

New Britain Makers Build First Trucks.

The New Britain Machine Co., of New Britain, Conn., has taken up the production of motor trucks. It already has completed two vehicles, built on special order.

RAJAH SPARKS AGAIN HIT LEAGUE

Buffalo Institution and Its President Pay \$1,650 for Contempt—When Imitation Is Unfair Competition.

Burnt children may dread the fire, but A. C. Bidwell, of Buffalo, N. Y., who operates the private corporation styled the International Automobile League, apparently is not a child of that sort. Possessed of nimble wit and nimble fingers he has toyed with fire so often that his hands may have become calloused, but calloused though they may be, Bidwell probably will "have a care" before he again attempts to defy the fire that flies from the Rajah spark plug or any plug that resembles it; if the sparks leave no mark, they are unduly expensive to him.

The so-called league, which to all intents and purposes is Bidwell, toyed with a counterfeit Rajah plug last spring and paid a \$250 fine for doing so, but the lesson was not stern enough and Bidwell and his "league" continued quietly to defy not only the Rajah Auto-Supply Co. of Bloomfield, N. J., but the United States Court, with the result that last week Judge Lambert, sitting in that court in Buffalo, fined Bidwell personally \$250 and the International Automobile League, \$1,000 for contempt of court on four counts and assessed the costs, \$400, against the league. The fines imposed are the limit permitted by law.

The contempt consisted of having sold imitations of the Rajah plugs and porcelain in violation of the perpetual injunction issued in March last, the court holding Bidwell guilty of being personally responsible for at least one of the four sales.

The so-called league's offense was flagrant. The Rajah Company first obtained a temporary injunction restraining it from selling the counterfeit plug, and it was while in Buffalo to argue for a permanent decree, that the Rajah patent counsel, Emerson R. Newell, dropped into the league's

THE MOTOR WORLD

bargain-counter establishment, and by personal purchase found that despite the injunction, the offending plugs still were being sold. The permanent injunction was granted and the league was fined \$250 for its contempt. Apparently believing that the Rajah people were no longer on his trail, Bidwell seemingly took a chance of "working off" his stock of counterfeits, only to learn, at a cost of \$1,650, that the Rajah principals were very much awake.

The unusual part of the proceedings is that no patent was involved. The Rajah Auto-Supply Co. acted under the law applying to unfair competition, the court holding that the company was entitled to the exclusive use of its distinctive design of plug and porcelain even though Bidwell did not employ the registered trademark "Rajah."

Kelsey Motorette in Bankruptcy Court.

Following an attachment placed on its property by a New York creditor, the C. W. Kelsey Mfg. Co., of Hartford, Conn., on Thursday last was petitioned into bankruptcy and Lawrence A. Howard appointed receiver. The petition was filed by Howard acting for a creditors' committee and was designed to protect the interests of the creditors. The company, which manufactured a three-wheel "motorette," has been in straightened circumstances for some time and the creditors' committee, represented by Howard, had been seeking to find a way out of the difficulty. Filing of the attachment, however, complicated matters and practically required that bankruptcy proceedings be instituted. No statement of assets and liabilities as yet has been made public. The company was organized about a year since and conducted an active campaign, but at no time did its output attain any considerable volume.

Treadwell Takes Over Lebanon Castings.

The Lebanon Steel Casting Co., of Lebanon, Pa., which made small steel castings for the automobile trade, has been absorbed by the Treadwell Engineering Co., of Easton, Pa. The manufacture of these steel castings will be continued but hereafter they will be produced from an electric furnace, the crucible process having been abandoned. By the electric furnace system it is claimed that it is possible to obtain an elastic limit 20 per cent higher than can be secured by any other process and that the percentage of carbon can be absolutely controlled, permitting castings to be made as hard or as soft as desired.

Kulka Opening Markets for Accessories.

L. J. Kulka, representing the Emil Grossman Co., of New York, is now in Europe with a view to opening markets for American automobile accessories. In addition to the Grossman lines, Kulka, through the Grossman company, is prepared to represent one concern in each line of automobile accessory manufacture.

EXPORTS MOVE UP 75 PER CENT.

Canada Still Remains Heaviest Buyer— Oceania and South America Show Largest Proportionate Gains.

Despite the falling off in exports to seven of the twelve geographical divisions, the figures for the month of October, 1911, show the remarkable gain of \$584,745 in total value of automobiles and parts exported from this country, as compared with the corresponding month of 1910, the figures being \$1,356,384 and \$771,639, respectively, representing a gain of more than 75 per cent. Of this total amount, \$1,043,093 is the value of 952 complete cars, as against 529 cars valued at \$647,785 in October, 1910, while \$313,291 represents the value of parts sent abroad, as compared with \$123,854 during the same month of the preceding year.

As has been the case during the past six months, the gains made by South America and British Oceania by far exceed the losses experienced in Mexico, Germany, France and Other Countries. British Columbia increased its purchases from \$79,219 to \$248,985, a gain of 240 per cent., while South America took \$100,066 worth as against \$32,390 in October, 1910, an increase of more than 200 per cent. The United Kingdom, too, which for some months had remained stationary, as far as automobile exports from the United States are concerned, increased its purchases during October by fully 102 per cent. over those in the same month of last year, the figures being \$237,109 and \$115,158, respectively.

During the ten months ending October 31, 1911, no less than 12,196 cars, valued at \$12,608,127, and parts valued at \$2,736,550, were sent abroad, as compared with 7,011 cars, valued at \$9,521,851, and parts to the value of \$1,669,787, during the same period of 1910. Canada still is by far the best customer, taking \$4,880,911 worth of cars, with England (\$2,407,373), British Oceania (\$1,602,383), South America (\$967,358) and Asia (\$647,067), following in the order named. The report in detail:

	October		Ten months ending October	
	1910	1911	1909	1911
Automobiles and parts of—				
Automobiles	\$647,785	\$1,043,093	\$5,921,033	\$9,521,851

				\$15,344,677

October Figures Disclose Import Uplift.

Statistics of imports of foreign-made automobiles for October last hold more hope to importers than has been the case for many months past, no less than 103 cars, valued at \$207,059, reaching this country during that month, as compared with but 59 cars, valued at \$125,919, in the same month of the preceding year. Despite this increase of 64 per cent., however, the losses sustained in the early part of the year were sufficient to cause a net decrease for the ten months ending October, 1911, of 95 cars, valued at \$91,778, the figures for the months of October 1910 and 1911, being, respectively, \$1,749,059 and \$1,657,281. For the ten months ending October, 1911, \$266,992 worth reached this country from abroad, a loss of \$349,197 as compared with the \$615,189 imported during the same period of 1910. The following table gives a comparison of the last two years' imports:

	October	
	1910	1911
Automobiles and parts of—		
Automobiles	\$125,919	\$207,059
Parts of	23,409	31,398
Imported from—		
United Kingdom	9,821	54,054
France	63,704	67,896
Germany	16,354	34,738
Italy	25,789	23,449
Other Countries	10,251	26,922
Totals	\$149,328	\$238,457

Tire Exports Pass Two Million Mark.

Although the value of American automobile tires exported during October, 1911, was not as great as during the preceding month, the demand maintained its upward trend. During the month there were sent abroad \$138,744 worth of tires, as compared with \$103,788 in the same month of 1910. During the ten months ending October, 1911, \$2,080,517 worth were sent abroad, but no comparison with last year is available, as the government did not list tires separately previous to July, 1910.

Rayfield Car May Remove to Christman.

It is not improbable that the Rayfield Motor Car Co. will remove from Springfield, Ill., to Christman in the same State. There is a factory in the latter town which will be occupied if the citizens of Christman produce a bonus of \$100,000.

DURANT-DORT TAKES UP TRUCKS

**W. C. Durant's Original Carriage Company
Enters Motor Vehicle Industry—Will
Build "Best" Trucks.**

The Durant-Dort Carriage Co., of Flint, Mich., which is a prodigious producer of popular-priced horse-drawn buggies, and in which the Buick car practically was conceived, formally has entered the automobile trade. It is building a two-cylinder opposed truck, which will be styled "Best," in what is described as the Flint Motor Wagon department of its plant.

The Durant-Dort company is the same which gave W. C. Durant to the automobile industry, and in which he made his first fortune, indeed, he still is its vice-president, and the fact that recently he became the power behind the thrones of both the Mason Motor Co., engine builders, and the Little Motor Car Co., which recently were organized in Flint and the latter of which acquired the plant of the Flint Wagon Works, lends point to the Durant-Dort company's entry into the automobile industry at this time. Like Durant, J. D. Dort, president of the Durant-Dort Carriage Co., was an original prime mover in the Buick Motor Co., of which C. W. Nash now is general manager, to which office he was appointed after the General Motors Co. acquired control of the property. Nash is also vice-president of the Durant-Dort company and Durant occupies a similar office in the General Motors Co., which \$60,000,000 corporation he organized and dominated until a year ago.

The Best truck, which Durant-Dort will manufacture, will be of 800 pounds capacity. Its two-cylinder motor will be of 4½-inch bore and stroke, and will be positioned under the floorboard in front of the driver's seat. It will employ friction transmission, thermo-siphon cooling and jump-spark ignition effected by means of a high tension magneto and an auxiliary battery-coil system for starting. By way of insuring that a maximum speed of 18 miles an hour cannot be exceeded the motor is equipped with a centrifugal governor which operates through the throttle. The same governor also serves to advance and retard the spark automatically according to the speed of the motor.

The radiator is spring mounted and connection between it and the motor is made by means of quick-detachable couplings. The radiator itself is held in place by a rod which passes through it from side to side, the removal of which permits the radiator to be taken off easily and quickly, leaving the motor and all the mechanism in front of the car accessible. Semi-elliptic springs support the chassis in the front and those in the rear are full-elliptic. The front wheels are shod with 32x2-inch solid rubber tires and the rear with 34x2-inch tires. Though

panel or express bodies are supplied as standard equipment, almost any style of body may be fitted to the chassis to suit the requirements of the purchaser. The standard body is 40 inches wide and the loading space is 63 inches long; the floor line of the body is 31 inches from the ground.

Demotcar Factory Passes to New Hands.

C. H. Ritter, a wealthy, retired wholesale liquor dealer in Detroit, has acquired possession of the plant of the Demotcar Co. at 1305 Bellevue avenue, Detroit, the operation of which will be at once resumed. Associated with Ritter are R. A. Skinner, who previously was in the printing business, and A. W. Voegel, one of the trustees of the bankrupt Demotcar Co. The factory now will produce a four-cylinder runabout which will sell for \$685, complete with top, windshield, lamp equipment and gas tank. The motor will be of 3¼ inches bore by 3¾ stroke and the cars, which will have a wheelbase of 90 inches and which will be equipped with 30 x 3-inch tires, will employ a multiple disk clutch and a two-speed transmission.

Klaxon Files Suits Against Ever-Ready.

The Lovell-McConnell Mfg. Co., of Newark, N. J., has filed a series of suits in the United States Circuit Court for the Southern district in New York against the American Ever-Ready Co. of New York, all of them based on infringement of the patents covering the Klaxon horns. The first suit alleged unfair competition and an imitation of these warning signals and also specific infringement of the Klaxon patents Nos. 923,048, 923,049 and 923,122. This suit was followed on the 8th inst. by one of similar nature which alleged infringement of Klaxon patents Nos. 956,898 and 957,161. Another suit alleging infringement of the Klaxon design patents Nos. 39,785, 39,801 is in preparation.

Truck Making Starts in West Virginia.

The Kanawha Auto Truck Co., of Charleston, W. Va., which recently was incorporated with \$50,000 capital, will engage in the manufacture of the Kanawha truck, which is a design of W. S. Roberts and D. S. Guenther, president and superintendent, respectively, of the company. The first model, a two-ton truck, already is being demonstrated and it is expected that two others will be ready by show time. When the plant in Charleston is completely in operation, it is expected that the company will be able to produce 250 trucks for the 1913 market.

Kelly Goes to Europe for Electric Data.

George H. Kelly, manager of the commercial department of the Baker Motor Vehicle Co., of Cleveland, sailed last week to Europe to study transportation problems and to obtain data regarding electric trucks operating on the Continent. He will be absent about six weeks.

WHY LINDSAY AXLE SUITS FAILED

**Collapse of Case Against National Discloses the Reason—End of Patents
That Became Almost Famous.**

Just what caused the sudden collapse of the chain of suits instituted by Thomas J. Lindsay and Willard Harmon, the Indiana inventors who claimed to hold basic patents on the so-called "floating axle," has been made plain as the result of the dismissal of their action for infringement against the National Motor Vehicle Co., of Indianapolis, which was the first of the suits to be filed and the last one to be dismissed. The action was brought in 1905 and lay dormant until this year, when it was revived. It was argued in June last and while Judge Anderson of the United States Court in Indianapolis had the case under advisement, the complainants requested a re-argument, which was set for November. But before the time arrived, according to the National Company, Lindsay and Harmon became convinced that one of the anticipations that had been brought to bear, a British patent granted to Elliott in 1893, so clearly antedated all they claimed that they voluntarily decided to dismiss the action.

The so-called Lindsay axle patents, two in number, disturbed the industry at several periods during the past three or four years. Originally, the Timken Axle Co. operated under them but later repudiated them and extended litigation with the patentees resulted. While it was going on the inventors offered their rights for sale to many persons and the "independent" or anti-Selden Association that was in being at the time. They were heralded as rivaling the Selden patent in scope and importance; but no one would touch them. Although the suit against the National Motor Vehicle Co. had been pending for years no effort was made to push it to a conclusion. Instead, Lindsay and Harmon made a show of activity within the past twelve-month by suddenly bringing actions against a number of makers and dealers within the Indiana jurisdiction, all of which were dismissed in the course of the past 60 days. The National case was the last one that so collapsed.

The complainants based their suit on two patents, No. 612,360, dated November 11th, 1898, and No. 748,760, dated January 4th, 1904, issued to Lindsay and Harmon. Patent No. 612,360 covers a "motor vehicle" and purports to cover the construction of an entire vehicle, but in this case the only part under consideration was the rear axle. The three claims of the patent with some variations of language claimed substantially "the combination in a vehicle, with a suitable motor and the vehicle frame, of a tubular axle casing on said frame inclos-

ing the driven axle, and having wheel-supports on its outer ends, wheels mounted on said wheel-supports the hubs whereof contain internally-toothed gear-rings, and an axle within said tubular axle-casing and having pinions on its ends which engage with said gear-rings."

Patent No. 748,760 purported to be a "driving-axle structure for motor vehicles," which is the rear-axle, and while the three claims in the suit differ somewhat the substantial claim was "In a motor-driven vehicle, the combination, with a pair of tubular axle structures, of a pair of casing-sections connecting the adjacent ends of said tubular axle structures, and one of said casing-sections being detachably connected a pair of shaft-sections revolvably mounted in the tubular axle structure and projecting into the casing-sections, an axially-separable driving connection between the shaft-sections from which the shaft-sections may be outwardly axially withdrawn, and independent means for normally retaining the shaft-sections against axial displacement, said means being removable to permit the outward withdrawal of each shaft-section from the structure."

The complainants contended that the National Motor Vehicle Co. used the mechanism of the two patents conjoined in one rear-axle so that both patents were infringed. They sought to have the court hold that the function performed by the pinions on the ends of the live-axles and the internal gears in the wheel-hubs which parts were not to be found in the defendant's rear axle, was transferred to another part of the vehicle, and the defendant claimed that it had discarded these parts and their functions so that there was no infringement, even if the earlier patent was valid.

It denied that there was any real novelty in the second patent. The record was very voluminous, almost a hundred patents and motor vehicles being put in evidence, among which were also British and French patents, among them the Elliott patent, which was the oldest patent and the one that decided the day.

McCord Increases Room and Productions.

The McCord Mfg. Co., of Detroit, just has completed an addition to its factory building, which will provide 12,000 additional square feet, and an extension of 4,000 square feet to its foundry. The enlargement will enable it better to take care of the production of the Hill-Precision lubricators and oiling devices, the rights to which it recently secured from the Precision company of Chicago, and which, with the McCord devices, give the Detroit company a complete line of mechanical lubricators of all types. The McCord company also recently has added to its line a cellular radiator of approved design which will be produced in connection with its well known tubular type radiator.

SUPREME COURT O.K.'S RETAIL TAX

Test of Pennsylvania Law Goes Against Automobile Dealers—Contracts With Manufacturers Discussed.

In an opinion delivered by Justice Lamar and representing the unanimous decision of the court, the United States Supreme Court last week pointed out when the retail sale of automobiles does not constitute interstate commerce and more or less directly touched on the character of contracts existing between manufacturers and dealers.

The opinion was rendered in the case of the Banker Brothers Co., a Pittsburgh corporation, plaintiff in error against the Commonwealth of Pennsylvania, the proceedings being in the nature of a test of the Pennsylvania law which imposed a tax of 1 per cent. on retail vendors of automobiles on their sales of automobiles made to persons in Pennsylvania. The Banker Brothers Co. had been taxed on sales aggregating \$351,000. and being beaten in the State courts carried the fight to the highest tribunal, denying liability on the ground that the sales were interstate transactions.

A decision of that point, said Justice Lamar in his opinion, involves the question as to whether Banker Brothers Co. acted as principal or agent of a New York manufacturer—the George N. Pierce Co., of Buffalo, which in 1905 executed a contract by which it agreed "to build for and sell automobiles to Banker Brothers Co. at 20 per cent. less than list prices. Deliveries to be f. o. b. Buffalo as soon as practicable after order for deliveries are received. Payment to be made in cash."

The Banker Brothers Co. kept no machines in stock except those used for demonstration, and was allowed to sell only within a restricted territory on terms stipulated by the manufacturer. The purchaser of the machine was required to pay at least 10 per cent. when he signed a printed form addressed to Banker Brothers Co. requesting it "to enter my order for — motor car, for which I agree to pay the list price f. o. b. factory, as follows: \$..... upon signing this order, and the balance upon delivery of the car to me."

The name of the Pierce company did not appear anywhere on this printed form furnished by it, but when the Banker Brothers Co. accepted the order it remitted the cash to the Pierce company. If the latter accepted the order, it agreed thereupon to manufacture the automobile and ship it, drawing upon Banker Brothers Co. for the balance of the list price, less 20 per cent., with bill of lading attached. The Banker Brothers Co., on paying the draft, took up the bill of lading, received from the carrier an automobile which though shipped in interstate commerce had become at rest in the State of Pennsylvania. The Banker

Brothers Co. had the title and delivered it to the buyer on his paying the balance of the purchase money. Compare *Dozier v. Alabama*, 218 U. S. 124. The written contract was silent on the subject, but it was stipulated that the Pierce company warranted the machine direct to the purchaser.

Summarized, the Court's decision said:

"It is contended that Banker Brothers Co. were agents and the Pierce company an undisclosed principal. It is urged that the sale was an interstate transaction between the manufacturer and the purchaser, with Banker Brothers Co. merely acting as an agent which looked after the delivery of the machine and collected the purchase price.

"This is one of the common cases in which parties find it to their interest to occupy the position of vendor and vendee for some purposes under a contract containing terms which, for the purpose of restricting sales and securing payments, come near to creating the relation of principal and agent. But as between Banker Brothers Co. and the Pittsburgh purchaser, there can be no doubt that it occupied the position of vendor. As such it was bound by its contract to him and under the duty of paying to the State a tax on the sale.

"The name of the Pierce company was not mentioned in the order signed by the purchaser. Had there been a breach of its terms he would have had a cause of action against the Banker Brothers Co., with whom alone he dealt. If he had failed to complete the purchase the Pierce company would have no right to sue him on the contract. The fact that he was liable for the freight by virtue of the agreement to 'pay the list price f. o. b. factory' did not convert it into a sale by the manufacturer at the factory; neither was that result accomplished because, with the machine, Banker Brothers Co. also delivered to the buyer in Pittsburgh a warranty from the manufacturer direct.

"These were mere incidents of the intrastate contract of sale between Banker Brothers Co. and the purchaser in Pittsburgh, who was not concerned with the question as to how the machine was acquired by his vendor, or whether that company bought it from another dealer in the same city or from the manufacturer in New York. The contract was made in Pennsylvania, and was there to be performed by the delivery of the automobile and the payment of the balance of the purchase price. See *American Steel & Wire Co. v. Speed*, 192 U. S. 500; *American Express v. Iowa*, 196 U. S. 146. The court properly held it was not an interstate transaction, but taxable under Pennsylvania laws."

Small Failure in Oklahoma City.

The Wood-Knight-Hawk Co., which manufactured automobiles and carriages on a small scale in Oklahoma City, has filed a petition in bankruptcy. Its liabilities are \$7,794 and its assets are placed at \$21,350.

RED AND GOLD FOR THE GARDEN

Decorative Treatment to be Attractive as Ever—Record-Breaking Number of Exhibitors—First Complete List.

Despite the fact that the six-day bicycle race at present occupies the now "doomed" Madison Square Garden to the exclusion of everything else, the "foundations" for the twelfth annual automobile show already have been laid—the floor is in place and the bases of the huge pillars which will support the specially constructed elevated platforms and balcony already have been installed. The decorative work, the color

five of whom will show electrics; 311 accessory manufacturers and jobbers, and 19 motor-cycle manufacturers; a total of 390 exhibitors, as compared with 387 in the first week of last year's show, which then was the high record. The accessory makers include members of the Motor and Accessory Manufacturers, as well as non-members, the names of the latter and their space allotments being here published for the first time. During the second week 32 manufacturers will show commercial vehicles of all sorts and sizes, while a majority of the accessory manufacturers exhibiting in the first week will remain for the second week, augmented by a few newcomers who will only show their wares during the commercial vehicle week.

201 The Garford Co.
114 Haynes Automobile Co.
20 Hudson Motor Car Co.
50 Inter-State Automobile Co.
111 Jackson Automobile Co.
121 Knox Automobile Co.
10 Locomobile Co. of America.
7 Lozier Motor Co.
208 W. H. McIntyre Co.
204 Marquette Motor Co.
120 Matheson Automobile Co.
18 Maxwell-Briscoe Motor Co.
52 Mercer Automobile Co.
104 Metzger Motor Car Co.
12 Mitchell-Lewis Motor Co.
107 Moline Automobile Co.
118 Moon Motor Car Co.
119 National Motor Vehicle Co.

GENERAL VIEW OF THE MADISON SQUARE GARDEN SHOW AS IT WILL APPEAR WHEN OPENED ON JANUARY 6TH

scheme of which will be held in crimson and gold, is being carried on in several studios, where more than 200 artists and sculptors are devoting their talents and energies to the production of something that will be "worth while," while in Exhibition Hall, Jean Paleologue, the French artist, is painting a huge mural scene entitled "Sunset in California." An idea of the effect of the decoration is conveyed by the accompanying illustration.

The show—which is at the same time the first to be held under the auspices of the Automobile Board of Trade, successor to the Association of Licensed Automobile Manufacturers, and the last exhibition of any kind to be staged in the doomed Garden—bids fair to surpass any of its predecessors, both in quality and quantity of exhibits, when its doors are opened on January 6th next. During the first week there will be 60 exhibitors of pleasure vehicles,

The complete list of exhibitors and their allotted spaces is as follows—those marked with an asterisk (*) exhibiting during the first week only, those with a double asterisk (**) in the second week only; those accessory exhibitors without such designation will exhibit at both Parts I and II:

Pleasure Vehicles.

MANY TRADESMEN IN NEW PLACES

Long List of Those Who Just Have Changed Positions—Most of the Shifts Occur in the West.

R. D. Rocap, of Kalamazoo, Mich., has been appointed superintendent of the Alpena Motor Car Co., of Alpena, Mich. He succeeds George E. Cately.

A. B. C. Hardy, formerly manager of the Marquette Motor Co., of Saginaw, has been appointed general manager of the newly organized Little Motor Car Co., of Flint, Mich. He will assume his new duties on January 1st.

George B. Pratt, for several years sales manager for the Dean Electric Co., of Elyria, O., has joined the staff of the Anderson Electric Car Co., of Detroit. He will cover the State of Ohio and part of New York and Pennsylvania.

J. H. Newmark, for several years advertising manager for the Oakland Motor Car Co., of Pontiac, Mich., has been transferred to the advertising department of the General Motors Co., in Detroit, of which the Oakland company is a subsidiary.

George L. Lavery, formerly traveling representative for the Irwin-Robbins Co., automobile body makers in Indianapolis, has gone over to the Racine Mfg. Co., of Racine, Wis., which also produces bodies. He will represent the Racine company on the road.

F. H. Quick, formerly with the United Motors Indianapolis Co., has been added to the sales force of the Findeisen & Kropf Mfg. Co., of Chicago, manufacturers of Rayfield carburettors. Quick's particular field will be visiting the automobile manufacturers.

Eugene F. Ball, secretary and treasurer of the Ball-Fintze Co., Newark (O) jobbers, has resigned those offices and will sever his connection with the company on January 1st. He may re-enter the jobbing business on his own account or may go into the manufacturing field.

B. F. Blaney, who for two years has been general sales agent for the Johnson Service Co., of Milwaukee, has resigned that connection to become sales manager for the Havers Motor Car Co., of Port Huron, Mich. Blaney is now in the East interesting dealers in the new Havers "6-44."

H. E. Dove has been appointed manager of the Buick Motor Co.'s Cleveland branch, succeeding Ray M. Colwell, who resigned in order to devote his time to the manufacture and marketing of a self-starting device. Previously Dove was connected with the Buick sales department in Flint, Mich.

Frank M. Sealand, former Ohio sales supervisor for the Winton Motor Carriage Co., has been promoted to the management of the Winton branch in Detroit. He suc-

ceeds T. W. Henderson, who resigned to take charge of a motorcycle company in which he had become financially interested.

Leroy Hagerline, previously connected with the Packard Motor Car Co. of Philadelphia, has been appointed manager of the Packard Motor Car Co. of Pennsylvania, which has its headquarters in Harrisburg. The latter branch controls the Packard territory in Central and Eastern Pennsylvania outside of Philadelphia.

A. C. Leonard, who for the last nine years has been identified with Goodyear tires in San Francisco, latterly as manager of the Goodyear branch in that city, has resigned that position in order to engage in business on his own account. His duties will be assumed by N. D. Taylor, district manager for the Goodyear company.

C. A. Emise having been promoted to the sales management, J. M. Evans has been appointed advertising manager for the Lozier Motor Co., of Detroit. He is well equipped for his new duties, having served successively with the Mahin Advertising Agency, the Berlin Machine Co., the E-M-F Co., and the Brush Runabout Co. When the latter company was taken over by the United States Motor Co., Evans was given a position in the advertising department in New York, which he relinquished to join the Lozier staff.

West Virginia Norwalk Begins Operations.

The Norwalk Motor Car Co., of Martinsburg, W. Va., which was organized to take over the Norwalk (O.) company of the same name, which latter at the eleventh hour of the transaction was thrown into bankruptcy, will proceed with its plans despite the unexpected situation that developed. A. E. Skadden, former president and manager of the defunct corporation, and several other officials and a number of employees have removed to Martinsburg to undertake the production of the cars the West Virginia company will place on the market.

Kimball to Go Deeper Into Automobiles.

C. P. Kimball & Co., the well known carriage makers, who have dealt with automobiles on a limited scale, have executed a 25 years lease for a three-story concrete building, 380 x 160 feet, which is to be erected at Michigan avenue and 39th street, Chicago, for their occupancy. It will not be completed, however, for several months, when it will be employed for a considerable expansion of the Kimball body building and electric vehicle interests.

Wayne Motor Co. Admits Bankruptcy.

The Wayne Motor Co., of Detroit, on Monday last, 11th inst., filed a voluntary petition in bankruptcy, which disclosed liabilities of \$3,576.15 and nominal assets of \$14,303.63. Of this amount \$3,000 is in machinery and \$6,000 is the valuation of a completed engine.

THREE MORE ELECTRIC STARTERS

Apple, Dean and Detroit Companies Each to Produce One—All Combine Lighting and Ignition Features, Also.

Despite the sudden and pronounced "arrival" of the self-starter in the form of compressed air starters, gasoline starters, acetylene starters and spring starters, to say nothing of others, more or less worthy, it has been a matter of comment that there has appeared in commercial shape but one starter in which an electric motor is used to rotate the crankshaft, notwithstanding the theoretical beauties of such an arrangement.

Those who took this to mean that the electrical people were "asleep at the switch," were much mistaken, however, for apparently they have been working quietly and developing their product without saying much about it. At any rate it now is known three brand new engine starters, all of the electric motor type are about ready for the market, all of them the product of experienced hands. The makers are the Apple Electric Co., Dayton, O., the Detroit Electric Appliance Co., Detroit, Mich., and the Dean Electric Co., Elyria, O. These three new starters are similar in that they are used in connection with electric lighting, ignition and signalling systems, taking current from storage batteries charged by a dynamo while the car is running.

In the case of the Dean invention the starter is designed to be built into the car as an integral part of its equipment, and is used in conjunction with the "Dynalux" generator—a producer of electricity that requires only two wires, which may be connected without reference to polarity. In the Dean system a new device also has been incorporated, called a "tell-tale," the object of which is to warn the driver of the car if his electric tail-light goes out. A relay device, called the "Centurion" lights a small lamp on the dashboard if the tail light ceases to burn; the signal may be a special lamp, or else any lamp that is not usually burning, such as the speed-indicator lamp. A feature of the Dynalux generator is a governor or regulator called the "speed limit" and its object to bring the rotative speed of the generator within reasonable limits and so avoid needless wear and severe mechanical strains on the dynamo.

Schacht to Offer Stock to Canadians.

The Schacht Motor Car Co., of Canada, which is located at Hamilton, Ont., and which is an outgrowth of the Ohio corporation of the same name, is about to offer for public subscription in the Canadian market 15,000 shares of its 7 per cent. cumulative preferred stock. As a bonus, 20 per cent of common stock will be given with each purchase of preferred.

A. V. Manning is erecting a one-story concrete and steel garage on South Broad street, Trenton, N. J.

The Boston Kissel Kar branch has been moved from Boylston street to the Motor Mart, 10 Columbus avenue.

F. Conrad, who operated a garage at 1516 N. Register street, Baltimore, Md., has sold his business to Diehl & Son.

The Paris-American Motor Car Co. has been organized at St. Louis, Mo. It is located at 2125 Shenandoah avenue.

E. B. McNaughton is building a one-story garage on Washington street, Portland, Ore. It will cost, when complete, \$7,500.

The Empire Automobile Co. is the style of a new concern that has "opened up" at 1517 S. Jefferson avenue, St. Louis, Mo. J. C. Sommers is the manager.

The Firestone Tire & Rubber Co., of Akron, Ohio, has opened a branch in Dallas, Texas, at 1521 Commerce street. It will be under the management of P. P. Talbot.

The Kennebec Garage has "opened up" in Portland, Me., at 199 Kennebec street, with I. P. Holman as manager. The sale of used cars will be made a feature of the business.

The Fisk Company of Texas, which has its headquarters at San Antonio, has opened a branch at the corner of Young and Ervay streets, Dallas. E. H. Peck is manager of the branch.

The E. E. Graber Co., which was composed of Elmer Graber and Sayer Miles, and which conducted a garage in Newton, Ia., has changed hands. Ora Woody is the new owner.

The Warner Garage is the style of a new establishment that has been opened at Amsterdam, N. Y., with Jesse Seward as manager. Stoddard-Dayton and White cars are handled.

The firm of Mirrion & Castle, Amsterdam, N. Y., has been dissolved and the business henceforth will be conducted by W. J. Mirrion and T. J. Franconer. Marmon and Ford cars and Michelin tires are being handled.

The Hupp Corporation has opened a branch in Atlanta, Ga., with temporary headquarters at 203 Peachtree street. Permanent quarters are in course of construction at the corner of Peachtree and North avenues.

The Ferromatic Tire & Mfg. Co. is the style of a spring wheel concern which has opened general sales offices at 1745 Euclid avenue, Cleveland, Ohio. C. F. Wren is

the inventor of the tire and president of the company.

J. W. Brooks and C. L. Norton have formed the Brooks-Norton Motor Sales Co., in Cleveland, for the purpose of handling Ohio electrics and one or two lines of motor trucks. They are located at 1917 Euclid avenue.

The C. & F. Motor Car Co., which recently was organized in San Francisco, Cal., to handle Stutz cars, has opened salesrooms at 436 Van Ness avenue. Albert Cosby and J. A. Chanslor are the partners in the enterprise.

The Goodyear Tire & Rubber Co. has opened a branch in Spokane, Wash., at 1107 First avenue, which will cover the territory in the Cascades in Washington, Oregon, Idaho and Montana; it is under the management of C. D. Clement.

Frank W. Philips has resigned as manager of the Chisholm-Philips Automobilia Co., of Cleveland, Ohio. He will devote his time to an eastern body-building plant in which he is interested, but will continue to make his home in Cleveland.

Charles E. Riess & Co. have moved into their new commodious quarters on Broadway, corner Sixty-third street, New York City, where they have a floor space of more than 20,000 square feet. They handle the American and Marion lines.

J. W. Newsom, who conducts a tire repair business at 4148 Olive street, St. Louis, Mo., and F. S. Seever, of the Auto Marine Supply Co., of the same address, have formed the Newsom-Seever Supply & Tire Co. They will continue business on Olive street.

George Ostendorf, formerly manager of the Franklin Automobile Co.'s branch in Buffalo, has purchased the establishment and hereafter will conduct the business on a dealership basis under his own name. Ostendorf will retain the present location at 683 Main street.

The Milwaukee Auto Specialty Co. has purchased a large piece of property at Seventh and Chestnut streets, Milwaukee, Wis., on which to erect a garage, repair shop and service building. The structure will be 150 x 110 feet, five stories high, of concrete and steel.

The Columbia Garage, which heretofore has been operated as a garage and livery only, with headquarters at 355 West Madison street, Chicago, Ill., has taken on the sale of pleasure cars and opened a service department and salesroom at 1615 Michigan avenue. Velie cars will be handled.

H. J. Twelvetree, formerly manager of

the Cleveland branch of the Thomas B. Jeffery Co., has purchased the interest of Frank Sealand in the Weaver-Sealand Motor Co. and become vice-president of the concern. Sealand goes to Detroit to become manager of the Winton branch there.

The H. G. Hawkins Co., representative for Baker electrics in Spokane, Wash., has found its quarters at 508 Second avenue too small and taken more commodious rooms at 818 Fourth avenue. The H. G. Hawkins Co. formerly did business under the style of Washington Motor Vehicle Co.

J. M. Wolf and Emil Bolina, of Albert Lea, Minn., and Peter G. Hammel, of Beaver Dam, Wis., have formed the Fairmont Motor Co., and are building a garage in the Minnesota town of that name. The building will be 110 x 52 feet, and will contain salesrooms, an accessory department, and a garage and repair shop.

John F. Shuford, E. J. Ryan and F. Schmit have purchased the business of the Continental Motor Equipment Co., 5887 Delmar boulevard, St. Louis, Mo., changed the name to Continental Equipment Co. and have established headquarters at 3124 Locust street. The Delmar boulevard store will be continued as a branch.

The Wishart-Dayton Auto Truck Co., which recently was incorporated in New York with \$25,000 capital, has opened for business at 501 Fifth avenue, New York City. The company, of which the wealthy George Wishart is president and his son Spencer, the well-known racing driver, is secretary, will handle Dayton and Barker trucks.

J. S. Patterson has purchased the interest of the Jackson Hardware Co. in the Jackson & Patterson Garage, on South street, Lafayette, Ind., and will continue the latter in his own name. The Jackson Hardware Co. has opened automobile salesrooms at the corner of Third and South streets, where Frank Jackson will be in charge.

Recent Losses by Fire.

Abilene, Texas.—K. P. L. Auto Co. damaged. Loss, \$3,000.

Glasco, Kans.—Davidson Garage and 10 automobiles burned.

Jamestown, Kans.—Wilcox Garage and the Fitzgerald & Hill Garage destroyed.

Canton, Ohio.—Republic Stamping & Enameling Co.'s garage and two cars destroyed. Loss, \$7,000.

Savannah, Ga.—Ford Automobile Agency's garage, 221 East Broughton street; five cars burned. Loss, \$4,000.

This simple device
places your car among
the safe percentage.

Skidding is responsible for 90 per cent. of automobile accidents. See that you do not risk the lives of your passengers on the greasy roads and pavements this Fall and Winter. Equip your automobile with

Pennsylvania Vacuum Cup Tires

The principle is simple, like all big ideas. On a tread of regular thickness is moulded a series of cup-shaped rubber knobs which exert a vacuum hold on wet and greasy pavements. Slipping in any direction is im-

possible. The rolling of the wheel releases each cup automatically by raising one side first, so that forward speed is not retarded.

In snow and mud the knobs sink in and provide a better hold and better "traction" than any other form of non-skid.

Longer Service is a strong feature of Pennsylvania Vacuum Cup Tires. Even when the rubber knobs wear down, the tire is still as good for service as a smooth tread tire of regular thickness.

You combine the essential qualities of Safety and Economy by using these non-skid and long wearing tires.

SOLD BY THE BEST DEALERS EVERYWHERE

NEW YORK, DECEMBER 14, 1911.

Faith and the Three-Wheel Vehicle.

Doubtless not even the failure last week of the most conspicuous recent advocate and manufacturer of three-wheel motor vehicles will serve to diminish interest in that type. Since 1769, when Captain Cugnot produced his freakish three-wheel steam artillery carriage, the effort to produce and popularize a vehicle of the sort has been continuous if intermittent, if such a paradox may be employed.

The whole history of self-propelled and man-propelled vehicles, both ancient and modern, is studded with such examples, which in every instance have met with failure. When Daimler first applied a gas engine to a road vehicle, he applied it to what looked like a bicycle and what by courtesy was termed a bicycle, but which to all intents and purposes was a three-track and therefore substantially a three-wheel vehicle. Benz's first vehicle was a three-wheeler; so, too, was the first popular-priced motor vehicle to be produced in America.

At this latter period and before the automobile, as now understood, attained real prominence, the motor tricycle was in considerable use, both here and abroad; indeed, all of the earliest motorcycles were tricycles; the motor bicycle was considered

an impossibility. In the early days of the pedal propelled bicycle—the high bicycle—the tricycle was prominent; it held the element of personal safety which element was foreign to the nature of the bicycles of those days. But the tricycle perished—perished miserably. Here and there there may be a two-passenger motor tricycle or a three-wheel "motorette" or "delivery car" running around, but they are few and far between.

No three-wheel vehicle ever produced ever attained real popularity or maintained headway in the sense of usage. It is not conceivable that any that may come after will share a better fate. It is essentially a restricted smooth-road vehicle; away from such roads it is, in any form, a "man-killer;" it is only the near-superhuman who can endure the toil and racking that it entails. In America, least of all, can it become a practicable vehicle. Our roads are not adapted to the use of three-track vehicles. The surfaces, the ruts, the side-paths of our highways permit only the use of single-track and two-track conveyances. The bicycle quickly swept out the tricycle and the three-wheel automobile never had even a ghost of a chance to prevail against a four-wheel, two-track vehicle of any sort.

The history of three-wheelers is one unending succession of failures. It is possible to paint glowing and attractive pictures of their possibilities—the manufacturer who failed last week was deluged with inquiries—but possibilities will not stand against facts—against history. The wonder is that at this late day, and in the light of comparatively recent experiences, men can be found to devote their time, their energy, their capital to the production and popularization of three-wheelers. Their faith is admirable, their judgment beyond understanding.

Two Sides of the Service Problem.

"Service" has become a word to conjure with in the automobile trade. It is full of meaning and too freely used it undoubtedly conveys more meaning to prospective purchasers than always is desirable. This is particularly true as applying to motor trucks. The salesman almost lovingly hangs onto the word. Not infrequently he talks more of "service" than he talks of trucks, which in its way is well enough. But he seldom goes far enough. He talks chiefly of the service the truck or its manufacturer will render, and too often

commits the latter to practices or performances that are unreasonable, and that serve merely to breed dissatisfaction.

The years spent in bringing the vehicle to a state of development where it would give satisfactory results, the many early failures and the dissatisfied purchasers of bygone days have all impressed the manufacturer with a deep sense of his own responsibility, and he shoulders the burdens as a matter of course. But so immersed is the salesman in making sales that he forgets that there are responsibilities that devolve upon the user—certain burdens that the purchaser must assume if the truck is to do all it is capable of doing. Too often—indeed, in most instances—the salesman fails to press home this, the other side of the transaction, lest it make an unfavorable impression on his "prospect." And the "prospect," on his part, rarely gives the matter the consideration it merits.

The truth of the matter is that once a vehicle is sold it is just as important that the user give it the right kind of treatment as it is that the builder should have done his work well. He should feel it obligatory to follow the directions given for the care of the mechanism, or else take upon his own shoulders the responsibility for the failure of the truck to give expected results. He should load it with the loads it was built to carry, make adjustments promptly and intelligently, use supplies recommended by the builder and, if anything needs to be done, see that it is done promptly, so that the truck shall not be operated while in a condition to be injured by running; and he should at once notify the agent of the existence of trouble beyond his ability to remedy. Moreover, the user should be perfectly frank in discussing with the agent all matters pertaining to the use of the car, giving all possible information, even if by so doing he reflects adversely upon his own judgment or that of his employees.

Unquestionably both buyer and seller should attach more importance than they usually do to the fact that there are two sides and two sets of responsibilities connected with every transaction, and that after the truck has been sold the user has obligations to fulfill that are quite as important as those of the agent. And it is only by the intelligent and conscientious carrying out of obligations on both sides that the motor truck can be made to render the best service of which it is capable.

St. Louis, Mo.—Electric Motor Car Co., under Missouri laws, with \$10,000 capital; to deal in electric motor vehicles.

Springfield, Ill.—Flexo-Motor Co., under Illinois laws, with \$30,000 capital. Corporators—F. C. Miller, W. Wishart, H. L. Smith.

Detroit, Mich.—Briggs-Detroit Co., under Michigan laws, with \$200,150 capital. Corporators—John A. Boyle, Claude S. Briggs.

Chicago, Ill.—La Salle Auto Oil Co., under Illinois laws, with \$25,000 capital. Corporators—W. R. Watson, G. W. Curtis, L. E. Powell.

Decatur, Ill.—North Main Street Garage Co., under Illinois laws, with \$10,000 capital. Corporators—G. G. Council, E. R. Leggett, C. T. Council.

Chicago, Ill.—S. K. F. Ball Bearing Co., a New York corporation, admitted to deal in ball bearings in the State of Illinois. Illinois capital, \$50,000.

Columbus, Ohio—Auto Accessories Manufacturing Co., under Ohio laws, with \$10,000 capital; to deal in automobile supplies. Corporators—W. S. Paxon, et al.

Chicago, Ill.—Selden Motor Vehicle Co., a New York corporation, admitted to do business in the State of Illinois. Illinois capital, \$500,000. Corporator—W. A. Albaugh.

Los Angeles, Cal.—Beverly Automobile Co., under California laws, with \$10,000 capital; to deal in automobiles. Corporators—John Wright, Fred L. Moses, Charles H. Pool.

Selma, Ala.—Central Alabama Motor Car Co., under Alabama laws, with \$1,500 capital; to deal in automobiles. Corporators—George H. Auburn, H. A. Vaughn, G. G. Vaughn.

Racine, Wis.—The Racine Rubber Co., under Wisconsin laws, with \$10,000 capital; to deal in rubber goods. Corporators—Martin J. Gilen, Milton J. Knoblock, Mary E. Linn.

Toledo, Ohio—The Royal Auto Co., under Ohio laws, with \$10,000 capital; to deal in motor vehicles. Corporators—Marion M. Kennedy, E. B. Parker, B. C. Christen, E. J. Heiss.

Augusta, Maine—B. F. Moffat Punctureless Tire Co., under Maine laws, with \$2,500,000 capital. To manufacture and sell punctureless tires. President and treasurer, E. M. Leavitt.

Philadelphia, Pa.—The Tire Shop, Inc., under Delaware laws, with \$25,000 capital. Corporators—J. A. Fischer, Philadelphia,

Pa.; J. G. Hughes, Haddenfield, N. J.; H. W. Davis, Wilmington, Del.

Greenville, S. C.—The Marathon Car Co., of South Carolina, under South Carolina laws, with \$10,000 capital; to manufacture and deal in automobiles. Corporators—C. W. Ellis, H. D. Caldwell.

Chicago, Ill.—The Motor Bus Co., under Illinois laws, with \$60,000 capital; to maintain and operate motor buses and trucks. Corporators—Clarence E. Morris, James E. Hauronic, Frank P. Page.

Marshalltown, Iowa—The Eldridge-Beebe Auto Co., under Iowa laws, with \$10,000 capital; to deal in automobiles and other motor vehicles. Corporators—Charles C. Eldridge, Edwin J. Beebe.

Cincinnati, Ohio—Auto Accessories Manufacturing Co., under Ohio laws, with \$15,000 capital. Corporators—S. C. Roettinger, H. L. Habekotte, W. S. Paxon, Henry E. Beebe, William Stichtooth.

Rahway, N. J.—Acme Body Co., under New Jersey laws, with \$100,000 capital; to manufacture automobile, carriage and wagon bodies. Corporators—H. A. Grube, F. P. Gallagher, G. L. Freeman.

Ft. Wayne, Ind.—Merchants' Motor Delivery Co., under Indiana laws, with \$25,000 capital; to transport merchandise in motor vehicles. Corporators—A. W. Harris, William Hahn, A. H. Fernwalf.

Detroit, Mich.—Detroit Tube Products Co., under Michigan laws, with \$40,000 capital; to deal in motor vehicles. Corporators—A. Chester Jones, Henry E. Bellaimey, Frederick W. McClyellon.

Fairmont, Minn.—Fairmont Motor Co., under Minnesota laws, with \$15,000 capital; to deal in automobiles and other motor vehicles. Corporators—John M. Wolf, Emil C. Belina, P. G. Hammer.

Redmond, Wash.—Redmond-Kirkland Auto Stage Co., under Washington laws, with \$3,000 capital; to maintain and operate motor buses. Corporators—A. N. Brown, Charles Brown, William Brown.

Buffalo, N. Y.—Buffalo Motor Vehicle Service Co., under New York laws, with \$100,000 capital; to manufacture, repair and deal in motor vehicles. Corporators—W. R. Huntley, J. H. Vail, C. R. Huntley.

Hartford, Conn.—The Knight Garage, under Connecticut laws, with \$15,000 capital; to deal in automobiles and maintain a garage. Corporators—Harry T. Hotchkiss, George E. Tester, Pierrepont B. Foster.

Camden, N. J.—The Little Giant Motor Car Co., under New Jersey laws, with \$125,000 capital; to manufacture and deal in automobiles. Corporators—W. C. Davis, D. Cooney, A. H. Holl, A. E. Simmons.

New York City, N. Y.—Batavia Co. of Pennsylvania, under New York laws, with \$30,000 capital; to manufacture and deal in automobile and bicycle tires. Corporators—H. W. Newburger, M. Lustig, both of New York City; D. Weiss, Yonkers, N. Y.

December 20, New York City, N. Y.—Annual banquet of the Automobile Club of America at Waldorf-Astoria.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

December 30-January 6, Buffalo, N. Y.—Buffalo Automobile Trade Association's annual show in 74th Regiment Armory.

January 2-10, New York City, N. Y.—Importers' salon at Hotel Astor.

January 6-13, New York City—Automobile Board of Trade's 12th annual show in Madison Square Garden. Pleasure vehicles only.

January 10-13, Peoria, Ill.—Peoria Automobile Club's show in the Coliseum.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual national show in New Grand Central palace. Pleasure and commercial vehicles.

January 13-19, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's annual show in Auditorium.

January 13-27, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show in First and Third Regiment Armories.

January 15-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden. Commercial vehicles only.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-27, Providence, R. I.—Rhode Island Licensed Automobile Dealers' Association's show in the State Armory.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show at Wayne Garden.

January 27-February 3, Pittsburgh, Pa.—Automobile Dealers' Association of Pittsburgh, Inc., sixth annual show of pleasure cars.

February 3-10, Montreal, Can.—Automobile Club of Canada's annual show at Drill Hall.

February 5-10, Pittsburgh, Pa.—Automobile Dealers' Association of Pittsburgh, Inc., sixth annual show of commercial vehicles.

February 5-17, St. Louis, Mo.—Annual show in the Coliseum.

February 12-17, Ottawa, Can.—Ottawa Valley Motor Car Association's first annual show.

February 12-17, Kansas City, Mo.—Motor Car Trades' Association's show in Convention Hall.

WHAT IMPRESSED THE ENGINEERS

Returning S. A. E. Members Talk of What They Saw Abroad—Clarkson and Coffin Find Interesting Comparisons.

Of the 60-odd members of the Society of Automobile Engineers who sailed away from New York on November 1st to make their first official visit to the British body of kindred spirits, the Institution of Automobile Engineers, some 45 returned on Thursday last, 7th inst. aboard the White Star liner Olympic. Though they saw much that was interesting during their visits to the manufacturing plants of the more prominent foreign automobile and parts manufacturers, there were those who were not sorry to be back home again, for aside from its educational value the trip was strenuous to say the least. For the entire time they were abroad, their time was taken up by a continual round of sight-seeing and banqueting; not even Sundays were days of rest.

Some of those who did not return with the party on the Olympic remained abroad for a more leisurely examination into manufacturing methods, and others had returned previously. Among the more prominent men who made up the returning party were: Howard E. Coffin, vice-president of the Hudson Motor Car Co.; William E. Metzger of the Metzger Motor Car Co.; Coker F. Clarkson, secretary of the Society of Automobile Engineers; G. R. Wadsworth of the Peerless Motor Car Co.; Walter C. Baker of the American Ball Bearing Co.; D. G. McDiarmid, superintendent for the C. P. Kimball Co.; W. G. Wall, chief engineer of the National Motor Vehicle Co.; William Kelly, vice-president of the Metzger Motor Car Co.; C. H. Foster, president of the Gabriel Horn Mfg. Co.; J. B. Hull, vice-president of the Perfection Spring Co.; Arthur B. Cummer, of the Autocar Co.; Alden L. McMurtry, of Gray & Davis; F. S. Dusenbergh, assistant manager of the Sears Automobile Co.; H. G. Stutz, of the Stutz Auto Parts Co.; E. A. De Waters, of the Buick Motor Co.; H. B. Bachman, assistant engineer of the Autocar Co.; John G. Wood, general manager of the Empire Motor Car Co.; Bert Morley, of the Kelsey Wheel Co.; C. J. Metzger, sales manager of the Woods Motor Vehicle Co.; B. G. Hayes, of the Hayes Mfg. Co.; Paul L. Snutzell, representing C. F. Splittorf.

That the trip was entirely successful goes without saying. The American automobile engineers were most hospitably and fully welcomed by their British and Continental cousins; joint professional deliberation and inspection of actual working conditions in Europe were had, and as soon as practicable the Institution of Automobile Engineers will send a delega-

tion of its members to America to meet in technical discussion with the Society of Automobile Engineers and to view the methods and workings of American motor car factories. It is improbable, however, that any large party of British engineers will visit America before 1913 as a trip to France has been arranged for next year. The following year, it is understood, the Institution of Automobile Engineers will pay its formal return visit.

That the engineers would hear a lot about the so-called American invasion was to be expected, though the average Briton's alarm at the insidious advance of the American medium-priced car is groundless in the opinion of Howard E. Coffin, for the reason, he states, that the same transition has taken place in this country and worked for the good of motoring; the medium-priced car will stimulate greatly the British interest, and lead to the sale of many larger cars. "Though the production of the medium-priced car in America was croaked to be the death-knell," he says, "these 'death-knells' have proven to be the greatest missionaries ever."

Commenting further on foreign tendency in design, Coffin says:

"I am inclined to think the small bore-long stroke idea is, in some instances, being carried too far. As to whether the use of the wire wheel and worm drive can become popular on American roads, is a question, both from the commercial and engineering standpoints. French makers do not seem to be following the English lead very greatly as yet. Self-starters are not in evidence and there seems to be little, if any, experimental work in this connection. A good many attempts are being made at the hydraulic type of transmission, but all these efforts as yet are in the experimental form. Slide and rotary valve motors are less in evidence than the records of the foreign patent offices would seem to warrant. Very few startling innovations of any kind were to be found in the Olympia show, but the show was extremely interesting from every standpoint."

It is the consensus of opinion that the thing which most impressed the American engineers was the widespread use of the worm gear for final drive. In practically every factory which they visited were found evidences either of its use at present or its intended use in the near future. According to present indications, the number of cars which will be worm-driven next year will be considerably greater than the number so constructed at present. In only one instance was it found that after trial a manufacturer had returned to the use of the bevel drive and in this case, no accurate information regarding the reason for the change could be obtained.

The increasing use of the "silent" type of chain for driving cam shafts, pumps and magnetos, was another feature which was conspicuous, though the trend toward this construction was not as noticeable as

it was in the case of the worm drive. One of the more recent developments in the application of the "silent" chain which steadily is coming into greater prominence is its use for transmission purposes. The London General Omnibus Co. has used chain change gear mechanisms on its fleet of buses for some time, but recently the manufacturers of two pleasure cars, the Maudsley and the Dennis, have adopted similar "gear" boxes, and indications point toward a still more general adoption of chains for this purpose in the near future.

Naturally, much was heard of the various types of non-poppet valve engines which recently have made their appearance and their ready acceptance by the motoring public proved a genuine source of wonder to not a few of the visiting engineers. As opposed to the pioneer in the field, the Knight engine, it was found that there are several other types of sleeve and rotary valve engines which before long bid fair to attain to considerable popularity, though at present they are in more or less experimental forms.

Regarding production methods and the use of automatic machinery, Coker F. Clarkson, secretary of the society, says that it is difficult to generalize. "In some factories," he says, "notably in the case of the Panhard, Renault, Benz and Wolseley, we found excellent examples of work done on full automatic machinery; the jig work was particularly good, and was in every way up to American standards. But in others the inclination toward the use of semi-automatic machinery was just as pronounced. As a rule, the amount of hand work which is done is greater than is the case in America, and greater attention is given the finish of small parts." "It is the lower cost of labor," he explains, "which permits of more manual operation in the manufacture and finish of parts."

In reference to the number of cars produced per man per year, it was found that in several cases the figures closely approximate those which obtain in the large car factories in this country, namely, one car for each two men per year. In another case, the manufacturers of a notable French car claim the production of one car a year for less than each man employed. It is in this same factory that an elaborate system of training apprentices is in vogue, and in this way operators literally grow up with their work.

As to engine starting devices, the movement in favor of which has received such really tremendous impetus in the United States during the past three months, little or nothing has been done abroad. Instead manufacturers appear to be watching and waiting, and according to several of the returned engineers all the information which could be gleaned regarding American practice, was snapped up eagerly. The acetylene starter in particular was of interest, but that little is known of its possibilities abroad is evidenced by the fact

that questions regarding its efficiency and the number of starts which it is possible to obtain from a tank of gas were numerous.

Similarly, standardization has received little attention, and in speaking of this feature, Clarkson says that there is nothing on the surface and apparently nothing below the surface. Some attempt has been made to standardize screw threads, he says, but this is really the only indication of the movement other than that foreign manufacturers have suggested that in the standardization of wheel sizes, metric sizes be used, because of the world-wide character of the tire business.

"One of the really striking things which impressed us collectively," says Clarkson, "was that in both Paris and London anti-skid chains are almost unknown. It is probable that the reason for this is that pavements are largely wood block. Also the number of steel studded tires which are used is considerably greater than is the case in America. As a matter of fact, taxicabs are required by law to be equipped with one steel studded tire in front and one in the rear, and undoubtedly the extensive use of the anti-skid tires has much to do with the absence of tire chains. On the whole, British and continental roads are good, though in this case too, it is hard to generalize for the reason that there are bad roads as well. In France the roads are particularly good, though due to the high crown which is given the majority of them there is a marked tendency to cause skidding."

Another of those who were impressed by what he styles "the great advance made by those contending for 'lilent' motors as opposed to poppet valve engines," was J. B. Hull, of the Perfection Spring Co. He also remarked the great amount of hand work done in the factories.

Of those of the engineers who kept their eyes open for individual parts, rather than for cars in their entirety, Bert Morley of the Kelsey Wheel Co., says that owing to the fact that in England wooden artillery wheels are made of oak or ash, and in France of cypress, they break off short when they do break, whereas American wheels, which are made of hickory, tend rather to splinter. "The strength of the American hickory wheels," he says, "will stand the tests of the wire wheel without trouble."

Hickman Heads Milwaukee Dealers.

I. G. Hickman will direct the affairs of the Milwaukee (Wis.) Automobile Dealers' Association for another year. He was re-elected president at the annual meeting of the association December 4. The other officers are: Vice-president, Emil Estberg; secretary, A. E. Raffauf; treasurer, August Jonas; directors, I. G. Hickman, August A. Jonas, L. R. Brown, Frank J. Edwards, Emil Estberg, Edgard F. Sanger, A. E. Raffauf.

GANG PUMP TO START THE MOTOR

Prest-O-Lite Self-Starter Utilizes Odd But Simple Mechanism—Automatic Pressure Valve the Principal Feature.

Having acquired an enviable reputation by reason of the general merit of its acetylene gas tanks, it was to be expected that the latest offering of the Prest-O-Lite Co., Indianapolis, Ind., the Prest-O-Starter, would measure up to the high standard which has distinguished its predecessor, the Prest-O-Lite tank; that it has done so, it is almost needless to add. As its designation implies, the new engine starter is of the acetylene type and is quite simple and positive in action. It consists of but four essential parts other than the standard Prest-O-Lite gas tank.

Probably the principal feature of the

THE PREST-O-STARTER PUMP

system is that by means of an automatic pressure reducing valve the pressure in the starter pipes never can exceed two ounces, the probability of leakage thus being minimized. The pressure reducing valve is part of the system and attaches to the standard regulating valve as supplied on all Prest-O-Lite tanks. From the pressure reducing valve, a pipe is led to the gang pump operated by a small handle from the dash or any other convenient location. The word gang pump in this connection is used advisedly for the reason that four or six small pumps, according to the number of cylinders in the engine, are enclosed in the single pump housing and are operated simultaneously, one of them for each cylinder. From each of the tiny pumps a pipe leads to a cylinder where it is connected by means of a special injector nipple which is in effect a miniature check valve.

To operate the starter, the gas having been turned on at the tank, it merely is necessary to pull out the pump handle as far as it will go to admit gas to the small pumps, and then push it in again with a quick motion, when the gas is forced into the cylinders, the ignition spark serving to start the engine. Obviously the number of starts which may be made on a tank of gas depends on the size of the motor, as the starters are made in several sizes to permit the starting of either small or large motors with a single operation of the pump handle. With the motorcycle size of tank, however, it is claimed that 1,200 starts is a fair average and that with the standard

Prest-O-Lite tank a motor may be started at least 6,000 times.

Forged Shafts Are Not Crankshafts.

Following the decision of the Board of Appraisers at New York City, that steel crankshafts are "manufactures of metal" subject to 45 per cent. duty, the Custom House officials classified steel shafts, which had been forged and subsequently turned in a lathe, as "manufactures of metal," the same as crankshafts. On appeal to the Board, however, the duty was reduced to 35 per cent., the shafts being classed at "forgings." The forged steel shafts were imported by the Hewitt Motor Co., and the American Locomotive Automobile Co., and were to be used as crankshafts in trucks.

Pays \$37,000 for "Compressed Air Wheels."

Although nothing previously was known of it, it transpires that the Auto Compressed Air Wheel Co. exists in Chicago, Cal., and that there are those who think well enough of its future to pay \$37,000 for an interest in the company. The men who, according to press dispatches, have paid this sum, are W. H. Rank, of Oakland, Cal., and "a party of Philadelphia and Eastern capitalists." The wheel is the invention of Lucian Gruss, of San Francisco, and with the money just obtained it is stated manufacturing will be commenced at once.

Magdeburg's Much-Mixed Taxicab Service.

Difficulties with the replacement of broken parts, and other problems relating to the much-to-be-desired standardization of taxicabs which is being attempted in this country, do not seem to worry foreign taxicab companies—if one can believe the figures dealing with the taxicabs of Magdeburg, Germany. In this thriving German city there are 20 motor cabs, operated by two companies, comprising no less than eight different makes, including Opel, Adler, Benz, Itala, Renault, Horch, Dürkopp and Windhoff.

S. M. B. to Make Fabric First; Tires Later.

The S. M. B. Rubber Co., which has been incorporated under the laws of New York, with \$150,000 capital stock, will establish a factory in Naugatuck, Conn., and ultimately will engage in the manufacture of automobile tires; for the present, however, it will produce only rubberized fabrics. Albert C. Squares is president of the company, T. F. McCarthy treasurer and general manager, and Harry Boardman, secretary.

Block President of Philadelphia Dealers.

Louis C. Block was elected president of the Philadelphia Automobile Trade Association at the annual meeting held last week in Philadelphia, Pa. The other officers are: Vice-President, William P. Herbert; treasurer, F. W. Eveland; directors, R. M. Cook, H. H. Cole; committee on admissions, W. Wayne Davis, J. C. Bartlett.

FINALITY SUGGESTED BY R. E. OLDS

Considers His "Reo the Fifth" Close to the Ultimate Design—Wherein it Differs from Previous Models.

Changed slightly in appearance and in other respects which are not so apparent, at least to the eye, the latest product of the Reo Motor Car Co., Lansing, Mich., has been styled by its producers "Reo the Fifth." Also it is styled R. E. Olds's "farewell" car, and though the designation is slightly misleading inasmuch as it might be understood to mean that Mr. Olds is making ready to retire from the company, the appellation, it is explained, is merely by way of indicating that in "Reo the Fifth," Olds believes he has reached the ultimate of perfection and

considerably, though none of the changes are radical in their nature. The engine is practically the same as that in former models, cylinders being cast in pairs and measuring four inches bore and $4\frac{1}{2}$ inches stroke. By a slight rearrangement of component parts, the flywheel now is carried about two inches further back to permit of better weight distribution and to effect a reduction in vibration. A new one-piece fan has been added and its method of mounting altered so as to make adjustment of the belt or removal of the fan simpler. Water pipes have been increased in size, as has the radiator, and, adding a distinctive touch, all small parts now are nickel plated. The position of the valves remains the same, the inlet valve being in the cylinder head and the exhaust valve at one side, where it is in a position to be directly cooled by the water where it enters the jackets. The timing gears are of

Both sets of brakes are located on the rear wheels, and only slight changes calculated to improve their uniformity of action have been made. They are of the double-acting wrapping type and are provided with equalizers; brake rods have been replaced by steel cables carried in the side frame members. The springs have been made slightly longer and are semi-elliptic in front and three-quarters-elliptic in the rear. The wheels are equipped with demountable rims shod with $34 \times 3\frac{1}{2}$ inch tires both front and rear.

On the "Reo the Fifth" chassis both four and five-passenger bodies are supplied at the same price, namely \$1,055. In two-passenger torpedo roadster form the price is \$1,000.

Uncle Sam Strikes at Illegal Practice.

In a decision handed down last week, the Board of United States General Appraisers criticizes the practice, said to be very common, of liquidating an entry where there is a pro forma invoice and a consular invoice, by selecting for assessment the highest value for each item in the two invoices. In this way the Custom House officials have collected excessive amounts from importers, but none of the importers heretofore had taken the trouble to protest this excessive and illegal tax.

The case under consideration was the protest of William A. Brown & Co., who had imported an automobile and accessories on a pro forma invoice and had given a bond for the production of a consular invoice. The Collector subsequently liquidated the entry, assessing the chassis and body of the car for duty at the value given in the consular invoice, and the accessories at the value in the pro forma invoice, and by this method of liquidation reached a sum for the total invoice, which was in excess of the pro forma invoice value, in excess of the appraised value and in excess of the consular invoice value.

"This procedure," says General Appraiser Hay, "is, we think, without authority of law, unjust and hence repugnant to the principles which underlie the law. Where an entry is composed of a number of items, and there is both a pro forma invoice and a consular invoice under circumstances as stated in this case, the Collector must either adopt one or the other, unless there has been an appraisal of the merchandise which differs from one or the other, or both, and then it is his duty to liquidate upon the value found in the last appraisal or reappraisal, if not less than the entered value. He cannot, as he did in this instance, pick out the high value from each and assess duty thereon. . . ."

"The protest is, therefore, sustained for reasons which are manifest from this brief opinion, and the Controller is directed to reliquidate the entry, following in the assessment of duty in that reliquidation the decision of the Court of Customs Appeals in *United States versus Bennett*."

"REO THE FIFTH"—R. E. OLDS'S "ULTIMATE" DESIGN

therefore will retire from the designing field. The car will be manufactured and marketed in years to come but it will remain in its present form except for such slight refinements of detail as experience may dictate.

"Reo the Fifth" is a 30-horsepower touring car and though it incorporates many of the features which have distinguished its predecessors, it has undergone such re-designing in process of evolution that it is practically a new car. Its change in appearance is due to the fact that the wheel-base has been lengthened from 108 to 112 inches and the single control lever has been placed in the center of the footboard, giving right hand control with the steering wheel at the left side. The emergency brake lever has been eliminated entirely, its place being taken by a pedal; the service brakes are interconnected with the clutch pedal. As regards the body, it presents a conservative straight-line effect in which door latches and hinges are concealed and all other protuberances which might tend to mar the smooth exterior have been subdued. The price of the car with the usual touring car equipment is \$1,055, such additional items as top with side curtains, windshield, speedometer and gas tank being furnished at an extra cost of \$100.

Mechanically, the car has been changed

the helical type and are lubricated from the crankcase. The main engine bearings and the cylinders are lubricated by splash. Ignition is by high tension magneto, with a dry cell and coil system as auxiliary.

In common with many of the other parts of the transmission system, the clutch has undergone a general refinement and though it still is of the multiple disk type, in its new form the alternate disks are bronze and steel. The change gear mechanism provides three speeds forward and reverse, and is selectively operated, one of its distinctive features being that the radius of movement of the control lever is only three inches. In general construction the mechanism is similar to that used in previous Reos, except that the countershaft now is carried on Hyatt high duty roller bearings and the drive shaft is mounted in Timken bearings. Though the rear axle is of entirely new design, its principal point of difference from previous models is embraced in the use of better materials. The axle shafts are made of nickel steel and are of the semi-floating type. The differential mechanism has been made heavier and stronger and now embraces four pinions instead of three; the driving pinion is made integral with its shaft to eliminate the possibility of its becoming loosened.

MAGNETOS OR ENGINE STARTERS?

"Arrival" of Self-Starter Gives Makers of Low-Priced Cars an Embarrassing Choice—Unlooked-for Situation.

"Astounding though it may appear, the automatic engine starter, which so suddenly has attained high favor, is likely to have a direct and unlooked for influence on the use of magnetos, at least in the lower priced cars," was the rather startling declaration of an engineer who has delved deep into the mysteries of motor starters and who just has returned from a visit to a number of the important automobile factories in the country.

"Every car manufacturer who already has not adopted a self-starter, is on the hunt for one. But the available starters made at prices that permit their use on low-priced cars are of types calling for the use of a spark to ignite gas in the motor cylinders; and, as everyone knows, a magneto in a state of quiescence is of no use whatever as a spark producer. In order to retain the magneto, the car maker must either add a battery and its accessories to his ignition system, or use a more expensive type of starting device. Either course will entail an added outlay that will be serious, and so there is but one course open, apparently—to do away with the magneto and substitute a battery system for the ignition and starter. It looks just now as if this very thing would happen, and that before very long. In fact one manufacturer already has made the move, and I know several others who are considering it with wrinkled brows. It is one of the most unlooked for situations that have developed in a long time and that apparently was unthought of until the self-starter really 'arrived.'"

How Germany and United States Compare.

According to official statistics published by the German government, and relating to the automobile industry, there were, in 1909, no less than 19,000 persons employed in 121 factories engaged in the making of automobiles, which 19,000 employees received during that year \$6,250,000 in salaries and wages. The value of the raw material reached \$10,000,000, and was used in making 8,808 passenger automobiles, 636 motor trucks, 3,703 motorcycles and 286 motor boats, with a total value of \$34,850,000. Of this total production, 77.7 per cent. was consumed in the country and 22.3 per cent. was exported. The export figures amounted to \$8,000,000. In 1901 there were in Germany but 12 manufacturers producing motor cars, motorcycles and motor-boats, employing 1,733 persons whose combined wages amounted to barely \$550,000.

The German figures serve to accentuate the bigness of the industry in this country.

For, according to the United States census of 1909, there were in actual operation here 743 factories in which automobiles, bodies and parts were turned out, employing 84,754 persons and paying them \$58,173,000 in salaries and wages. Of the 743 manufacturers, 316 produced complete cars, their output comprising 127,289 cars valued at \$164,216,000.

"Marine Windows" in Alco Limousines.

Giving evidence of the infinite pains at which the American Locomotive Co., of Providence, R. I., has been to make its product not only the acme of comfort but the incarnation of beauty as well, small oval windows have been incorporated as an exclusive and distinctive feature of its limousine bodies. Indeed, the two windows which are in addition to the large rectangular one in the center are so sug-

gestive of things nautical that they have been styled "marine" windows. From a strictly esthetic point of view, their value lies in the fact that they tend to relieve the monotony in the lines of the body. Their real worth, however, is much more material, inasmuch as they permit the chauffeur a less obstructed view to the rear than is possible otherwise. The windows are of heavy plate glass, beveled, and in accordance with the usual Alco specifications are draped with curtains to match the upholstery and carpet of the bodies.

Holland Establishes a Patent Office.

On and after January 1, 1912, citizens of Holland will be allowed to patent their inventions and discoveries by letters of patent issued in their own country—something they cannot do at present. A patent office modeled upon the lines of the English, German and French offices is being established at present, and will be ready for business by New Year's Day. The patent law of the Netherlands grants to all foreign patentees, or owners of patents issued by foreign nations, twelve months' grace in which to apply for a patent at the Hague, and requires the same rights for citizens or patentees of Holland in other countries.

BAKU TO STAGE AN ALL-MOTOR SHOW

Russian Oil Town Invites Manufacturers from All Countries—Trade and Road Conditions in the Caucasus.

According to advices from American Vice-Consul Frederick W. Cauldwell, stationed at Batum, Russia, an international exhibition of internal combustion motors, electric motors and automobiles will be held at Baku, the famous oil town and seaport on the Caspian Sea, from April 15 to May 28, 1912. It will be held under the auspices of the Baku branch of the Imperial Russian Technical Society and will be open to exhibitors from all countries, and it is for their benefit that the show will be extended over the unusual period of six weeks.

For the purpose of attracting foreign exhibitors to this out-of-the-way seaport the transportation tariff on the Russian and other continental railroads will be lowered, while all exhibits addressed to the exposition committee will be allowed to pass through the Russian customs free of duty. Despite this abolishing of the high duties, goods exhibited at Baku will be for sale during the time of the show. The receiving of goods at the exhibition commenced yesterday, December 13, and will continue until February 13, 1912.

In its bulletin the organization promoting the show particularly suggests the utilitarian value of light delivery wagons and convertible runabouts.

"Such motor cars," says the bulletin, "would sell for the use of engineers and mechanics who travel to and from the various oil fields. The roads there are pretty good and well laid out for traffic. Unfortunately there is but little room for pleasure automobiles, as scarcely any suitable roads exist between the different towns and villages.

"It is only about two years since the first automobile made its appearance in this region. Now their use has developed so rapidly that there are many garages and numerous cars in use. There are many projects for road making to connect Baku with other towns, and some roads are already in the course of construction.

"At Tiflis the military roads give good opportunities for pleasure travel by automobile as well as for business. In the Transcaspia there are good roads and some of the large towns are connected with automobile services. It is the same in Persia, where the Russian military roads between Enzeli and Teheran and between Julfa and Tabriz are shortly to be opened for public use and where there is no doubt the way of transport will be by automobiles. Commercial cars for carrying three or four tons weight are in use in the Caucasus, Persia, and Transcaspia."

WALTER TRUCK TO BE "GOVERNED"

**New York Maker Adopts Speed Regulator
—Two Motors and Five Chassis Used—
Increased Output in View.**

Though still occupying quarters in West 66th street, the Walter Motor Truck Co., of New York, which has taken over the business of W. Walter, who is now president of the company, is actively preparing to move into its new factory in Broome street, where manufacturing will be carried on under improved conditions.

Nothing in the way of startling innovations or radical design is embodied in the

els. Particular attention has been given to the requirements of commercial work in the design and construction of the motors. Valves are made large so as to afford free passage for both incoming and outgoing gases, and all are placed on one side of the pair-cast L-head cylinders, the two exhaust valves being on the outside in each pair of cylinders, with the intake valves between them. This results in a certain amount of heat interchange between the passages, the object being to heat the fresh gas to assist carburation and to reduce the temperature of the exhaust. The cooling of the exhaust is further helped by the fact that the exhaust passages are partly water jacketed. Cooling the exhaust gases has the effect of reducing their pressure, with the result that

Lubrication of the engine is effected by means of an eccentric-driven oil pump with oil feeds to the main bearings and the cylinders.

From the engine power is transmitted through a cone clutch with camels hair facing backed by springs, a three-speed change speed gear of the selectively operated type, housed in a manganese bronze casing suspended from three points, and countershaft and chains to the rear wheels. The bevel gears and differential are housed in a rearward extension of the gear box. Gears and shafts, the makers state, are made large enough to give adequate service in commercial work, and are of vanadium steel, hardened and ground. Particular attention has been given to the brakes, there being two sets, operated in the customary way through a hand lever and a pedal, both acting on the drums on the rear wheels by expansion. No braking strains are applied through the transmission system. Brake adjustments are readily made from the side of the car.

In all the standard Walter trucks the driver's seat is placed behind the motor. Springs are long and easy, and in the later models auxiliary springs have been placed directly over the rear axles, with the object of making the vehicle easy riding whether empty or loaded.

WALTER FIVE-TON TRUCK WITH OPEN BODY

gasolene motor trucks manufactured by this concern, but sound engineering practice and an appreciation on the part of the builders of the purpose of a commercial car are visible throughout the line.

Walter trucks are built in five sizes of 1½, 2, 3, 3½ and 5 tons capacity, respectively. The same general features are carried through the entire line, the differences being only such as are naturally called for by the varying sizes and carrying capacities. In the five-ton truck the motor is of 40 horsepower and of the long stroke type, the bore and stroke being 4½ and 6 inches, respectively, while the four smaller vehicles are driven by motors rated at 30-35 horsepower, with 4 inches bore and 5 inches stroke. In all cases the front wheels are 36 inches in diameter, those on the two smaller cars having 3½ inch tires and on the larger sizes 5 inch tires, all single. The 1½-ton truck has rear wheels of the same diameter as the front, with 5-inch single tires, and the 2-ton, 38-inch rear wheels with 6-inch single tires. The 3-ton car has unusually large rear wheels, 48 inches in diameter, with 6-inch single tires, while the 3½-ton and the 5-ton trucks have 42-inch rear wheels with 5-inch dual tires.

Apart from the differences mentioned, one description will cover the several mod-

els. The efficiency of the motor as a whole is improved. Flanges, cast integral with the cylinders, and removable plates serve to enclose the valve springs and stems, not only subduing the noises of the valve operating mechanism, but keeping out dust.

Recognizing the futility of endeavoring to obtain long life from a commercial vehicle that can be run at excessively high speeds, the makers of the Walter trucks have fitted all models with ball governors acting on the throttles. These can be set to act at any desired speed from 10 to 18 miles per hour, and can be locked when set. This seems to be the only way in which the riotous spirit of the average truck driver can be curbed; with no such check on the car the driver is certain, nine times out of ten, to "hit it up" whenever the combination of good road and no traffic police permit.

The ignition outfit, consisting of a Bosch dual system with high-tension magneto and a battery for starting the motor, has been so arranged that there is no manual adjustment of the spark when running. The battery spark is set late, so that there will be no "kick" when cranking the motor, but the magneto is advanced, giving proper timing for running. A single spark plug is placed over the inlet valve of each cylinder.

Fined for Calling Shop a "Factory."

The strictness of German industrial laws hardly needs any comment at this late date, for it is fairly well known all over the world, but even the well-informed American may be shocked to learn that fine and imprisonment await him who dares call his repair and assembling shop a "factory." However, that is exactly what happened to the owner of a garage and assembling shop in Munich last month. It was shown in the evidence submitted by the public prosecutor that the defendant owned a garage and bicycle store, and that he in the rear of this store made small repairs, occasionally even building or assembling complete bicycles and motorcycles. In order to impart to this enterprise an importance calculated to impress prospective customers, he used stationery with the imprint "Auto & Bicycle Works." The public prosecutor got wind of this "misrepresentation," had him arrested, and the court fined him 100 marks for every individual case in which he advertised or represented himself as "manufacturer." The court also ordered the stationery, sign, etc., destroyed; it furthermore interpreted the law to mean literally, that: "The appellation 'Works' denotes employment of numerous workmen, regularly engaged in turning out considerable quantities of manufactured articles by the aid of several machines and by other than muscular human power. The defendant employed a journeyman and an apprentice, and therefore used the term 'Works' illegally." The fine imposed by the court amounted to several thousand marks.

FLUSH-SIDED BODIES THE FASHION

So Says Body Designer Who Went Abroad to Study Foreign Styles—How France and England Differ.

W. H. Edmond, designer for the H. H. Franklin Mfg. Co., of Syracuse, N. Y., who recently returned from his European trip made for the purpose of studying the development of automobile body design in Germany, France and England, found the flush-sided body predominant.

"It is interesting to note the way the various designers are going at it," he said in recounting his impressions.

"England has led in the development of the flush-sided type and France seems to be the last one in line. This may be due to a small amount of 'pique' because the French designers do not like to admit that they are following any others.

"In Germany everything is flush-sided and the Germans are also carrying the matter of the scuttle front to the extreme. One of the most popular types now seen in Germany has a scuttle to both the front and rear seats, the back of the front seat being developed into a scuttle design. Concerning the matter of placing the control levers inside or outside of the body, there is a wide divergence of opinion, but the practice which obtains to the greatest extent is that of putting the shift gear lever inside the body, the emergency brake lever outside.

"The French designers are all for graceful and consistent design with the body lines developed to give the fullest harmony of outline and balance of proportion. In England, the whole idea seems to be utility and practicability. The Englishman gets the idea that he wants both levers inside and he puts them there and builds the body around them apparently without consideration as to the effect on the body contour.

"Every once in a while the sloping type of hood crops out unexpectedly from some old-line designer, and even on the water-cooled cars that still put their radiators at the front of the chassis there is a tendency to slope the hood from the dash down to the radiator; in fact, a great many designers think this sloping type of hood—which is the Franklin type—is the only type, and the more fully this type can be carried out the better the appearance of the car."

Starts Engine Without a Spark.

Despite the intimation which lurks in its name, it is stated that even a child can crank an engine with the help of the Hercules starter, which is one of the recent additions to the already long list of engine starting devices which have made their appearance within a comparatively short space of time. The device is manufact-

ured by the Hercules Auto Starter Co., of 441 Golden Gate avenue, San Francisco, Cal., and in principle is not absolutely new, though in it have been incorporated a number of new features. In its simplest aspect, it is merely a lever attached to the side of the car near the other control levers, its purpose being to permit the "transmission of arm power from the driver's seat" to the crankshaft through the intermediary of a wire cable, a short length of chain and the starter itself which is really the principal part of the arrangement, and which attaches in place of the ordinary crank.

The whole mechanism of the starter is enclosed in a small housing, approximately five inches in diameter, to which is attached a short lever connected to the hand lever by a wire cable and supported by a short length of chain where it turns around the end of the frame. Briefly, the mechanism consists of a miniature multiple disk clutch, one side of which is connected to the casing and the other side to the part which engages the fingers on the

HERCULES LEVER STARTER

end of the crankshaft extension that serve to engage the ordinary crank. It also embraces a sliding sleeve which fits over the end of the crankshaft, and a multiple ratchet movement which serves to make the connection between the casing and the sliding sleeve. In action, the first movement of the hand lever serves to cause the sliding sleeve to move outward so that its fingers engage those in the end of the crankshaft extension. On the next pull, connection with the engine having been made, the crankshaft is rotated and immediately the engine starts the sliding sleeve automatically returns to its former position with its fingers out of contact with those on the crankshaft. The pressure between the friction disks is adjusted so that it is just sufficient to permit the engine to be "turned over." When a backfire occurs, the friction disks slip and the ratchet movement permits the engine to make one or two revolutions backward without disturbing the position of the hand lever.

Heat That Affects the Spark Coil.

Part of the insulation used in high tension spark coils consists of wax, which melts at a temperature of about 125 degrees F. For this reason great care must be taken to keep coils away from heat. The melting of the wax not only results in the loss of insulation, but allows the coils of wire to become loose and short-circuit the coil.

FRENCH MAKER JAILED FOR FRAUD

International Dispute Arises Over Quality of Motor Car—Appeal to French Court Results Disastrously.

That sometimes it is exceedingly dangerous for a manufacturer to substitute inferior material in automobiles guaranteed by him to contain a certain quality of steel, was proven recently when the Court of Cassation, the highest tribunal of appeal in France, sentenced a prominent manufacturer to one month's imprisonment and a fine of 100 francs for fraud. Besides being sent to prison the unscrupulous manufacturer was compelled to refund the 7,000 francs deposit paid on the car, plus interest, and to pay the disappointed purchaser 500 francs as damages.

The case was fought bitterly, and at one time threatened to cause serious complications, as the respective State departments of France and Hungary were appealed to by their subjects. The evidence submitted at the High Court of Hungary, before which the case first was tried, showed that a certain manufacturer, M—, has sold to a citizen of Budapest, K—, two automobiles for pleasure and business purposes, respectively, and had guaranteed the same to be made of a certain quality of steel and to give good work for one year. When the cars arrived at Budapest and were examined, it was found that they did not come up to the guarantee, and the purchaser refused to accept them. Having paid a deposit of 7,000 francs on them, he demanded the return of this money and cancellation of the contract. The Hungarian court upheld him and ordered the French manufacturer to return the money and to take his cars back to where they came from.

The manufacturer, thinking national prejudice had something to do with the judgment of the Hungarian court, appealed to the French ambassador at Vienna, and the wheels of diplomacy were set in motion. By mutual agreement, the matter was submitted to the French Court of Cassation, which is probably the most impartial judicial body in Europe. If, however, the Frenchman thought his own countrymen would exonerate him, he was mistaken, for not only did the court of appeal confirm the judgment of the lower Hungarian court, but it made a criminal case of the attempted fraud, caused the arrest of the manufacturer and sentenced him to imprisonment.

Connecting Carburettors for Winter Use.

When cars are used during the winter it is well to see that their carburettors, if fitted for hot water circulation, are connected up and the water turned on and flowing properly. The extra heat is not usually required in summer and it is quite easy to forget it in winter.

MARION ADOPTS LONG STROKE MOTOR.

**Uses It in New 45-Horsepower Model—
Abandons Disk Clutch in Favor of
Cone—Other Refinements.**

In adopting for the larger cars in the Marion line a new 45-horsepower motor which incorporates a long stroke and other modern engineering practices, the Marion Sales Co., Indianapolis, Ind., has effected also a complete revision of its 40-horsepower chassis to conform to the increase in the size of the motor. As a matter of

sirable noises, have not been relied upon. Instead, the method takes the form of a preventive rather than a remedy and embraces the elimination of every possible source of lost motion or "slap." As valve mechanism in general is a prolific source of noise, it has received an unusual amount of care in design, silence being insured by the use of push rod rollers of a larger diameter than that of the cams, the result being that a dash-pot effect is obtained.

The valves themselves are $2\frac{1}{4}$ inches in diameter and are arranged all on one side, this arrangement permitting the use of but two gears in the timing gear train and these are of the helical type. The valve

size of parts and bearing surfaces. The crank-shaft is $2\frac{1}{4}$ inches in diameter and is supported at the flywheel end in a $4\frac{1}{16}$ -inch bearing; the center bearing is three inches and the connecting rod bearings are $2\frac{1}{2}$ inches long. Lubrication is effected by a constant-level pump-over splash system, the oil being maintained in circulation by a worm driven gear pump. In addition to the high tension magneto ignition system, an auxiliary battery system with dash coil, operating through the same set of plugs, is provided.

Though former Marion cars have been equipped with multiple disk clutches, the cone type will be used exclusively this

THE 45-HORSEPOWER, FIVE-PASSENGER MARION AT \$1,750 AND THE 30-HORSEPOWER MODEL AT \$1,285

fact, the revision has been so complete that the chassis is substantially a new one, though in it are retained many of the features that have distinguished Marion cars in the past. The new 45-horsepower model and two 30-horsepower cars which employ the same engine constitute the Marion line.

In the construction of the new motor which forms the power plant in models 46, 47 and 48, these being a roadster, a four- and a five-passenger touring car, respectively, particular attention has been given the desirability for silence of operation, though secondary methods of obtaining silence, as indicated by a tendency to enclose all parts and thereby deaden unde-

stems and springs are enclosed by means of a light aluminum cover plate. The high tension magneto and the centrifugal water pump are driven by worm gearing and are located at the extremities of a transverse shaft mounted between the first and second cylinders. The worm which drives the shaft is mounted directly on the crank-shaft.

Cylinders are cast in pairs and measure $4\frac{1}{8}$ inches bore and $5\frac{1}{2}$ inches stroke, and though reciprocating parts have been made exceptionally light, pistons complete with connecting rods weighing approximately eight pounds, the motor is none the less substantial, as is indicated by the liberal

year on all models, construction in each case being practically the same and embracing the use of Thermoid facing and auxiliary springs to insure smooth action. The gear set employed permits three speeds forward and reverse, the changes being obtained selectively by means of the orthodox side lever. Final drive is by shaft to full floating rear axles, the gear ratio at the differential being $3\frac{1}{2}$ to 1. Semi-elliptic springs support the front of the chassis and those in the rear are three-quarter elliptic. Tire sizes are 36 x 4 both front and rear, the distance between wheel centers being 120 inches. Both sets of brakes, service and emergency, are of the internal

END AND SIDE VIEWS SHOWING NEW 45-HORSEPOWER MARION MOTOR PARTLY SECTIONED

expanding type and operate on liberal size drums bolted to the rear wheels.

In roadster, four-passenger or five-passenger touring car form the price for the car is the same, namely \$1,750, and includes as standard equipment the usual complement of lamps, these being black enameled with nickel trimmings, lighting gas tank, horn, tool kit, tire repair outfit, pump and jack. For those who desire greater equipment, a top with boot, a Stewart speedometer and a windshield will be fitted at the factory at an added cost for them all of \$125.

Regarding the two smaller models, the

axle, remaining the same. Tire sizes on model 33 are 32 x 3½; on the model 35 they are 32 x 4 inches. With both models the equipment is the same and includes a Prest-O-Lite tank, horn, tools, tire repair outfit, pump and jack. Model 33, which is intended primarily as a fast runabout, lists at \$1,150, and the price of model 35, which is equipped with a five-passenger, flush-sided, closed front touring body, is \$1,285.

Chicago Supplies Some Truck Statistics.

Due to its not wholly welcome wheel tax, Chicago is one of the few cities that is able to supply authentic statistics bearing on

istered on September 5th, against 17,640 on May 1st. These figures show an astonishing decrease in the number of horse-drawn vehicles during this period, the total decrease being 8,200, while the increase of trucks placed in service was 253.

"Even the most enthusiastic motor truck supporter would not make the claim that these 253 motor trucks were able to entirely displace 8,200 horse teams," says B. A. Gramm, vice-president and general manager of the Gramm Motor Truck Co., of Lima, Ohio, in commenting on the figures. "It would, of course, be an absolute impossibility to accomplish such result, and there

FACTORY DEVOTED EXCLUSIVELY TO THE PRODUCTION OF SPEEDOMETER PARTS

STEWART & CLARK'S NEW PLANT, ERECTED FOR THE MANUFACTURE OF DROP-FORGED SWIVEL JOINTS

changes which have been made are slight, and as the two chassis are identical, saving only that in model 33, which is made only in roadster form, the wheelbase is one inch shorter—111 inches—than in model 35 and that full elliptic springs are used in the rear as against the three-quarter elliptic members that are used in the other model, a description of one suffices for both. The cylinders in each case measure 4 x 4½, bore and stroke, respectively, and are separately cast. Ignition is effected by means of a Splitdorf high tension magneto with a battery system as auxiliary, and lubrication is by constant level sash.

As already has been stated, a cone clutch, Thermoid-faced, has been substituted for the multiple disk member used heretofore, other component parts of the transmission mechanism, such as three-speed selectively operated gear set and semi-floating rear

the several forms of traffic vehicles in use, which figures show that on September 5th last there were exactly 958 motor trucks in use in the western metropolis.

On May 1, 1911, there were registered 436 motor trucks rated at one ton or less, while on September 5th this number had increased to 595, which would be a gain of 36.46 per cent. During this same time the number of one-horse wagons registered had decreased from 40,109 to 34,051, which is a loss of 15.1 per cent. A comparison of the statistics for the larger size vehicles, reveals that the same condition prevails. On May 1st there were 363 trucks registered of a carrying capacity of more than a ton, which number had increased to 457 by September 5th, showing a gain of 25.89 per cent. During this same period the loss sustained in the number of two-horse wagons was 12.14 per cent., there being 15,498 reg-

are other causes for the decrease of the number of horses during the period which may be considered. It is estimated that fully 1,000 of these horses were killed by the heat, and that hundreds of others were laid up at least temporarily. Some of these may be returned to service at a later date again, and thus slightly increase the number of horses registered, but it will make small difference in the total registration."

Minneapolis to Open Municipal Garage.

Finding it too expensive to have its automobiles and motorcycles stored and repaired in private garages, the Minneapolis municipal council has decided to establish its own garage and repair shop. A number of police officers detailed to the wagon barns are good mechanics and will be assigned to regular "garage" duty in the future.

HEAVY TRUCKS FOR FARM SERVICE

Diversified Work Performed in New York Serves as a Good Example—Equal to Three Teams of Horses.

Converted pleasure cars frequently have been employed on farms to perform all kinds of duties usually relegated to horse or manual power, and have proved their value in performing these duties as well or better than could have been accomplished by other means, but, so far as is known, few farmers have ventured to invest in large and powerful motor trucks exclusively for haulage purposes. One of the

During the time of September 1 to December 1, 1911, the truck covered 1,538 miles in its transportation work, using 378 gallons of gasoline and hauling 1,316,620 pounds of freight, or at the rate of four miles to the gallon. The following table gives the total cost of operation.

Gallons gasoline 376 at 12c.....	\$45.12
Time of men handling freight, and driver	225.00
Insurance on truck	24.00
Depreciation at 5 per cent.....	40.00
Oil and grease.....	6.00
Interest on investment at 6 per cent.	48.00
Total	\$388.12

This cost is believed to be excessive, and probably will be reduced during the next similar period of time, for similar work,

PIERCE-ARROW FIVE-TON TRUCK WITH A LOAD OF CABBAGES

first to purchase a vehicle of this kind is Alfred G. Lewis, who owns a 700-acre farm near Geneva, N. Y., and who uses a five-ton worm-driven Pierce-Arrow truck, shown in the accompanying picture. The truck belongs jointly to Alfred G. Lewis and to Mrs. George H. Lewis, who operates a farm of 350 acres, adjoining that of her relative, and in the short space of less than three months has served as an impressive object lesson.

The truck was purchased on September 1, 1911, practically at the end of the season, and has since been used in hauling building materials, fruits, grain, vegetables, hay and feed of all kinds, manure, cord wood, coal, bailed shavings, sheep and cattle to market, milk to the town dairy, etc., accomplishing in regular farm haulage the work of three teams, while in road work to and from Geneva it is said to do as much as five teams. Later in the season it was used for cutting silos, and corn stalks, as well as for plowing and hauling harrows over plowed ground.

because of the fact that a new man who had never driven a motor vehicle had to be taught how to operate the truck. On that account a good deal of the time and mileage was wasted as the truck was not loaded to full capacity until he became proficient.

Summarizing the advantages of a motor truck on the farm, the owner states that "it hauls freight at much less cost than is possible with horses; it saves time; the farm work is better done; crops are put in more promptly and harvest is easier handled."

Water That Remains in Cooling Systems.

It is sometimes disastrous to assume that when water has ceased to drip from the drain-cocks of the cooling system there is no water left in it. Often a little will remain in the low parts of bent pipes, or in the bottoms of cylinder jackets, where it will freeze if the temperature gets low enough, and possibly crack pipes or jackets. Carburettor water jackets should be remembered when draining off water, and also circulating pumps.

HAULAGE ON THE CONTRACT BASIS

Cincinnati Company Organized to Perform Such Service—Its Charges and How They Were Arrived At.

When a business man purchases a motor truck for the transportation of his goods, he does it, not because he wants the truck, but because he wants to get his hauling done as quickly and economically as possible. The machine is merely a means to an end, and in most cases it can safely be said that if the merchant knew of any easier method of accomplishing the desired result he would gladly avail himself of it. If he is purchasing his first truck, he is entering what is to him a new field. He must obtain information and figures through his own experience, for it is a fact that most concerns having accurate and detailed figures as to operating costs, prefer to keep them, while the data that is available is for the most part incomplete or unreliable, or else is not applicable to a particular case.

As a matter of fact, it is practically impossible to figure with any degree of correctness what the cost will be of hauling goods by motor trucks unless the conditions under which the work is to be done are taken into consideration. Road surfaces, grades, traffic delays, loading and unloading conditions, labor, the possibility of overloading and overspeeding, garage and repair facilities—all these and many other factors enter and are liable to completely upset any figures based upon a basis of arbitrary conditions. Even such an intangible thing as an undercurrent of sentiment inimical to power haulage may have the effect of turning the balance against the machines, as has been frequently proved by actual experience.

Yet another set of conditions is arrayed against the merchant who, desiring to learn by experience what results can be obtained from motor trucks in his particular line of business, decides to install a machine or two as a sort of adjunct to his stable. The records of truck manufacturers bristle with failures made under such conditions by vehicles perfectly capable of doing satisfactory work.

Considerations such as these have resulted in the planning of enterprises contemplating the sale of motor truck service rather than the sale of the vehicles themselves. The idea is to work out the cost of operation of the trucks, under average conditions, as accurately as possible, and then, using such figures as a basis, to hire out the machines at such a rate as will be profitable to the service company and economical for the user.

In line with the policy of selling service instead of trucks, a motor drayage service has been organized in Cincinnati, Ohio, by the Cincinnati Service Co. and the Speed-

well Motor Car Co. of Dayton, Ohio, the Speedwell company being the builders of the trucks employed. The machines used are of two sizes, the larger carrying six tons and having a speed of nine miles per hour, and the smaller carrying four tons and making 12 miles per hour. The idea is not wholly new but the fact that before the service was instituted, exhaustive tests were made to arrive at a fair and satisfactory basis of operating costs, makes the resulting figures of more than local value. These are as follows: Depreciation, 20 per cent.; driver's wages, \$3 per day; tire expense and premiums on fire, liability and accident insurance policies, \$522 per annum; upkeep, garage expense, gasoline and oil, \$600 per annum. Allowing for a mileage of 40 miles per day for 304 days in the year, the cost of operation per ton mile comes to about six cents for the four-ton machine and five cents for the six-ton car, and on this basis charges are made, though it is claimed that customers frequently find the price for hauling a given quantity of goods much lower than anticipated.

Trucks are placed ready for work at 7 o'clock each morning, and work regularly nine hours per day. Anything over the nine hours is charged for at one and one-half times the nine-hour rate. Users agree not to load the trucks beyond their rated capacity. Each evening the machines are inspected in their garage and prepared for the work of the following day, so there can be no question as to their fitness for service.

Perhaps the most important factor in the success of such an arrangement is the fact that a considerable number of cars are garaged together. Thus they can be cared for by the minimum number of mechanics, in the shortest possible time and with the least expenditure for a stock of spare parts. Supplies can be purchased in quantities at the best prices and, in short, all the conditions are favorable to economical operation and maintenance.

Pans That Should Be Cleaned.

Though most cars are equipped with under pans, in few is provision made for draining them, and as a rule the accumulation of oil and grease which collects in a short time is considerable and scarcely can be reassuring in view of its inflammable nature. It is well to remove pans occasionally and clean them out thoroughly. When they are replaced a couple of handfuls of clean sand spread in them will do no harm and will serve to absorb a considerable amount of "drippings." Incidentally, the sand will be jarred out a little at a time and will carry with it much of the undesirable accumulation.

Chlorides for Anti-freezing Solutions.

When making up anti-freezing solutions containing calcium chloride only the commercially pure salt should be used. Free acid in injurious quantities is liberated by

the cruder grades with more or less rapid corrosive effects on the metal of the motor and cooling system according to the strength of the mixture. Chlorate of lime, which has much the same appearance as calcium chloride, is occasionally used by mistake; its corrosive action is swift and strong.

Broad Claim for J. M. Shock Absorber.

To absorb the greater part of the smaller vibrations which are not absorbed by the ordinary type of leaf spring and also to

relieve the mechanism of a car from heavy rebounds, is the purpose of the "J. M." shock absorber which is marketed by the "J. M." Shock Absorber Co., 210 South 17th street, Philadelphia, Pa. In construction it is essentially an auxiliary spring device, though it differs from others of a similar nature in that the springs themselves are neatly and completely housed and therefore

are dust and dirt proof. Though in effect it is to provide a "springy and elastic" substitute for the ordinary type of solid spring shackle, that its benefits are more manifold than appear on the surface is indicated by the maker's broad claim that on cars fitted with "J. M." shock absorbers solid tires may be used in place of pneumatics without endangering the mechanism of the car and without discomfort to the passengers

Furthermore it is claimed that the device assists materially in keeping down maintenance cost by insuring constant contact between the tires and the road, the result

being that tire depreciation is lessened. The shock absorbers are made in a variety of styles and sizes and may be applied to any car in which the springs are attached by means of shackles, the several types illustrated herewith being applicable to light commercial vehicles as well. For heavier commercial vehicles up to the largest trucks, the manufacturers are prepared to design and supply shock absorbers of special sizes to suit the requirements.

Fake Chauffeur's New Form of Theft.

American and English tourists traveling in their own motor cars on the European continent, during the past few months have been made the victims of a brand new scheme of larceny, and not a few of them have lost, if not their cars and all that was in them, at least the use of these vehicles for extended periods—i. e., until the absconding thief got tired of his plaything, smashed it somewhere or was apprehended by the police. The case of a well-known English author who recently lost his car in this manner is illustrative of the way the scheme is worked. While staying at one of the hotels in one of the smaller continental towns he was approached by a chauffeur in full "regalia," who pretended to have wrecked his employer's car and who desired to go to the nearest large city—the same the Englishman intended to visit next—there to obtain some necessary spare parts.

As is but natural, the Englishman offered him transportation on his own car to his destination. Arriving at the city, the chauffeur overflowed with gratitude and insisted on being permitted to clean and wash the Britisher's car as soon as it had been placed in the garage. Together the owner and the "tramp" chauffeur drove to the garage and there the latter began his self-imposed labors, while the owner hid himself to his hotel. Next morning the car would be a hundred or more miles away, the industrious chauffeur having taken it out at sunrise and vanished. The garage owner, of course, could not be blamed, for, having seen the chauffeur drive the car to the garage with the owner in it, he was justified in believing the chauffeur's assertion that the car was to be taken out at the request of the rightful owner.

Quick Remedy for Broken Valve Spring.

Necessity, the mother of invention, is grandmother to numberless kinks and schemes for saving time and trouble for the motorist on the road. One idea that is really old but will doubtless be new to some, is to insert a washer between the two parts of a broken valve spring, which will prevent them from working into each other and will allow the spring to remain in service until a new one can be put in. The washer must be of such size that the broken spring ends cannot pass it, either through the hole or over the edge; it should be wired in place.

Systems of Transmission; the Friction Drive

Palpable to those whose minds are trained in things mechanical, as it must be to those who are merely observant of the onward march of civilization, the tendency in every field of endeavor is to use the simplest possible means of achieving an end—the means which is not only simple

transmission problem still remains to be reached.

In the planetary type of transmission the principal disadvantage of the sliding gear type, embraced in the necessity of meshing two gears rotating at different speeds, is eliminated, but another objection

more general adoption of four speeds ahead.

But there is another form of transmission that is very little used, comparatively speaking, and yet which combines the advantages of delightful simplicity, cheapness of manufacture, low up-keep cost and such ease of operation that no skill at all is required to obtain the best results. It is the friction transmission, and there is just about a baker's dozen of manufacturers in the United States who use it. Of course, all transmissions are friction in principle, the word transmission in this case being used in the broader sense, in which it is correct, and meaning all of the component parts by means of which power is transmitted to the road wheels and motion is imparted to the car. Most clutches are essentially friction devices, and, delving still deeper, the movement of the car is dependent upon the friction between the driving wheels and the road.

The mere word "friction," as applied in this sense, however, is a misnomer insofar as it means "rubbing," and therefore implies that rubbing must take place in order to produce resistance. In reality, the resistance is obtained not only during the rubbing but also before the motion or rubbing takes place. "Resistance of rough-

THE CARTER CAR FRICTION DRIVE IN ITS ENTIRETY

but which permits the nearest approach to perfect efficiency that is possible. That this applies in the building of automobiles goes without saying, and in this respect it is doubtful whether a greater amount of study has been given toward the solution of any other problem than that which has to do with the transmission, the word transmission being used in the sense in which it is generally used, though none the less erroneously understood, namely, the change gear mechanism.

Years ago, when the sliding gear transmission first began to be used, manufacturers readily turned to it in the belief that in it they had found the ideal system. Since then the number of applications of the system steadily has increased, and though it is probable that the very fact of its widespread adoption may perhaps have furthered the belief that it really is the ideal system, the fact remains that in every sense, strictly speaking, it is not. Which is to say that it still has the disadvantage that its proper manipulation requires a certain amount of skill, and unless it is handled properly it is likely to entail an inordinately high up-keep cost.

Of course, such systems are better mechanically, structurally and in material than they were several years ago; many of their disadvantages have been eliminated, but the objection that obtained then still obtains in a measure, and there are not a few engineers and others who are of the opinion that a satisfactory solution of the

in the form of excessive weight and size is raised. For light cars, or for very heavy commercial vehicles, there are those who incline to the belief that in it is found the

FRICTION DISK DRIVE AS EXEMPLIFIED IN THE LAMBERT

real solution of the problem, and there are any number of instances where it has proven eminently satisfactory for both of these kinds of work. But for the average touring car it scarcely is possible, and this for the reason that at least three speeds forward and reverse must be provided, and the very apparent tendency is toward a

ness," as it is expressed in engineering parlance, perhaps would better express its nature.

Of course, everybody who is even fairly well informed knows what friction is, but it is not irrelevant to state what friction does, by way of refreshing memories that may, perhaps, have become dimmed

through lack of frequent recurrence of the subject. According to Trautwine, "friction always tends to prevent relative motion of the two bodies between which it acts, i. e., motion of one of the two bodies relatively to the other. In doing so, however, it tends equally to cause relative motion between each of these two and a third, or outside, body." Which is to say, that the friction between a belt and the pulley that is driven by it tends to prevent slipping between them. But it also tends to make the belt slip on the driving pulley and sets the driven pulley and its shaft in motion relatively to the bearing in which the shaft revolves. This motion is resisted by the friction between the journal and the bearing, and this friction, in turn, tends

Naturally, there must be a certain amount of slip by reason of the fact that the driving disk imparts a rotary motion to the driven disk, which rotates at right angles to it. And while it has been pointed out with irrefutable logic that slip means wear, the actual amount of wear that really takes place is so small as to be almost negligible. In fact, in strict justice to exponents of the friction disk transmission, it is only fair to say that with ordinary usage, the friction material seldom if ever requires renewal oftener than once a year. When it does require to be replaced, that the renewal can be made almost in the proverbial jiffy and at an outlay that is purely nominal, merely serves to enhance the value of the arrangement.

METZ ARRANGEMENT SHOWING USE OF DOUBLE CHAINS

equally to make the bearing revolve with the journal and to make the belt slip on the driven pulley. The friction between two bodies at rest relatively to each other is styled static friction or friction of rest. That between two bodies in relative motion is kinetic friction or friction of motion.

In the friction transmission (change speed mechanism is the more correct term), the usual arrangement embraces a driving plate or disk, direct connected to the engine by means of a universal joint, and one or more wheels slidably mounted so that it or they may be moved into contact with the driving disk, motion being transmitted to the road wheels usually through the intermediary of a chain or chains. The face of the driving disk is perfectly plain and smooth and the contact rim of the driven wheel which presses against it is faced with paper fiber, this material having proven after continued test to show the highest coefficient of friction, which means literally the least amount of slip or the greatest possible adherence to the smooth surface of the driving plate.

The principal advantage of the friction transmission from the manufacturer's point of view, as well as from the user's, is that its proper manipulation requires no skill. There are no gears which can be stripped or chipped through careless or ignorant handling and almost an infinite number of speeds can be obtained by means of a single lever, which moves only in two directions—backward and forward. Similarly there is no clutch and even the remote possibility of clutch trouble of any kind is obviated. This in itself should prove a valuable feature, particularly for commercial vehicle work, where it is notoriously true that much of the trouble that is experienced originates in this part of the mechanism.

Of disadvantages, the system has few, the statement that the friction obtained is inadequate to permit really steep hills to be climbed having been disproven time and again and by different manufacturers. To the "doubting Thomases" who still incline to the belief, it should suffice to state that on any number of occasions friction driven

cars have been driven up hill until their motors stalled, demonstrating beyond cavil that the friction obtained really is sufficient. There is one real disadvantage in the system, however, and that is that when the greatest power is required from the engine, viz., when running on lowest "gear," the greatest slip takes place. This is because at the lower ratio of rotative speeds between the driving and the driven members, the driven disk presses against the other near its center, where the rotative motion of the driving disk on the friction material of the driven disk is more exaggerated than it is when the driven disk is near the periphery of the driving disk.

Another objection, though it is one that is largely hypothetical, is that for greatest efficiency it is essential that final drive be by means of a single chain or a pair of chains. Owing to the fact that the driven disk must be placed at right angles to the driving member, shaft drive would necessitate such a number of gears being employed that efficiency would suffer. The cost of manufacture also would be increased considerably because of the gears and the mechanical difficulty in ensuring positive and perfect alignment at all times. Just as it is with other things, however, methods of chain driving have been greatly perfected within the last few years, until at present there is a well-defined tendency to return to chain driving methods because of the efficiency and silence which they permit. This is particularly so in the case of the "silent" type of chain, the efficiency of which, it is claimed, is considerably greater than is that of gearing.

One of the first manufacturers to place a friction disk driven car on the market was the Buckeye Mfg. Co., of Anderson, Ind., and the mere fact that its product, the Lambert, has stood the test of some 10 years without having undergone any radical alteration as regards its transmission should go far toward proving its merit. As may be seen in the accompanying illustration, the system embraces the use of a flat plate directly connected to the engine and a slidably mounted friction wheel at right angles to it. By means of a side lever, the position of the driven wheel with respect to the center of the driving disk may be varied over a wide range. High speed is obtained, of course, when the friction wheel is nearest to the periphery of the driving disk; the nearer it approaches to the center the lower the "gear" ratio will be, and when it is moved over past the center its direction of rotation will be changed and the reverse motion obtained.

In order to make and break contact between the driving and driven members, a slip joint is placed in the shaft by means of which the driving disk is attached to the engine, the disk being held away from the wheel by a spring. When it is desired to start the car, it merely is necessary to depress the "clutch" pedal which moves the driving disk back against the driven mem-

ber. The pedal is held down, and the disks in contact, by means of a ratchet and pawl, the amount of pressure between the disks being under control of the operator who may increase it for hard pulling or decrease it for normal running conditions. One of the novel points of construction is that when the brake is applied the disks automatically are separated. Likewise when the disks are brought together the brake is released. Final drive is by means of a single Renold "silent" chain.

In the Cartercar system the principle involved is exactly the same as the Lambert, though the arrangement of the levers by means of which the driven disk is moved is slightly different, as may be seen in the picture. In this car, also, a single "silent" chain serves to transmit the power to the road wheels. The chain, however, is encased in a tight case and operates in oil.

Double chain drive is employed in the Metz cars, and the rest of the system also is slightly different as regards the method of "hook-up," the levers by means of which the driven disk is moved across the face of the other being mounted over the rear axle, which is of the dead type. The single control lever is placed at the left, and, as in the case of the other two, the pressure between the disks is regulated by the foot through a pedal, according to the power demanded by conditions.

What scarcely may be termed a friction transmission, but which still partakes of many of the features of one, is used in Duryea cars, one rear wheel illustrating the system being shown herewith. Strictly speaking, it is a roller device and is infinitely simpler than any of the others, inasmuch as by its use a great number of parts are eliminated. The driving rollers which are grooved and fit correspondingly grooved rings bolted to the drive wheels are attached to the crankshaft of the engine. There are two pairs of driving rollers, a small pair for slow speed ahead and reverse, and a larger pair for high speed

ARRANGEMENT OF GARFORD TRANSMISSION ELEMENTS

ahead. Similarly, there are two pairs of grooved rings arranged concentrically with the grooves facing. By bringing the small

DURYEA ROLLER DRIVE

rollers in contact with the outside rings, slow speed ahead is obtained. When the small rollers are shifted backward so as to come into external contact with the inside rings, the reverse drive is obtained. Shifting the rollers inward and forward brings the larger pair into internal contact with the outside rings and gives high speed ahead. The shifting devices are simple and positive, and are actuated by means of a small heel pedal in the floorboard. Moving the pedal forward brings the small rollers into position for driving; withdrawing the "clutch" lever permits springs to return the parts to their normal position for high speed ahead or reverse. The driving rollers themselves are of hardened steel.

Though all those systems which have been instanced are in use in pleasure cars, the friction transmission is applicable to commercial vehicles as well, and there are those who opine that it is in this field that it is most useful because of the fact that skilled operators are unnecessary, and also because of its low upkeep cost, both of which are vital factors to the operation of motor trucks on a paying basis.

The system which is in use in Seitz trucks is particularly interesting in view of the fact that no less than five disks are used; it is practically a double friction system. Mounted at one end of a separate shaft, which is supported by two bearings from the main frame, the driving member is a simple friction disk of steel about one-half inch in thickness. The other end of the shaft on which the disk is mounted is attached to the engine by means of a flexible coupling. Two pairs of friction wheels, one pair on either side of the driving disk are mounted on individual shafts carried in sliding bearing boxes on the side frame members. The friction wheels are faced with paper fiber and are mounted at right angles to the driving disk.

In applying the system cognizance is taken of the well-known law of mechanics to the effect that when two bodies of equal size and weight oppose each other with equal force no motion is produced. This

SEITZ TRUCK CONSTRUCTION SHOWING DOUBLE FRICTION DRIVE

is to say that by means of a simple system of leverage two opposing friction wheels are moved into contact with the driving disk at the same time, in the same place—only on opposite sides of the disk—and with equal pressure. To allow the disk to adjust itself automatically between the two friction wheels, the driven disk shaft is flexibly mounted, as already has been stated. By this arrangement of friction wheels, side pressure and end thrust on the disk is avoided.

Because it seldom if ever is necessary to use more than one speed for reverse, the friction wheels by means of which the reverse motion is obtained are not arranged to be moved across the face of the driving disk. The other wheels, however, those by means of which the forward speeds are obtained, may be moved and move together, the actuating medium being a side hand lever. When the lever is moved forward, the forward driving wheels make contact with the driving disk, and when it is moved backward the reverse driving gears come into contact with the disk. As may be seen in the accompanying illustration of the Seitz system, the pairs of friction wheels are connected by means of chains, final drive to the rear wheels also being by side chains.

In the Garford system which hereafter will be used only on the one-ton trucks, the arrangement is distinctly different, two driving disks are mounted on the same shaft and connected to the flywheel of the engine with which they rotate in unison. Between these two disks are located the driven friction wheels which are faced with paper fiber. They are mounted on separate shafts, however, the reason being that for forward speeds both friction wheels are forced into contact with the forward driving disk. As they are on opposite sides of the center of the disk they must rotate in opposite directions for which reason they cannot be connected together. In order to impart the same direction of rotation to both driving sprockets, one of the friction wheels is connected to the other sprocket through the intermediary of gearing which changes the direction of rotation.

To obtain reverse drive, the rear driving disk is brought forward into contact with the friction wheels. By means of a hand lever, the fiber faced friction wheels may be moved together toward the center of the driving disks for minimum speed, and toward the outside for maximum speed, the same number of speed changes being possible in either direction. Final drive is by means of side chains.

Just what is the future of the friction disk transmission is open to conjecture. It is certain, however, that it is quite the simplest system in use at present, and is, not unlikely that the future may bring forth other applications.

At any rate, as has been stated, the transmission problem has not been solved to the satisfaction of every one concerned. For

that matter it is almost impossible that it ever should reach that stage, but it also is reasonable to expect that further advances will be made.

Frenchman Develops New Friction Drive.

While radical ideas concerning friction drive mechanisms are few and far between, something really new seems to have been evolved by a Frenchman, Ferdinand Forest, who has adapted his friction speed changing device to a Sizaire-Naudin car. The driving disk is corrugated, as the accompanying

illustration shows, there being as many concentric grooves as there are to be changes of speed. The driven disk is on a spherical joint slidably mounted on a squared part of the driven shaft, and its edge is of an obtuse V shape. The corrugations in the driving disk are cut to the same angle, but the nearer they approach the center of the disk the more the V's incline their openings toward the periphery, so that while the driven disk is at right angles to its shaft when the outer groove is engaged, it departs more and more from the right angle as it is moved to one after another of the smaller grooves. Apparently the advantages of this device are that there is practically nothing but rolling contact between the disks, but while this holds good in large measure even when the inner grooves are engaged, the friction of the spherical joint due to the angularity of the driven disk to its shaft and the heavy pressure, would seem to offset this advantage.

How Reynolds Heats Cars and Trucks.

Among the devices designed for the purpose of heating the front half of touring

cars and limousines in cold weather, it is doubtful if there are any quite so simple as the Reynolds heater, which is manufactured by the Reynolds Dull Flasher Co., of Chicago, Ill., and which is shown by the accompanying illustration. It utilizes the hot air drawn from the engine into the space under the hood through the radiator

interstices and sends it in a continuous flow over the feet and bodies of the persons in the front seat of the car.

The heater consists of a box-like casting, which is let into the floorboard and screwed into place, and a shutter which is used for regulating the amount of heat desired. The casting is so constructed as to permit the air to pass through, but to obstruct the passage of oil and grease from the flywheel. It is made in three sizes, adapted to small cars, medium size touring cars, and inside-driven limousines, respectively; the latter, which is the largest, size being also recommended for truck use. Particular stress is laid by the manufacturers upon the advantages of the "heater" for trucks, where drivers have to make longer trips in cold weather, and are in slower motion than drivers of pleasure cars.

Mosler Evolves Radical Anti-skid Device.

Following what appears to be the path of least resistance, inventors have been busy for years devising anti-skidding devices which are designated for attachment to the tires of a motor car or else are themselves tires having peculiarly constructed treads. Something radically different, however, is the new anti-skid brought out by A. R. Mosler & Co., of 163 West 29th St., New York, the well known makers of spark plugs and other accessories, which differs from the familiar forms of its class in having nothing whatever to do with the tires or wheels. The new device, which is termed "Skidnit," consists of what the makers call a "tripod arm," attached to the rear axle and terminating in "a flat surface carried on small rollers."

It is intended to be brought into use only when there is danger of skidding, and to this end is controlled by the driver, who without leaving his seat, can lower it into contact with the road or raise it until it is out of sight under the car body. When lowered the business end of "skidnit" rolls along the road offering no retarding effect to the progress of the car, according to the makers, until skidding commences, when a flat surface is brought into contact with the ground, preventing side-slipping beyond the slight amount required to bring the device into action. One of the claims made for the "skidnit" is that it makes non-skid hands unnecessary and thus saves tires from the damage which, they aver, such appliances cause.

To Locate Hole in Punctured Float.

Probably the best way to locate the hole in a leaky carburettor float and at the same time get rid of the gasoline that has found its way in, is to immerse the float in very hot water and watch for the bubbles that will issue from the puncture. The heat will vaporize the gasoline and, expanding, the vapor will be forced out. Care must be taken, however, to remove the float from the water the instant bubbles cease to show, or water will work in.

 Two Shows For Pittsburgh Again.
 Contrary to a report that had been circulated, the conflicting interests in Pittsburgh which last year gave rise to two shows there have not become reconciled, and two shows again will be the rule. The Automobile Dealers' Association's show, which is the sixth annual affair of its kind to be held under these auspices will open on January 27th in Duquesne Garden and until February 3d pleasure cars will be exhibited. Commercial vehicles exclusively will occupy the floor from the 5th of February to the 10th. The other show, which is to be held under the auspices of the so-called insurgents, the Pittsburgh Automobile Show Association—which has increased from 22 to 43 members—is to run from January 17th to 24th, and will be held in Exposition building; both pleasure and commercial vehicles will be exhibited during the one week.

PROBLEMS OF THE PRIVATE GARAGE

**How One Motorist Solved Them—Cheap
Boy Labor a Factor in Keeping Car
Clean at Low Cost.**

The mere keeping of an automobile, the housing of it in a small structure close by the home of the owner, presents little difficulty. A house that is sufficient for the purpose can be put up at a cost that is small compared with the cost of storing a car at a public garage during the idle moments of its useful life. With a private garage and a gasoline tank buried outside so that fuel may be purchased in quantity, the owner is in a position to enjoy the pleasures of motoring at the minimum expense.

But there is just one drawback to such procedure. If the car is of the average type with the usual amount of bright paint and brass-work, its appearance is likely to be far from pleasing in a very short time, even if the weather is nearly perfect, assuming, of course, that the garage is not equipped with apparatus for washing the car, and few of them are. Two alternatives remain, viz., to leave the car at a public garage occasionally, for cleaning, which is objectionable, inasmuch as the object of the private garage is defeated in a measure by this course, or to design the finish of the car so that it seldom if ever will require other than the most superficial care.

The latter plan is one that has been adopted by more than one motorist, and after a year's experience with what he styles "the car that is never cleaned," one of them reviews the merits and demerits of the policy, and in doing so outlines several interesting modifications of the plan, which he intends soon to put into practice.

"Were I now ordering another car," he says, "I could actually make it all but dirt-proof. I could have every portion of metal work in the new black oxidized finish, which never looks dull—a failing of the best brass—and which shines more brightly when it is wet and other surfaces would be tempted to tarnish. I should have the wheels disked in somehow. Dirty artillery wheels look abominable, and I must admit that the mud-caked spokes of my wheels often have proved an eyesore."

"But I am not going to order a new car," he continues, "and consequently for the coming season I shall adopt an entirely new policy. In my neighborhood there are many boys of 12 years and upwards who are accustomed to eke out the meager earnings of their respectable but inefficient sires by selling papers, delivering groceries, etc., for an hour or two every evening, and three hours on Saturday morning. I could procure any one of a score of youngsters tomorrow morning for the munificent sum of 75 cents a week or thereabouts. As the open doors of my garage leave the car in

full sight of the house, I propose to hire one of these 'young Turks,' as their fond mammas proudly designate them, to keep my wheels clean and my metal work bright, with which small attention my car will always look as if a well-paid chauffeur had spent three hours per diem on it. And such is the glamor of motoring, I dare guarantee to have the pick of the local urchins permanently at my disposal when my requirements in this direction are known."

Overgard Heads Nebraska Association.

Dr. A. P. Overgard, Fremont, Neb., was elected president of the Nebraska State Automobile Association at the annual meeting held last week in Omaha, Neb. The other officers are: Vice-presidents, I. E. Doty, David City; J. M. Prime, Oxford; L. M. Talmadge, Grand Island; secretary, D. E. Watkins, Omaha; treasurer, E. R. Wilson, Omaha; directors, John T. Swan, Auburn; Lee Huff, Omaha; A. P. Overgard, Fremont; I. E. Doty, David City; H. E. Erickson, Holdrege; J. T. Dorgan, Lincoln; W. J. Kirkland, Omaha; Fred J. Bell, Ord; state representative A. A. A., W. D. Hosford, Omaha; state legislative committee, D. S. Dalby, Beatrice; Judge Epperson, Clay Center; Fred W. Ashton, Grand Island.

What Happened to Burman and Hemery.

Despite reports to the effect that Burman's chance to land some of the prize money in the Grand Prize race at Savannah on Thanksgiving Day was spoiled by a broken magneto, it transpires that that was not the reason after all. The Bosch magneto on his Marmon sparked with its accustomed vigor and what really happened was that the pump shaft, which serves to drive the magneto, snapped. The magneto in Hemery's Benz also fired the mixture in the cylinders with its expected regularity, and though he also was reported to have retired with ignition trouble, it was really a cantankerous valve that caused his early withdrawal.

Chicago May Bid for Grand Prize Race.

If Savannah, Ga., definitely decides that it has had enough of Grand Prize races, it is not improbable that the next one will be run on the Elgin (Ill.) course. The Chicago Motor Club, which conducts Elgin's National road championships, already is moving in the matter or rather its newly elected president has stated that Barkis—that is, Chicago—probably will be found willing, if Savannah isn't.

Where Jail Sentences Are Numerous.

According to statistics just published, one motorist and seven pedestrians were killed in the grand-duchy of Baden, Germany, in automobile accidents in 1910. During the same period 51 motorists and 65 other persons were injured. Twenty-four professional chauffeurs and two private owners were sentenced to jail for having caused the accidents.

BELGIAN CITY'S QUEER DISTINCTION

**Cobblestones and Prejudice That Dampen
Use of Cars—Bakery Forced to Discard
Trucks—Chauffeurs Cheap.**

Ghent, Belgium, probably has the peculiar distinction of having fewer motor cars per population than any other thoroughly civilized city in Europe. According to Henri de Rudder, a resident of Ghent, who is in this country on a short visit, there are only about 70 cars owned by a population of 160,000, none of which are commercial vehicles. The streets of Ghent, which are paved chiefly with cobblestones, constitute the chief cause of the scarcity of automobiles, but as Ghent is to be the scene of a World's Fair in 1913 the necessity for improvement finally has become apparent and steps in that direction already are being made, and in due course the Belgian city probably will be able to live down its undesirable distinction.

At one time there were six commercial motor vehicles in use in Ghent, but now there are none, not, however, solely because of the roughness of the streets, but, according to de Rudder, because the people of Ghent became possessed of the notion that the bread which was delivered by the trucks smelled and tasted of gasoline. Because of this unfounded idea the business of the big bakery company which owned the trucks fell off so rapidly that as a matter of self preservation the owners were compelled to use horse drawn vehicles. Taxicabs also proved a failure in Ghent, the miserable streets adding so much to the cost of upkeep of the cabs that the venture proved unprofitable and was discontinued. One garage, however, contrives to exist in the Belgian city where, de Rudder states, a first-class chauffeur can be had for the munificent sum of \$30 per month, plus board and lodging, the owner also being compelled to pay the chauffeur's license fee of \$20 per year. In Belgium all employers are also compelled to pay a tax on each employee and also to insure the latter. Even the housewife does not escape; she is taxed and compelled to take out an insurance policy for her hired girl.

Although women visitors are not interfered with, Belgium women are not permitted to drive motor cars, the issuance of licenses to them being prohibited by law. The basis of automobile taxation in Belgium also is peculiar, being at the rate of \$12 per wheel regardless of weight, horsepower or passenger capacity. In relating these interesting details, Mr. de Rudder laughingly stated that when the 70 motorists of Ghent desire to obtain real pleasure, they drive into Holland, which is a half-hour distant and where the roads are really good.

This advertisement in the Saturday Evening Post suggests new possibilities in the automobile field

Perhaps you were one of the five million who read it.

If you are an automobile manufacturer or dealer, it will pay you to read it again.

A scientific investigation of American axles has convinced the more prominent automobile manufacturers that mechanical correctness and safety from accidents will secure to their cars the high favor of motor car buyers.

This weight of evidence will not only accrue to the reputation of those cars that are now using American axles; but will direct the future selections of the informed motorist to the same high degree of safety and satisfaction which experience has taught him to expect in the better automobiles.

The wide-spread sentiment in favor of American Axles will greatly aid the man, who is yet to buy his first motor car, in escaping the dangers and expense so surely attendant upon the purchase of lesser than American quality.

Some day *American* Axles will equip a majority of all good American cars

It is interesting and impressive to talk with a motor manufacturer who has adopted the *American* Axle. He entertains no misgivings, no doubts, no uncertainties. He firmly believes that he has bought the best axle in the world; and he will tell you why. And we firmly believe that the weight of his experience will presently impel a majority of other manufacturers to specify the *American*.

We have implicit faith in the working of that business-law which rewards a product in proportion to its deserts; and we are willing that its application should apply to the *American*.

We believe that in the manufacturing world—whether it be axles or transmissions or motor cars themselves—a sifting process goes on continuously which sends the unfit to the bottom and the fittest to the top.

We believe that that inexorable law is set in motion by a public opinion which will unerringly hunt out the *American* if it is the best axle just as it has hunted out the best motor cars.

And it is our quiet conviction that the *American* is the best axle built in America today; that the sifting process is under way; that public opinion is pressing upon the manufacturer; and that it is only a question of time before the *American* will be specified in most of the good cars in this country.

Some of the reasons back of our faith in the immediate wide-spread recognition of

American

AXLES

The American Axle is furnished to the Manufacturer Equipped With Annular or Cup and Cone Ball Bearings or With Straight or Taper Roller Bearings, as May be Specified

In his investigation of the *American* Axle the motorist immediately commensurate a fact of tremendous significance.

He knows that sixty per cent (60%) of all motor car accidents are due to axle defects.

He knows, moreover, that the motor buying public has become immensely interested in this particular phase of motor car construction; because of the danger to life and limb which it involves.

And his discovery that the *American* Axle has never as yet been asked to accept responsibility for such disasters; that it has stood the greatest racing strains; and that it has been instrumental in establishing most of the existing track and road records, upon

him on to further investigation of the methods involved in its construction.

Whenever we have been able to induce such an investigation, it has invariably resulted in the selection of the *American*.

The motor car owner is interested in the car equipped with an *American* Axle because of its clean, clear record in the matter of axle accidents.

The careful, non-discriminating manufacturer is interested for the same reason—because of the extra factor of safety which the *American* Axle supplies to his product.

This safety, of course, is only another word for quality—the reflection and the result of scrupulous adherence to the highest manufacturing standards.

You as a motor car owner are vitally concerned in the element of safety and we frankly desire to enlist your interest in the advantages of the *American* Axle in this respect.

Public opinion recognizing the safety of the *American* will crystallize in the conversion of a majority of all good manufacturers in due time.

Therefore, even though you are not ready to buy a car equipped with the *American* Axle, or cannot have the car you now own equipped with it, we shall be glad to have you read our little book called "Axle Safety"; or if you are interested for a more thorough study of our methods, the more elaborate book called "Front and Rear Axles."

Send for this literature today.

997,409. Stalling Device for Automobiles and Other Vehicles in Case of Accident. Leo O'Brien, Montclair, N. J. Filed Sept. 27, 1910. Serial No. 584,029.

1. In a device for stalling automobiles and the like, a combination of a suspended front rod, a detent therein for restraining a brake-applying mechanism, a connection between said detent and the front rod, and a ratchet and pawl for holding the brake-applying mechanism in position after it acts.

997,417. Carburetter. William F. Rothe, East St. Louis, Ill., assignor to Wm. F. Rothe and Company, East St. Louis, Ill., a Corporation of Illinois. Filed Feb. 21, 1910. Serial No. 544,991.

1. A carburetter comprising a hollow casing having a mixing chamber in the bottom thereof, an air inlet passage leading to said mixing chamber, an outlet passage leading from said mixing chamber, a throttle valve arranged to control the outlet of the mixed air and oil, a valve arranged to control the air inlet, an oil nozzle arranged to discharge into said mixing chamber, a valve arranged to control the discharge from said oil nozzle, a resilient working connection between said air valve and said oil valve whereby said valves are simultaneously actuated, an adjustable stop for varying the opening limit of said oil valve,

and an adjustable stop for proportionately varying the limit of the opening of said air valve with respect to the oil valve.

997,443. Pneumatic Tire. Thomas Dunn, London, England. Filed Nov. 25, 1910. Serial No. 594,133.

The combination, with a wheel rim, and a tire cover engaging therewith; of a pneumatic tire arranged in the upper part of the tire cover with its lower part extending crosswise between the sides of the cover and adapted to form a diaphragm across the cover, and a packing comprising a pneumatic tube provided with a cover of inelastic material having a reinforcing band at its periphery, said packing having a cross-section of substantially triangular outlines, arranged between the said tire and rim with two of its sides bearing against the end portions of the tire cover and operating to reinforce the said diaphragm.

997,470. Vehicle Spring. Arthur Leland Snow, Kingfisher, Ohio, assignor to Grace C. Snow, Comfort, Tex. Filed June 30, 1908. Serial No. 441,187.

1. A device of the character described, comprising a continuous leaf spring, and a leaf spring associated therewith formed of a plurality of pivoted sections, said pivoted sections being provided with portions designed to abut after a predetermined movement of the spring.

997,484. Lamp. Richard H. Welles, Kenosha, Wis., assignor to the Badger Brass Mfg. Co., Kenosha, Wis., a Corporation of Wisconsin. Filed May 3, 1909. Serial No. 493,459.

1. The combination with a lamp having

a reflector therein, of a relatively fixed burner mounted in the focus of said lamp, a substitute burner adapted to be moved into and out of focus above said fixed burner, and spring actuated mechanism for automatically shifting the movable burner into the focus of the lamp.

997,549. Resilient Wheel. George R. Gay and John C. Streibich, Little Rock, Ark. Filed Feb. 25, 1911. Serial No. 610,809.

In a resilient wheel, the combination of an inner rim, an outer rim spaced therefrom, leaf-springs connected between their ends to the inner rim, boxes containing roller-bearings provided on the free ends of these springs, rollers mounted in these boxes and in contact with the outer rim, a coil-spring connected at one end to each box and an attaching device on the outer rim and between the rollers to which the other ends of the coil-springs connect.

PITTSFIELD

SPARK COILS

Splendidly Designed — Perfectly Constructed

THE PERFECTION with which these coils operate, their long life, their reliability have been obtained not by chance, but by a deliberate determination on our part to perfect every detail in their construction.

Every particle of moisture and air being removed, the windings are impregnated under great pressure with a solid compound that makes them absolutely waterproof. The contact points are larger than usual and made of expensive iridio-platinum. Cost of renewals infinitesimal.

Vibrators make perfect electrical contact at every impulse; a semi-hammer blow is struck; points cannot stick; less frequent adjusting is required.

Condensers are of large capacity and sparking at vibrator points almost entirely eliminated. A single unit may be removed from box without disturbing the others and without removing from dash.

Pittsfield Coils provide the most perfect ignition obtainable. Sparking is sure—combustion complete.

PITTSFIELD SPARK COIL CO., Dalton, Mass.

METZGER AND HEWITT "UNMERGED"

Hewitt Gets Back His Truck Interests and Forms New Company—Four Millionaires Associated With Him.

Hewitt trucks have returned to their fathers, so to speak. They left them in January, 1909, when the Hewitt Motor Co., of New York, was merged with the Metzger Motor Car Co., of Detroit, although the trucks have continued to be produced by the Metzger company through its truck department in New York, of which Edward R. Hewitt, the original Hewitt engineer, has remained in charge.

When the merger was effected it proved one of the sensations of the time. It is probable that "unmerging," which was completed on Monday last, will prove equally surprising. For on that day, interests represented by Mr. Hewitt and with many millions behind them, acquired the Metzger truck department and at once filed articles of incorporation under the laws of New York for a new Hewitt Motor Co., capitalized at \$1,000,000, all in one sort of stock. There are no bonds.

The personnel of the directorate of the new company will occasion as much comment as the "unmerging" transaction itself. In addition to Mr. Hewitt, the directors are William E. Corey, E. C. Converse, M. F. Burns and Ambrose Monell.

Burns is one of the principals in the big coal firm of Burns Bros., New York, which has for some time used a large number of huge Hewitt trucks; Corey is a former president of the United States Steel Corporation, and still is a director of that organization; Converse likewise is a director in the Steel Corporation and, like Corey, is on the boards of more than a score of other important industrials; Monell is president of the Monell Metal Mfg. Co.

The plans of the new Hewitt company have been so well laid that already it has acquired a new factory and service station at West End avenue and 64th street, New

York, and as soon as the installation of machinery is completed, about January 15th next, the manufacture of Hewitt trucks, with Mr. Hewitt in entire charge, will commence.

The original Hewitt Motor Co. was one of the first to undertake the production of gasoline commercial motor vehicles and for several years it probably was the most successful builder of really heavy trucks, on which its reputation was made.

The Metzger Motor Car Co. will not wholly abandon the commercial vehicle field. It will continue to produce the lighter types.

La Croix Forms New Import Company.

Paul La Croix, who for the last six years has been vice-president and general manager of the Renault Freres Selling Branch, New York City, has formed the Paul La Croix Automobile Co., with offices and salesrooms in the Demarest building, Broadway and Fifty-seventh street. His associates in the company are Harry U. Kibbe, formerly assistant manager of the Renault branch, and Stefan Kjeldsen, at one time president of the S. P. O. Automobile Co., and later connected with Renault Freres. The new company, as a sub-agent, will handle not only the Renault and Panhard, but will have the exclusive agency for the English Daimler, Clement-Bayard, Itala and Zedel cars. The Renault branch will be continued, Norris N. Mason succeeding to the general management vacated by La Croix.

Grinnells Purchase Phipps's Holdings.

Having purchased the interests of J. G. Phipps and thereby acquired control of the Phipps-Grinnell Electric Co., of Detroit, L. L. and C. A. Grinnell have changed the title of the company to the Grinnell Electric Car Co. and will immediately proceed to enlarge the business, which heretofore has been chiefly of a local nature. C. A. Grinnell remains general manager of the company. He will be assisted by Henry Goodman, one of the veterans of the electric vehicle trade, who just has been appointed general sales manager.

BRINGS UP A THREE-POINT PATENT

Detroit Inventor Lays Claim to Rights Affecting Unit Power Plants and Seeks Tribute—Litigation Likely.

Patents applying to three-point suspension systems, the Huber patent in particular, apparently are due to receive a more or less extended legal airing. The North American Vehicle Co., of Detroit, is shaping things in that direction. It controls the Huber patent, No. 788,407, issued April 25, 1905, to Emil Huber, who is a member of the North American company, although at present in the employ of the Hudson Motor Car Co., of Detroit.

The North American itself builds no vehicles, despite its name; it merely is a patent-holding and patent-operating company incorporated two months ago under the laws of Michigan, with \$10,000 in capital stock, \$9,600 of which is held by Huber, as trustee. Henry C. Ide, a physician, is its president, and Thomas J. Clinton, a real estate man, its secretary-treasurer. J. Emmet Sullivan, an attorney, holds the other share. They have served notice on several manufacturers that unless the Huber patent is recognized and royalties are forthcoming they will take steps to enforce their claim in the matter.

Summarized, the North American company claims that the Huber patent covers "any driving mechanism of an automobile wherein the parts that go to make up the same are brought together in what is termed a unit power plant, suspended at three points upon the main frame, and wherein one of the points forming the triangle is arranged to swivel."

In presenting Huber's case, Attorney Sullivan cites three earlier patents, issued respectively to T. French, January 9, 1900, to A. B. Fowler, January 7, 1902, and to Paul Synnestvedt, February 18, 1902, all of which he asserts "are purely axle propositions for the support or suspension of the sub-frame." All were lacking in practi-

THE MOTOR WORLD

HAVE NOT RESIGNED, SAYS FLANDERS

Sets at Rest Reports Affecting His Connection With Studebaker—Six-Cylinder Car Wrapped in Mystery.

Undoubtedly due to the facts that within the last month Walter E. Flanders, who is vice-president and general manager in charge of the Studebaker Corporation automobile interest, assumed the presidency of his own company, the Flanders Mfg. Co., of Pontiac, Mich., and that the Studebaker directors had created the new office of general manager of the entire corporation and filled it by the appointment of J. N. Gunn, the report has run the length and breadth of the trade that Flanders had been displaced, or had resigned or intended to resign his office in the Studebaker Corporation.

When early this week the report was carried to Flanders himself by a Motor World man, he promptly and positively denied its truth. He said that he has not only not resigned from the Studebaker Corporation, but that he has no intention of doing so. He branded the rumor as absolutely false.

Preceding these reports affecting Flanders and following them, another story has been current to the effect that the Studebaker Corporation was developing a popular price six-cylinder car which shortly would be placed on the market, and regarding which there appears to be a conflict of opinion. Apparent substance was given to the story by the fact that a six-cylinder car, which not a few people termed the "Studebaker Six," has been running around the streets of Detroit and which it was known was developed by some of those who are or who had been associated with Mr. Flanders in one or the other of his enterprises. Despite the fact, however, Scott Brown, secretary of the Studebaker Corporation, disowned the Detroit-made car and stated last week in reply to the direct question from a Motor World man that the company had not developed a "six" and had no present intention of placing one on the market; and there the story rests.

Creditor Seeks to Find Correja Property.

When on August 8th last, the La Hacienda Co., of New York, obtained a judgment for \$326.46 against the Correja Motor Car Co., also of New York, it had some expectations of collecting the money. That these expectations, however, came to naught, was disclosed yesterday, when Justice Giegerich of the New York Supreme Court issued an order directing J. Mora Boyle, president; E. M. Boyle, secretary, and James W. Boyle, a director of the Correja company, to appear before him on December 28th, next, and tell under

oath what has become of the property of the defendant company.

From the papers on file in the Supreme Court it appears that the sheriff endeavored to collect the amount of the judgment, but that his efforts were "wholly unsatisfactory" and that E. Mortimer Boyle, who personally was named in the judgment, "cannot be found." As there is some doubt as to the present whereabouts of the officers of the company, the court order was served on the attorneys for the Correja company and directs them to cause the appearance of the judgment debtors.

Company Formed to Make Lewis Truck.

To manufacture a truck designed by Charles B. Lewis, which has stood the experimental test during the past year, the Lewis Motor Co. has been organized in San Francisco and opened offices in the Merchants Exchange Bldg. It is stated that a factory already had been secured and that manufacturing operations will begin as soon as the necessary machinery is installed. The officers of the company are: Gustave Brenner, president; Charles B. Lewis, vice-president and manager; Jacob Samuels, secretary; J. H. Baxtor and Louis G. Henes, directors. The Lewis truck will be made in four sizes: A light delivery, a two-ton, four-ton and six-ton.

Delay Gives Williams Judgment by Default.

As a result of a disputed account, judgment for \$2,794.36 in favor of J. H. Williams & Co., the Brooklyn drop forgers, against the Palmer & Singer Mfg. Co. was entered in the New York Supreme Court on Saturday last, December 16. The amount represents principal, interest and costs for merchandise delivered between January 1, 1910, and August 1, 1911. Judgment was taken by default, the Palmer & Singer Co. failing to put in an appearance owing to oversight of its legal representatives, who filed their answer to the Williams action two days after the legal limit had expired.

Diamond Opens Four More Branches.

Four new branches have been opened in the South and Middle West by the Diamond Rubber Co. They are located at 1316 Grand avenue, Kansas City; 910 Broadway, Nashville, Tenn.; 229 Tryon street, Charlotte, N. C., and 427 S. Twentieth street, Birmingham, Ala. In Kansas City Diamond tires previously were handled by the Gustin-Bacon Mfg. Co., which hereafter will deal in tires and accessories generally on a jobbing basis.

Nyberg Arouses High Hopes in Atlanta.

Henry Nyberg, president of the Nyberg Automobile Works, of Anderson, visited Atlanta, Ga., and said something that induced the Georgians to believe that he will establish a branch factory in that city. One of the Atlanta papers says it will be a large factory.

cability, he contends, and it was Huber who solved the problem by "suspending the sub-frame carrying the driving mechanism on the main frame" by three points, one of which is adapted to swivel.

Not all other patent lawyers, however, are in agreement with the Sullivan opinion. Some of them hold that a sub-frame to support the driving mechanism is the entire subject matter of the Huber patent, and that an engine bed which may be mounted on three points, two of which are rigidly connected with the main frame, does not constitute infringement. As these opinions have been rendered to manufacturers on whom the North American company has served notice "to step up to the captain's office," it implies that the Huber interests will have to prove their claims by the long and expensive process of law before they will be recognized.

Atlas Not to Abandon Two-Cycle Cars.

Though it might perhaps be inferred by the action of the Atlas Motor Car Co., of Springfield, Mass., in introducing a new Knight-engined car that it proposed abandoning the manufacture of the two-cycle cars which have constituted its principal field of endeavor in the past, such is not the case, the Atlas people state. The two-cycle cars will be continued for the present, at least, the new car being an addition to the line. Though the Knight engine itself is no novelty, nor are the other unusual features of the new car, the combination of left-hand steer and center control, the worm driven rear axle in which is incorporated the change gear mechanism and a motor-dynamo engine starting and lighting system are sufficiently novel to be notable. The motor will have four cylinders and will be built only in one size, namely, 4½ inches bore and 5½ inches stroke. The car, however, will be made in two sizes, five and seven passengers capacity. The former will sell for \$3,500 completely equipped, and the price of the larger car will be \$3,700.

Mooers to Produce a \$2,000 "Six."

Louis P. Mooers, one of the early workers in the vineyard, who had a hand in designing several well-known cars and who, with H. D. Michaels, a New York broker, recently organized the Mooers Automobile Co., has leased factory quarters in the Ter-radelpia building in Trenton, N. J., where operations will commence during the first week in January. The Mooers car, which will be largely an assembled product, will be a six-cylinder model, with a list price of \$2,000.

Another Carriage House Takes Up Trucks.

Caley & Nash, of Rochester, N. Y., who have been building horse-drawn carriages and wagons, have added a gasoline delivery vehicle to their productions. They recently erected a two-story addition, 80 x 100 feet, to their plant, which will permit them to take care of their new wagon.

CREDIT PLAN IS RE-INTERPRETED

Misunderstanding Caused by Studebaker Announcement is Cleared Up—Buyers Still Must Pay Cash.

Because of misunderstandings which were conveyed by the announcement of the adoption of a credit system by the Studebaker Corporation, which misunderstandings existed even within the Studebaker ranks, it has been necessary to freshly interpret it for the benefit of those in whose minds it had become confused. This "fresh interpretation" was issued late last week by Walter E. Flanders, vice-president of the Studebaker Corporation, in a public statement that conveyed its own suggestions.

"Without regard to what it may seem wise to do in the future or my personal judgment as to the ultimate trend of the industry," he said, "we simply have made it possible for our dealers to buy their cars earlier and to make earlier sales and prompt deliveries by helping them to carry a portion of their account for a short time on credit."

When further information was sought and he was asked whether this statement implied that the credit system as announced had been changed or altered in any way, E. Leroy Pelletier, than whom none is closer to Flanders, said that such was not the case. Despite the general belief to the contrary, Pelletier, without a smile, stated that it never was the intention to accept notes from farmers, doctors, etc., and that the plan has to do exclusively with dealers whose notes are the only ones that will be accepted and then only when they are financially responsible or the security offered is ample and beyond question.

"We might, as a special accommodation to a dealer of this sort," added Pelletier, "accept the note of a farmer or a doctor when it is endorsed by the dealer himself, and backed by ample collateral, but in that event the notes would represent only a part of the cost of the car, and we would reserve the right to decide how and when and where such accommodation shall be extended."

Studebaker cars still are being shipped sight draft attached to bill of lading, though in some special cases it may be arranged that a draft shall read half cash and half notes, which notes, however, must be the dealer's own notes.

Asked if the new plan embraced the abandonment of the deposit system, Pelletier replied that the deposit system had been discontinued a year ago, that is to say, the only deposit now required merely is a sum sufficient to guarantee the respective dealers' parts accounts so that parts for repairs or replacements can be shipped

immediately on receipt of even a telegraph order.

New Yorkers Acquire Detroit Truck Plant.

Interests represented by Howard W. Walton, president of the Universal Motor Truck Co., of New York, metropolitan agents for the truck of that name, have purchased, lock, stock and barrel, the Universal Motor Truck Co., of Detroit, which manufactures the truck and which is capitalized at \$350,000. The deal was consummated early this week, and while the plans are carefully guarded, it is likely that they will cause surprise when they are unfolded. Other than to admit that they are New Yorkers, Walton will not disclose the identity of the real purchasers; they will not even be made plain when new officers are elected, as the officers will be merely the purchasers' representatives. But practically unlimited capital is in hand and it is the intention to make the Universal establishment one of the biggest in the truck industry. Its present factory in Detroit occupies a city block but it will be greatly enlarged. The members of the Universal company who disposed of their holdings are C. H. Haberkorn, C. B. Culbertson, August Kling, A. E. Barker, George Uhlein and Louis Camper.

Lozier Wins First Round of Big Suit.

Supreme Court Justice Cohalan, on Tuesday last, granted the plea of Harry A. Lozier, asking that Fletcher R. Williams and Joseph L. Rhinock be compelled to furnish a bill of particulars in their sensational suit against Lozier and the Lozier Motor Co. The only new development brought out in the argument was that George B. Cox, the one-time political boss of Cincinnati, Ohio, was the moneyed man whom Fletcher R. Williams claims to have interested—at the alleged request of Harry A. Lozier—to the extent of \$300,000, while Williams himself was to have added \$200,000 of his own money. When the negotiations failed Williams instituted a suit for \$500,000 damages against Lozier, while Rhinock, a broker, sued for \$150,000 for services alleged to have been rendered by him to Lozier, in introducing Williams to the automobile manufacturer. In his answer to the bill of complaint Harry A. Lozier asked that the complainants be compelled to make their claims for alleged damages more specific, and it is this request that the New York court has granted.

To Represent Studebaker in Japan.

Kaju Nakamura, a native Japanese automobile dealer, who has served an apprenticeship in the Studebaker factory in Detroit, is booked to sail to his native country from Seattle on the 30th inst., where he will act as the official representative of the Studebaker Corporation. He will be accompanied by J. B. Crockett, of Detroit, and together they will take up the work of placing agencies in both Japan and China.

U. S. MOTOR RE-ELECTS OFFICIALS

Selection of One New Director Only Change Made at Annual Meeting—Report Shows Surplus of \$453,748.

Excepting only that J. W. Stoddard was chosen to succeed H. J. Edwards as a member of the board of directors, the incumbent officials of the United States Motor Co. were re-elected at the annual meeting of that big corporation, which occurred in Jersey City on Tuesday last. They are as follows:

Officers: President, Benj. Briscoe; first vice-president, C. G. Stoddard; second vice-president, J. D. Maxwell; vice-presidents: Horace DeLisser, Frank Briscoe, Alfred Reeves, J. W. Wellington; secretary, F. D. Dorman; treasurer, Carl Tucker; assistant treasurer, J. M. Edsall.

Directors: J. C. Brady, Benj. Briscoe, Frank Briscoe, Richard Irvin, Herbert Lloyd, Edgar J. Meyer, J. D. Maxwell, Eugene Meyer, Jr., O. J. Mulford, H. W. Nuckols, R. A. Robertson, K. B. Schley, C. G. Stoddard, J. W. Stoddard.

The report for the year ended July 31st last shows net profits of \$2,040,256; deduct interest, \$488,065; dividends, \$738,411; total interest and dividends, \$1,226,476; balance, \$1,098,092; amount written off, \$644,344; net surplus for year, \$453,748.

In rendering this report, the full details of which have not yet been put into print, President Briscoe in commenting on the net surplus stated that the outlook for 1912 is much brighter and a gross business of \$31,000,000 is expected. Orders now on the books are sufficient to keep plants active for at least two months. The showing of the past year is attributed by Mr. Briscoe to the strong antipathy of bankers toward the automobile industry.

Kansas City Taxicab Enterprise Enmeshed.

Due to the efforts of the city council of Kansas City to have the taxicab fares reduced, the Blue Taxicab & Baggage Co., which had been formed in that city six months ago and acquired valuable franchises, found it impossible to carry on its stock selling campaign and landed in the bankruptcy court on Thursday last, 14th inst. The small sum of \$152, due to the Faeth Iron Co., was the proverbial straw that broke the camel's back. The total liabilities of the company are placed at over \$40,000, with assets of at least equal value. J. D. Anderson, formerly president of the Park National Bank, has been appointed receiver, and an injunction has been issued restraining the creditors of the company from in any way interfering with the property or the receivership. Practically all the indebtedness is due to money borrowed from banks to pay for motor trucks and taxicabs.

MEN WHO SELL TIMKEN PRODUCTS WHO WERE PRESENT AT FIRST CONFERENCE

Though the practice of a number of the big companies connected with the automobile industry, of holding annual or semi-annual gatherings of their traveling salesmen and other representatives, is a fairly common one, officials of the allied Timken companies, the Timken-Detroit Axle Co. and the Timken Roller Bearing Co., have gone just a step further and have inaugur-

ated quarterly conferences as a regular feature. The first of these was held on the 5th and 6th inst., and though the two days were devoted almost entirely to business, time was taken for a theater party after a dinner on the first day; luncheon, the same day, was served at the Wolverine Automobile Club. Later, they faced the camera, the result of which is portrayed by the ac-

companied picture. It shows E. B. Lauser, E. E. Gordon, H. J. Porter, T. W. Hood, and T. W. Doyle of the sales department, E. W. Lewis, secretary-treasurer of the Timken-Detroit Axle Co.; F. C. Gilbert, assistant secretary of the same company; Herman Ely, secretary-treasurer of the Timken Roller Bearing Co., and E. A. Walton, advertising manager for both firms.

Flying Rim Cause of \$25,000 Law Suit.

One of the most unusual automobile accidents that ever occurred forms the basis of a damage suit for \$25,000, which James B. Stiles has filed in the New York Supreme Court against the Lozier Motor Co., and Robert Kamber, of New York, for injuries alleged to have been received on June 29, 1910. According to the complaint, Stiles was walking or standing on the sidewalk opposite the Lozier showrooms, at Broadway and 56th street, when a "heavy rim or similar attachment of one of the wheels" of an automobile was hurled across the street, striking him and causing painful injuries. In his complaint Stiles declares that the car from which the rim came, belonged to Robert Kamber, and that at the moment of Stiles's passing, the chauffeur of the car was engaged in removing the rim "or attachment" in such

forcible manner that it flew across the street "with considerable energy" and struck the plaintiff. For the injuries alleged to have been sustained, Stiles thinks a balm to the amount of \$25,000 will be about right.

De Tamble Adds to Its Facilities.

The De Tamble Motors Co., of Anderson, Ind., is building an addition to its plant which will provide 30,000 feet more floor space. A large purchase of new machinery also is being installed, which improvements will permit the company practically to double its manufacturing capacity.

Preferred Stock For Watt Carburetter.

The Watt Carburetter Co., of Holly, Mich., has amended its articles of incorporation by providing for a \$50,000 issue of

preferred stock. This will be in addition to the \$100,000 common stock already provided for.

Seventeen New Solar Lamps in Sight.

No less than 17 new and distinctive styles of Solar lamps have been added to the Badger Brass Mfg. Co.'s line for 1912. They comprise two gas headlights, four electric headlights, one electric searchlight, one small electric searchlight, to be mounted on the steering column, two electric combination oil and electric side lights, four electric side lights, one combination oil and electric fender tail lamp, one electric tail lamp and one hexagon tapered-shaped electric limousine lamp. The Solar-clipse headlights and several of the standard Solar side and tail lamps, both oil and electric, will remain part of the Badger line.

OLD TRADESMEN IN NEW PLACES

Most of Them Attain to Higher Positions
—Kennedy Becomes Head of Alco
Transportation Cost Bureau.

George E. Messer has resigned the management of the Syracuse, N. Y., branch of the Franklin Automobile Co. He has gone into the paper business.

Horace Mills, formerly a member of the firm of Mills & Rockwell, of Detroit, has joined the staff of the Westinghouse Co. He will be the manager of its automobile department.

Nelson Gottshall, who sold Lozier and Detroit cars in Denver, Colo., under the style Krebs-Gottshall, has been added to the traveling force of the Lozier Motor Co., of Detroit. He will cover the Rocky Mountain territory.

F. I. Blake has resigned the factory management of the Alden Sampson Mfg. Co., of Detroit. P. H. Breed, chief engineer of the company, is now acting as factory manager, uniting with that office his duties as chief engineer.

J. F. Gfrorer has been appointed chief of the Alco service department of the American Locomotive Co. Gfrorer, who has been connected with the industry for some eight years, has latterly been doing special work for the Alco people.

Leonard W. Williams, at one time connected with the Philadelphia branch of the Locomobile Co. of America, and more recently manager of its Oakland (Cal.) branch, has been transferred to the factory in Bridgeport, Conn. His particular duties will be in the advertising department.

The Streater Motor Car Co., maker of the Halladay car, has added three new men to its traveling staff. They are L. W. Thompson, who will cover Oklahoma and part of Kansas; C. R. Riley, who will travel part of Iowa, and F. S. Van Veghten, who will represent the Halladay interests in the State of Nebraska.

W. S. Stevenson, sales manager for the Mack Motor Car Co., of Allentown, Pa., has been appointed general sales manager for the International Motor Co., which recently took over the plant of the Mack and Saurer companies. His appointment carries with it removal from Allentown to the International headquarters in New York.

W. P. Kennedy has been appointed head of the transportation cost bureau which has just been established by the American Locomotive Co. in connection with its motor truck department. Kennedy, who has been identified with the automobile business for twelve years, is one of the most experienced and best known transportation engineers in the country.

W. F. Byrket, of Newcastle, Ind., has been appointed to the management of the United

Motor Indianapolis Co. He takes the place of Thomas L. Marshall, who has been promoted to the post of assistant superintendent of the central sales district, embracing the majority of the Central States. Byrket only recently returned from an extended trip to Europe, where he investigated trade conditions in England, France and Germany.

Frank H. Smith, who for two years has been keeping tabs on the efficiency of the various Studebaker branches, has been appointed manager of the automobile division of the Minneapolis branch of the Studebaker Corporation. He takes with him as assistant manager, D. D. Byers, who for several years has been in the accounting and sales departments of the Detroit factory.

New Men Enter Batavia Solid Tires.

New men and capital having been interested, the Batavia Rubber Co., of Batavia, N. Y., has increased its capital stock from \$70,000 to \$500,000, and will at once proceed to greater things. The new men who have entered the company are: Charles R. Rogers and D. E. Carpenter, of New York City, and John W. Mullin, of Morganville, N. Y., who, with Ashton W. Caney and George E. Perrin, constitute the new board of directors. Caney will remain vice-president of the company and Perrin, secretary-treasurer. A new president, however, will be chosen to succeed John H. Ward. He has not yet been elected, but it is understood that he will be a financier of some prominence in New York City. With the fresh capital secured, the factory will be enlarged and it will go more heavily into the production of solid rubber tires.

Lauth-Juergens to Triple Production.

The Lauth-Juergens Motor Car Co. has placed contracts for the erection of a 520 x 60-foot addition to its factory in Fremont, O. The enlargement will be devoted to assembling and body building work. Still another building will be erected in the Spring which, with the three buildings already occupied, will permit the output of Lauth-Juergens trucks to be tripled within the next twelve months.

Chalmers Taking Up Truck Manufacture.

Its new six-cylinder touring car now being ready for market, the Chalmers Motor Co., of Detroit, is about to take up the manufacture of trucks. It already quietly has produced several light delivery wagons and is understood to be experimenting with a five-ton truck.

Simplex Secures Service Structure Site.

Like the Packard, Alco and Ford companies, the Simplex Automobile Co., of New York, will erect a big service building on the opposite side of the East river in Long Island City. The site for the purpose has been secured on Webster avenue and Pomeroy street.

THOMAS SUES A SURETY COMPANY

Wants Judgment Against S. & V. Company
Paid—Countersuit Pending Based on
Dealer's Agreement.

An echo of the suit of the E. R. Thomas Motor Branch Co., of New York City, against the S. & V. Motor Co., of 312 Livingston street, Brooklyn, N. Y., which was decided in favor of the Thomas company on July 21, last, was heard yesterday (Wednesday) in Part II of the Trial Term of the New York Supreme Court, before Judge Erlanger, the title of the suit being E. R. Thomas Motor Branch Co. vs. United States Fidelity and Guaranty Co. The basis of the suit is the judgment for \$3,329.87 obtained by the Thomas company against the S. & V. company on July 21, for which judgment the Fidelity and Guaranty company had assumed warranty. Argument in the suit was postponed until January 3, 1912.

The dispute between the companies hinges upon a dealer's agreement said to have been made by them in 1909. According to this agreement the Thomas company contracted to furnish the S. & V. company with the required number of cars at discounts varying from 12½ to 20 per cent. on the listed prices, and not to invade the territory of the S. & V. company—Kings County—with its own sales. A Thomas car listed at \$4,000 was sold by the S. & V. company, but the money, less discount, was not paid to the Thomas concern, which brought suit for the amount and obtained a judgment on July 21, 1911.

While this suit was pending, the S. & V. company filed a counter suit for \$8,000 damages alleged to have been sustained by it, by reason of the Thomas company invading its territory and selling ten Thomas cars in Brooklyn and Kings, and depriving the S. & V. company of its commission of 20 per cent. per car. Before this suit came up for trial, the claim was transferred, "for a good and valuable consideration," to the United States Fidelity & Guaranty Co., which signed an agreement to pay any judgment which the Thomas company might obtain against S. & V., not exceeding \$3,500. When the judgment was rendered in favor of the Thomas company, the guaranty company declined to pay and pressed its countersuit for \$8,000. Thereupon the Thomas company promptly filed suit against the Title & Guaranty company to compel it to carry out the agreement.

In the bill of complaint filed by the attorneys for the E. R. Thomas Motor Branch Co., particular stress is laid upon the fact that the president of the S. & V. Motor Co. is attorney for the U. S. Fidelity & Guaranty Co. Since the proceedings were instituted, the S. & V. company has retired from business.

FRANKLIN DISCONTINUES BRANCHES

Finds Working of Long Distance Control Unsatisfactory—Four of the Managers Who Have Become Dealers.

Having convinced itself and been convinced by most of its branch managers that a "free" agent usually is more desirable than an attache connected and restricted by long distance strings to the factory, the Franklin Automobile Co., of Syracuse, N. Y., is practically discontinuing its system of branch houses. In doing so it is making it possible for at least its veterans in the Franklin service to acquire the stores they have conducted and to continue the business without interruption, but on their own respective accounts and responsibilities, and as free agents. About a month since O. A. Lawton took over the Boston branch; two weeks ago George Ostrander acquired the Buffalo establishment which he had managed, and last week the New York store at Broadway and 73d street became the property of G. A. Tisdale, who for three years has represented the taxicab department of the Franklin company, while John C. Kerwin assumed charge of the repair shop at 242 West 80th street. At about the same time the Pittsburgh branch at 5926 Baum street passed into the hands of W. Murray Carr, another Franklin veteran. In each case the business will be continued at the former addresses.

Two Shows for Buffalo and the Reason.

In addition to the "regular" exhibit in the 74th Regiment Armory, Buffalo, N. Y., scheduled for the week December 30 to January 6, under the auspices of the Buffalo Automobile Trade Association, a second one is to be held during the week of February 5, 1912, in Convention Hall. George C. Fehrman, whose name is the only one to appear on the printed matter issued by the promoters, and who signs himself as its manager, gives as the reasons for holding the second show "the opinion of many of the local dealers that the first show is held too early," and that "many of the manufacturers have not completed their 1912 show models and will not have them available until after the New York show in Madison Square Garden."

Belgium Exports Take Boomlike Turn.

Although few, even well-informed, Americans credit Belgium with being an important manufacturing country, it is nevertheless a fact that its exports of automobiles are increasing in leaps and bounds. During the first nine months of 1911 this small country exported motor cars valued at 15,203,000 francs, or about \$3,040,000, as compared with \$1,400,000 in the same period of 1910, and \$1,000,000 in 1909. England and Germany are Belgium's best

customers, the former taking \$1,088,000 worth and the latter \$260,000 worth of cars.

Stuyvesant Enlarges Capital and Plant.

The Stuyvesant Motor Car Co., of Cleveland, Ohio, has taken over the Grant-Lees Machine Co. of that city, and having increased its capital stock to \$350,000, it is now proceeding to become a factor in the trade which must be reckoned with. Ground has been broken for a new building adjoining the Grant-Lees plant at Quincy avenue and East 69th street, and when it is completed the Stuyvesant company will remove from the west side to the east side of the city. The new structure will be 120 feet square and four stories high.

New Carburetter Coming from Oshkosh.

Leo J. McKone, of Oshkosh, Wis., who is the proprietor of the McKone Automobile and Repair Co., is forming a company for the manufacture of a carburetter of his own invention, several of which have been put to the test. The McKone carburetter is a springless device which is described as "virtually two carburetters in one," and is claimed to be almost as well adapted to kerosene as to gasoline.

Show Association Chooses Officials.

J. J. Deright, Omaha, Neb., has been elected president of the Omaha Automobile Show Association. The other officers are: Vice-president, J. T. Stewart; secretary and treasurer, Clark G. Powell; directors, the officers, Guy L. Smith and Denise Barkalow. Powell has been made manager of the 1912 show, which will be held in the latter part of February.

Detroit Body Builders Get More Room.

Knell & Adams, who operate a body building plant at 1020-1030 Beaufait street, Detroit, Mich., have purchased a two-story factory building at 1039-1043 Jefferson avenue, in that city, which after alterations are completed will be maintained in addition to their present place. The acquisition will permit their output to be about doubled.

Carriage Dealers Court Automobile Agents.

Although the automobile dealers of Philadelphia have an organization of their own, the Philadelphia Carriage and Wagon Association has altered its title to permit its membership to include automobile dealers. The revised name of the organization is the Philadelphia Carriage, Wagon and Motor Vehicle Association.

Final Melting of New Process Steel.

The New Process Steel Co., of Marshall Mich., a \$75,000 corporation which manufactured steel casting for automobiles, is being dissolved. The venture was not a paying one and in order to stop the loss, the directors applied for the appointment of a receiver who is performing the last sad rites.

DEALER AND CUSTOMER AT ODDS

Second-Hand Car Problem in Law Suit—Conflicting Claims Finally Settled Amicably Out of Court.

While the suit of John W. Devoy against the Sidney B. Bowman Auto Co., of 225 West 49th street, New York City, did not come to trial when it was called on Monday last and the warring parties agreed to settle their quarrel out of court, enough details of the action were disclosed to render the case of more than cursory interest. According to Devoy's complaint he turned over to the Bowman company a Clement-Bayard car of early vintage, to be sold on commission of 5 per cent., which car the company did sell for \$800, which money Devoy claimed was not turned over to him.

In his answer to the complaint, Sidney B. Bowman alleged that Devoy had agreed to buy from him a Marmon car for \$2,800, provided the Clement-Bayard car was sold for \$800 or more, and that the money received for it was to be part of the purchase price of the Marmon. After the foreign car had been sold, Devoy failed to carry out his agreement to buy the Marmon and asked for the \$760 due him. The Bowman company not only refused to pay over this money, but filed a bill for storage charges, repair costs and similar items, amounting to about \$150, and a counterclaim for \$2,000 due on the purchase price of the Marmon which had been ordered from the factory. The terms on which peace was concluded were not disclosed.

Drops Motor Buggies for Touring Cars.

The Corbitt Automobile Co., of Henderson, N. C., which is an outgrowth of the Corbitt Buggy Co., and which recently was incorporated with \$250,000 capital stock, has undertaken the production of a conventional four-cylinder touring car. It will have a 120-inch wheel base, 56-inch tread and 34 x 4-inch wheels fitted with demountable rims. Its equipment will include an electric lighting apparatus and an automatic engine starter. Heretofore the Corbitt company has manufactured a motor buggy in connection with its horse-drawn vehicles.

Motor Club Becomes Dealers' Association.

At the annual meeting of the Minneapolis (Minn.) Motor Club held Tuesday, December 5, it was decided to change the name of the organization to the Minneapolis Automobile Dealers' Association, under which title the annual show will be held in the Auditorium January 29 to February 3. Both pleasure cars and commercial vehicles will be displayed. The election of officers for the coming year has been postponed until January 5.

P. C. Creso is building a garage at 221 South K. street, Tacoma, Wash., at a cost of \$4,500.

George R. Long is building a garage on Main street, Warsaw, N. Y. It will be 50 x 130 feet.

Wilmont, Minn., soon will have a garage and automobile salesroom. Peter Spartz is building it.

Elizabeth J. Yoa is building a garage at 1050 South Clinton street, Syracuse, N. Y., at a cost of \$8,000.

Albert E. Elser is erecting a garage at 633 Lake Drive, Milwaukee, Wis., at a total cost of \$4,000.

Owen Mon, Jr., is building a garage at 314-316 East State street, Trenton, N. J. It will represent an expenditure of \$5,000.

Bernhard Rosenberg has broken ground for a two-story brick garage at 4815 Drexel boulevard, Chicago, Ill. It will cost \$8,000.

J. B. Newman, of Santa Monica, Cal., is erecting a two-story brick garage at 311 Spring street. It will cost, when complete, \$7,000.

Wallace Everson has broken ground for a brick garage at Twenty-second street and Broadway, Oakland, Cal. It will cost \$11,000.

Struve & Worth, who conducted a machinery warehouse, have converted it into a garage. They will add a repair establishment.

J. D. and M. W. Woodsides are preparing to open a garage and salesroom in Charlotte, N. C. They will handle E-M-F and Flanders cars.

The Fountain City Garage Co. has taken possession of its new garage in Fond du Lac, Wis. It is a two-story, fireproof, post-less structure, 40 x 115 feet.

A one-story brick garage is in course of erection at the corner of Atlantic and Chelsea avenues, Atlantic City, N. J., which, when finished, will be occupied by Ryon & Collins.

Van Deman & Wainwright is the style of a new firm which has "opened up" in Newark, N. J., at the corner of Halsey and Canfield streets. They will handle Abbott-Detroit cars.

T. T. Bergh, of Spring Grove, Minn., has purchased the Park Roller Rink in La Crosse, Minn., and is remodeling it into a garage. He expects to start a renting and repairing business.

Clark A. Sanford, editor of the Catskill Mountain News, at Margaretville, N. Y., has gone into the automobile business also. He has opened a garage, 100 x 45 feet, ad-

joining the "News" office, and will sell E-M-F, Flanders and Ford cars, under the style the Sanford Auto Co.

L. B. Saunders, a Grand Rapids (Mich.) alderman, has gone into the garage business. He is building one at the corner of Division and Pleasant streets, to be 70x100 feet, of concrete construction.

S. A. Foster & Co., who are handling American, Rambler and Regal cars in Hartford, Conn., are building a new garage and salesroom at 18-20 Elm street. It will be ready for occupancy on January 1.

The Stanley Steam Car Co. has been organized in San Francisco, Cal., by L. H. Austin and C. E. Bennett, both of Bakersfield, Cal. As the name implies, the company will handle the Stanley steamer.

C. F. Miller, of Defiance, Ohio, has purchased an interest in the Jefferson Garage, in Bryan, Ohio, from its former owner, H. E. Throne. Miller will handle the repair department and Throne the sales room.

The Tri-State Auto & Supply Co., of Los Angeles, Cal., having found its old quarters too small, has removed to 1017 South Olive street, where more room has been obtained. M. C. Mason is the manager of the establishment.

The J. I. Case Co., of Racine, Wis., has invaded New York City and opened a branch at 1860 Broadway, in charge of O. A. Lewellen. The company also is preparing to establish a big service building in Long Island City.

Edward Rigg, who for some years conducted a garage at Petoskey, Mich., has disposed of his business to John L. A. Galster, Owen McMahon and C. A. Lovelace. They will do business under the style Northern Auto & Machine Co.

The Spokane Auto Co. is the style of a new concern which has opened a salesroom at 109 Pacific avenue, in Spokane, Wash. E. C. Finlay, formerly president of the Regal Garage Co., and H. B. Annable, of Detroit, comprise the company.

Robert Sherwood, who for several years has been employed in garages in Cleveland, Ohio, has gone into business on his own account in his home town, Painesville, in the same State. He has taken the agency for E-M-F, Flanders and Rambler cars.

Under the style the Beaver Auto Repair Co., a new concern has opened up in Philadelphia, Pa., with William Veis and H. A. Wenkenbach as the moving spirits. The company is erecting a two-story garage in the rear of the Wenkenbach wagon factory,

facing on Orianna street, which will cost, when completed, \$25,000.

The Schildwachter Carriage Co., 249-253 West 57th street, New York, which has the metropolitan distributing agency for McIntyre power wagons, has added the Sternberg line of heavy trucks to its offerings. It will have the Sternberg representation for the entire eastern part of the country.

The International Automobile Co., which was incorporated last week in Moncton, New Brunswick, with a capital of \$50,000, has taken over the business of Carter & McDonald, who conducted a garage and salesroom in the Canadian town. R. C. Bacon and F. L. Crandall are the moving spirits in the enterprise.

William Parkinson, who operates a garage at 29 Washington place, East Orange, N. J., where he sells Overland cars, has invaded the metropolitan field and opened a salesroom at 1755 Broadway, New York. He has secured the distributing agency for Stutz cars and will do business under the style the Stutz Motor Car Co.

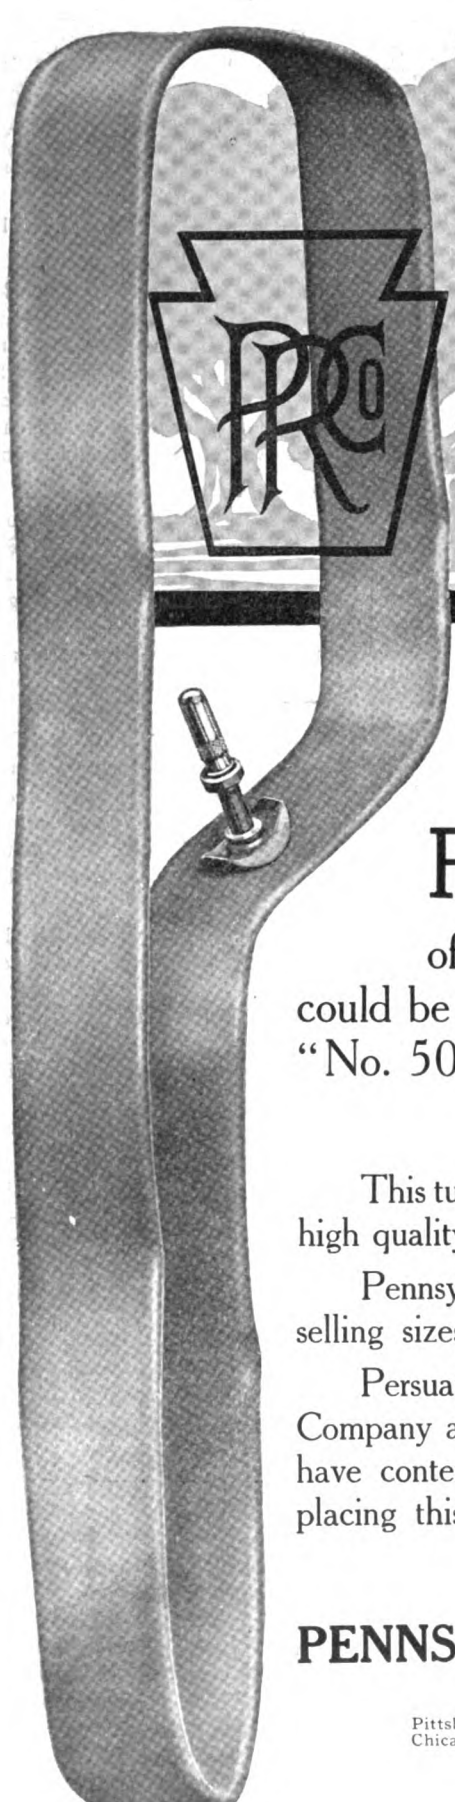

The Newton-Humphreyville Co., distributor of Thomas and Everitt cars for the State of New Jersey, has opened new salesrooms at 124 Washington street, Newark. Temporarily it will share the quarters with the Ellis Motor Car Co., until the latter's new show rooms in the Pierce-Arrow building at Central avenue and New street are completed.

A. J. P. Bertschy, formerly secretary and manager of the Bertschy Motor Co., of Council Bluffs, Ia., has formed the Bertschy Motor Co. of Omaha, of which he will be the manager. He retains his stock in the Council Bluffs concern, but has transferred its management to Harry Searle and Frank Children. The new company will carry on a general repair business, specializing in an autogenous welding process invented by Bertschy.

In connection with its salesroom for Detroit electric trucks and garage for commercial vehicles, at 322 North Delaware street, Indianapolis, Ind., the Merchants' Auto Co. will operate another garage and salesroom devoted to the sale of Woods electrics and to the storing and handling of both gasoline and electric pleasure cars, at 9 East Pratt street. Simultaneously with this branching out, H. B. Stout, formerly manager, has resigned, and E. Frank Brown has become manager in his place.

Recent Losses by Fire.

Philadelphia, Pa.—Joseph L. Crawford's garage and two cars destroyed. Loss, \$6,500.

PENNSYLVANIA

"Guaranteed"

INNER TUBES

"No. 503"

A high grade tube sell-
ing at a moderate price

For months the Pennsylvania Rubber Company has been experimenting with the development of a genuinely serviceable automobile tube which could be sold at a reasonable price. The Pennsylvania "No. 503" is the result.

Each Tube is Guaranteed

This tube has been so thoroughly tested, is so well made and of such high quality material that it carries an unqualified season's guarantee.

Pennsylvania "No. 503" Tubes are made in the most popular selling sizes.

Persuant to the policy adopted by the Pennsylvania Rubber Company at the time of its re-organization, February 1st, 1910, we have contemplated an attractive margin of profit for the trade, in placing this tube on the market.

*Jobbers and Dealers Desiring to Sell Automobile
Inner Tubes for Profit Should Write Us.*

Foreign and Canadian Subscriptions \$3.00
Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions. Checks, Drafts and Money Orders should be made payable to The Motor World Publishing Co.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

Contributions concerning any subject of automobile interest are invited and, if acceptable, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 21, 1911.

WOMAN'S INFLUENCE ON AUTOMOBILE SALES.

While the influence of womankind on the sale of automobiles has been a subject for occasional remark, that it is more far-reaching and substantial than generally is supposed to be the case easily is demonstrated.

Whenever there are gathered men possessed of motor cars it requires no very searching inquiry to discover that were it not for the women members of the households represented, the number of cars owned by the men comprising such groups would be considerably reduced or that the cars would be put to much less use; and this is true of many households in which ownership of an automobile is not born of social aspirations or pretentiousness, and on which the purchase and maintenance of a car imposes no sacrifice or burden.

While it may be true that few women are concerned with the mechanism of a car or with mechanical contrivances of any sort, and that they are more impressed by appearance or price than by anything else, that very circumstance contains and conveys significance, and he is a wise manufacturer or dealer or advertising manager who knows how to make the most of it.

Women long have been reckoned the real spenders, that is, the real buyers of the world, but generally they are considered small purchasers—chiefly purchasers of what are denominated bargains. But that they know how and on occasion do not hesitate to "buy big" there is no lack of evidence. The average woman may look longer at a dollar than the average man, but that she is a potent factor in influencing him to let go of it is not to be gainsaid.

So far as motor cars are concerned, she may not actually pay the purchase price of many of them nor actually decide the selection of a particular car, but in tens of thousands of instances each year it is she who inspires or suggests the purchases and who at least casts an impressionable eye over them before a choice is made. In other words, hers is an influence that promotes the sale of cars and it is she who uses them most after the sale is made.

It may be a bold guess, but probably it is conservative, to say that at least one-third of the sales that are made are directly attributable to woman's influence and that but for her the use of cars after they are sold would diminish in even greater proportion, which implies that the sale of tires and oil and gasoline and the other things that keep cars going would shrink correspondingly.

The manufacturer who does take account of the appearances and little "fixings" that impress womankind, the dealer and salesman who fail to display their wares in a manner and amid surroundings that create a favorable impression, and the advertising campaign that does not include an occasional studied appeal to woman—the effectiveness of each falls short of what it might be and permits a real and powerful influence to go to waste.

WHY THE PAUCITY OF HORSE HAULAGE COSTS.

How great is the paucity of figures on the cost of horse transportation is indicated by the statement of an expert whose work has caused him to delve deeply into the subject, that not one per cent. of the thousands who make use of horses for haulage know what the expense really amounts to.

The advent of the practical commercial vehicle chiefly is responsible for the bringing to light of this truly remarkable state of affairs. In seeking information as a basis for comparison between horses and motors, in the endeavor to show the economy of the more modern method, it early was discovered that while there was little difficulty in obtaining statistics covering to the last detail the costs involved in the maintenance of other departments, figures giving the itemized cost of horse haulage were simply unattainable. This situation was found to exist in practically every line of business, excepting only large public or semi-public corporations.

For a long time this lack of information, which was—and still is, for that matter—very general, was ascribed to the unwillingness of firms having in their possession such figures to impart them to others, the usual excuse being that it required years of experience and the expenditure of considerable money to gather the knowledge, and to give it away for the mere asking, and for the possible profit of rivals, would indicate a lack of common sense. This, while not at all satisfactory, sounded quite plausible, and has been the standing excuse for the widespread ignorance which prevails with regard to this vital subject. With unanimity truly surprising, transportation department heads have looked wise and declined to give up their precious data—their cherished secrets.

But as a result of the recognition of the motor truck, it now is quite generally known that in few instances are there serious attempts to keep accurate and complete haulage costs, and that even where such attempts are made rarely are the results either accurate or complete. The "secrets" are no "secrets" whatever. The attitude of the men who harbored them proves to have been the attitude of men who are asked for something they ought to know but do not, and who therefore make a secret of it rather than confess their ignorance of their own business.

Dallas, Texas—Regal Motor Car Co., a Michigan corporation, admitted to do business in the State of Texas. Texas capital, \$1,000,000.

Toledo, Ohio—Toledo Auto Delivery Co., under Ohio laws, with \$10,000 capital. Corporators—Charles K. Friedman, Morris Tobias, Joseph Alexander.

Chicago, Ill.—National Automobile Owners' Alliance, under Illinois laws, with \$50,000 capital. Corporators—W. G. W. Ford, C. E. Becker, S. C. Miller.

Camden, N. J.—Penn Motor Car Co., under New Jersey laws, with \$500,000 capital; to manufacture and deal in automobiles. Corporators—V. A. Murray and others.

Charleston, W. Va.—Callison-Pierson Co., under West Virginia laws, with \$25,000 capital; to deal in automobiles, wagons, etc. Corporators—J. F. Callison, S. R. Pierson and others.

Chicago, Ill.—American Mercantile Supply Co., under Illinois laws, with \$2,500 capital; to deal in automobiles. Corporators—Albert J. Elliott, H. Prather Elliott, John T. Evans.

Milwaukee, Wis.—Wisconsin Auto Sales Co., under Wisconsin laws, with \$20,000 capital; to deal in automobiles. Corporators—George P. Hewitt, Lucy F. Hewitt, R. L. Anderson.

Kansas City, Mo.—E. S. Hutchin Auto Co., of Kansas City, under Missouri laws, with \$10,000 capital; to deal in automobiles. Corporators—E. S. Hutchin, M. G. Hutchin, William Harmon.

Janesville, Wis.—Janesville Motor Co., under Wisconsin laws, with \$20,000 capital; to deal in automobiles and other motor vehicles. Corporators—G. M. Decker, L. J. Doris, A. Schaller.

Chicago, Ill.—Williams' Steel Rim and Tire Co., under Maine laws, with \$1,000,000 capital. Corporators—W. H. Williams, Chicago, Ill.; H. L. Drullard, Verona, N. J.; J. H. Thain, New York City.

Indianapolis, Ind.—The Motor Shop, under Indiana laws, with \$15,000 capital; to deal in automobiles and other motor vehicles. Corporators—Hoover Holton, Lottie E. W. Holton, C. B. Marshall.

Chicago, Ill.—F. A. L. Auto Co., under Illinois laws, with \$2,500 capital; to deal in motor vehicles and maintain a garage. Corporators—Frederick C. Harbour, Clinton S. Lamb, E. M. Lundberg.

Pittsfield, Mass.—Pittsfield Auto Garage Co., under Massachusetts laws, with \$3,000 capital; to deal in automobiles and maintain a garage. Corporators—Mary I. Mills, Arthur A. Mills, Arthur J. Mills.

Chicago, Ill.—Simkin Manufacturing Co., under Illinois laws, with \$25,000 capital; to manufacture and deal in automobile accessories. Corporators—Walter R. Simkin, George F. Friez, Frank Greenberg.

Steamboat Springs, Colo.—Mackey Automobile Wrench Co., under Colorado laws, with \$24,000 capital; to manufacture automobile wrenches. Corporators—William W. Green, H. C. Dodge, Albert Towers.

Salt Lake City, Utah—Anderson-Rippe Co., of Sale Lake, under Utah laws, with \$5,000 capital; to conduct a general automobile repair business. Corporators—B. M. Anderson, Della F. Bowden, Henry Rippe.

Buffalo, N. Y.—Carroll Tire Co., under New York laws, with \$20,000 capital; to manufacture rubber tires. Corporators—John Gregson, George Cunliffe, J. Edward Gregson, Alfred F. Dutch, R. H. MacGregor.

Binghamton, N. Y.—York Gasolene Engine Co., under New York laws, with \$5,000 capital; to deal in gasolene engines and automobile supplies. Corporators—Harry R. Bauer, Theodore W. Oliver, Herbert L. Jennings.

Chicago, Ill.—Commercial Car Sales and Service Co., under Illinois laws, with \$10,000 capital; to deal in automobiles and maintain a garage. Corporators—George H. Taylor, Benjamin McWilliams, Frank A. Rinehart.

New York City, N. Y.—Compound Cycle Engine Co., under New York laws, with \$30,000 capital; to manufacture engines and machinery. Corporators—R. W. France, Brooklyn, N. Y.; C. J. Kulberg, J. P. Thorn, both of New York City.

Windsor, Vt.—Windsor Automobile Co., under Vermont laws, with \$2,000 capital; to deal in and repair automobiles and other motor vehicles. Corporators—F. L. Cabot, Willard D. Cabot, Jessica White Cabot, Frank D. Tracy, J. H. Kinney.

Los Angeles, Cal.—White Garage Corporation, under California laws, with \$100,000 capital; to deal in automobiles, other motor vehicles, and maintain a garage. Corporators—F. Fay Sibley, Martin E. Tew, R. Roy Sibley, C. M. McCully, E. L. Sibley.

Indianapolis, Ind.—The Bright Carburetor Co., under Indiana laws, with \$200,000 capital; to manufacture and deal in carburetors. Corporators—Samuel M. Bundage, Dr. Clark E. Day, Ulric Z. Wiley, Henry S. Rominger, William P. Coswell, Clifford Arrick.

Increases of Capital.

Detroit, Mich.—Chevrolet Motor Car Co., from \$100,000 to \$2,500,000.

Hartford, Wis.—Kissel Motor Car Co., from \$400,000 to \$1,000,000.

Springfield, Ohio—Springfield Tire & Rubber Co., from \$50,000 to \$150,000.

December 25-26, Los Angeles, Cal.—Racemeet at Los Angeles Motordrome.

December 30-January 6, Buffalo, N. Y.—Buffalo Automobile Trade Association's annual show in 74th Regiment Armory.

January 2-10, New York City, N. Y.—Importers' salon at Hotel Astor.

January 6-13, New York City—Automobile Board of Trade's 12th annual show in Madison Square Garden. Pleasure vehicles only.

January 10-13, Peoria, Ill.—Peoria Automobile Club's show in the Coliseum.

January 10-17, New York City—National Association of Automobile Manufacturers' 12th annual national show in New Grand Central palace. Pleasure and commercial vehicles.

January 13-19, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's annual show in Auditorium.

January 13-27, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show in First and Third Regiment Armories.

January 15-20, Toledo, Ohio—Toledo Automobile Dealers' Association's annual show in Terminal Railway Building.

January 15-20, New York City—Automobile Board of Trade's 12th annual national show in Madison Square Garden. Commercial vehicles only.

January 18-20, New York City—Annual meeting of the Society of Automobile Engineers.

January 22-27, Providence, R. I.—Rhode Island Licensed Automobile Dealers' Association's show in the State Armory.

January 22-29, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show at Wayne Garden.

January 27-February 3, Pittsburgh, Pa.—Automobile Dealers' Association of Pittsburgh, Inc., sixth annual show of pleasure cars.

February 3-10, Montreal, Can.—Automobile Club of Canada's annual show at Drill Hall.

February 5-10, Pittsburgh, Pa.—Automobile Dealers' Association of Pittsburgh, Inc., sixth annual show of commercial vehicles.

February 5-17, St. Louis, Mo.—Annual show in the Coliseum.

February 12-17, Ottawa, Can.—Ottawa Valley Motor Car Association's first annual show.

February 12-17, Kansas City, Mo.—Motor Car Trades' Association's show in Convention Hall.

TAFT SPEAKS AT A. C. A. BANQUET

Declares Himself Opposed to Federal Road Building—Foreign Diplomats and Other Celebrities Who Heard Him.

On Wednesday, 20th inst., for the first time, the chief executive of the United States addressed the members of an automobile organization, the occasion being the twelfth annual dinner of the Automobile Club of America, which was held in the Waldorf-Astoria Hotel, New York. Not all of the thousand-odd men present, however, are members of the club. Most of them are persons of no little distinction in affairs national, civic and commercial, and their presence made the function the most notable of a succession of similar functions, which serve annually to demonstrate that the club really is more than a great big owners' garage association. Those seated at the guests' table were:

The toastmaster, who is the president of the club, Henry Sanderson; on his right was the President of the United States; on his left Gen. Horace Porter. The other guests of honor in the chairs were Count J. H. von Bernstorff, the German Ambassador; Gov. John A. Dix, Senor Don Juan Riano y Gayangos, the Spanish Minister; Lieut.-Gen. Nelson A. Miles, E. H. Gary, Col. John Jacob Astor, M. du Pulligny, representing the Automobile Club of France; Franklin Murphy, ex-Governor of New Jersey; Walter H. Page, Frank A. Vanderlip, president of the National City Bank; Chauncey M. Depew, Supreme Court Justice Victor J. Dowling, William Barnes, Jr., Henry W. Taft, the Duke of Newcastle, President John H. Finley of the City College, Patrick Francis Murphy, manufacturer of leather and epigrams; F. M. Schmolck, representing the Nederlandsche Automobil-club; Rear Admiral E. H. C. Leutze, Jacob H. Schiff, E. S. Martin, Henri Martin, representing the Automobile Club de Suisse; Morgan J. O'Brien, Major Thomas L. Rhoads, President Taft's physician; M. Clarholm, representing the Kungi-Automobil-Klubben; Major Archibald W. Butt and Dave H. Morris.

President Taft, of course, was the principal speaker, and of the others who enlivened the dinner the more important were the German Ambassador, President Finley of the City College of New York, and Patrick Francis Murphy, a wit.

The President's speech was liberally interspersed with humorous remarks and therefore frequently was interrupted by applause, but eventually he got down to serious things, though even the subjects were handled gently and in non-committal fashion. His most committal remarks disclosed that he is opposed to the movement in favor of Federal aid in building and maintenance of roads; he intimated that it

was "unstatesmanlike" and told his hearers that they should not ask the government to stand the expense because no one could tell what the ultimate expense might be. Though it was hoped he would say something about Federal registration he adroitly dodged the question and left his audience little the wiser. He said in part:

"Seriously speaking, my friends, the working out of the automobile is a wonderful development. As you look back as far as I can look back at least with any sense of economic changes, to 1876, and to what has happened in that period in the production of the comfort of the human race, the changes are marvelous. The telephone, the electric railway, all the electrical devices for the reproduction of the human voice, and the automobile. What could we do without them now? How rapidly we adapt ourselves to the absolute necessity of these improvements of which we knew and imagined nothing fifty years ago!

"Many serious problems are going to be presented, and you are having them now, with these State lines and these authorities, of whom you can have three in a very short automobile ride, just in this neighborhood. I don't know how you are going to get rid of them. You might set up some theory of yourself being an unopened and complete package, sent from Connecticut into New Jersey through New York, that cannot be opened until you reach the point of the designation and in some way or other call upon the Federal Court to protect you in that transportation.

"The question of good roads is a difficult one, not only because of the perfection of a road for the purpose of resisting this much heavier travel but it is also difficult because of a question who is to pay for the roads? Are they to be built by the State? Are they to be built by the county, and who is to take care of them? which is a much more important question, but I hear the earnest patriot—and it does not make any difference how he construes the Constitution if there is any plan of running a national road near his farm—I hear the earnest patriot say, 'It is the business of the general Government to build those roads. Let's have a national road running from New York to San Francisco to teach the world what a model road is.' 'But what would it cost?' 'Oh, what difference does it make what it costs? You can strive and hunt ways of saving a hundred million dollars in the matter of employees at Washington, but when it comes to building roads what is a hundred million between friends?' And there is the difficulty, gentlemen.

"I admit that the general Government has the power, for the purpose of promoting interstate commerce, to build national roads. It has done it already, but I venture to question the wisdom of opening that method of spending Federal Government money. I think it is much better to have the neighborhood and the State as a

large unit expend its money in the construction of roads across the State, of aiding the counties to keep the roads in repair, because if you once set out upon a plan of national waterways I do not know how great the expenditure will amount to. If we could confine it to two or three roads I would not object, but we have forty-eight different States, and every State is as anxious to share in the common funds at Washington as every other State. And it is a dangerous experiment that I would suggest great delay and deliberation in before you undertake so great an expenditure, the stopping of which will have no end.

"We have had some experience in that in Washington and we are looking forward now to large expenditure and if we are going to add roads and if you are going to run automobiles through them and over them and into them and going to promote the cost of them, as you will, increasing, of course, the intercourse between all the people, creating a benefit which I do not minimize, nevertheless I say to you that if you can reach that benefit without opening the national Treasury I think it will be the wiser and more statesmanlike course."

Scarritt Joins the Silent Majority.

One familiar face and figure was missing from the Automobile Club's twelfth annual banquet—that of Winthrop E. Scarritt, who died at his home in East Orange, N. J., on Thursday list, 7th inst., after an illness of scarcely four days. Pneumonia was the cause of his death.

It is probable that there are few men who were better known to those intimately connected with the automobile interests than was Winthrop E. Scarritt. He was a successful broker, and though he never actually became connected with the automobile trade, other than that he held shares of stock in several companies, he was one of the men who always was prominent. He was one of the earliest and hardest workers in the vineyard. He was one of the founders and the first president of the American Automobile Association, his term of office beginning in 1902; later, in 1904, he became president of the Automobile Club of America. He was a fluent and frequent speaker and the unremitting champion of good legislation. He always was ready and willing to go where self-imposed duty called, and it called often and earnestly.

Winthrop E. Scarritt was born in Alton, Ill., on June 17th, 1857, and educated at De Pauw University in Indiana. Subsequently he engaged in the banking business both in South Dakota and in Kentucky, and later moved to New York, where he entered the brokerage business and amassed a considerable fortune. Mr. Scarritt was an energetic Mason, being a 32d degree member of the Scottish Rite. He was also in the Hope Lodge of East Orange and the Jersey Commandery of New York City. He is survived by a wife and three sons.

ECONOMICAL DRIVING EARNS AWARD

Cincinnati Chauffeur Wins Winton's \$1,000 in Annual "Upkeep Contest"—Nineteen Others Who Kept Down Upkeep.

Sixty-four drivers of Winton cars again proved that when chauffeurs are on their mettle, so to speak, the cost for repairs and replacements on big cars can be made uncommonly small. In the case of the 64, the cost of upkeep between April 1 and November 30 of this year was so small that it earned them handsome bonuses. The skilful 20 drove their employers' cars over 394,333.9 miles, at a total repair cost of only \$20.88, averaging but \$1.04 per car, and thereby shared the \$3,500 which the Winton Motor Carriage Co. awarded this

Sixteen awards of \$100 each were made to the following winners:

William Tesnow, chauffeur for J. W. Strackbein, Chicago, Ill., 23,970 miles. No expense.

John L. Dondero, chauffeur for F. M. Hawthaway, Boston, Mass., 22,932 miles. No expense.

W. Bach, chauffeur for Mrs. Anna M. Hermes, Pittsburgh, Pa., 21,258 miles. No expense.

G. W. Butler, chauffeur for J. E. Clenny, Chicago, Ill., 21,133 miles. No expense.

P. O. Hawkins, chauffeur for W. B. Simpson, Chicago, Ill., 20,551 miles. No expense.

Lloyd Hoge, chauffeur for F. H. Greene, New York City, 19,096 miles. No expense.

M. T. Jones, chauffeur for Dr. A. H. Hilsman, Albany, Ga., 21,505 miles. Repair expense, \$1.25.

B. A. Trimpe, chauffeur for E. W. Ed-

P. W. MULFORD, WINNER OF WINTON "UPKEEP CONTEST"

year to the 20 best records made during that time. It was the fourth annual "upkeep contest" of the kind, those of former years having been limited to the best ten drivers.

P. W. Mulford, driver for R. R. Reilly, of Cincinnati, Ohio, was the most successful of the 20 in keeping down the upkeep expense; he drove 27,325 miles during that period at a total repair cost of \$1.20, and received first prize—\$1,000. In last year's contest Mulford, who then drove for W. J. Friedlander, of Cincinnati, won third prize with an expense of 30 cents for 18,809 miles. Equally notable is the record of William E. Ochsie, driver for Martin Daab, Hoboken, N. J., who received the third prize, \$250, for having caused his employer an expense of but ten cents for 24,221.4 miles. Ochsie won fourth prize last year with an unblemished account for 17,130 miles. The second prize, \$500, went to R. W. Lee, Millville, N. J., who drove S. J. Franklin's car over 25,290 miles at no expense. Fourth prize, \$150, went to John Dugan, driver for Mrs. William E. Fox, of New York City, who covered 24,082.6 miles at no expense for repairs.

wards, Cincinnati, O., 19,960 miles. No expense.

E. P. Brubaker, chauffeur for James W. Stevens, Chicago, Ill., 18,960 miles. No expense.

Samuel Emerson, chauffeur for A. S. Gilman, Cleveland, O., 15,017 miles. Repair expense, 25 cents.

W. R. Saxton, chauffeur for E. M. Patter, New York City, 14,259 miles. No expense.

L. V. Wright, chauffeur for Charles F. Lembke, New York City, 14,235 miles. No expense.

S. E. Johnson, chauffeur for E. B. Putnam, Philadelphia, Pa., 17,396 miles. Repair expense \$7.32.

William J. Green, chauffeur for Dr. E. L. Smith, Chicago, Ill., 16,531.7 miles. Repair expense, \$10.76.

Everett E. Stokes, chauffeur for Henry Hall, Philadelphia, Pa., 13,853 miles. No expense.

Alfred Colscen, chauffeur for W. R. Noone & Co., Boston, Mass., 13,634.1 miles. No expense.

The contest is open to all employed drivers of Winton Six cars.

EMPLOYER LIABLE FOR JOY-RIDER

Detroit Manufacturer Mulcted by a Jury for Tester's Offense—Law's Constitutionality to be Attacked.

According to the law of Michigan the owner of an automobile is responsible for all damage done or injuries inflicted as a result of accidents by his car, no matter who is in charge of the machine at the time, and even though the owner may not even know the car is out of the garage. The only way he can escape responsibility is by proving that the machine was stolen. Under this law John W. Parrott, of Mt. Clemens, Mich., won a suit against the Metzger Motor Car Co., of Detroit, for injuries sustained when an automobile belonging to the Metzger company ran into his milk wagon, overturning it and injuring Parrott. The contention of the Metzger company, which acknowledged the ownership of the machine, admitted the accident and agreed that there had been no negligence on the part of Parrott, was that the law conflicts with the fourteenth amendment to the Constitution of the United States, which provides that a person shall not be deprived of property without due process of law. The law was characterized as class legislation.

The plaintiff contended that the State Legislature had a right to make police regulations to protect the public from reckless chauffeurs, and that if owners could not be held responsible there would be no way for injured persons to recover damages in cases of accident. This is the first time the constitutionality of the act making owners responsible for the results of accidents caused by their cars when out of their control has been questioned, and neither side could find a decision that threw light on the point. When the case went to the jury, therefore, all it could do was to determine the amount of the award to the plaintiff, and this was fixed at \$1,843.

Judge Angell, before whom the case was tried in the United States District Court, expressed doubt as to the constitutionality of the act. "The same degree of responsibility does not attach to the owner of a horse and wagon," he said, "and it seems unfair to place the owner of an automobile in a special class." The case will be appealed and the constitutionality of the law thoroughly tested.

A. A. A. Lifts Ban from Offending Trio.

J. P. Ogden, J. W. Richly and Charles Lambright have been reinstated by the A. A. A. Contest Board. They were suspended on July 18th last for participating in an unsanctioned race meet at York, Pa., on the "glorious Fourth." Their sentence of "six months" was due to expire on January 1st next.

WILL BE AN "ORIENTAL GARDEN"

Such Will Be the Decorative Scheme of New York Show—How the Idea Will Be Carried Out.

It will be an "Oriental garden" in which the Automobile Board of Trade's next and last show in Madison Square Garden will be staged. Several pictured suggestions of the decorative scheme have been issued from time to time, and last week the Motor World illustrated the entire interior as it will appear when the show is opened on January 6th, but the official definition of the decorative theme just has been supplied: it will be representative of an "Oriental garden."

Entering the foyer from the Madison avenue entrance, the visitor will find himself in this oriental garden, dotted with recessed plaster figures and surrounded with hedges. After having feasted his eyes on the statues and near-statues in the foyer the visitor will pass into the main hall, where the ceiling will be found to resemble what is described as an "inverted oriental carpet" of red and gold. The painting which will accomplish this resemblance is said to weigh more than three tons; it will cover the entire ceiling and hang down over the sides of the top gallery.

The exhibition spaces on the main floor, elevated platform and balcony will be carpeted with a specially woven fabric of green, resembling a huge fountain backed by a statue representing the "motor era," while about the fountain are eight allegorical figures ten feet high arched by garlands of natural flowers. Six bay trees are recessed in the front of the fountain. Beyond this fountain will extend the main display space.

The plan of having the elevated platform and balcony above the arena boxes project over the main floor and of covering the high rear seats so as to make a sort of mezzanine floor again will be repeated. For the edges of the elevated platform and balcony special railings have been designed, which, like the stairways, standards and decorative borders, will be finished in gold. In the general view these railings of the platform will rise in three rows in front and rear and two rows on each side of the interior.

Along both sides of the arena will be boxes similar to those of the horse show, which will seat 1,200 people. Extending about the arena, towering to the dome, will be a number of ornate steel columns, which are expected to lend much to the stateliness of the whole effect. These columns support the balconies. More than 200 tons of steel and 1,000,000 feet of lumber are to be used in reconstructing the building. The two monster elevators which were successfully used at the last show will again be put

into service to hoist the exhibits to the balconies.

The "exhibition hall" will be transformed into a patio. Here the exhibits will appear in a "Lower California" setting. A big pergola will extend about the room. This pergola is supported by Doric stucco columns and is topped on one side with a tile roof. The center of the room is open except for a miniature pergola which is topped with cross beams entwined with foliage. A blue sky effect is afforded by peering upwards through the beams. A mammoth painting, by "Pal," depicting California scenery, will extend about the four walls of this room.

The "concert hall" will be transformed into a veritable cherry garden. The visitor will be under a canopy of cherry blossoms, in full bloom, so dense that nothing can be seen beyond the branches of the trees. Incidentally, the branches will be real. Along the walls of the room will be a Japanese panorama with Fujiyama, the sacred mountain of Japan, a feature of the scene. In the basement will be found a Bodega. A big mirror will add width to this room and Spanish scenes can be viewed by the visitor through big arches.

5,124 Commercial Vehicles in New York.

Although Secretary of State Lazansky declared in a recent public address that there were "about" 8,000 commercial vehicles in use in New York State, it appears that those figures were general and included the estimated number of motor vehicles owned and operated by dealers under their manufacturers' licenses. According to the official records of the State Department there were registered, up to November 28, 1911, 5,124 cars as commercial vehicles, out of a total registration of 82,943.

Defining the term "commercial vehicle," the Secretary of State declares that as far as registration in New York State is concerned, it applies exclusively to trucks, delivery wagons and omnibuses operated over a defined route under schedule time and at uniform rates of fare, and that all other motor vehicles which are operated or may be operated for profit under some circumstances are, nevertheless, classed as pleasure vehicles. This decision appears to lay at rest the rumor that taxicabs were to be classed and taxed as commercial vehicles; a rumor which arose after the test case brought by the New York Transportation Co. against the Secretary of State, in connection with the motorbuses on Fifth avenue, had resulted in their being declared "commercial vehicles."

San Francisco Building for Goodyear.

The Goodyear Tire and Rubber Co. has executed a lease for a two-story, reinforced concrete building which will be erected on West Van Ness avenue and Sutter street in San Francisco. It will be designed specially for the Goodyear use and will, of course, house its San Francisco branch.

STUDIED TRUCKS WHILE IN EUROPE

S. A. E. Members Who Found Such Study of Special Interest and Their Opinions —Steam Lorries Numerous.

Though little or nothing has been said regarding the status of the motor truck industry in England and Continental Europe, not all of the members of the Society of Automobile Engineers who crossed the Atlantic to study foreign practice confined their investigations to pleasure car factories. Several of them made the trip for the express purpose of delving considerably below the surface in that particular field and some of the conclusions they reached and some of the things they saw are interesting, to say the least.

For instance, they saw immense steam tractors lumbering and smoking through the streets and dragging after them three and in some cases four big trailers all loaded high with merchandise. In fact, these steam trains really constituted one of the impressive features of the visit to London. During the day not many of them were seen. It was after nightfall that they commenced to be plentiful, and in recounting some of his experiences Arthur J. Slade, who is one of the engineers who made the trip with a view to investigating commercial vehicles in particular, stated that the din they created was unmistakable.

"This is rather curious, too, when you stop to think about it," he said to the Motor World man. "As you doubtless are aware, the London police regulations governing the use of motor vehicles are rather strict, particularly as regards noise. Silence is insisted on as one of the conditions under which licenses are issued for taxicabs and buses, and yet these great steam lorries clatter around the streets and the police never seem to take the slightest notice of them. And it is not as if they were few and far between for they are fairly numerous and the average Briton scarcely turns his head to watch one pass.

"They are not used in the city proper to any great extent. They are employed principally between small outlying towns where the haul is comparatively short—50 to 100 miles—the transportation of goods in this way having been found to be cheaper than railroad transportation. They are used, too, to a great extent between factories and not far distant distributing points, which accounts in a measure for their appearance in the larger cities after dark. They are necessarily slow, and leaving suburban towns early in the morning, they reach the big trade centers late at night when traffic is not so congested and the long trains of trailers can be handled more easily.

"Transportation by this means is considerably cheaper than it can be when gasoline trucks are used, but of course speed is

not a consideration. But slow speed has an undoubted advantage in that depreciation costs are materially lessened. The average speed of these steam lorries with their string of trailers varies from three to eight miles an hour, according to the length of the haul and the character of the roads.

"One of the surprising features of the whole scheme is that the men who are employed to drive the steam trains really are an intelligent set. Even if they are not required to pass an examination and obtain a license to operate their road locomotives, at least they must know as much as the average locomotive engineer, and this necessitates a certain amount of schooling that is not necessary for the operation of gasoline trucks. Despite this, however, the wages they receive are comparatively low, quite a bit lower, in fact, than are received by the average motor truck driver in this country.

"Is there anything about it—is there even a ghost of a chance that the steam lorry will become popular in New York? Well, I hardly think so. Just imagine a big steam tractor puffing up Fifth avenue with four or five trailers in tow and you very nearly have the answer right there. In the first place, they are destructive to pavements, which in itself is a serious drawback, and in the second place it is extremely doubtful if the American manufacturer ever would be satisfied with their slow speed, notwithstanding their economy of operation. If they are arranged to run faster, which can be done in some cases, then there arises the objection of vibration, for steel tires are used exclusively and unless the roads are exceptionally fine it is difficult to keep joints steam-tight. No, I don't think they ever will be used here to anything like the extent they are abroad—if at all.

"There is another feature which helps to make them popular abroad and this is that some governments subsidize them. Also, municipal governments have given considerable encouragement to the industry by using steam lorries for the removal of refuse such as ashes and garbage, and for street sweeping and sprinkling."

"Regarding gasoline trucks," he continued, in answer to a suggestion, "it is my opinion that despite the fact that foreign manufacturers turned to the production of trucks before we did, and therefore can boast of longer experience, this branch of the industry is not as well developed abroad as it is in America. It is quite true that a great number of trucks are used in England and France, but their number is not as great as it is here. Neither do the really large manufacturers of pleasure cars seem to be giving trucks the attention that is given them here. Over there one finds a great number of light trucks that once were pleasure cars. Also there is a great number of light three-wheel delivery cars that are used about the cities. There are few really big firms, however, that

specialize in the production of the heavy class of trucks."

"In the shops where trucks are manufactured," he continued, "we saw a great deal of hand work though there is no ground for the expressed sentiment of some of the British trade papers to the effect that we thought that their cars were built by hand and with the help of antediluvian machinery. It is true that in many of the shops the amount of hand work is double or triple the amount done in the average American factory, but in other shops it is a question whether American methods are even a little bit ahead of those that are used abroad.

"For instance, in France we visited the Delage factory, which is a comparatively small one, and yet we found some of the most up-to-date machinery and methods. Crankcases and gear boxes are die cast in the most approved fashion and afterward are placed in jigs and without marking or centering are drilled and removed ready for assembling. And the accuracy of the parts which are turned out on the automatic machinery in this plant was particularly noteworthy. We were handed pistons out of one stock bin and connecting rods out of another and wrist pins out of another, just as these parts had come from the machines and yet they fitted together with a beautiful sucking fit and without the slightest rattling or binding.

"It is difficult to try to compare production costs for there are so many factors which must be considered. Labor is cheaper, of course, but this is largely offset by the smaller quantity of trucks which is produced, and in the end it seems to me that the actual cost must be very nearly the same there as it is here."

A. B. Cumner, who is maintenance engineer for the Autocar Co., is another of the party who made the trip for the express purpose of studying the commercial vehicle industry, and that which impressed him most was, to use his own words, "the apparent lack of standard models."

"Almost every purchaser," he says, "designs his own cars to a certain extent, using as much of the manufacturer's design as meets his approval and changing those parts which do not. This forces on the manufacturer special work for almost every order, delays delivery and particularly delays the obtaining of replacement parts. It also forces on the owner a much larger and better maintenance equipment than were the cars of standard manufacture, and as a result, cars are better taken care of by their owners than in this country.

"The British driver, as a rule, is one who obeys orders, particularly with reference to overloading and overspeeding. The owners accord to the drivers sufficient time to keep their cars in good road condition and insist upon their legitimate use, even to the possible detriment of delivery of good efficiency, as they find that policy far cheaper in the end. Overspeeding is less prevalent than it is in this country, as the police are

very strict and the record of each offense is endorsed on the driver's license. The third offense results in revocation of the license for various periods, but generally for one year.

"The large number of quantity owners was particularly noticeable, and it appears that when a concern starts to use commercial motors the increase in its equipment is rapid. Cars generally are equipped with bodies built for a certain class of haulage and are used only for that particular work, with the consequent result that they seldom are overloaded.

"For cars of less than two tons capacity, the general practice of using two-cylinder motors was most pronounced, the large majority of them being so equipped. The operating cost per mile, when due allowance is made for difference in wages, seems to be about the same as the cost in this country."

The extensive use of steam vehicles for the transportation of larger load units also was remarked by Cumner.

"It seems that the cost of operating steam lorries per ton mile in load units of five tons and above is considerably lower than when the same size units are transported using internal combustion motors for power," he says. "The government has repealed the old laws prohibiting the use of steam vehicles in the streets but I doubt if American officials ever will permit their unhampered use. These steam tractors, often hauling trains of four or five trailers, are a common sight."

To factory and production methods, Cumner paid little attention, this part of the investigation for the Autocar company being carried on by B. B. Bachman, who is the company's assistant engineer. That which impressed him most, he says, was the small number of jigs and special tools which are used. That this probably is due to the cheap labor and the comparatively small production of similar models is his opinion.

While not applying particularly to the commercial vehicle side of the industry, the inaccessibility of most of the parts on foreign cars which was remarked by W. G. Wall, of the National Motor Vehicle Co., is interesting inasmuch as it indicates that in this respect, at least, American manufacturers are ahead of their foreign cousins. He, also, was impressed with the frequent evidences of the efforts of manufacturers to reduce motor and transmission noises, and particularly with the tendency to eliminate torsion and radius members by arranging for the springs to perform the functions of these parts.

John G. Wood, who is general manager of the Empire Motor Car Co., was most impressed, he says, by the high finish which is given the ordinary mechanical parts and also by the unusual lack of parts makers or specialists. Also, he noted that apparently the total output as compared to the investment involved is small.

GIANT MOTOR TO GATHER REFUSE

Paris Instals Remarkable Vehicle to Assist Motor Sweepers in Cleaning the Streets—Its Capacity for Work.

While the United States in many respects is in the vanguard of the nations as far as mechanical efficiency is concerned, it is far behind in everything pertaining to street cleaning methods and the gathering of

MOST MODERN GARBAGE CART—IN USE IN PARIS

refuse. Compared with the stone-age system of dumping ashes and garbage into open carts, from which a large percentage of the contents is carried away by the wind, which system is in vogue in New York and most other large American cities, the methods adopted in Paris, Berlin, Vienna and other continental European cities might be styled ideal.

In Vienna, for instance, suction sweepers are in operation, which work on the principle of the vacuum cleaner. In Berlin, the exchange system of garbage collection is in vogue, under which full boxes are taken away by means of motor trucks, while empty receptacles are left in the court yards of the houses; the sweeping is accomplished by motor sweepers preceded by flushing wagons, and followed by a company of "white wings," who put the final touch to the "manicuring" of the streets.

In Paris there has been added to the street cleaning outfit a vehicle of extraordinary dimensions, which is shown in accompany illustration. It is designed to cart away sweepings and garbage, keeping the latter protected from disturbing breezes and the pedestrians' lungs from inhaling the dust. The sweeping itself is accomplished by a whole fleet of motor-driven, high-wheeled vehicles, shown in the second photograph. These vehicles are operated in companies of three, capable of cleaning one side of the street in a single trip. A number of "white wings" follow the motor-driven sweepers, gathering the refuse into

heaps at intervals of a block. Later on the huge covered vehicle travels over the same route collecting the refuse. The cart is capable of hauling the ordinary sweepings of one hundred street blocks in a single

Lapse of a Year Means New Registration.

In answer to an inquiry from the Secretary of State as to the requirements for new registration of an owner who, although legally registered in 1910, fails to register of one hundred blocks in a single trip.

IN FAVOR OF BOOSTING STATIONS

Electric Light Man Suggests Modified Electric Vehicle Campaign—Also Runs Counter to Several Popular Notions.

Though manufacturers of electric vehicles have consistently advocated the maintenance by central stations of charging facilities for the individual user, and in most cases the central stations themselves have supported the proposition, not all of them can agree as to the legitimacy of the plan.

Stephen G. Thompson of the Public Service Electric Co., of Newark, N. J., represents one of them that cannot do so, and in support of his views he stated in a paper read before the last meeting of the Electric Vehicle Association of America, held in New York on Tuesday, 19th inst., that the same contention "might logically apply also to the free installation of motors, fans, irons, house-wiring, and in fact, all electric appliances." "It would appear more rational to assume that the sale of a vehicle should include all accessories required for its proper care and operation," he added.

That the establishment of boosting stations might, however, legitimately come within the scope of central station activity,

FRENCH MOTOR STREET SWEEPER OF UNUSUAL PATTERN

ruled that "the motor vehicle law requires that an application for a renewal of a registration of a motor vehicle must be made within the year following the termination of the last registration, and if such application be not made, the application must be made in the same form as if the motor vehicle had never been registered."

is his opinion. Naturally, they would be cheaper to maintain, for the reason that the equipment required for a full-fledged charging station would not be necessary; there would be no necessity, either for employing an expert to devote his time to the care of batteries. "Such stations," he explains, "would not only relieve the minds of vehicle

operators of the constant anxiety regarding the ability of a machine to meet a desired performance, but in doing so would promote a more extended use of electric machines, and invite manufacturers to engage actively in selling their wares in the territories thus served." "Boosting stations", it may be added, are places where vehicle batteries can be given a short charge at a high rate to permit them to be continued in operation temporarily, after the normal charge has been exhausted.

"If there be any truth in the oft-reiterated statement that the electric vehicle will

that they also may secure their proportionate share of the business. * * *

"The question: Should the central station maintain public garages for electric vehicles? is one which has been solved only in those cities where the number of machines is already sufficient to induce capital to invest in the project. In other localities it is generally difficult to prevail upon garages housing gasoline cars to care for electrics and provide proper charging facilities, because the income to be derived from these machines is not sufficient to induce them to allot the necessary space to

to warrant their operating their own garages. The Union Electric Light & Power Co., of St. Louis, furnishes an excellent example of the results to be expected from the establishment of garages by the central stations. This company first became interested in electrical vehicles in 1907, at which time there were but eleven machines in operation in the city. Subsequently they established two electric vehicle garages, one for pleasure machine with a capacity of 60, and one commercial vehicle garage capable of caring for 75 machines. The number of vehicles now in operation

INNER TUBES FOR TOWING PURPOSES—NOVEL "STUNT" PERFORMED IN FLORIDA

To the wonderful records which have been made by tires, there has been added one which if unsubstantiated by photographic proof might well be open to suspicion. The tire in question is in reality

capacity than that of a tow line and its elasticity and strength were such that it is said to have come through the ordeal scathless. At any rate, it is on view in the window of a Jacksonville garage that those

with four passengers, the approximate weight of the "tow" being 2,500 pounds. The other end was attached to another car and through the intermediary of the tube the E-M-F and its load were towed not only

only part of one; it is a 32x4-inch Kelly-Springfield inner tube, and though the record was made in a 15-mile run over city and country roads in and about Jacksonville, Fla., it is the manner in which the tube was used which warrants the claim for the record. Briefly, it was used in no other

who so desire may see that it is unharmed. That the test really was a strenuous one may be judged from the accompanying picture. Ostensibly for the purpose of demonstrating the ability of the tube to withstand unusual strains one end of it was attached to the front axle of an E-M-F car loaded

through the city streets but out into the country, over sandy roads and up a hill as well. At the completion of the test it is said the tire was found to be in perfect condition despite the inordinate amount of stretching to which the rubber had been subjected.

represent 65 per cent. of the total number of commercial machines employed," he stated further, "at the end of 1915 instead of 50,000 electrics and 150,000 gasoline machines, based on the present ratio, there should be 130,000 electrics and 70,000 gasoline; and it is this fact alone that justifies the central stations in actively promoting the introduction of electric vehicles in the same manner in which they have promoted the introduction of other current-consuming devices, that this condition which should exist may exist, and each be assured of a just percentage of increase in this business within his territory. In like manner must the activities of the vehicle manufacturers extend to the territories of the central stations promoting electric machine usage,

the exclusion of the more remunerative gasoline car. This, of course, is particularly true of garages where the number of electric vehicles housed would be so small as to make the employment of a competent battery man unwarranted, and the current rate earned would be insufficient to permit of a reasonable margin of profit.

"Because of this condition, it would seem advisable in those sections where there is an apparent need of electric vehicle garages to promote the more general use of electrics, that the local lighting company should subsidize such garages during the period necessary to put them upon a paying basis, or until such time as the vehicle manufacturers themselves shall have placed enough machines in the territory

is reported to be 450; and whereas at the time they commenced activities it was impossible to induce the local garage men even to recognize the electric machine, since October, 1910, the number of public electric garages has increased 62.5 per cent., and there are over 16 commercial garages."

Regarding the argument that the central stations themselves should operate electric vehicles to demonstrate their faith in the apparatus they are recommending, it is in itself not a legitimate one, he said in substance, if the operation is for the purpose implied alone. "There is no more reason why they should be employed," he said by way of emphasis, "than that the central station man should refuse toast not made on a patent electric toaster."

ALPCO STARTER CLOSELY REGULATED

Novel Governor Prevents Overproduction of Current—Entire System is Built Directly Into the Car.

Electric motors and generators have been brought to such a high state of efficiency that their employment, in conjunction with storage batteries, for starting gasoline motors, has offered a tempting field for designers. The problems involved, however, were not easily solved, and for this reason acetylene, compressed air and gasoline starters have predominated numerically. Having carried out the necessary preliminary

work, and may be gear driven in precisely the same manner as a magneto or pump, with the important exception, however, that a friction clutch, automatic in operation, is included in the driving system. When acting as a starting motor, the drive is through a reducing gear which gives the crankshaft a rotative speed of from 40 to 60 r. p. m.; but when the engine picks up and runs under its own power the reducing gear is automatically disengaged and the motor becomes a generator, running at the same speed as the engine and furnishing current. A governor, said by the makers to be of a type entirely different from the standard Apple governor, holds the speed of the generator within such nice limits that it is claimed a two candle-power lamp

be used for the battery. It is claimed that this battery will furnish sufficient current to keep the engine running for 40 minutes.

None of the controlling apparatus is placed on the dash, but is concentrated in a controller box placed on a panel at the front of the driver's seat. This, the heart of the system, includes the starting lever, which turns on the current for starting the motor and at the same time switches on and retards the ignition; the switch for the lights, which permits the use of any desired combination of lights and also provides for the dimming of the headlights; buttons for the lash lamp and electric horn, and a pilot light which burns as long as all the apparatus is working properly. This lamp is covered by a metal hood to pro-

SHOWING THE ALPCO ENGINE STARTING AND LIGHTING DYNAMO IN POSITION AND THE "CONTROLLER BOX"

mary work, the electrical people are now coming to the front, as was indicated by the announcement in last week's Motor World of the "arrival" of three electric starters, all the products of well-known concerns. One of these, brought out by the Apple Electric Co., of Dayton, Ohio, is shown in the accompanying illustrations.

The AlpcO electric self-starter has, as its principal features, a storage battery and a motor-dynamo, the latter being driven by current from the storage battery to start the engine, and being driven by the engine for the purpose of generating current to charge the batteries for electric lights and signals. The feature of the system which is most conspicuous is that it is built into the car and is as much a part of its permanent equipment as the ignition or cooling system.

The motor-dynamo is located alongside the engine with its shaft parallel with the

crankshaft, and may be gear driven in precisely the same manner as a magneto or pump, with the important exception, however, that a friction clutch, automatic in operation, is included in the driving system. When acting as a starting motor, the drive is through a reducing gear which gives the crankshaft a rotative speed of from 40 to 60 r. p. m.; but when the engine picks up and runs under its own power the reducing gear is automatically disengaged and the motor becomes a generator, running at the same speed as the engine and furnishing current. A governor, said by the makers to be of a type entirely different from the standard Apple governor, holds the speed of the generator within such nice limits that it is claimed a two candle-power lamp

can be burned on current supplied direct from the dynamo—which is very close regulation. The governor is so set that when the car is running at a speed of less than ten miles an hour, more or less, according to the type of vehicle, the storage battery furnishes the current required for ignition, lamps and signals; but at greater speeds the dynamo does the work, and when the current output is more than can be absorbed by ignition and lamps, the excess goes to the battery. The governor takes effect when the current becomes equal to all demands, whether light or heavy, and prevents over-production and consequent damage to the apparatus.

tect it from accidental damage and has an aperture through which the light shines. Each of the controls is provided with a lock of its own, so that it can be left in any desired position without fear of its being tampered with.

The Alphabet Brought Up to Date.

"As simple as A-B-C" is an expression often heard when a motorist gets to discussing the merits of his favorite car. It was recently used by William W. Bride, a Washington attorney who owns an E-M-F "30." This method of alphabetical praise must have been overheard by Mr. Bride's little daughter, aged four, who had recently "learned her letters," for when asked to demonstrate this accomplishment before a gathering of friends, she remarked:

"A-B-C-D-E-M-F," at which juncture she was not unnaturally interrupted by a burst of laughter.

SAVING TIME IN THE FACTORIES

Some of the Many Unusual Methods Employed—Even a Man With a Horseshoe Plays a Useful Part.

There are few other industries in which production methods are systematized and routine work facilitated to the extent they are in a large automobile factory, and it is seldom, if ever, that the average owner has opportunity of learning of the hundreds of ways in which work is expedited and overhead expense kept at its lowest ebb. In order to keep production cost down, work must be done in the shortest possible time, and the necessity of saving minutes, or even seconds, has resulted in the invention of a myriad of time-saving devices and methods. Though the use of highly perfected automatic machinery has contributed in no small degree to the general saving, there are other things as well which are equally as important, though they seldom are brought to the attention of outsiders.

For instance, there is what is known as the call bell system, and this in itself has proven such a valuable feature that it is to be found in practically every large factory. Even in small factories it is valuable, for a plant need not be very large for considerable time to be lost in searching through it all for some individual who is wanted at the other end of the shops. In the larger factories, the president, the vice-president, the chief engineer, or any other individual who is likely to be wanted almost at any minute, probably at the far end of the works, is allotted a particular number of rings. From a central switchboard, where all inquiries are made, the bells throughout the whole shop are set ringing the call for the person who is wanted, and wherever that person may be he is apprised at once and gets into immediate communication with the office by means of the intercommunicating telephone system. In this way valuable time is saved and the work is expedited.

There also is a variation of this system whereby different colored lights are used for the various heads of departments. This system is susceptible of wider adaption, as, for instance, the combination of several lights of different colors may be made to signify that some particular person desires to see some other person, and if a return system is used, the person called quite easily can signify whether or not he considers it desirable to be "in" or "out," according to the personality or the mission of the caller.

Similarly, wonderful stories of the easy lives that testers live have been circulated, but in truth they are not quite as easy as generally is supposed. In reality, a tester's life is one long hurry, and to help him in hurrying not a few clever devices have

been perfected. As is generally known, every finished chassis is given a road test before it is turned over to the paint shop or to the body shop, where the finishing touches are put on it. To facilitate testing, it is the general practice to fit to the chassis some form of light body which provides a seat for the driver and also room for three or four bags of sand for ballast. Usually, such bodies have fixed to them the ignition apparatus, if it consists of a coil and batteries, and the gasoline tank. To attach the body to the chassis clamps are provided, and the gasoline connection is made by means of a quick detachable coupling. All of which is done to shorten the time required to complete the testing.

But the actual road test which the vehicle gets, however, is none the less rigorous, as many a venturesome person who has elected to ride with a tester can vouch for. The cars are slammed and banged over the roughest roads it is possible to find—at high speed, too—and one of the favorite "stunts" of the testing fraternity is to jam the brakes on and skid the car completely around at high speed—a daring and skilful performance that usually causes strangers to gasp. Needless to say, such procedures are extremely severe tests not only on the transmission elements and the steering connections, but on every other part of the car as well. Generally, special wheels and tires are used in such road tests, these being removed afterwards and others put on in their place and these in turn given a short road test.

After the car has undergone the proper road test, the chief tester attaches red or blue tags to the several parts of the car, such as the motor, the steering gear, the rear axle assembly, the transmission, etc., and on the tags is noted the fact that the parts are "O. K.," or if they require changes or adjustments these are noted. Before the car is shipped, it is given a short final test, and the sight of a lot of such cars flying around with these colored tags fluttering in the breeze is an odd one to strange eyes. In some plants the tester leaves by an exit where a clerk takes the number of the car and stamps the time of day on one of the tags, the same process being repeated when the car is returned, the tester turning the tag in at the end of his day's work. In this way the factory officials keep "tabs" on the testers, and "joy-riding" and theft are prevented.

There are other things, however, which must be tested, but with which the regularly employed corps of testers has nothing to do. These are embraced in the hundred and one little things—both mechanical features and accessories. These are tested under actual service conditions on the private cars of the president, the vice-president, the engineers and the superintendents or heads of departments. There are few of the higher officials who do not own cars and drive them to and from their homes and the factory, and there seldom

are two which are equipped with the same devices. Sometimes a single private car will literally bristle with such devices, all undergoing a real test under conditions which will obtain when they are fitted to customers' cars. Of course, not all these devices "pan out" as well as might be expected, and when this happens they are either discarded or else they are so modified as to make them efficient and practicable.

Even in the testing of cylinder castings, the same careful attention is given to the saving of time. In not a few factories, water jackets are tested to withstand 100 pounds cold water pressure. All the openings are plugged up except one, and to this one the hose to the water supply is connected by means of quick detachable joints similar to those which are used in making connection between the air pipes on railroad cars. Of course, where only a very few cylinders are tested, such methods scarcely would pay, but where the number of cylinders tested in a day runs well up into three figures, and in some cases into four, it readily may be appreciated that considerable time is saved.

For moving bodies, large, wide trucks are provided, and the bodies are loaded on them several at a time and so placed and covered that they cannot be harmed in transit. They are carefully covered with tarpaulins to exclude rain or snow, and as a number of them can be moved at a time, considerable time is saved in this way. Special trucks, fitted with racks, for conveying radiators and other parts, also are used, and all of these modern methods save time and therefore reduce production cost.

In one factory there daily is enacted a scene which might well cause the uninitiated to stare in undisguised wonder. Apparently aimlessly, a man wanders around the immense yards carrying a large horseshoe magnet. Occasionally he stops momentarily, points the magnet at the ground, and then resumes his wandering. Inquiry or investigation reveals the fact that he really is working—that he is employed to do just what he is doing. His particular job consists in collecting nails and other small scraps of iron or steel which, if left on the ground, might puncture or otherwise damage tires. The magnet is a quick and easy means of picking up the nails. And this is another of the little things that keep down production cost and enable factories to turn out cars in the shortest possible time.

When Tires Are Not Worth Retreading.

Using a tire until the rubber tread is all gone and the underlying fabric begins to wear is permissible only if the motorist has so much money he doesn't care how many tires he buys. If the fabric is intact the tire can be retreaded and used for many miles, but the destruction of the fabric, which is the backbone of the tire, precludes retreading.

LARGER BORE IN CUTTING CARS

Increased Cylinder Dimensions to Give Greater Power—Pump Cooling System for All Models—Other Refinements.

In increasing the cylinder dimensions of the motors in Cutting cars, which alteration constitutes the principal divergence from previous practice, as exemplified in the products of the Clark-Carter Automobile

and measured $4\frac{3}{8} \times 4\frac{1}{2}$ inches bore and stroke, respectively, this year is rated at 40 horsepower in conformity with the increased cylinder dimensions, which are $4\frac{1}{2}$ inches bore and 5 inches stroke; cylinders are cast individually in this case. Though the rating of the largest motor has been reduced from 60 to 50 horsepower, it remains practically the same as its immediate predecessor, the cylinders being cast in pairs and measuring $4\frac{3}{4}$ inches bore and $5\frac{1}{4}$ inches stroke, as heretofore.

pump of the same general type as is used on the other motors. Lubrication also is carried on in the same way in the several motors, oil being forced through a hollow crankshaft by means of a gear pump. In this way the main bearings are lubricated and sufficient oil is thrown off the connecting rod big end bearings to lubricate the cylinders and wrist pins. The whole lubrication system is self-contained in the crankcase, the oil being strained and kept in constant circulation. The timing gear train is

THE 50-HORSEPOWER, FIVE-PASSENGER MODEL AT \$1,850

Co., Jackson, Mich., as they will be marketed during the coming season, it is explained that while the slightly smaller motors always have been equal to the claims which have been made upon them, the purpose of the change is to provide a greater surplus of power than has been obtainable heretofore. Though the line still embraces four separate chassis, but three sizes of motor will be used instead of four. Also, two new body styles have been added, one of them a five-passenger torpedo, which is mounted on the 30-horsepower chassis, and

Structurally, except for the slight changes in cylinder dimensions which have been noted, all three motors remain substantially the same, the faith of the manufacturers in continuing them in their present forms being warranted by their past records for reliability and efficiency. Ignition in each case is effected by means of a Remy low tension magneto with dash coil of the

located in the crankcase, one of the gears being arranged to operate in an oil pocket and convey the lubricant to the others.

Regarding the transmission elements, the two smaller chassis and one of the larger ones, model F-60, remain practically unchanged except in minor respects. The chassis of model T-55, however, which is very similar to the one which was used in

INTAKE SIDE OF THE CUTTING "50"

THE 30-HORSEPOWER CUTTING

the other a similar model fitted to the 50-horsepower chassis.

In the case of the 30-horsepower chassis, the cylinders have been increased in bore from $3\frac{3}{8}$ inches to 4 inches, the stroke remaining the same at 5 inches. The cylinders are cast in a single block with the valves all on one side and their stems neatly enclosed by means of light aluminum plates, which may be removed by loosening two thumb screws. The motor, which last year was rated at 35 horsepower

same make, and a battery system for reserve. On the smaller cars, models A-30, D-35 and T-35, being of 30 horsepower, and model D-40 or 40 horsepower, dry cells are used for the battery system. Storage batteries are used on the two larger models, T-55 and F-60, both of which are equipped with the 50-horsepower motor.

The cooling system used on all motors now is the same, the thermo-siphon system which was used on the 30-horsepower engine having been replaced by a centrifugal

last year's 40-horsepower cars, and is identical with the other present 50-horsepower model, except as regards its change gear mechanism, now has a full-floating rear axle. Except in model F-60, in which is retained the same four speed change gear mechanism which last year was one of its features, three speed gear boxes are used; all are selectively operated. The clutch in all models is of the multiple disk variety.

In connection with the control mechanism, a noteworthy change has been made in

THE 30-HORSEPOWER CUTTING IN ROADSTER FORM

the 30-horsepower chassis in the adoption of separate pedals for the clutch and brakes in place of the single pedal which previously served this purpose. Both sets of brakes in all the models are located on the rear wheels, the service brakes being external contracting on 14-inch drums in all but model F-60, in which the drums are 16 inches in diameter, and the emergency brakes being internal expanding. The springs in each case are semi-elliptic in front, while those in the rear are three-quarter elliptic.

Tires have been increased in size throughout the line and on all models they are the same both front and rear. The 30-horsepower models are equipped with 34 x 4 inch tires instead of 32 x 3½ as heretofore; on model D-40, the size has been increased from 34 x 3½ to 34 x 4 inches; model T-55 is shod with 36 x 4 inch tires, and on model F-60 the size now is 37 x 4½ instead of 35 x 4. Both of the 50-horsepower models are equipped with Booth demountable rims. The wheelbase of model F-60 has been increased two inches to 124 inches, and on all the others it remains the same, namely, 116 inches.

Not all the refinement which has been made has had to do with the mechanical part of the cars, however. The bodies, as well, have been given a goodly share of attention with a view not only of enhancing their appearance but of increasing the comfort of passengers as well. Curves have been rounded out, door latches and hinges and other projections have been hidden wherever practicable, and by way of adding an artistic touch, as well as increasing the durability of such necessities, lamps and tonneau fittings are finished in nickel plate and black enamel, a finish that is increasing in popularity because of its rich appearance and also because it is more easily kept clean than polished brass.

With regular equipment, which includes Prest-O-Lite tank, top and windshield, as well as the usual complement of tools and other accessories, the price of model A-30, which is a torpedo roadster, is \$1,200. Model T-35 is one of the new ones which just has been added to the line. It is a straight-line torpedo touring car mounted on the 30-horsepower chassis, and sells for \$1,250; the car accommodates five passengers, as does model D-35, which is a standard closed front touring car, mounted on the same chassis, for which the list price is the same. The 40-horsepower chassis mounts a five-passenger touring body similar to the one mounted on the 30-horsepower chassis, and the price asked for it, with full equipment, is \$1,500. Model T-55 is the other new model, and is a five-passenger torpedo touring car, which lists at \$1,850. Listing at \$2,250, model F-60 is substantially the same roomy seven-passenger closed-front touring car as heretofore, the price, including full equipment, of gas tank, top, windshield, tools and accessories.

LIGHTS LAMPS AND SOUNDS HORN

"Dynalux" System Serves Several Purposes —Speed Regulator That is Practically a Speed Limiter.

Only a few years ago a motor car that carried a full set of acetylene lamps was considered very well equipped, so far as illumination went. It is one of the signs of the times, however—a straw showing which way the wind blows—that the car of 1912, in order to be up to the minute,

DYNALUX LIGHTING GENERATOR

must have a complete electric light plant capable of turning night into day, not only on the road ahead of the car, but also in the vehicle itself. Besides this, electric current is available for ignition, signaling, cigar lighting—anything for which a moderate current can be used. Such a little plant is that of the Dean Electric Co., of Elyria, Ohio, which has even gone a step

DYNALUX GOVERNING MECHANISM

further and included in the system an electric starter for the engine, which, however, requires a special installation.

While the "Dynalux" system, as the Dean company calls it, resembles other electric lighting systems for automobiles in that it has a storage battery and an engine-driven dynamo, it has certain novel features that are interesting, and, what is more, are of a practical nature. For instance, the dynamo has no extra apparatus for controlling the current, such as outside regulators or meters; and in "wiring up" only two leads

are carried to the generator. It makes no difference which is the positive or which the negative pole. This not only simplifies the work of wiring but it removes the danger of damaging or possibly ruining the battery by charging in the wrong direction. A speed regulator, which becomes operative only when the engine runs at an excessive rate, prevents unnecessary wear on the bearings, commutator and brushes and tends to increase the life of the wearing parts. This device is called the "speed limit."

A device that has been worked out in connection with the Dynalux system, but can be used with any electric lighting outfit of a similar character, is a tell-tale connected in circuit with the electric tail lamp to inform the driver if his tail light goes out, thereby relieving him of a doubt that must be ever present when no such indicator is employed. The device is called the "Centurion" and consists of a special form of relay which shows a signal or lights a small lamp when the tail light goes off duty. The signal lamp may be any small one already in use on the dashboard, as long as it is one that is used only occasionally. And not only will the "centurion" tell tales on the circuit with which it is connected, but it will show its signal or light its lamp if it goes wrong in its own vitals. The device is designed as an improvement on the plan of having a tell-tale lamp that burns constantly, using current and at the same time wearing itself out.

Another thing that can be operated on electric current is the Tuto electric horn, a specialty of the Dean company. In addition to the Tuto, which has been on the market for some time, a new signal device has been brought out, operating on the same hammer-and-diaphragm principle and having two tones, in which respects it is like the Tuto, but designed to sell at a considerably lower price. The new model is called the Tutoette and is sounded by pressing a button placed on the steering wheel or column.

Good Way to Ruin Storage Batteries.

One of the worst things that can be done to a storage battery is to allow it to stand in a discharged condition. If this is done the plates become sulphated, and while sulphating can be remedied by a long charge at a low rate—called by the electrical people "soaking"—serious sulphating means the permanent injury and perhaps the ruining of the battery. The best way to keep a battery in a healthy condition is to work it normally and re-charge it when necessary, not attempting to get the very last ampere out of it or, on the other hand, charging before a reasonable discharge has been taken. A battery that is to stand idle for some time should be fully charged and the electrolyte should cover the tops of the plates, which never should be allowed to become dry.

Wherein Electric and Gasolene Suspensions Differ

To those who have ridden for the first time in almost any one of the several electrics on the market, it is doubtful if there is any more impressive feature than the easy riding qualities which this class of vehicle as a rule possesses. On more than one occasion it has been remarked that

car springing is the "poorest accomplishment of the modern car." In accounting for the retarded progress he scarcely utters a new thought in saying that it is due to the "impossibility of measuring in terms of any unit the value in comfort of any one spring over another."

in so many others, and it is necessary to be content with the transmission of the smallest amount of shock possible. As simple as the matter seems, however, there exists considerable misconception of exactly what causes the shock, though this is a point which must be understood properly

they seem fairly to glide over the bumps and uneven spots in the roads with scarcely any appreciable movement of the body of the car, and though it generally is known that the spring suspension of the individual car is responsible for the effect obtained there are few who appreciate the differ-

ences which exist in the methods of springing electrics and gasolene cars. Incidentally, there are even fewer who have attempted to reconcile the evident differences in "ridability" to the apparent differences in spring suspension.

ences which exist in the methods of springing electrics and gasolene cars. Incidentally, there are even fewer who have attempted to reconcile the evident differences in "ridability" to the apparent differences in spring suspension.

When a vehicle is traveling over a perfectly level surface it suffers no shock. But the instant the wheels encounter an obstruction two distinct shocks, one as they mount it and the other as they again

ences which exist in the methods of springing electrics and gasolene cars. Incidentally, there are even fewer who have attempted to reconcile the evident differences in "ridability" to the apparent differences in spring suspension.

Of course, the spring suspension of a

to be bounced out on even a moderately bad road, and there is small likelihood of the many nuts and bolts in the car remaining in their respective places for more than a very short time. It is necessary to strike a happy medium between the two and as no two cars are exactly the same,

reach the roadway, are transmitted to the springs. But it is only at the instant that the obstruction is met that the shock takes place. The rise and fall of the vehicle do not cause shock as long as the vertical motion occurs at constant velocity, nor does the magnitude of the motion or

car, whether it be of the electric or gasolene variety, embraces much the same problem, and it is safe to say that seldom does any other problem connected with the building of automobiles disclose quite so many complications under investigation. One well-known engineer who has had more than a score of years experience in automobile manufacture, both in this country and abroad, is quoted as saying that

any more than the minds of any two designers are precisely alike, almost any number of solutions of the problem have been reached—and none of the number can be considered absolutely correct.

The ideal spring, if it could be obtained, would so support its load that none of the movements of the axles would be transmitted to the body. But it is impossible to reach the ideal in this case, as it is

its rapidity cause shock or discomfort. Which is to say, it is not the vertical distance traveled nor the velocity acquired, but, instead, it is the quickness with which the vertical velocity is acquired. In mechanical language, this is styled acceleration or the rate of change of velocity. The class of motion derived is styled periodic.

Without going too deeply into the mat-

ter it is sufficient to state that of the cardinal points in the design of efficient springs, the first is that the period of oscillation must be slow, in order to secure adequate acceleration insulation, and the second is that there must be sufficient internal friction in the springs to effectually damp out the tendency to continued oscillation. Good springs have a period varying between 80 and 100 double oscillations a minute; it has been demonstrated that more than this causes discomfort and less entails the use of inordinately long springs and causes difficulty in construction. Also the range of motion with slow oscillation,

travels at a much slower average rate of speed than does the gasoline pleasure car and this in itself contributes largely to the difference. The reason for this is, as has been pointed out, that it is the quickness with which the vertical motion is acquired that constitutes a shock. As the electric vehicle travels more slowly its wheels meet obstructions with less force and the consequent vertical motion produced is slower and hence the actual shock is less.

Then there is another factor which very seldom is thought of. It is that in the average electric car the passengers' seats are very near the center of the chassis

1,000 and 1,300 pounds. The proportion which has been stated, having been found by experience to be correct, should go far toward disproving the erroneous impression which is held by not a few to the effect that owing to the weight of the batteries, the total proportional weight of the electric car on the tires is greater than it is in the case of the gasoline vehicle. In other words, it is a mistaken idea that the average electric vehicle is comparatively heavy. Quite the reverse, it is comparatively light.

In the form of the springs used in electric pleasure cars, there is considerable

CONTRASTS IN METHODS OF SPRING SUSPENSION USED ON ELECTRIC PLEASURE CARS

necessitating long springs as it does, increases the required distance between the axles and the body and makes necessary large clearances and high frames.

Though all of this is, perhaps, a little bit away from the subject of the differences between the springing of electrics and gasoline cars, it nevertheless has a direct bearing on it, inasmuch as it shows in brief a few of the difficulties which have to be overcome in either case and the conditions which must be met. That the electric vehicle is ahead of its gasoline prototype as far as easy riding is concerned, is the opinion of not a few who are engineers, and a greater number who are not engineers. The fact remains, however, that there really is a marked difference in the majority of cases and there are several reasons why such a difference may be considered legitimate.

In the first place, the electric vehicle

frame and thus the benefits of both front and rear springs are felt. In fact, the passengers are in reality suspended between the two sets of springs. This, in turn, makes for better weight distribution, and when, as is the case in a great many electrics, the batteries are carried in two sections, one at either end, the proportion of the total weight supported by each pair of springs is equalized better.

Regarding the relative total weight on the springs of the electric and gasoline car, it is the opinion of several engineers who have made a study of the subject, that the average weight supported on the springs of an electric car is between one-half and two-thirds as much as in the case of the gasoline car. Which is to say, that if the average weight of the average gasoline car on the springs is, for instance, 2,000 pounds, then the average weight of the electric car on the springs is between

diversity. Semi-elliptic, three-quarter-elliptic, and platform suspensions are used to very nearly the same extent as they are for gasoline cars. For electrics, however, it is more common practice to combine two or more of these forms and thus obtain the benefits of both. Though it has been suggested that the form actually used depends largely on sentiment or the desire to produce a harmonious appearance, and that any car can be fitted with semi-elliptic members of the proper periodicity and strength, there is real reason in the adoption of combination forms.

The manufacturers of the Bailey electrics, however, prefer to stick to the semi-elliptic type springs though their shape and the method of attachment is quite different from the usual spring of this type as used on gasoline vehicles. Both the front and rear springs are placed directly below the side frame-members. At the rear, the side

frames are extended downward in a graceful curve eliminating the usual goosenecks and serving as spring hangers themselves. The frames extend out over the springs, to which they are attached by means of hanging links. The front ends of the rear springs support the frame upon heavy standing links which extend up inside the frame in a casing. Similar standing links serve to fasten the rear ends of the front springs, the front ends being attached to sockets without links.

As may be seen in the accompanying illustration the ends of the Bailey springs are curved in the reverse direction to con-

double the damping effect for the same length as can be obtained with the ordinary type of semi-elliptic member. This is because there is double the friction surface between the spring leaves. It follows, therefore, that a slightly greater degree of resiliency with the same periodicity can be obtained and for this reason full-elliptic springs are favored when solid tires are used.

The Woods suspension is not unlike the Waverley in the use of a cross semi-platform spring at the rear of the front members, but the rest of the suspension is entirely different. Scroll full-elliptic

only at the center, a heavy bracket and the usual spring clips serving this purpose. The Rauch & Lang rear springs also are full-elliptic but they differ from those used on the Detroit in that they are not scroll members. The method of attaching them to the frame also is different and is in the form of a swiveling bracket, the manufacturers having deemed this method superior to rigid attachment in the anticipation of freer spring play. Of course, where the drive is transmitted through the springs instead of through the usual torsion and radius members, it is essential that the springs be rigidly attached unless special

SOME FURTHER VARIATIONS IN THE ARRANGEMENT OF ELECTRIC VEHICLE SPRINGS

form to the curvature of the frame. The purpose of thus forming the springs, however, is merely to enhance the appearance of the car. The principal part of the load, which is the battery, is carried low down between the axles and not over them as is the general custom.

The spring suspension on Waverley cars is unusual and decidedly novel. The weight is supported both front and rear on full elliptic members, one end of each of them being attached to semi-platform springs mounted at their centers on cross frame members. These semi-platform cross springs do not support any of the weight of the car, however, as they generally do in other constructions. Their purpose is to take the torsional strain of starting and braking and to assist in the dissipation of horizontal road shocks.

One of the principal reasons for the use of the full-elliptic spring is that it permits

springs are used in the rear and these are not anchored to the frame at their front ends, in order to allow of slightly greater spring play. For the front suspension a form of three-quarter-elliptic members is used, the rear ends of the lower halves being shackled to the ends of the cross semi-platform member. The top halves, or rather three-quarters, of the springs are attached to the frame by means of the orthodox spring clips and the rear quarters of the top members are attached to brackets on the side frame members.

Though the majority of manufacturers of electrics agree on the use of full-elliptic springs for rear suspension, that there is a wide diversity of opinion regarding the exact form of the springs and their method of attachment is evidenced in the accompanying sketches. In the Detroit, for instance, scroll full-elliptic springs are used and they are anchored to the chassis frame

provision is made for the taking up of the driving stresses.

Baker rear springs also are attached to the chassis frame by means of swiveling brackets though they also are fastened at their forward ends by long shackles. The object of these shackles is to insure perfect alignment of the springs under all conditions of road surface and also to permit of the springs taking the place of radius and torsion rods. The Rauch & Lang front springs, which are illustrated in the same group, are unusual in that a long gooseneck is used to connect the front of the semi-elliptic members to the chassis frame.

The rear springs used on Grinnell electrics are of the full-elliptic variety, too, and though their method of attachment is not unusual, the length of the spring clip is slightly longer than generally is employed. The use of three-quarter-elliptic rear springs is confined to comparatively few

manufacturers of electrics despite the fact that its majority over other types in use in the gasoline vehicle field is considerable. They are used on Broc electrics, and it is claimed for them that their rate of periodicity is lower and that the degree of resiliency obtained is greater in proportion than can be obtained from other types in which the same amount of spring play is allowed. They are rigidly attached at their forward ends and serve to transmit the drive.

Though the advantage of underhung suspension in the lowering of the center of gravity of a car is fairly well known and this method is used on several makes of gasoline pleasure cars, only one manufacturer of electrics has seen fit to adopt it. The rear springs of one model of the Hupp-Yeats electrics are hung below the axles, as shown in the accompanying illustration; the front springs, however, are of the conventional semi-elliptic overhung type. Underhanging the springs effects their resiliency but little, if any, but it is not with this end in view that springs are so mounted. The beneficial effects are embraced in the lower center of gravity which is gained and the reduced tendency toward sidesway and skidding.

As has been stated before, the problem of spring suspension is more than ordinarily complicated and though great advances have been made in the methods in use there still is warranted considerable deep study. Spring wheels and numerous other devices intended to ease the mechanism of cars and to increase the comfort of passengers almost daily are being placed on the market, and it is reasonable to expect that there will be no appreciable diminution in the production of such devices for some time to come. Some of them are good, though it is difficult to get at the degree of their goodness because it is impossible to measure their action mechanically. Similarly, they cannot be measured by the sensations of the passenger, and there remains only the alternative of scientific analysis of the claims made for them. But this, too, often may be unsatisfactory, for not always can cold scientific facts be reconciled to the sensations of the occupants of the car. That there eventually will be springs even better than those that are in use at present is highly probable in the light of the development of other parts of cars in general. Whether they will be hydraulic, or pneumatic, or coil, or leaf, or anything else no man can tell at present.

Will Produce Eight-inch Truck Tire.

After considerable experimenting, the United States Tire Co. has perfected a new pneumatic tire of unusual size for use on five-ton commercial vehicles. It is of eight-inch section and will be manufactured in various diameters to suit requirements. A special fabric is used and the method of wrapping also is different from the usual.

RUSHMORE DEPARTURE IN DYNAMO

Lighting Apparatus Claimed to Render Regulator Unnecessary—Designed to Be Operated at Engine Speed.

With the object of avoiding as much as possible complication in automobile electric lighting systems, the Rushmore Dynamo Works, of Plainfield, N. J., has completed and placed on the market a generator that is radical in that it requires no extraneous appliances for the regulation of the current. After considerable preliminary work the company has evolved a method of winding which permits the generation of useful current at a rotative speed as low as 200 r. p. m., but will cease to increase the output when the current reaches the maximum for which the dynamo is designed, which is 14 amperes.

RUSHMORE AUTOMATIC GENERATOR

The generator is designed for use in connection with a storage battery, and the voltage of the current, when charging is in process, is governed by the requirements of the battery, the resistance and the voltage increasing as the charging approaches completion. The current generated is of the proper potential and amperage, at normal rotative speeds, for lighting the lamps, and the generator is capable of doing this without assistance from the battery. Therefore the owner of a car equipped with the Rushmore system has only to close the generator switch, when the outfit automatically takes up its work, the dynamo keeping the battery properly charged at all times. There is, of course, a cut-out which opens the circuit between generator and battery when the speed of the former falls so low that the battery voltage would exceed that of the generator. In this case the battery would discharge itself through the generator if there was no means of interrupting the circuit. The result would be the complete loss of the charge in the battery should the circuit remain closed for some time, and there might be injury to the windings of the automatic generator as well.

When the engine is not running, or is running so slowly that the dynamo is not

rotating fast enough to generate the current required to overcome the resistance of the storage battery, the latter furnishes all the current for the lamps. As the speed increases, however, the dynamo current becomes stronger until it closes the cut-out and takes up the work of supplying the lamps. At a speed of 600 r. p. m. the current is about 10 amperes which is enough to supply all the lamps and leave a surplus. The surplus then goes to the battery, replacing the current used from it during the inactive periods of the generator. At a speed in excess of 600 r. p. m. the current output increases very slowly indeed until the maximum of about 14 amperes is reached. No matter how fast the generator runs, it cannot exceed this output. At no time is the generator speed so high as to be mechanically dangerous, as the speed is the same as that of the engine—quite a slow rate for a small machine. The makers state that when the generator is running at normal speed and giving a current of about 10 amperes or more, changes in the number of lamps in circuit, or the switching on or off of the whole lamp load makes very little difference in the ampere output of the generator.

In addition to this generator, the Rushmore company builds a machine which, though smaller, has the same capacity, viz: 6 volts and 13 amperes. The smaller type does the same work as the larger by running at from 2 to 2½ times engine speed. The small generator weighs 23 pounds and is 5½ inches in diameter and 8½ inches long, exclusive of the shaft coupling. Both are bi-polar machines of the cylindrical ironclad type. They may be used in connection with any good storage battery of 80 to 100 ampere hours capacity.

Flying Fan Blade Kills Pedestrian.

Circumstantial evidence, which on many occasions has been sufficient to send a murderer to death, is likely to be the means of keeping George H. Sherman, a motor truck driver of Utica, N. Y., in jail for a longer period than he expected to be when first arrested. The case is an unusual one, in that it involves that comparatively rare accident, the snapping of a fan blade on the motor, while the car is in motion. According to the evidence collected, the body of Daniel Donovan, a stone mason of Deerfield, N. Y., was found on the road between Utica and Herkimer, with a piece of metal sticking in it. This metal later was recognized as part of an automobile fan blade. Sherman had been driving a truck along this road and had collided near Herkimer with a peddler's wagon, for which he was arrested. An examination of the truck showed one of the fan blades to be broken, and when the piece found in Donovan's body was fitted to Sherman's fan it matched perfectly. Sherman now faces two serious charges: one for causing the death of Donovan and the other for injuring the peddler in the collision on the road.

FOUR CYLINDERS FOR GRABOWSKY

Detroit Truck Maker Abandons Two-Cylinder Opposed Motor and Planetary Transmission—Other Changes.

Though retaining many of the distinctive features which heretofore have proven of genuine merit, the Grabowsky line of commercial vehicles, manufactured by the Grabowsky Power Wagon Co., Detroit, Mich., has suffered a most complete revision, the most important change being the substitution of four-cylinder vertical motors

the use of quick detachable water and gasoline connections. The cross member of the chassis frame is arranged to hinge outward after the removal of a single bolt when the entire power plant may be slid forward onto a special truck, or only partly removed to expedite inspection or adjustment.

Quite as important in its way as the change which has been made in the motors is the replacement of the planetary change gear mechanism which previously has been used in all the trucks by selectively operated three-speed sliding gear sets. As heretofore, the steering wheel is located at the left side of the chassis and the emer-

For the three-ton truck a 40-horsepower motor is used in which the cylinders measure five inches square and deliver 48 horsepower on the brake. The motor in the five-ton truck is rated at 44.1 horsepower, though this rating, too, is conservative, the actual output under a brake test showing 63 horsepower; the cylinders measure 5¼ inches bore and 5¼ inches stroke.

As all three of the motors are identical in construction except as regards their cylinder dimensions, a description of one fits them all equally well. Cylinders are cast in pairs with the valves all on the same side and in the positioning of the intake and exhaust manifolds, which are of liberal size, particular attention has been given the necessity for leaving the valves as accessible as possible. Reflecting the latest engineering practice, the crankcase is made of nickel aluminum alloy and is in two parts, the crankshaft being carried in the upper half. The lower half of the crankcase contains the oil reservoir.

Regarding the lubrication, the manufacturers have been at considerable pains to provide an efficient and economical system which is entirely automatic in operation. It is a combination force feed and splash system, the main bearings being fed under pressure by a shaft-driven pump, the excess oil serving to maintain a constant level under the connecting rod big end bearings which dip into the oil and splash it over the minor bearings and the cylinder walls. The oil is thoroughly strained before it is permitted to drain back into the crankcase reservoir. The timing gears are located in the crankcase and are positively lubricated.

Cooling is effected by means of an exceptionally large centrifugal pump and the radiator is so located that in case the pump should become inoperative through any cause circulation would be carried on by thermo-siphonic action. With regard to the radiator itself a new feature has been incorporated in its mounting which is a steel cradle pivoted at both ends. The motion of the cradle is restricted to avoid undue strain or rattle.

For ignition, a Bosch high-tension magneto is used principally, an independent Bosch system operating through a separate set of plugs being supplied for starting and for emergency. The battery equipment embraces a six-volt, 60-ampere-hour storage battery. To prevent the racing of engines or overspeeding, centrifugal governors operating on the throttle are regularly built into the engines. One of the interesting points in connection with the governors is that when they are set at the factory they cannot be altered without breaking the factory seal and thus disclosing the fact that they have been tampered with.

From the engines, power is transmitted to the rear wheels through the intermediary of multiple disk clutches and side chains in all the models, the alternate disks in the clutches being faced with Raybestos. As

NEW FOUR-CYLINDER GRABOWSKY POWER PLANT SHOWING DEMOUNTABILITY

for the two-cylinder opposed engines which in years gone by have constituted one of the distinguishing marks of the line. Also, there has been added a new model of five tons capacity, the complete line now including one, one and one-half, two, three and five-ton models.

In adopting the new motors, however, the advantage of the removable power plant which always has been a feature of Grabowsky trucks has not been overlooked. As has been the practice in the construction of previous models, both motors and change gear mechanism are mounted on sub-frames and may be removed quickly and easily, the work being facilitated by

gency brake and gear shift levers have been placed in the center of the footboard, permitting free access to the driver's seat from either side. Otherwise, the trucks have changed but slightly in general appearance, the adoption of a sloping hood over the engine tending to accentuate the general air of pugnacity and reliability which always has been one of their characteristics.

In the one, one and one-half and two-ton models the same size motor is used, the cylinder dimensions being 4¼ inches bore and 4½ inches stroke and the rated horsepower 28.9. On a brake test, however, the motor develops 35 horsepower.

has been previously mentioned the planetary change gear mechanism has given way to one in which sliding gears are used, the same type being used on all the trucks. The springs are semi-elliptic in the front and three-quarter platform in the rear. In all the models, the service brakes are mounted on the jack shafts and the emergency brakes are located on the rear wheels. Both sets are adjustable and are Raybestos lined.

The wheelbase of the one-ton chassis is 121 inches and the front wheels are shod with 34x3½-inch solid tires; the rear tires are 34x4 inches. The chassis price is \$2,200, and the available loading space of the standard body is eight feet by four feet. The one and one-half-ton chassis has 145 inches wheelbase and the tires are 36x4 inches both front and rear. The chassis price is \$2,550 and the loading space on the standard body measures 10 feet by five feet six inches. Both the two and three-ton chassis are built on 145 inches wheelbase also, the first being equipped with 36x4-inch single tires in the front and 36x3½-inch dual tires in the rear and the latter having 36x5-inch tires in front and 40x4-inch dual tires in the rear. The price of the two-ton chassis is \$3,000, and the loading space is 12 x 6 feet. The three-ton chassis lists at \$3,400 and the loading space is 12 x 6 feet.

The wheelbase of the five-ton chassis is 156 inches and it mounts a standard body having a loading space of 14x6 feet. The front tires measure 38x6 inches and those in the rear are dual 42 x 6 inches. The price of the chassis is \$4,500.

Long Hair and Short Hair for Cushions.

That little things in automobile construction make a great deal of difference in the final results is indicated by a few facts concerning such a minor detail as the kind of hair used in stuffing the cushions. According to an expert, the best hair, though the most expensive, is the most satisfactory not only from the point of view of comfort to the user of the car, but also from the makers way of figuring, because the good qualities are long in fiber and are easily stuffed into the cushions without waste, while the cheaper grades are short and much hair is lost while pulling apart previous to stuffing, and when in place it packs hard and makes an unsatisfactory job. It is said that moss, though still cheaper, is preferable to cheap hair.

Assisting a Cold Motor to Start.

Sometimes a motor that is very cold refuses to start, though the ignition system is in first-class working order and the carburetter right. The trouble is usually that there is not sufficient heat to vaporize the gasoline, and often the trick can be turned by priming the cylinders heavily, using what in warmer weather would be an excessive quantity of gasoline. Sometimes a cloth wrung out in hot water and wrapped around the carburetter will suffice.

BARREL CAM FOR MITCHELL MOTOR

Ohio Tool Company Employs Novel Valve Mechanism—Magneto on Elevated Bracket—Other Features.

Motors having intake and exhaust valves located in the heads of the cylinders with stems inclined, operated by cams on a camshaft of the overhead type running in bearings carried above the cylinders, are not new, but there is real novelty in the grooved cam valve actuating mechanism

MITCHELL VALVE MECHANISM

embodied in the motor designed by R. C. Mitchell, of the Webster & Perks Tool Co., of Springfield, Ohio, which is shown in the accompanying illustrations. In working out this valve gear it was the object of the designer to evolve a system that would be positive and efficient in operation and that could be economically

EXTERIOR OF MITCHELL MOTOR

manufactured owing to the small number of parts required in its construction, and its sponsors are so well satisfied with the result that arrangements are making to place the Mitchell engine on the open market.

Instead of the conventional type of valve

gear in which the valve is lifted and held open by the action of a cam, and returned to its seat by a spring when the cam permits it to close, the new design employs a barrel cam, grooved, on an overhead camshaft. Motion is transmitted from the cam to the valve through a pivoted rocker arm, one end of which engages the valve stem while the other is a close sliding fit in the groove cut in the cam. This groove, instead of being a perfect circle cut in the cam, follows a sinuous path, so that as the cam rotates the groove moves the rocker arm and the valve with which it connects. The time of opening and closing and the period of opening are determined by the shape of the groove, and consequently the valve timing is permanent; the valve closing, like the opening, always occurs at the same time with relation to the position of the piston, regardless of the speed of the motor.

The exhaust valve is placed on one side of the cylinder and the intake valve opposite, with the cam between, and each cam actuates two valves. There are, therefore, but four cams for the eight valves of a four cylinder engine. Lubrication of the valve gear is effected by wicks taking their supply of oil from a reservoir containing sufficient lubricant for a month's ordinary running. The entire valve mechanism is enclosed in a substantial casing which is dust proof and water tight and also serves to deaden the click of the valves on their seats.

The camshaft is driven through bevel gears by a vertical shaft at the front of the motor, the vertical shaft being driven in turn by bevel gears from the crankshaft. The vertical shaft and its gears are also enclosed.

An interesting feature of the motor is the placing of the magneto on a bracket on the rear cylinder in line with the camshaft. In this elevated position it is well out of the way of flying oil, and, being at the rear of the motor, is protected from dust and water that may pass through the radiator. Inspection, oiling and adjusting can be readily attended to without the necessity for delving into the depths of the engine space. The magneto is driven from the camshaft by a pair of spur gears.

H. Voges, Jr., president and treasurer of the Webster & Perks Tool Co., thinks so highly of the engine that he is aiming at the formation of a company for the exclusive purpose of manufacturing these motors. Meanwhile they will be built in limited numbers on exclusive contracts.

To Reduce Millimeters to Inches.

The dimensions of motor cylinders, tires and other automobile parts are so often designated in millimeters that a rough and ready way of converting millimeters to inches is frequently useful. The easiest way is to figure 25 millimeters to the inch. The exact figures are 25.4 millimeters to the inch.

CONTINENTAL PRODUCES A "SIX"

Famous Motor Makers Finally Add One to Their Line—Cylinders are Cast in Threes.

Supplementing its introduction a little over two months ago of a new long-stroke Continental motor, the Continental Motor Mfg. Co., of Muskegon, Mich., has further increased the size of its line by the addition of a new "six" in two sizes and two styles which in structural detail is quite similar to the new four cylinder model. Though this is the first six-cylinder motor which this well-known company has produced for the market it savors not at all of the experiment inasmuch as the reputation of its producers is sufficient warranty that it has been thoroughly tested out and measures up to the high standard of merit which the

bearing surface obtained is greater. Regarding the number of bearings, it is interesting to note that but three are used to support the crankshaft, which construction follows closely the construction of the "fours" and permits of considerable weight reduction. As a matter of fact it is claimed for the new "six" that it is actually lighter per horsepower than the average four-cylinder motor.

Following the same general construction as is employed in the new four-cylinder motor, the valves in the "six" are arranged all on the same side, the valve stems and springs being enclosed by light metal plates. By way of insuring equal distribution of the gases, intake ports are cored in the cylinder castings, a short Y-shaped intake manifold serving as the connection for the carburetter. The crankshaft is drop-forged from a special grade of carbon steel, and because of its size, connecting rod bearings also are slightly larger than usual. Cooling is by centrifugal pump ex-

END AND SIDE VIEWS OF THE NEW CONTINENTAL "SIX"

Continental company has set for itself and which it has maintained.

The new motor has been developed with a view to supplying the demands of those who desire a "six" in which the principal features of previous Continental products are retained. Therefore, though the cylinders are cast in threes, their dimensions remain the same as those in the two sizes of the new four-cylinder motors. The stroke is $5\frac{1}{4}$ inches in both, the smaller cylinders measuring $3\frac{3}{4}$ inches bore and the larger ones $4\frac{1}{8}$ inches bore. As in the case of the new "four," the six-cylinder model is supplied either as a motor alone, or as a unit power plant, in which case the flywheel is enclosed and mounts a Raybestos-faced multiple disk clutch; the gearset provides three speeds forward and reverse, selectively obtained.

In casting the cylinders in threes several valuable features have been gained and not the least of these is that the motor is made short enough to fit comfortably under the average 40-inch bonnet. Also its shortness permits four point support, though to obviate the possibility of frame weaving causing damage, it is arranged to be supported at three points. Though the placing of the cylinders close together in this way reduces the length of the center bearing, the diameter of the crankshaft has been increased and the actual amount of

clusively, the water entering the jackets close to the exhaust valves and maintaining them at an even temperature.

The oiling system, also, is the same as is used on the new four-cylinder motor, two separate plunger pumps actuated by the crankshaft being used. One of them forces the lubricant directly to the helical timing gear train in the front of the crankcase and the other serves to maintain a constant level in the crankcase compartments; the main and auxiliary engine bearings are lubricated by splash as are the cylinder walls. All the oil is filtered after having been used and before it is recirculated. A conveniently located float indicator serves to register the amount of oil in the reservoir.

To Clean the Teeth of a File.

A file that has become so clogged with metal that it does not cut freely can be made to work properly by cleaning the teeth. Rub the end of a piece of wood across the file, in the direction of the teeth or "cuts," until the wood works to the bottom of the cuts and forces out the clogging metal. Some times wood will not do the work, but a piece of stout sheet brass, used the same way, will have the desired effect. Lead, solder, copper, aluminum and other soft metals quickly fill up file teeth. For lead and solder only old files should be used.

PROSECUTING SALE OF TRUCKS

Lack of Horse-Haulage Data Hard to Overcome—Figures and Methods That Are Brought to Bear.

There is a peculiar condition existing in connection with the motor truck business that is seldom met in other industries—at least in such marked degree. It is a condition which, to start with, militates against the sale of motor trucks, but which the dealer, with the acumen that is characteristic of his kind, actually turns to his own advantage and uses as a potent aid in placing trucks. To be specific, users of horse-drawn trucks seldom know, with any degree of accuracy, what they really pay for transportation—that is, the whole cost—and it is therefore difficult to convince them of the correctness of estimates showing the financial advantage of motor transportation.

In order to cast real light in that direction, the American Locomotive Co., builder of Alco trucks, just has established a motor truck cost bureau, at the head of which it has placed W. P. Kennedy, who is one of the most eminent transportation engineers in the country and has been identified with the automobile industry for twelve years. The comprehensive and detailed character of the company's plan is indicated by the fact that in its offices are card indexed all the horses on Manhattan Island, numbering 71,151. Realizing that though the last cent of the cost of running other departments is known, probably less than one per cent. of business houses know exactly what their horses cost them, and that the only way to find out is to put trained cost accountants to work, the company offers to compile for prospective truck purchasers complete transportation costs, going into all details. Route diagrams, vehicle movement records, time schedules, time lost, life of horses, will be properly worked out and the whole made into a chart that can be read at a glance. The comparison between horses and motors is then easily made, and it is stated that the saving it is possible to effect runs all the way from 15 to 40 per cent.

It is of course understood that the work is undertaken solely with the idea of selling trucks if their use can be shown to be advantageous and in order to make the work count as much as possible, considerable care has to be taken to avoid spending time and labor on those who have no real intention of purchasing cars. In this, as in other fields, there are not lacking those who would be glad to obtain the services of expert accountants without cost to themselves by refusing to buy machines, regardless of the result of the accountants' work. The Alco staff has found several such instances of merchants who ultimately were

interested or anxious to discover exactly what horse-haulage was costing them.

The Packard Motor Car Co., in prosecuting the sales of its trucks, goes about the matter in a somewhat, but not wholly, similar way.

"If you will tell us how much it costs to feed a horse, how much to stable him, how much to doctor him and how much to keep him in shoes and harness," says the Packard Company "we will tell you how much it costs to operate a Packard truck.

"We have figures showing costs of hauling by horses. They may not be the same as your costs. We have figures showing costs of hauling by Packard trucks. They might not fit your case.

"Among four cartage companies in Detroit the lowest cost of shoeing per team was \$54, the highest, \$77.50; the lowest veterinary cost \$12, the highest \$20; the lowest wagon and harness repair cost \$24, the highest \$100. Horses can be purchased at all kinds of prices. Stabling cost varies with localities and conditions. Fixed charges vary accordingly.

"Horses may be said to cost from four to seven dollars a day in ordinary localities; a Packard truck from eight to twelve—approximately twice.

"The truck can do the work of at least three teams if the hauling conditions are arranged to give the truck a chance. Sometimes it does more; sometimes less."

As this involves the consideration of costs which vary greatly because of different localities, tables have been prepared giving the cost of operating horses and Packard trucks under fair average conditions. The Packard company figures that while it costs approximately twice as much to operate a Packard truck as it does a team, the motor will do the work of at least three teams, according to which method of calculating the machine is a sure winner under almost any conditions. More favorable comparisons are mentioned, such as a truck that displaced ten teams in hauling brick for road work, and another, in the service of a piano house, that displaced three horse wagons, and with each wagon a crew of four men. Still another case is cited where the use of a motor truck made possible the elimination of a branch warehouse, saving \$2,000 in rent and \$3,000 in wages.

Following is one of the tables prepared by the Packard company:

	One Truck	Three Teams
Amortization at 20 per cent. One truck, \$3,800, less \$295 for tires. Teams, seven horses at \$400, and three sets of wagons, harness, etc., at \$500, totalling \$4,300	\$701	\$860
Interest, at 5 per cent., computed for 5 years on amortized principle, averages, per annum....	105.15	129
Insurance, fire, collision and liability, which in New York City amounts approximately to 6 1/2 per cent. on an investment of \$3,800	247	*
Feed—estimated	1,000	1,500
Gasolene—based on 5 miles per gallon, 50 miles per day, 15 cents per gallon.....	450
Lubricant—based on 120 miles per gallon of cylinder oil, at 44 cents, plus \$25 for greases, etc.	80

Tires—based on \$.036 per mile, according to tire company guarantees	540
Repairs—estimated	350	225
Veterinary—average	61.25
Shoeing—average	220
Stable—guess	200	500
Drivers—truck, one; teams, three	1,000	2,340
Total, per year.....	\$3,673.15	\$5,835.25
Total per working day—300 to year	\$12.25	\$19.45

* Not insured.

Priming Cup That Comes from Kansas.

Departing radically from the usual type of priming cup, the Hagstrom Bros. Mfg. Co., of Lindsborg, Kansas, have put upon

the market a priming cup embracing an entirely new principle, the gasolene being sucked into the manifold instead of being forced into the cylinder by gravity.

The device, which consists of a brass fuel chamber fitted with a tight cover, has a duct to conduct the gasolene; instead of being placed upon the cylinder, gravity being relied on to feed the charge in a liquid state, as in the ordinary priming cup, it is attached directly to the intake manifold, the partial vacuum formed when the engine is cranked being utilized to draw the fuel through a vaporizing nozzle into the manifold, where it mixes with the air drawn through the carburetter, and is conducted as a gas to the cylinders. One turn of the crank, it is claimed, is sufficient to start the motor on the coldest day, quite a contrast to the ordinary cup, with which it is first necessary to turn the motor over slowly to allow the gasolene to enter the cylinder, then a couple of times more to mix it with the required amount of air requisite to produce an explosive mixture.

English Idea of an Engine Starter.

According to all reports, the automatic starter movement which is so much in evi-

dence in the United States, has not attracted much attention abroad—at least not to the extent of developing starters in the way they are springing up here. Occasionally, however, some enterprising inventor

puts his ideas on the subject into concrete form, and one starter, brought out in Westminster, England, by A. A. Christensen, is illustrated by the accompanying line drawing.

Evidently it was Christensen's plan to combine two methods of starting in a single apparatus; for his device not only provides for the compression and storage of air, at a pressure sufficient to turn over the engine, but he also passes the air through a surface carburetter, charging it with sufficient gasolene to form an explosive mixture. The result is that there is no delay in filling the cylinders with gas that can be ignited, and starting should occur promptly and without much "spinning" of the motor by pressure of air.

The system includes an air compressor driven by the engine, an air tank of comparatively small size—8 inches in diameter and 20 inches long—a surface carburetter through which the air passes on its way to the engine after it leaves the tank, a rotary air-distributing valve and a control lever. There is no automatic control of the starter, everything being done by manual operation of the control lever. Only pure air is pumped to the tank, so that tires can be inflated.

Graphite Paste to Prevent Carbon!

Although the anti-friction qualities of graphite and its resistance to high temperatures are well known, it rarely is used as a cylinder lubricant for gasolene engine cylinders, largely because of the danger of short-circuiting the spark plugs, graphite being a comparatively good conductor of electricity. Fears for his spark plugs, however, apparently did not trouble the mind of a foreigner who had experienced the evils of carbon in the cylinders of his motor, and who evolved a method of prevention that worked to his own satisfaction at least. "I carefully cleaned the combustion chambers and the tops of the pistons," he says, "and coated them with graphite and gasolene made into a paste and well rubbed in. After running the car some 9,000 miles I examined the cylinders and piston heads, and found no carbon whatever. While my motor is water cooled, I can see no reason why the same plan would not work satisfactorily in air cooled cylinders, some of which, I understand, become carbonized after being in use for a comparatively short time."

Radiators Sometimes Too Efficient.

At this season of the year it is as well to bear in mind that the radiator of a motor car is designed primarily as a means of getting rid of heat in the quickest possible way. In other words, it will become cold in a remarkably short time if permitted to do so, and will continue its efficient heat-radiating action until the temperature of the water is the same as that of the air. If the air happens to be below the freezing point something is likely to happen.

EMPLOYEES CAN DRIVE TRADE CARS

New York Magistrate Makes a Far-Reaching Ruling—Apparent Conflict With Official Definition of "Chauffeur."

The question—and it is one which has agitated New York automobile dealers for the past year—as to whether or not employees of a corporation having a general license have the right to operate cars belonging to such corporations without obtaining special licenses, has been decided in favor of the automobile companies, by at least one judge, but as he merely is a local magistrate his ruling does not go far or carry great weight. The opinion was rendered by Magistrate Murphy in the Jefferson Market Court and holds that an employee of an automobile manufacturer or dealer has the same rights to operate their cars as the officers of the company—provided he is acting in the interest and on the order of such officers. The law covering the point says: "The term 'chauffeur' shall mean any person operating or driving a motor vehicle as an employee or for hire." This would imply that each employee is a chauffeur.

The whole question was brought into court by the United States Motor Co., in the nature of a test case. Howard J. Rogers, a shipping clerk, employed by the company, was driving a car ordered by one of the company's customers, to the pier for shipment. The police arrested him, taking the position that a general license to a motor manufacturer or selling agent did not give employees the right to operate cars. Hundreds of fines had been imposed by magistrates before this test case was made. Henry D. Merchant, counsel for the United States Motor Co., undertook the defense of Rogers.

"An officer of the corporation could have proceeded unmolested," said he. "Why not the shipping clerk in the performance of his duties under instructions from an officer, so long as he was not employed in the particular capacity of a chauffeur?"

He argued that the Callan law could not have intended to license a corporation and then restrict it in the operation of its cars to officials and licensed chauffeurs.

"It would have been easy for the Legislature," said he, "to have stated in unequivocal terms that every employee or agent or servant of an individual owner or corporation must be licensed as a chauffeur in order to be permitted to drive upon the highway if that had been intended."

Magistrate Murphy upheld this view.

Where Motor Cars Must Have Horses.

Denmark usually is given credit for being a rather progressive country, but that there are some parts of it in which it almost is a crime to be "modern" amply is proven

by the regulations of the small town of Otter, a place of some 4,000 inhabitants. Motorists passing through the streets of this reactionary town must procure a horse to draw their cars while within the confines of the city limits, and those guilty of violating this restriction are heavily fined.

Sentinel That Guards Gasolene Supply.

Attacking the problem of providing a gasolene reserve for emergency use in a manner different from the well-known and obvious instalment of a separate tank, the Sentinel gasolene tank alarm, which is manufactured in Germany and marketed in the United States by Zwilling & Feldman, of 560 West 171st street, New York City, has several unique features. It is designed not only with a view to give the motorist due warning as soon as his gasolene supply falls below a predetermined limit, but it also acts as a preventive

against theft or loss of fuel by mischievous persons.

The device, which is shown in the accompanying illustration, consists of a standpipe, screwed into the bottom of the tank and extending about two inches upward from the bottom into the fuel. The gasolene flows through this standpipe until its level is even with the upper end of the same, when the flow is interrupted and the motor brought to a stop. In order to restart the engine the driver must leave his seat and turn the valve at the bottom of the standpipe, as indicated by the dotted lines, thus causing the remainder of the gasolene to flow out of the lower outlet. The stopping of the engine gives the driver due notice that his gasolene supply has fallen below the limit and allows him to replenish his supply without being subjected to vexatious delays. The quantity held in reserve may be adjusted according to the fuel consumption of the engine.

The device, which is furnished either with handle or key, also serves as a protection against theft or loss of fuel caused by opening of the valve on the part of mischievous persons, inasmuch as the entire supply can be stopped until unlocked by the key.

"DOING BUSINESS BY THE MILE"

Some Phases of Taxicab Operation That Are Not Generally Known—How Telephone Reduces the "Idle Time."

One of the problems confronting the officials of taxicab companies is that of keeping their vehicles busy throughout the day instead of having them rushed with work at certain periods—usually from 4 P. M. to midnight—and at other times mostly idle.

"There is money in it for the chap who can show us how," said John W. Weibley, manager of the Pittsburgh Taxicab Co., in discussing the subject, and he went on to point out how a telephone service that the company maintains had at least partly solved the problem.

"You see," he continued, "we have our own 'peak loads,' the same as in the telephone or telegraph services. Of course, the reason for this is simple enough. You can't take people to the theaters, the restaurants or the lecture halls in the morning. If you could change American daily life in this respect and the present evening usage were maintained, our existence would be the happiest sort of an arrangement."

Time is the paramount factor in all of the taxicab problems. As the consumption of time decreases, the number of problems becomes smaller. For example, it would never do to let each driver return to a dispatcher's station when a fare could be picked up along the way. Each empty taxicab traveling to and fro means a cost of 31 cents for each mile so traveled. So the telephone is arranged to flag the driver who is out in the suburbs. It enables him to pick up a fare in the locality, and the empty hauls at 31 cents a mile are reduced and almost eliminated.

"Pittsburgh's topography is ideal for the taxicab business," said a taxicab man. "In fact, the city is really three towns in one. Most of the hauls are confined to each locality, and the long money-losing trips are eliminated."

The sections to which Mr. Weibley referred are the East End, Down Town and the North Side. This bit of geography was taken into consideration when the taxicab concern's telephone plant was arranged.

The Pittsburgh Taxicab Co. has 25 Bell telephones and 21 of them are taxicab stations, from which dispatching is done. Three trunk lines connect the company's private branch with "Hiland," the East End exchange. There is a tie line that connects the private exchange with a small board at the Fort Pitt Hotel. From the Fort Pitt direct lines connect with down town taxicab stations at theaters, hotels, office buildings, etc.

The East End being a residential section,

no difficulty in dispatching is experienced. Calls are naturally sent to the company's office and garage, which is situated in the center of this section. But it was in this part of the city that for some time long hauls without passengers made big leaks in the revenue. The management found the answer a few months ago. The trouble arose from the inability to flag cars in the residential outskirts. So a Western Electric police telephone was placed at Shady and Northumberland avenues, and another at the corner of Murry and Forbes streets. These intersections are quite a distance from the garage and Rittenhouse stations and effectually shut off the empty haul.

When the police sets were placed in operation, each chauffeur was given a key and instructed to make stops at these stations. If the driver's services are needed in the immediate neighborhood, he is dispatched.

In the old cab and hansom days, costs were not considered as in these times. Quite obviously it takes more training to steer an automobile successfully than it did to pilot a cab horse. Naturally a higher class of men is employed to do the work. The old-fashioned cab man did about as he pleased, but the taxicab chauffeur is under check each minute of his working day. The checking is accomplished in a large measure by means of the telephone.

Suppose a driver leaves the garage at 6:20 P. M. His destination is the Frick building, a distance of four miles from the garage. This man's departure and the reading of his taximeter are noted at the garage. When the four-mile trip is completed, he steps to the Frick taxicab station. Then the attendant calls up the garage and compares notes. If two hours have been consumed, the taximeter registers 20 miles and the chauffeur has only \$1.75, there is something wrong and the management learns the reason in very short order. The taxicab people study their business day and night, Sundays and holidays. As a result, telephone service is used efficiently, not needlessly.

"We aim to be paid reasonably for every single mile covered," is the way Manager Weibley introduced the subject of efficiency. "Everything is figured on a mileage basis, even our executive salaries. We are doing business by the mile in every sense of the word.

"Our taxicabs are being repainted and a gray color is being substituted for black. This is not alone for artistic reasons. Through painting a cab for the Hotel Schenley, we found that it was easier to keep a yellow body clean. Since that was true, gray would be still easier, so we are changing all of the machines.

"Whenever a driver tells us that he can't get 15 miles per gallon out of his machine, we simply give him some other man's car. Then if he fails to get the 15 miles, we know it is the man who is at fault. Forty-five machines running day and night, 365

days in the year, use a lot of tires. The taxicab company buys its tires by the mile and our contract is made at so much a mile. The contractor vulcanizes cuts when they first appear, then shifts from rear to front wheels in such a way that the tires average 4,500 miles, while the initial guarantee is for 3,500.

"You can see that our use of the telephone is in line with our other practices. Whenever there is anything that will save time, we do not hesitate to adopt it; for time is money in our business in every sense of the word."

To Save Pedestrians from Mud Splashing.

Following a number of law suits and an agitation to compel owners of public service motor vehicles, at least, to equip their

FRENCH AUXILIARY MUDGUARD

cars with mudguards of such form that mud or water cannot be splashed on pedestrians, the French Compagnie Generale des Omnibus has introduced such a device in Paris and in the future it will be used on all the vehicles operated by that company. In Belgium there recently was passed a law making compulsory the use of some such device and in view of the fact that a similar law is expected soon to be passed in France, the action of the French omnibus company in forstalling it is interesting. The mudguard itself, as may be seen in the accompanying illustration, is nothing more nor less than a slightly hollowed rubber ring which is attached to the spokes of the wheel by means of six bolts. In position it is parallel to the wheel and about three inches distant from it. It is quickly and easily attached or detached, and it is claimed that the splashing of mud and water is effectively prevented.

Public Touring Service on Pacific Coast.

Carrying out its announced intention of utilizing the 40-horsepower Garford tour-

ing cars which were used for public touring service in New England during the past summer and which conveyed a party from the Atlantic to the Pacific on the first "pay-as-you-enter" automobile transcontinental party ever organized, the Raymond & Whitcomb tourists' agency, of New York, has inaugurated a passenger service between San Francisco and Los Angeles. This service is to be continued during the winter and anyone who has the price of the required ticket may enjoy the pleasures of an automobile trip between the two great California cities, without going to the trouble of purchasing or hiring an entire car. Seats will be sold just as they were sold many years ago for the famous coaches of the West, and as they now are sold for Pullman cars on the modern railroads. The new service will be conducted according to printed time tables.

Austria to Squeeze Visiting Tourists.

Owing to the storm of protest which the proposed "upward revision" of the license and registration fees for automobiles in Austria-Hungary has raised in the dual monarchy itself and in other countries of Europe, the Reichsrat has taken the schedule under advisement once more and has made substantial changes. While in the schedule first submitted, which was published in a recent issue of the Motor World, the big cars were taxed most heavily, in the revised list the small cars are "boosted" and the "foreigners" are treated worse than ever, the latter being compelled practically to take out a full year's license for a mere visit to the land of Francis Joseph.

The new schedule provides the following licenses fees:

Motorcycles	\$ 2.25
Motor Side Cars	6.75
Electrics	45.00
Gasolene—	
General tax for all cars	\$13.50
Additional tax per horsepower in	
Cars up to 10 H. P.90
cars from 11 to 20 H. P.	1.35
cars from 21 to 30 H. P.	1.80
cars from 31 to 40 H. P.	2.25
cars from 41 to 50 H. P.	2.70
cars from 51 up	3.15

According to this schedule an American tourist desirous of motoring in Austria for a month or two with a car of 60 horsepower would have to pay a fee of 900 Kronen, or \$202.50.

"Bliss" Was Duby; Gets Two Years Penalty.

Theran S. Duby, registered racing driver No. 49, has been suspended for a period of two years by the A. A. A. Contest Board for using a false name and for participation in an unsanctioned race meet at De Witt, Iowa, on Sept. 15th, last. Duby confessed that he had raced under the name of "Bliss." His sentence will expire December 14, 1913. C. D. Kemp, driver No. 399, has been given six months for participation in an unsanctioned meet at Madison, Wis., on September 24th. His suspension will expire June 14th next.

997,469. Automobile Number Displaying Device. Frederick Robinson, New York, N. Y., assignor to Sure Number Lamp Company, New York, N. Y., a Corporation of New York. Filed Feb. 11, 1910. Serial No. 543,329.

1. In an automobile number display device, the combination with a box, of a transparent plate dividing the same into two compartments, the front wall of one of said compartments having an opening covered by a colored transparent member, and the front wall of the second compartment being provided with openings representing numbers and characters, a translucent plate covering the openings in said second compartment, a parabolic mirror in said first compartment, a source of light located in the same compartment and in the focus of said parabolic mirror, a plurality of reflecting surfaces in both compartments co-operating with said parabolic mirror to reflect the light upon said transparent member and said translucent plate, and a shield in said second compartment arranged at an angle to the surface of said translucent plate, and adapted to cut off the direct rays of said source of light from the portion of said translucent plate adjacent to the shield.

997,497. Automobile Storage Jack. William H. Hattel, Kalamazoo, Mich. Filed May 1, 1911. Serial No. 624,429.

1. In an automobile storage jack, the combination of a base having three projecting members; double angle uprights projecting therefrom and curved at top to engage a suitable handle; a cross-head having arms adapted to be adjustably secured to said uprights by means of bolts; a vertically reciprocating plunger provided with a saddle, said saddle being provided with a pad to prevent marring the hub, said plunger operating in a sleeve secured to said cross-head; a cam rotatively secured to said cross-head beneath said plunger and adapted to raise said plunger when said cam is rotated; limiting stops secured to said cam and adapted to engage opposite sides of said cam and retain it in either its up or down position, and a lever secured to said cam in such a position that its weight locks and holds said cam in either its normal or raised position, substantially as shown and specified.

997,561. Automobile Construction. William Kelly, Detroit, Mich., assignor to Everett, Metzger, Flanders Company, Detroit, Mich., a Corporation of Michigan. Filed Sept. 28, 1908. Serial No. 455,032.

1. The combination of an engine having a crank case and having an opening for the main shaft in the end of said crank case, a main shaft passing through said opening, a part constituting a bearing for said main shaft fitting into said opening, a bracket having an aperture therein, the wall of said aperture being adapted to fit around said bearing part, and means for securing said bracket to said crank case.

997,573. Roller Bearing. Onesime E. Michaud, St. Louis, Mo. Filed May 2, 1910. Serial No. 558,954.

1. A roller bearing comprising a cage sleeve having an annular series of openings

15 cents per line of seven words, cash with order.
In capitals, 25 cents per line.

REBUILT THOMAS CARS—One year's work usually tells the story of the difference in construction between a high grade, high priced and high powered car and those built to sell at a low first cost. The strain of gear shifting, the jar of road shocks, and the stress of brake work begin to tell on the cheaper cars. Therefore the logical deduction is, that for the man who wants a thoroughly dependable car at a moderate price the very "best buy" is a high grade used car that has been rebuilt in the factory where it was originally made. We have a few four and six cylinder cars. 1908, 1909 and 1910 models, some priced as low as \$1,000. These cars should not be confused with the ordinary "second hand" proposition, as in the rebuilding all parts which show the slightest wear are replaced by new ones. If you want a car for real work, write us and we will send you special bulletins descriptive of rebuilt cars we have on hand. For a reasonable payment we will hold one of these cars for you for early spring delivery. **USED CAR DEPARTMENT, E. R. THOMAS MOTOR CAR CO., Buffalo, N. Y.**

WANTED—First class experienced electric pleasure car salesmen. Must be a hustler and competent to handle retail men. State salary wanted and references. **GRINNELL ELECTRIC CAR CO., 16 East Atwater St., Detroit, Mich.**

DO YOU WANT TO SELL your car? Place it with us on sale at a net price to you; we will make absolutely no charge for storage, advertising, insurance, etc.; you have the privilege of rehoming same at any time without notice. **MOTOR CAR EXCHANGE, 250 W. 54th St., New York City. Tel. 4511 Col.**

LIMOUSINE body costing \$1,000. Sacrifice for \$350; no dealers. **ROOM 800, 110 W. 34th St., New York City.**

FOR SALE—To Packard "18" owners. A new 1912 fore-door runabout body with fenders, rumble seat, special leather top; all new; suitable to make over an old "18" Packard into a 1912 car. **LOCK BOX B, Erie, Pa.**

AUTOMOBILE INSTRUCTION—Individual road work and small group classes. Day and evening. Arrangements for out-of-town men. Booklet on request. **West Side Y. M. C. A. Automobile School, 313 West 57th St., New York City. Phone 7920 Columbus.**

FOR SALE—65 shares United Motor (Rutherford Rubber Co.), 7% cumulative preferred. **LEWIS W. BROWN, Englewood, N. J.**

FOR SALE—Bargain prices in several used cars—Cadillac, Maxwell, Hup, Flanders and others. **RUSSELL CURRY, Ridgeday, Pa.**

WELD-IT-ALL—Cast iron, aluminum, crank cases—in fact any metal. Machine shops and garages, send your address, we will tell you how; absolutely safe. Good territory for good sales agents. Don't delay. **H. D. PROSE & CO., Hutchinson, Kan.**

AUTOS AT LOWEST PRICES "NOW."

New York's Automobile Bargain Establishment "Par Excellence." Never before so many sacrifices by owners of high class cars at "Your Price." Exchanges Made and Easy Payments. 1910 "Forty" Fiat, 1911 American Traveler, 1911 Bergdoll roadster, Renault town cars, Stearns town cars and Stearns touring cars, \$450 up. 1911 to 1907 Packards (all styles); Peerless landaulet, \$750; other Peerlesses up to \$1,800; six cylinder Pierce, \$1,200; Stoddards, \$500-\$750. Six cylinder Stevens, \$550 to \$1,800; Chalmers town cars, \$700 up; 1911 Pullman landaulet, \$1,100; Mercedes, \$500, \$750, \$1,000; Mercer, \$750. Hotchkiss, four cylinder landaulet, \$850; six cylinder landaulet, \$1,000; taxicabs, \$300, \$400, \$600, etc.; delivery wagons, \$225 to \$1,100; Hupmobiles, \$325. Itals, \$900 to \$2,500; "fifty" and "ninety" Simplex cars, \$1,500 up; Buicks, \$200 to \$550; Cadillacs, \$500-\$700; Marions, \$600-\$900. "E-M-Fs," \$395, \$450, \$550 to \$850; White steamers, \$200-\$500; Marmon, \$1,200; Overlands "forty," \$425. 200 other unusual opportunities. Examinations invited. "Square deals." Demonstrations cheerfully given. Lot of Closed Cars; Bargains. Bodies, Closed, etc., Rock Bottom. Ready for your chassis. Complete A1 job. Send for the price lists. Magnetos, horns, lamps, tubes, shields, etc., cheap. **BROADWAY AUTO EXCHANGE, L. C. Jandorf, Pres., 1759 to 1765 Broadway. Entrance at 1761, between 56th and 57th Sts.**

A BANKING HOUSE of long established business, wishes to engage as bond salesmen several young men of proven salesmanship in other lines, but who are desirous of entering the investment business. **BANKER, 603 North American Bldg., Philadelphia.**

AUTOGENOUS welding of broken cylinders and crank cases is most expertly done by WATERBURY WELDING WORKS, Waterbury, Conn.

CYLINDERS RE-BORED, piston and rings fitted. We make cut gears, cranks, connecting rods, any part. Send old pieces. **MCCADDEN MACHINE WORKS, St. Cloud, Minn.**

FOR SALE—Bodies. We offer subject to sale some four and five-passenger touring car and fore-door roadster bodies. Can be rebuilt to fit, and fore-doors can be added to touring bodies if desired. **RACINE MANUFACTURING CO., Racine, Wis.**

FOR SALE—Knox Model O, water, full equipment. Oakland Model K, top, glass front. Oakland Model 25, elegant full equipment. Oakland racer, a dandy hill climber. Oakland Model K, near new, good. Maxwell D-A model touring, good shape. **F. W. SMITH, 161 Commerce St., New Haven, Conn.**

WANTED—A capable, experienced advertising and publicity man; one who can get up attractive advertisements and handle publicity properly for one of the best known lines of automobiles in America. State experience and give references in first letter. Address, N. V., Box 649, New York City.

STORAGE—\$4 a month and upward. **RIVERSIDE STORAGE WAREHOUSE, 618 West 131st St., N. Y. City.**

therein, rollers fitted loosely in said openings and having reduced end portions, and retaining bands fitted on the outer side of said cage sleeve so as to be normally stationary but adapted to be rotated thereon and having their inner edge portions notched and arranged to overhang the reduced end portions of the rollers, whereby said rollers are normally retained against removal outwardly from the respective openings in said cage sleeve.

997,585. Differential Hub. George W. Stanley, Logansport, Ind., assignor of one-eighth to Zachra Taylor, Daws Taylor, Clark M. Taylor, and Joseph Taylor, and one-fourth to E. D. Morgan, Logansport, Ind. Filed Aug. 24, 1908. Serial No. 450,049.

1. The combination with a power axle, of a collar fixed upon said axle provided with oblique recesses or grooves forming shoulders and anchor shaped points, said collar being provided with an oblique recess or groove connected to one of the first mentioned recesses or grooves by a diagonal bore a ball mounted in said recess or groove, an idler mounted in the other recess or groove and a hub provided with a fluted box mounted on said collar adapted to be locked in position to be driven forwardly or backwardly by the live ball.

997,606 Differential Gearing for Automobiles. John Demmler, Lansing, Mich. Filed Aug. 22, 1910. Serial No. 578,275.

1. The combination of a driving shaft, a beveled gear wheel on said driving shaft, a differential gear casing, a beveled gear wheel on said casing engaging the beveled gear wheel on said driving shaft, a stationary cylinder coaxial with said gear casing and provided with screw threads, a cup provided with screw threads engaging the screw threads on said cylinder, a bearing for said casing in said cup, and a thrust bearing engaging said cup and casing.

997,610 Process of Making One-Piece Radiator Sections. Frederick A. Feldkamp, Vailsburg, N. J., assignor to Electrolytic Products Co., a Corporation of New Jersey. Filed Sept. 15, 1910. Serial No. 582,110.

1. A process for producing hollow honeycomb one-piece radiator sections consisting in first preparing a core or pattern of a fusible metal with a series of openings, then producing electrolytically a first deposit of metal upon the outer face of said core or pattern and inwardly into the openings in said core or pattern, and then producing electrolytically a second deposit of metal into the interior of said openings and outwardly therefrom toward the outer surfaces of said core or pattern, and finally removing said core or pattern from said electrolytically deposited metal.

997,617. Differential Mechanism. Albert D. Gilpin, Lincoln, Kan. Filed Sept. 30, 1910. Serial No. 584,769.

1. A differential mechanism including a main gear wheel having drums upon its opposite sides, axle sections extending into the drums, pairs of oppositely formed ratchets carried rigidly upon the inner ends of the axle sections within the drums, rocking pins disposed within the drums and having offset pawls for alternate engagement with the ratchets, gears carried upon the inner ends of the axle sections, and yielding teeth carried in the outer ends of said rocking pins for engagement with said gears.

997,624. Rotary Power Muffler. George

Lewis, Brooklyn, N. Y. Filed Sept. 3, 1910. Serial No. 580,400½.

1. A rotary muffler for internal combustion engines, said muffler comprising a cylindrical casing, a rotary drum-shaped member mounted in said casing and around which is an annular chamber, said rotary member being open at one side, and the corresponding side of the main casing being provided with exhaust ports or passages and the opposite side of the main casing being provided with a radial passage which communicates with the interior of said rotary member and with said annular chamber, the interior of said rotary member being provided with radially arranged blades and the exterior thereof with transverse blades, and means for connecting the rotary member with a rotary part of the engine, and means for placing the annular chamber in communication with the exhaust of the cylinder of the engine.

997,636. Driving Gear for Vehicles. Clarence E. Patton, Cincinnati, Ohio, assignor to The Acorn Motor Car Company, Cincinnati, Ohio, a Corporation of Ohio. Filed Mar. 16, 1908. Serial No. 421,407.

1. In a friction gearing a longitudinally shiftable driving shaft, a friction wheel mounted on said shaft and provided with a wedge-shaped driving periphery, friction disks mounted on opposite sides of said wheel and provided with concentric V-shaped grooves adapted to engage the periphery of said wheel, means for simultaneously and yieldingly holding both of said disks in operative engagement with said wheel, means for moving said disks axially to disengage said wheel, and means for transmitting rotation in the same direction from said disks.

997,654 Steam Motor Vehicle. Louis Doillet and Paul Robert Faure, Paris, France. Filed Sept. 16, 1909. Serial No. 518,068.

A steam motor vehicle having its engine and boiler located side by side within the hood at the front end of the frame thereof, a radiator also located within said hood in advance of said boiler and engine and in pipe communication with the latter for condensing the exhaust steam flowing therefrom, a fan operated by said engine and interposed between the same and said radiator, said fan having its casing communicating with the combustion chamber of said boiler for supplying air thereto, and a direct shaft transmission drive from said engine to the rear axle of the vehicle, said shaft being located on the same side of the frame as the engine.

997,687 Pneumatic Tire Cover. Andre J. Michelin, Paris, France. Filed Nov. 16, 1910. Serial No. 592,690.

1. A tire cover for wheels with flanged rims, having embedded in said cover beads of relatively stiff but slightly flexible material; said beads comprising each a cover having a packing of resilient and textile material; and a reinforcing strand in said packing, said beads being elongated and tapering in cross-section and adapted to overlie the outer flange edges, as set forth.
